In the main, the miniatures have one feature in common, the blue background; but this does not seem to constitute a decisive test, for there are a few miniatures not executed in this way that nevertheless appear to have a definite affinity with Irano-Manichaean art, as in the case of the fragment depicting winged Victories. It is possible that not all the miniatures collected by Von Le Coq are Manichaean; however, since many of them are in such poor condition, a definite conclusion cannot be reached. In any case, widely disparate elements went into the making of Manichaean art: Turkestan was at that time characterized by a highly complex aggregation of races and creeds, not only by reason of its geographical position, but also because the religious communities which had become established there maintained close relations with those from which their founders had migrated.

All that can presently be stated is that some of the unusual features seem to have been common to other centers of art. As Von Le Coq pointed out, a link with the West may be found in the technique and decorative motifs of the Turfan bindings, which, according to him, seem to correspond to an analogous technique and similar designs in late Coptic manuscripts. This was confirmed by U. Monneret de Villard, who pointed out that the heart motif described by Von Le Coq is of Irano-Bactrian origin and that it also occurs in a Coptic binding preserved in the Museum für Völkerkunde in Berlin. On the other hand, the theme of the tree exaggerated in width and laden with enormous flowers and clusters of fruit, a motif which occurs in a fresco at Bezeklik as well as in several miniatures found in Murtuk and Khocho, seems also to recur in Tun-huang, where according to J. Hackin, it appears in a votive painting representing the Temptation of the Buddha.

In several of the miniatures, the figures have features resembling those of figures in Coptic painting and wear their hair in curls over the forehead and temples; it also seems that the same type of figure is to be found in the paintings at Miran, which date from the late 3d or early 4th century and are of an unmistakably Western origin that can apparently be traced to coeval Coptic art. Furthermore, since it is believed that Mani himself was the author of the illuminations that adorn the manuscripts written by him, it is probable that, like his writings, the corresponding illuminations were also faithfully copied, in accordance with his injunctions. Some of the Turfan paintings might therefore be distant copies of these originals, a fact which would explain their vague resemblance to the paintings of the 3d century, but that is a very tenuous hypothesis.

In actual fact — apart from the influence of Chinese T'ang painting, which had so marked an effect on the art of the Uigurs in Khocho, and that of northwestern India and eastern Iran, which may have been transmitted through Buddhist painting — Manichaean painting displays elements clearly derived from Sassanian Iran (see SASSANIAN ART), such as the winged Victories and the beaded ornamental bands so characteristic of Sassanian decoration. It also seems possible to establish some affinity with the art of Pyandzhikent, in which traces

of Manichaean influence may have appeared in turn; moreover, the facial expressions and coiffures in some of the Manichaean miniatures should perhaps be regarded as reflecting the influence of Coptic painting. One thing seems certain: namely, that the Manichaean clergy of central Asia must have kept in constant touch with Mesopotamia, and later with Sogdiana, hence maintaining relations with the whole of western Asia and perhaps even with Africa.

It is conceivable that Manichaean art reappeared in a disguised form in Iran after the Mongol conquest. Many Uigurian officials were entrusted with the administration of the conquered territories and even held high positions under the Ilkhans (see ILKHAN ART). Doubtless the Uigurs preserved the artistic traditions they had brought into the favorable atmosphere of Iran. There are those who see Sassanian and Manichaean traces in Persian painting; others maintain that the motifs and effects common to both the Manichaean and Persian miniatures were derived from a single source: the Sassanian miniature, of which absolutely nothing is known. There does, indeed, exist an interesting parallel between some of the Manichaean miniatures and the miniatures that adorn the text of Rashīd al-Dīn's great history *Jāmi' at-Tavārīkh* (early 14th cent.), Dioscorides' *De materia medica* (copy of 1222), and the manuscript of al-Bīrūnī's *al-Āthār al-Bāqiyah* (copy of 1307) discussed by T. W. Arnold (1924). Arduous research will have to be undertaken before any definite conclusions can be made in this regard. However, it does seem that the decorative border of Manichaean manuscripts was perpetuated in the Persian miniature, and that it reappeared no later than the end of the 13th century, in the bestiary known as *Manāfi' al-Ḥayavān* (New York, Pierpont Morgan Lib., M. 500). As to the influence which Manichaean painting may have exerted in the Far East — where numerous Manichaeanist communities were founded, some of them continuing to flourish for a long time in the region of the lower Yangtze — the question has still to be fully explored, but it seems reasonable to suppose that the existence of illuminated books in these communities must have exerted some influence on Chinese book illustration.

MANNERISM. The terms *maniera* (lit., manner or style; historically, the style of the 16th cent.) and "mannerism" have been used since the 16th century to designate and characterize the complex stylistic phenomena occurring in Italy and throughout Europe in the period between the apogee of Renaissance classicism, represented by Leonardo, Michelangelo, and Raphael, and the advent of the new artistic era ushered in by the Carraccis, Caravaggio, and Bernini. These phenomena have in the course of the following centuries been subject to a wide range of critical interpretation — being viewed variously as the final exhaustion, indeed, degeneration of Renaissance artistic premises, as the vital elaboration essential to a new stylistic synthesis, or simply as the expression of a self-sufficient esthetic entity. The last view has dominated the thinking of an active group of modern critics devoted to the restoration of the historical conception of the *maniera*, now elevated to a stylistic category, as mannerism, by means of careful analysis of single phenomena and of their historical interrelation. Since the outcome of this scholarly undertaking is still at issue, it seems useful to review both the history of the new critical formulation of the problem and its consequences for the historical reconstruction of the artistic revolution of the 16th century.

SUMMARY. The problem of mannerism (col. 444). The maniera in its historical setting (col. 453).

THE PROBLEM OF MANNERISM. The term *maniera*, from which "mannerism" derives, goes back to the earliest Italian critical writing. Cennini used it (ca. 1390) to mean individual style; Ghiberti was the first (ca. 1450) to extend its meaning to apply to the style of a period. Its specific application to 16th-century style originated in its use by the greatest of 16th-century critical writers, Giorgio Vasari (q.v.), for whom the term had a variety of clearly differentiated meanings (*Vite. . .*, 1550 and 1568). Like Cennini, he used it extensively to indicate a habitual mode of artistic expression, that is, the personal manner or style of an individual artist, but he also used it to denote a national or historical style, as had Ghiberti (*maniera greca*, Byzantine style; *maniera moderna*, modern style). However, in Vasari's hands it served too, standing alone, as a term of critical approbation in the absolute sense of *good* style: an artist either had *maniera* or he did not. Here *maniera* contrasted with the objective imitation of nature, which Vasari considered to be the primary characteristic of 15th-century painting, and denoted a quality peculiar to 16th-century painting, the ideal imitation of nature; *maniera* was the decisive factor integrating the achievements of the Renaissance — *regola* (rule), *ordine* (order, or composition), *misura* (proportion, or measure), and *disegno* (design, or drawing). If *disegno*, called by Vasari "the father of the three arts," was the physical expression of "a form, or idea, of all things in nature," the "idea" being identified in contemporary Neoplatonic thought with beauty itself, *maniera*, qualified as *bella maniera*, was the extension of this idea of beauty into a pervasive principle of style. "The artist's manner [*maniera*] becomes then the more beautiful from the practice of frequently drawing the most beautiful things and from adding together the most beautiful hands, heads, bodies, and legs, thus forming from all these beauties a figure more [beautiful] than is possible [that is, than occurs in nature], and making use of it in every work for all the figures; hence it is called *bella maniera*."

The process of study, selection, addition, and projection — of individual judgment and subjective interpretation — constituting the *bella maniera* implied the idea of the intervention of imagination alongside objective intellectual elaboration. In Vasari's view this process of the ideal imitation of nature was the liberating discovery of the 16th century, when art was thus freed from the self-imposed limitations of 15th-century art arising from its attachment to objective reality and was enabled, through this infusion of subjectivity, to surpass in effect the paradigm of the art of antiquity, admired throughout the Renaissance as capable of adhering simultaneously and equally to nature (*similitudo*) and to ideal beauty (*pulchritudo*). Inherent, however, in the very liberating function of the *bella maniera* was a subtle conflict between the desire for definitive rules and the desire for a form of expressive enrichment that made it necessary to transcend them. This tension implicit in 16th-century style was recognized by contemporary writers; Vasari's appreciation of the great creators of the High Renaissance, particularly Michelangelo, was based precisely on this capacity to transcend the established boundaries, especially those of classical example.

The term *maniera*, then, actually indicated by implication and by extension the common basis of all 16th-century style, not only of Vasari's own generation but also, and more particularly, of the golden age itself, which he regarded as an unsurpassable artistic achievement. Vasari recognized this age as already ended; thus, by indirection, the *maniera* as practiced in his own day represented a descent from that height. However, the difference was essentially one of magnitude, not of kind. For G. B. Armenini (*De' veri precetti della pittura*, 1586) too the grandeur of the attainments of the golden age ad-

mitted of eclecticism and imitation as the only developmental possibilities.

No real censure of the *maniera* was formulated until 1672, when, in the context of 17th-century classicism, one of its most authoritative spokesmen, Giovanni Pietro Bellori, published the work containing the celebrated definition of the *maniera* as "a fantastic idea based upon studio practice and not upon imitation [of nature or suitable classical examples]" which has served as the starting point for much of the modern discussion of the subject. In the course of less than a century the ideal principle of an entire style had become an empty shell, by Bellori's time persisting only in studio practice, no longer sustained by what had been its point of departure, the observation of nature. It must be remembered, however, that Bellori regarded the *maniera* as the style of the later 16th century (i.e., of Vasari's *Quarta Età*), which differed not only in degree but in kind from that of the High Renaissance, and that his disapproval extended equally to the "naturalistic" innovations of Caravaggio, which he mistakenly regarded as simply the representation of the immediate and accidental aspects of nature. The critical vantage point of Bellori was thus still one of high ideality: artists should "correct nature" so that a form "originating in nature overcomes its origin and is made an original of art." The late followers of the *maniera* were no longer capable of this, for they had become ensnared in the imitation of the great Renaissance masters. It was necessary not to reject the ideal principle of the style but to give it a new foundation, and this was provided by 17th-century classicism. Bellori's disapprobation was thus directed not so much at the artistic principle itself as at the senescence of the style of imitators incapable of understanding the stylistic elements they had borrowed, for whom (as Luigi Coletti has pointed out) the phrase "fantastic idea" has less relation to creative imagination than to empty intellectualism. On this basis the imitators of Raphael and Michelangelo were sharply criticized from this time forward.

The late-17th-century critic Baldinucci, in his *Vocabolario toscano dell'arte del disegno* (1681), gave *maniera* the altogether negative meaning of the individual will of the artist in opposition to the evidence of nature. As such, *maniera* might be variously qualified, but always in the negative sense (crude, washed out, pinched, languid, wooden, imitative, dry, etc.), the severe judgment being mitigated only in the case of *maniera gagliarda* (vigorous, bold, rich manner), which emphasized formal chiaroscuro; in the case of the "Lombard manner" of the north Italian painters, whose color retained its firm attachment to reality; and in the case of the "ideal manner" of those artists who were not so enthralled by reality as to forget what they had observed "in the most beautiful of nature and in the works of the most sublime masters." (But they must be interpreters, not copyists, of these masters, so as not to fall into the "wooden manner," the "vice of musculature," of the 16th-century followers of Michelangelo.) Apparently, even in the language of the workshops and studios, which were Baldinucci's sources, the term *maniera* was by then synonymous with creative inertia and expressed positive meaning only by virtue of a qualifying adjective. "Mannered" (*ammanierato*) was used by Francesco Milizia (1797) to denote artistic dishonesty, and "mannerist" became the term customarily applied to the imitators of Raphael and Michelangelo. This transition in the history of a term from an artistic category to a disparaging adjective sums up the parabola of the Renaissance artistic idiom.

Originating in baroque criticism of the art of the preceding period, the derogatory connotation of *maniera* remained unchanged until modern times. To Lanzi, writing in 1789, "mannerism" signified the decline of art into the inert repetition of formulas. But for the first time it was, by him, given chronological limits as a distinct trend: the golden age of Renaissance art did not survive the Sack of Rome (1527; "after this that capital gradually declined in painting and was finally filled with mannerists"). The same thing had happened in Florence after Vasari, while in Venice the mannerist dissipation of the great coloristic tradition took place only in the 17th century, with Palma Giovane. Furthermore, the 16th century, said Lanzi in the preface to his treatment of the Bolognese school, had been, at its apogee, so rich in definitive solutions that anyone who came after, "whether he wanted to or not, though he was an imitator of nature must at the same time be [an imitator] of the greatest masters." "Only the way of imitation was open to the human genius to distinguish itself" until the Carraccis (q.v.) — not Caravaggio, who to Lanzi was an isolated figure quite apart from the mainstream — found a new way through which "the painter might divide, so to speak, his glances between nature and art." Mannerism was henceforward to designate, however negatively, the style of a specified period of Italian art. Jakob Burckhardt (1855), limiting it chronologically to the 50 years between 1530 and 1580, traced its origin not only to the inhibiting presence of the great masters but also to social factors such as the final breakdown of the guild system.

The shift in the critical position on mannerism took place at the end of the 19th century and was a consequence of the reassessment of baroque art that followed the long estrangement from neoclassic intellectualism as well as romanticism. The study of the baroque led to the search for its premises and origins in the art of the 16th century, and in the quest, which began in the field of architecture, not only the crystallization of the "classical style" but also its radical transformation began to be discerned. Cornelius Gurlitt (1887) described a "late Renaissance" in which Michelangelo and the architects active in Rome at the end of the 16th century shared in that triumph of personal sentiment over intellectualism basic to both Reformation and Counter Reformation, but Heinrich Wölfflin in his fundamental work *Renaissance und Barock* (1888), rejecting the intermediary period proposed by Gurlitt, traced back to the "classical" maturity of the Renaissance the beginnings of the evolution leading to baroque style, which was in his opinion clearly defined as early as 1580. That artistic change which Gurlitt saw as the consequence of cultural and spiritual factors was defined by Wölfflin in purely formal terms as the shift from closed, "sculptural" form to open, freely pictorial form — a concept he later (1915) fully developed in his *Kunstgeschichtliche Grundbegriffe* (*Principles of Art History*). Renaissance and baroque style thus represent essentially opposed currents of art, the mutually exclusive, though chronologically adjacent, terms of the eternal classic-romantic antinomy. Within the brief period of "classic art," which began with Leonardo and was dominated by Raphael, Michelangelo represented the individual crisis presaging the rise of the baroque — even though the imitation of Michelangelo by the mannerists constituted dross destined to be discarded. The necessity of an intermediary phase between two diverse stylistic phenomena was restated by Alois Riegl (1894–1900; pub. 1908); he identified, besides the evolution leading directly from Michelangelo to the baroque, an architectural current — the optical-coloristic — derived from Raphael's purely pictorial interpretation of Donato Bramante (q.v.), which spread beyond Rome to Venice and the rest of north Italy. This current, which found theoretical expression in the treatise of Serlio, was characterized by a concern with the animation of surfaces rather than with baroque structural innovation. Riegl thus attributed a positive evolutionary character to that gray zone of art which earlier critics had delimited chronologically but had seen only as a crystallized involution. Extending this critical insight from architecture to painting, K. H. Busse discerned, several years later (1911), through his study of the origins of Lodovico Cigoli, that actually the crisis of Renaissance perspective — an essential condition for the free, pictorial space construction of the baroque — had taken place in Florentine mannerism. This marked the beginning of a new critical concentration on mannerist painting, henceforth regarded as a style of crisis, a crisis of liberation: the rational rule of the Renaissance had to be voided to make possible the free development of a new expressive volition. In the course of the inquiry F. Goldschmidt (without, it must be noted, using the word "mannerism") centered attention on Pontormo, Il Rosso, and Bronzino, demonstrating (1911) that in their work, despite their very different personalities, a definitive emancipation from the tyranny of perspective was achieved. Space, both as subjective observation and as rational

measure, had, as in Michelangelo, to be constructed through the figures themselves.

Subjectivism, affirming itself in contemporary art through the expressionist movement, by now swayed not only taste but critical perceptions, and criticism veered more and more toward a rebellion against rationality, in which the very concept of the Renaissance, in reaction to its canonization in the 19th century by Burckhardt and Eugène Müntz, became enmeshed. Indeed, as early as 1903, Bernard Berenson, while generally viewing mannerism as a decline, had not only noted the particular appeal of Pontormo to contemporary taste but pointed out his great worth as an esthetic personality. The importance of such factors to the new critical orientation was explicitly recognized by Werner Weisbach, who in 1910 summed up and extended earlier views in a basic article that he called *Der Manierismus* as a positive affirmation of the identity of mannerism as a style — the style in which the Renaissance was at once developed and concluded. "Mannerism exists when forms that originally had a precise meaning and expressive value are taken over and carried to extremes, so that they appear affected, artificial, empty, degenerate." However, the forms, drained of specific meaning, took on an abstract esthetic value that could be embodied in imitation of Michelangelo's heroic style or in an original ideal of grace, evolved from Raphael and Correggio (qq.v.). In particularizing this ideal Parmigianino (q.v.) manifested a creative vein thoroughly responsive to the taste of a new society, which differed from that of the 15th-century *bourgeoisie* in the very refinement of its behavior (as reflected in Baldassare Castiglione's *Il Cortigiano*). True, art was alienated, except in Venice, the true matrix of the baroque, from the vigorous sources of naturalism. It is also true that the Church of the Counter Reformation had no use for an art of moribund though persistent Humanistic content, which had further (like expressionism) succeeded in cutting itself off from any relation to natural verisimilitude and employed natural forms only as the means to new emotional experiences. On the impact of this factor, on either earlier or contemporaneous art, Weisbach reserved judgment.

By the post-World War I period, then, the bases for the revision of all preceding historical constructs had been established. The rehabilitation of baroque style represented a critical victory on a par with the reaction of art against the late-19th-century attachment to physical actuality. Increasingly, in the name of this reaction, the critical attack on the concept of the Renaissance, burdened since the 17th and 18th centuries with the now unforgivable cultural fetishes of rationalism and idealism, took shape. The favor the Renaissance lost accrued to mannerism precisely in proportion to the degree to which the two deviated, and this involved the risk that the new criticism might degenerate into sheer polemic or arbitrary generalization. The appearance in 1920 of Hermann Voss's *Die Malerei der Spätrenaissance in Rom und Florenz* was a call for the return to the close study of specific data. Voss, himself steeped in baroque painting, was opposed to the Wölfflinian view of the Italian 16th century as merely a preparatory stage. Baroque pictorial expression was conditioned by northern Italy, particularly Venice, but it could have become a style only in conjunction with the complex formal evolution of Florence and Rome. Voss traced this process through the various currents of 16th-century painting (one of which, but not the only one, was mannerism), suggesting parallels, but not causal relations, with contemporaneous developments in the other arts, for example, in architecture and music.

The objective viewpoint assumed by Voss put schematic generalizations to the test of individual facts, personalities, and works of art. Virtually concurrent with this historical objectivity was the unreservedly subjective countertendency of Max Dvořák, to whom is attributable the definitive status of mannerism as an autonomous style — a position that remained determinative for later critics. In the celebrated lecture delivered by Dvořák in 1918, *Über Greco und den Manierismus* (pub. 1924), the devaluation of Renaissance art was absolute. Its limitation lay in the submission to natural reality — although it had attempted to idealize this through form. Michelangelo overcame this limitation through an overwhelmingly subjective expression, so far beyond rationality of form that many of his late sculptures were considered unfinished. And through his influence, Tintoretto (q.v.) was able to transform the naturalistic sensualism of the Venetian palette into a free counterpoint of light and color. El Greco (q.v.), inheriting from both, became the great interpreter of that triumph of emotion over reason upon which was based the spiritual revival of Ignatius Loyola and St. Theresa. This profoundly religious resolution was made possible for El Greco, however, by his experience of a similar tendency in the secular world: the individualistic estrangement from rational form, characteristic of mannerism, as perceived in the Fontainebleau school (see FRENCH ART).

Dvořák's thesis was developed more fully in his *Geschichte der italienische Kunst* (based on lectures of 1919 and 1920; pub. posthumously, 1927–29), which must be credited with restoring to critical favor both Michelangelo's late paintings in the Pauline Chapel and the works of artists such as Daniele da Volterra, until then considered sterile imitators. In general, Dvořák discerned the positive aspects of the mannerist evolution more acutely than any other writer. He saw in the pupils of Raphael a revival of monumental painted decoration and the emergence of a new kind of religious painting, in which the dramatic aspect of the image was intensified on the basis of premises entirely opposed to the naturalism and rationalism of the Renaissance. Free movement in space replaced static regularity; poetic content was liberated in *invenzione*; new forms (the *storietta* and the ideal landscape) were invented; drawing, engraving, and book illustration flourished. Immediately on its completion (1541), the *Last Judgment* of Michelangelo dominated the contemporary artistic scene, as the inexhaustible source not only of a universal repertory of solutions to problems of form but also of that ideal conception of a world of metaphysical being before which, as in some vast drama, all rational certainty crumbled.

The Florentine artists Pontormo, Il Rosso, and Bronzino were most keenly aware of the crisis of style implicit in High Renaissance art, and it was in direct consequence of the critical confrontation with the weighty inheritance from the past that the characteristics of this art of formal and spiritual originality of the first generation of mannerists were determined: alongside fanciful caprice, a sadness intensified to the limits of the bearable, to the expression of martyrdom; the search in drawing for the most expressive lineaments of reality, which were then separately exploited in a new mode of representation; the effort, in the portrait, to convey, beyond the depiction of the individual, the essence of a particular social position. And this confrontation was the point of departure for later critics in their subtle individuation of the maddeningly subjective aspects of the new esthetic — the grotesque, the satanic, the saturnine, the ugly, and the absurd — which modern taste has found ambivalent.

The very extremism of Dvořák's premises (the absolute naturalism of the Renaissance, the absolute subjectivity of mannerism) made them useful as working hypotheses for further discoveries, so that they remained effective even though it later became necessary to reformulate them. All confusion between mannerism and protobaroque was now eliminated: mannerism assumed a character of its own and was henceforth studied as an independent style. The distinction was further articulated by Luise Fröhlich-Bum (1921): in the 16th century, besides the baroque direction indicated by Michelangelo and the impressionistic direction set by Venice, there was a new synthesis of old Renaissance data effected by Parmigianino, based on an ideal of grace detached from all but purely esthetic considerations; from this synthesis derived a vigorous style current, in sculpture as well as in painting, discernible in the work of Cellini, Ammanati, and Giambologna in Florence, of Vittoria in Venice, and, beyond the Alps, in such followers of Giambologna as Adriaen de Vries. Mannerism thus extended from painting into all fields of art. Erwin Panofsky, elaborating suggestions made by Gurlitt and Riegl, explored the possibility of a definitely mannerist, not protobaroque, architectural style which fully utilized the formal repertory of the clas-

449

sical style. This point of view was to be systematically developed by E. Michalski (1933), who advanced the thesis that mannerism in architecture consisted in the disruption of Renaissance static equilibrium through irrational inversion of the relations of mass and support, such as was apparent in the work of certain architects until then considered exponents of classicism: Peruzzi, Vignola, Palladio, Galeazzo Alessi, and, north of the Alps, De Vries, Ducerceau, and Frans Floris de Vriendt.

Scholars now attempted to provide the mannerist style, by this time homogeneous in the three arts, with a clear patent of esthetic legitimacy. Margarete Hörner (1924) drew parallels between the development of 16th-century Italian art and that of Greek sculpture from Phidias to Polykleitos, in order to raise the status of mannerism from an empirical historical observation to an ahistorical conceptual category necessarily intermediary between the terms of the Wölfflinian antinomy. Panofsky (1924) sought to establish an original philosophical foundation for the new style through analyzing the treatise of Federico Zuccari (or Zuccaro), *L'Idea de' scultori, pittori e architetti* (1607); he reassigned the subjectivist approach of mannerism to a new position as the philosophical premise on which the Renaissance had been based. The "idea" in which mannerist art originated was no longer of rational and naturalistic origin; it was of a mystical character — a revival of a Neoplatonic concept, in harmony with Counter-Reformation religious thought, according to which the very capacity for artistic expression was attributed to divine grace. Mannerism was thus historically confirmed as the expression of an autonomous current of thought. In a long controversy with Weisbach, who regarded the baroque as the style of the Counter Reformation, Nikolaus Pevsner held (1925) that, on the contrary, the aims of that movement were fully concordant with those of mannerism; he gave positive value to features until then judged negatively as medieval and Gothic elements rejected by the rationalist Renaissance — even to the Counter-Reformation mortification of individuality as an intensification and strengthening of artistic subjectivity.

From what had gone before, it was a natural step to the neat formulation of mannerism as an anticlassical style arrived at by Walter Friedländer and enunciated in his lecture *Die Entstehung des antiklassischen Stiles in der italienischen Malerei um 1520* (1914; pub. 1925). More important, Friedländer was the first to localize the origins of mannerism, not in Rome, as a reaction to or development from Raphael or Michelangelo, but rather in Florence, in the consciously dramatic stand taken by Pontormo and Il Rosso against the art of their masters Fra Bartolommeo and Andrea del Sarto (qq.v.): they broke up into irrational rhythmic freedom the fixed proportional meter of the older masters. The impact of these innovators was so great as to touch even Michelangelo, who was thus not the initiator of but only a participant in the mannerist trend. About 1523, Il Rosso took the new style to Rome, in this way exerting a decisive influence on the Roman development of Parmigianino and, through him, and through his own later work at Fontainebleau, on much of the subsequent artistic history of Europe.

The consistent direction taken by German criticism at the end of the 19th and in the first 30 years of the present century, in identifying mannerism as a countertendency to classicism, produced a total reversal in the view of 16th-century Italian art and the entire Renaissance phenomenon. The vitality of the Renaissance was no longer seen to consist in the elevated stylistic purveyance of a profound knowledge of nature; rather it was seen to consist in the freeing and expression of the more irrational and subjective impulses. The victory of Humanism, which imposed a rational order on the dark forces of nature, was regarded as transitory: the original struggle between it and the Gothic could only seemingly have ended in its favor if even the very height of the newly achieved classicism was marked by a Gothic revival in the form of mannerism. An increasing effort was made to identify mannerism with a new access of Gothicism, that vivifying Germanic element of Western art, seen as in perpetual antithesis to formalistic Mediterranean rationalism. H. Wescher-Kauert (1924) equated with Italian mannerism the resurgent Gothicism of late-15th- and early-16th-century painting — supposing Altdorfer, Grünewald, Baldung-Grien (qq.v.), and Jörg Breu to have constituted a more or less conscious opposition to the classical efforts of Dürer (q.v.). Frederick Antal (1948), in his comprehensive survey, from this viewpoint, of the whole Italian Renaissance, saw Florence, the birthplace of Humanism, as the theater of a continuing unresolved conflict with the Gothic, ultimately culminating in the anticlassical rebellion of the early 16th century, which left a deeper imprint on the character of both Italian and international mannerism than did the estheticism of Parmigianino and of the Fontainebleau school. Similar convictions led Georg Weise to the assiduous phenomenological identification of all the Gothicisms latent in Italian Renaissance art. From this searching inquiry the concept of mannerism as a style emerged as an indisputable historical discovery. Its precise position in the sequence of history was treated by Hans Hoffmann in his *Hochrenaissance, Manierismus, Frühbarock* (1938), in which he compared the stylistic concepts that inform mannerism to those of the High Renaissance and the protobaroque.

In the decade 1920–30 Italian critics were also concerned with the problem of mannerism, not so much in conducting a systematic examination as in measuring the conceptual structure of the German critics against the standard of what was to remain the fundamental premise: the living individuality of the work of art. From this and from the personality of the artist it was possible to re-create the homogeneous continuity of a historical fabric that would not be merely the arbitrary demonstration of a priori concepts. The need to historicize the newly accepted stylistic category also appears in the work of later German writers (e.g., Friedrich Kriegbaum, Ulrich Middeldorf) and, more recently, of American scholars. In Italy the crucial work was that of Roberto Longhi, who, while apparently limiting himself to the consideration of single works or single artists, drew conclusions valid for mannerism as a whole. As early as 1926 a sculpture of Pietro Bernini afforded him the occasion for framing a subtle distinction between abstract mannerist colorism and robust baroque pictorialism; an attribution to Lelio Orsi led to the most penetrating definition of the mannerist esthetic, as representing "Renaissance culture . . . in process of becoming once more romantic, without, however, wishing to lose an iota of the science and archaeology of the 16th century — on the contrary reveling in them and adorning itself with them as with borrowed finery." Later (1927), by way of confirming the attribution to Velázquez of a *St. Thomas* in the Musée des Beaux-Arts of Orléans, Longhi formulated a complete historical outline of the diffusion in Spain — by way of the works of late Florentine and, more importantly, Lombard mannerists — of those survivals of a "naturalistic vein that cherished the optical appearance of things" which prepared the way for the acceptance of the naturalism of Caravaggio, the artistic substratum of the new art of Velázquez. Finally (1953), it was his reconstruction of the Italian work of Alonso Berruguete that shed light on the complete interaction of stylistic influences characterizing the early 16th-century Florentine environment in which Pontormo and Il Rosso developed.

Since the decade 1930–40 Italian criticism has similarly centered its concern with mannerism on the reconstruction of individual artistic personalities. At the same time Adolfo Venturi's history of Italian art reached the 16th century. Throughout the immense amount of material there assembled is a wealth of perceptive comment altogether free of any conceptual prejudice. A general effort to define mannerism historically is evident in a series of monographs published in the 1940s (Luisa Becherucci, on 16th-century sculpture and architecture and on the Tuscan mannerists; A. Graziani, on Bartolomeo Cesi; and Giuliano Briganti, on Pellegrino Tibaldi, treated in the framework of a general consideration of mannerism).

Objection to the frequent insinuation that mannerism is to be identified with ambiguous and amoral expressive content was raised by Francesco Arcangeli, who stated that this content could have found expression only through a subtle

interplay of mannerism with the continuing formal heritage of the Renaissance: mannerism was, therefore, not so much a concerted artistic trend with its own expressive goals as the manifestation of an irreconcilable crisis. The consequences of this "realistic" revision of the concept of mannerism have been twofold. First, granting that everything that has been called "mannerist" is mannerist, in which case mannerism embraces nearly all of the 16th century, the question arises whether it can legitimately be termed a separate and autonomous artistic current. Secondly, the critical characterization of mannerism as an esthetic nurtured only by such pernicious sources as the absurd, the exaggerated, and the abnormal leads to doubt as to the positive ethical, and hence artistic, value of the entire trend.

On the occasion of the 1940 Mostra del Cinquecento Toscano in Florence, Mario Salmi had pointed out the equivocation implicit in the very term "mannerism," derisive in origin, and proposed a return to designating the trend, and regarding it historically, as a late phase of the Renaissance. In 1950 P. Barocchi posed the question whether the category was valid for artists of great originality, such as Il Rosso, who hardly merited a label bearing the stigma of decadence, which in addition wrongly lumped together phenomena so different as the rebellion against formal academicism and the rhetorical delight in it. Longhi took exception to this sweeping dissent — on the ground of the effective presence, even in Il Rosso, of that particular captious, introverted, imaginative quality which Longhi, more sensitively than anyone else, had observed — but a similar reservation has persisted, more or less explicitly declared, in later discussions of the problem.

The moral ambiguity of mannerism has increasingly concerned writers. G. C. Argan (1942) saw in late-16th-century mannerism the total "dislocation of the ethical certainty that had kept the 15th-century imagination within the bounds of reality"; the problem of truth was evaded in the approximation of verisimilitude, and moral commitment in the moralism propagated by the Counter Reformation. Going further, G. Nicco Fasola (1947) based her definition of the art of Pontormo on a negative valuation not only of mannerism but of the whole Italian Renaissance: Renaissance intellectualism dried up the spontaneity of Italian culture, whereas the northern Reformation revitalized transalpine civilization. Artists who were aware of this cultural malady might arrive at the tortured but vain rebellions of a Pontormo; those who were not could indulge in virtuosity and figural eccentricity, in dangerous dalliance with the abnormal and the terrible, without, however, ever breaking the vicious circle of stultifying intellectualism, which has been ever since the "plague of Latinity." This harsh condemnation was mitigated only in respect to 16th-century Italian architecture, where functional necessity applied the brake to intellectualizing abstraction. In Nicco Fasola's opinion, previous writers had been too much concerned with the formal aspects of mannerism, rather than with the investigation — required for a valid historical judgment — of the spiritual trends underlying artistic expression. In certain respects an excursus of Eugenio Battisti (1960) reveals a similar view; he fully accepts the concept of mannerism as a rebellion against the classicism of the Renaissance but judges it as lacking an adequate moral base, since, like the object of its opposition, it was intellectual in origin rather than the outgrowth of a new moral and religious experience. It was thus a revolt *manqué*, not even supported by contemporaneous society, which, in its spiritually impoverished state, repudiated it out of deep-rooted conservatism. And the Counter Reformation, far from identifying with mannerism, directed its criticism at the expressive extremes of mannerist art. On the social level both mannerism and the High Renaissance have been condemned also by Arnold Hauser (1951) as the expression of an aristocratic and oversophisticated neofeudal class.

This extreme negative view of mannerism both as a style category and as a historical phenomenon is not, however, the prevailing position of contemporary criticism. That position has been expressed by Longhi in his *Ricordo dei Manieristi* (1953): mannerism ought no longer to be spoken of as a programmatic tendency deliberately running counter to the stylistic mainstream of the 16th century. Rather, this modern-day distortion of the term, the product of a one-sided and tendentious critical position, should be rejected, and the definition of the *maniera* as the style of the 16th century itself — as it was used in contemporaneous historical writing, from Vasari on — should be restored. The *maniera* was interpreted with a high degree of originality by "those Florentine hands from boyhood grown weary in transcribing the two cartoons of Leonardo and Michelangelo in the Palazzo Vecchio . . ." in the same unfettered and whimsical spirit as Florentine artists of the last generation of the 15th century, such as Pollaiuolo, had interpreted naturalistic and classical Humanism. It was this freedom of action within the *maniera* that assured its vitality and gave to it that foundation of solid graphic experience present in even the boldest, most bizarre adventures of the imagination — indexes indeed of an ethical crisis, of a dissatisfaction from which a new future of art was arising. The early-20th-century intellectual movement, in seeking an origin for its own expressionistic and surrealistic graphic extremes, had arbitrarily separated out of the 16th-century context episodes congenial to itself, imposing on them the convenient tailor-made legend of mannerism as the style of the abnormal and the monstrous. The reaction of later critics against this form of expedient conceptualism has been toward a proper historical revision based on the careful study of individual artists and works of art.

That this revision remains a pressing scholarly concern was emphasized by the 1960 congress of the Accademia Nazionale dei Lincei on the theme "Mannerism, Baroque, and Rococo: Concepts and Terms," which thoroughly investigated the contemporary critico-historical situation in regard to the manifestations of these three in literature and music as well as the visual arts. The two basic papers on mannerism in art, given by Weise and Salmi, reexamined the two different approaches in modern criticism. Weise no longer saw in mannerism "a new style in the sense of the other great periods of the history of art"; rather, mannerism was "a shading [of the existing style] accompanied by the continuation of the classicizing vein," and thus "symptomatic of a period of transition and of contrasts between the High Renaissance and the formation of the new baroque synthesis." Salmi persisted in his refusal to use the term at all: mannerism could at most, he held, represent a qualification of one of the terms of the eternal dialectic between the classical and the anticlassical. In connection with the discussion of the boundaries between mannerism and baroque, Salmi cautioned that the individual fact of the work of art ought always to prevail over generalization. In a paper treating the subject from the literary point of view, Raimondi, though recognizing mannerism as a stylistic category of European range "necessary in order to remove the traditional verdict of decadence from the stylistic metamorphosis that overcame the great tradition of Renaissance classicism," noted that its adoption in the works of L. Curtius had virtually compromised the results of visual art criticism by transforming it from a definitive historical trend to a "phenomenon coincident with a style of the unnatural, complementary to classicism in all periods." Faced with this abstract vitiation of the concept of mannerism, Raimondi too advocated a "return to history."

Thus, a discussion that about 1925 had seemed definitively closed has been reopened, and modern scholars are beginning to see that the problem was inadequately framed from the start. Born of the necessity to provide an evolutionary continuity for baroque art, which late-19th-century criticism had construed as a sort of romantic rival to Renaissance classicism, the concept of mannerism as a style never lost its original polemic cast, whether viewed as the liberation of subjective sentiment in opposition to an intellectual stylistic norm, as the resurgence of the Gothic against Humanism, or as the tangible expression of impulses — perhaps ambiguous, but existentially genuine — forbidden expression by the hypocritical moralistic conformity of the Renaissance, reflected in art in an artificial formal idealism. But this persistent antinomy had then been examined in only one of its terms, the other term remaining permanently fixed in the concept of the immutable perfection of a formal style bound by the premises of conformity to nature and to the

453

esthetic principles of classical art in which it had been hypostatized by the criticism of 17th-century classicism and 18th-century neoclassicism. Only in comparison with such a crystallization of the High Renaissance, precluding any later evolution of art, could all the troublesome intolerances and rebellions with which mannerism had, almost symbolically, been burdened have retained any validity. Strangely enough, art historians seem to have been unaware that this antiquated intellectual structure had already received fierce blows from the direction of philosophical inquiry; Ernst Cassirer, as early as 1906, and later in the fundamental *Individuum und Kosmos in der Philosophie der Renaissance* (1927), as the protagonist of reopening the question of knowledge of the principle of form through the unceasing formulation achieved in living works of art, rather than through the speculation of theologians and philosophers, had put the consideration of Renaissance art on a new basis. Through perspective, the invention of artists and the interpretation, and hence the "imitation," of nature were based on the absolute rational certainty of numerical proportion, thus establishing the identity of artistic "form" with the essential "necessity" of nature. However, the development of perspective theory itself gave rise to the complex problems of the infinite proportional relation, and in consequence the concept of space as a measurable quantity evolved into that of space as a "free and ideal ordering function," opening the way to the theory of motion, from which at the end of the Renaissance emerged the new science of Galileo. The essential "form" that art, the standard-bearer of modern science, pursued in all the aspects of nature was not something changeless and static but the dynamic principle of the unending process of becoming. The inner tension thus produced pervaded the new artistic image, whatever its figural components, Humanistic or Gothic, and brought about that *superamento* which Renaissance criticism had already discerned in the pictorial chiaroscuro of Leonardo, in the plastic extremes of Michelangelo, and in the color-light configurations of the Venetians and of Raphael.

This art, whose formal basis was form itself, however, in its rationality — manifestation of the movement which, to Leonardo, was the "causa d'ogni vita" — did not require the opposition of the irrational, of the subjective, to open the way to the most daring experimentation. It could hazard the most perilous adventures without foundering in formlessness, the negation of all expressive power. It was enough — and Longhi clearly recognized this — that the minds of men were overwhelmed by the anxiety, the anguish, the tormenting doubts, the yearnings for transcendental evasions of an era of complex spiritual development such as the 16th century; the mastery of form calmly yielded to the expression of these, capable of embracing all such tendencies within itself.

The investigation of mannerism has thus led to the realization of the need for a more far-reaching analysis of the concept of the Renaissance. This process has already begun, and the new methodology is being applied to its fundamental problems, beginning with perspective. The accumulation of interpretive dross is being discarded and the "classical style" of the 16th century, the analytical consideration of which had been arrested, so to speak, at the impressive but now inadequate definition of Wölfflin, squarely confronted. It is symptomatic that the more subtle students of mannerist estheticism have turned their attention to this problem. Weise seeks its premises in the "heroic ideal" of Humanism (1961); Sidney Freedberg, whose valuable monograph on Parmigianino appeared in 1950, has traced the development of the classical style in the complex dialectic of Leonardo, of Michelangelo, and of Raphael and laid it down as the necessary first principle for the comprehension of Pontormo and Il Rosso (1961). And though mannerism is still seen as substantially different from the High Renaissance, the way is now open to a more coherent grasp of their relation, through which the development of 16th-century style can be assessed at its full historical value.

THE MANIERA IN ITS HISTORICAL SETTING. The painstaking study of the subject of mannerism resulted in a new interpretation of the entire course of the 16th century from a point of view totally at variance with the traditional approach. The focus of attention shifted from the great masters to certain marginal trends hitherto depreciated as constituting an opaque and distorted reflection of their art; here art historians discovered and traced a very energetic treatment of representational elements previously overlooked but fundamental to the historical continuity of the art of this period and capable of attaining — as they did in many cases — to the level of the masterpiece. Even though the legitimacy of regarding it as a style is still *sub judice*, mannerism cannot be denied a place in the historical development of the 16th century, whether regarded as an independent current, as one component of a larger dialectic, as only a nuance, that is, the visual embodiment of an intellectual canon, or even as a mere working hypothesis serving no other purpose than to eliminate the dross of long-standing interpretative accretions. The task of the modern art historian must be to differentiate more and more precisely the various aspects of this whole phenomenon, to trace the dialectic of its development, to evaluate the individual achievement of the artists who, in ever-increasing number, are emerging from the anonymous group of "followers." From such detailed study the continuity of the historical evolution not only of mannerism but of all the art of the 16th century emerges more clearly.

The most important factor, and one that is fundamental to the new approach to the problem of mannerism, was the critical rediscovery of those Florentine artists who had been rejected by the classical taste of the 17th, 18th, and 19th centuries. It was Goldschmidt who first saw in mannerist art the reversal of the premises of naturalistic rationality and perspective which were the basic tenets of the Renaissance tradition. Friedländer found confirmation of this deliberately anticlassicist purpose, the point of departure of a new style which was to have wide dissemination when the fully mature Pontormo made contact with northern art, taking the engravings of Dürer as the model for his *Passion* in the Certosa near Florence (1522–25). Today the tendency is to lay greater emphasis on Pontormo's lifelong study of Michelangelo's art; in works that preceded the Certosa *Passion*, such as the *Veronica* in the Popes' Chapel of S. Maria Novella, Florence (1515), and the lunette in the Medici villa of Poggio a Caiano (IV, PL. 201), there are distinct borrowings from Michelangelo, not so much from the Sistine Chapel ceiling as from such Florentine works as the *Holy Family* (IX, PL. 527). These are not imitations but rather interpretations of what appeared new in a culture whose Humanistic components seemed, by that time, obsolete and remote. Pontormo's Dürer phase does not therefore appear to be such an anomaly as to cause the outcry that it did among his contemporaries: it is almost the consequence (even if carried to the most dangerous extremes) of that revolution in the figural arts which produced, in the battle cartoons executed early in the 16th century by Leonardo and Michelangelo for the Palazzo Vecchio, the great paradigms of a new artistic idiom. This idiom, to which the traditional term "classical" can be applied only in the sense of a higher expressive choice, was the consummation, at the beginning of the 16th century, of the Renaissance mastery of form, which, all its aims achieved, had come to signify the free energy of movement, "the cause of all life" — the universal dynamic relation that was the great discovery of the Renaissance. The expressionistic elements, formal and coloristic, that had characterized "Gothic art" for centuries no longer appeared abnormal, as they had to the early Humanists. On the contrary, they became comprehensible and even congenial in this dynamic liberation of form.

Neither Pontormo nor Il Rosso was going against the stream when he studied the engravings of Dürer and Lucas van Leyden (q.v.): they were boldly yielding to the most vital pressures of their time. If their work represents a deliberate reaction, it is against compositional rationalism, crystallized into harmonic formulas in the iconic and devotional paintings of Fra Bartolommeo and his followers in the Scuola di S. Marco, formulas that even the vivid pictorial imagination of Andrea del Sarto could not manage to surmount. But under the liberating impulse of Michelangelo, Andrea's young disciples suc-

ceeded where their master had failed: it accounts not only for the strong draftsmanship of Pontormo but also for that artist's intensity of color as well as his treatment of complementary colors, daring to the point of actual dissonance. Also, it emboldened Il Rosso to carry out the imaginative pictorial reelaborations of Michelangelo's sculptural contrasts in the great works of the years 1521–23: the *Deposition* in Volterra (Pin. Comunale), the altarpiece in the parish church of Villamagna, near Volterra, the S. Lorenzo *Marriage of the Virgin*, and the *Moses* (PL. 290). Art historians, aware of the great difference in the problems these two artists faced, have not always accepted this theory of a decisive influence of Michelangelo. But Michelangelo opened up such immense expressive vistas as to give rise to the most diverse derivative strains: the tormented, morbidly introspective, haunted works of Pontormo as well as the ironic, mordant, and earthy paintings of Il Rosso. Their Florentine spirit was weighed down by disillusionment with a civilization that, in the decadence of its social fabric, was no longer finding nourishment for further great intellectual achievements. The living center of the Renaissance had become the *miserrima civitas* that aroused the distaste of Leo X's retinue when the Florentine pope returned there for a visit in 1515. The subtle romantic turn tinged with bitterness, which, at the end of the 15th century, had been the essence of the works of Filippino Lippi and Piero di Cosimo, developed in the next generation of artists into the hopeless awareness of a disaster from which there could be no escape. But the very sincerity of this avowal was a new element and marked an expansion of the domain of art. The images that Pontormo and Il Rosso painted (and not only in their portraits) of contemporary society gave expression to the marginal zones of the human spirit — to tortuousness, bewilderment, and illusory escapes into irony and mockery. Hence art historians recognized in them the artists of a new idiom, the most authentic interpreters in the whole realm of 16th-century art not only of the end of an epoch but also of the awareness necessary for a reawakening.

But this was not possible in Florence, where the expressive scope of Leonardo and Michelangelo had nothing to sustain it but that merciless self-criticism. The real problems of civilization were no longer the intellectual ones of the Florentine Renaissance. It was now a question of providing a new spiritual basis for every aspect of life through total religious reform such as had assumed diverse aspects in various countries — the great conflicts that harassed Europe throughout the 16th century. In this struggle the Catholic Church engaged all its most active forces, and Rome, the seat of the papacy, rather than Florence, became the arena. Though the basic texts of the new art remained in Florence, it was only in Rome that this art could develop the fullness of its idiom. This was to be the task of Raphael.

It was in his work that the new impulse, the true style of the Italian 16th century, which was termed "*la bella maniera*," achieved definitive expression. The occasion was provided by the frescoing of the Vatican Stanze, in which the glorification of the high points of ecclesiastical history and of Humanist culture (which the Church had by now completely absorbed) brought about the rise of artistic expression to the supreme level of almost emblematic impact. Raphael was able to achieve this sublime "rhetoric" (in the original and positive meaning of the word) because he was still acting from the conviction of that order, that system of universal value, which perspective had constituted for Humanism in art before the crisis of the Florentine concern with the problems of form. Acquired in the artistic circle of Urbino, where the teachings of Piero della Francesca (q.v.) still prevailed, Raphael's conviction had not been shaken by his youthful experiences in Florence. In the presence of this ideally ordering rule, the idiom of the *School of Athens* (XI, PL. 426) and of the *Disputa* (IV, PL. 230) presented a paradigm more universal than the gigantesque dynamism of Michelangelo's Sistine ceiling. What it taught did not burden the imagination but harmoniously disciplined all the elements: it was the foundation of the idiom on whose development the art of the 16th century was wholly centered.

It has come to be recognized that an important role in the development of the Raphael style was played by the circle of assistants — until recently classed together in the colorless anonymity of imitators — who made possible the master's immense *œuvre*. Frederick Hartt in his study of Giulio Romano (1958) went to the heart of this collaboration, which was not limited to the physical execution of Raphael's designs. Giulio Romano and Giovanni Francesco Penni, and, later, Raffaello dal Colle, Giovanni da Udine, and Perino del Vaga, worked out, from the model, ideas barely indicated by Raphael in quick sketches, sometimes even giving visual form to a merely verbal suggestion — preparing the program, as it were, the drawing to which he affixed the final stylistic seal of his color. Thus the collaboration, beyond its immediate practical goals, amounted to an earnest group effort toward the creation of a new artistic idiom: here converged all the various strains of the artistic milieu. Besides giving form to the great celebrative themes of the Vatican decoration, the Raphael workshop developed in the decoration of the Sala di Psiche (1517–18) in the Farnesina, the villa built in Rome between 1508 and 1511 by Baldassare Peruzzi for the wealthy banker Agostino Chigi, the themes of a secular culture for which, since the late 15th century, classicism represented no longer the domination of form but a realm open to the free flight of the imagination (X, PL. 250). The *Metamorphoses* of Ovid provided innumerable occasions for the more nonrealistic *invenzioni*, which Raphael — as is seen in the *Galatea* (III, PL. 392), the only one executed by his own hand — was able to resolve in a now musically refined rhythmic coherence. And Raphael's inspiration burns with lyric intensity in the final undertaking, the decoration of the Vatican Logge, in which the whole by then enormous band of his assistants was involved (II, PL. 291; V, PL. 239; XI, PL. 431). The personal imprints of Giulio Romano, Penni, Perino, Giovanni da Udine, Polidoro da Caravaggio, and perhaps also Baldassare Peruzzi are discernible within this symphonic orchestration of effects, where the vaults open into illusionistic perspectives and where grotesques and stuccowork of attenuated elegance (inspired by the recent archaeological discoveries of the Golden House of Nero and the House of Titus) enframe Biblical scenes — here an almost theatrical representation, vividly mimetic, indifferent to the awesome meanings that Michelangelo had elicited from them in the Sistine ceiling. But this extreme figural elaboration is always contained within the precise metrical clarity by then achieved by Raphael. He had turned to architecture not only because it was required of him by his appointment as master of works of St. Peter's in 1515 but also from a need to deepen his rhythmic sensibility through the exigencies of structural function. Implicit in the buildings he designed, such as the Chigi Chapel in S. Maria del Popolo (XI, PL. 436) and the Palazzo Vidoni (formerly Caffarelli), and in the changes that he made in Bramante's project for St. Peter's (shifting from a central to a longitudinal plan), and explicit in a letter of 1519 to Leo X, is his intention of working toward a complex pictorial enrichment of the severe "classical" style of Bramante.

It is impossible to imagine where this new direction of Raphael's might have led had it not been cut short by his untimely death. The *Transfiguration* (ca. 1517–20; Vat. Mus.), carried on concurrently with the Logge and completed by assistants after Raphael's death, reveals two as yet unreconciled expressive directions (Sergio Ortolani): the elevation of form and content to an ultrareal vision and the descent to a more immediate dramatic historicity — the two lines along which 17th-century art was to develop. Both were beyond the capacity of his immediate followers: they could only continue that elaboration of idiom which, no longer directed by the actual presence of the master, showed a dangerous tendency to slip into the figural virtuosity that gave grounds for the negative assessment of mannerism by critics from the 17th century onward. Regarded without preconceptions, however, the Raphaelesque products of his immediate followers — such as the elegant decoration in Villa Madama conceived by Raphael and executed by Giovanni da Udine and Peruzzi, and the works in the Vatican's Sala di Costantino (1520–25) by Giulio Romano and Penni, testamentary heirs to Raphael's commissions, and

in Perino del Vaga's Sala dei Pontifici in the Borgia Apartments of the Vatican (1521) — are admirable for their figural richness, accumulated like some boundless patrimony that could be spent, even squandered, for centuries. It is a tumultuous succession of variations sustained by extraordinarily accomplished draftsmanship and prompted by a body of learning continually enlarged by scholarly research. The artistic imagination seethed with the idea of shaping the new classic learning to the requirements of a stylistic rhythm intensified to the point of the most fanciful nonrealism.

Thus the *bella maniera* became so intellectually supple an expressive instrument that Perino del Vaga, on coming to work in Florence in 1523, dared pridefully to declare it capable of surpassing even the achievements of Masaccio. However, neither he nor the others of his circle were able to employ it poetically. For this, more genuine sources of inspiration were required, and herein lies the historical contribution of artists such as Parmigianino and Il Rosso, who, trained in different environments, arrived at full maturity in the experience of the *bella maniera*.

Beginning with Friedländer, critics have, rightly, recognized the importance of the meeting of these two artists in Rome about 1524, at the time when, after the brief pontificate of the Fleming Adrian VI, who was averse to all outward display, the election of another Medici pope, Clement VII, seemed to reopen to artists their former opportunities. Friedländer attributes a decisive role in the situation to Il Rosso, as having, from Rome, widely disseminated the Florentine anticlassical revolt. Yet further consideration of this meeting, in the light of the individual development of the two artists, would seem to indicate that it resulted not so much in giving rise to a new current, differing in its goals from the *maniera*, as in infusing the *maniera* with the vivifying force of a genuine poetic impulse. Parmigianino, as Freedberg recognized, had, even before going to Rome, drawn from the Pandean abandon of Correggio's art an intensely intellectual grace of Arcadian savor — as in the Diana and Actaeon frescoes in Fontanellato, in which Longhi has divined definite influence from the Sienese Domenico Beccafumi. Parmigianino's encounter with Il Rosso (which occurred, it must be remembered, within the circle of the followers of Raphael) was not, therefore, unilaterally decisive but rather was more akin to a complex interplay of reciprocal influences. This might be clearer to us if the cycle of frescoes in the Via Giulia, jointly executed by the two artists, had been preserved; still, it can be noted both in the nonrealistic emphases of luminary contrasts (showing the influence of Il Rosso as well as Beccafumi) apparent in Parmigianino's work of this time, such as the *Madonna and Child* in the Galleria Doria Pamphili (Rome) and the *St. Catherine* in the collection of the Earl of Normanton (Somerley, Ringwood, Hampshire), and, conversely, in the more continuous and elegant rhythms in Il Rosso's frescoes in S. Maria della Pace, in Rome, which recall Parmigianino. However, these contacts occurred within the framework of the more substantially influential presence of the *bella maniera*, which attracted both artists through the possibilities for the mastery of expressive technique. To it they brought an acute critical discernment, effecting that outpouring of heightened rhythmic power to which the too much and too exclusively stressed unnatural attenuation of figures is incidental. In turn, their effect on the current idiom was one of genuine poetic inspiration, be it the winning grace of Parmigianino or the biting extravagance of Il Rosso. Through them the *maniera* attained those lyric heights which strained even the descriptive powers of Vasari.

The stylistic evolution that began about 1520 in the troubled time preceding the great crises of the Sack of Rome (1527) and the siege of Florence (1529), in which the civilization of the Renaissance seemed to collapse, along with its greatest centers, therefore took the form not so much of the rise and polemical articulation of an anticlassical style as of a renewal of that lyrical trend initiated by Raphael in the Logge. And though this, in diverse guises, appeared in the various currents of Italian art, only in the fullness of the Roman idiom did it find complete expression. This is apparent in the later work of those artists who reached maturity in Rome before 1527. In Parmigianino's post-Roman work *grazia* was redeemed from its own intellectualism as a new revelation of reality. One thinks — along with the subtle stylizations of the so-called "Madonna dal Collo Lungo" (XII, PL. 81) and of the *Amor* (Vienna, Kunsthist. Mus.) — of the liveliness of portraits such as the Naples "Antea" and the young woman in a turban in Parma. And though Il Rosso's inspiration seemed to flag in the labored altarpieces in S. Lorenzo, Sansepolcro, and the Cathedral of Città di Castello, it rose triumphant again at Fontainebleau, where he (in the service of Francis I, from 1530) resolved the Roman decorative repertory into a rich, imaginative pictorial effect, consisting equally of the sprightly *invenzione* of the frescoes and the intense light-created plasticity of the exuberant stucco frames, carved in relief and in the round.

The Sienese Domenico Beccafumi (PL. 295), too, whose development had from youth proceeded through the tortuous ways marginal to the major currents of Florence and Rome, attained through his complete experience of the *maniera* to the enchanted chromatic lyricism that characterizes the masterpieces of about 1530, such as the ceiling of the Palazzo Bindi Sergardi in Siena and the *Birth of the Virgin* in the Pinacoteca in the same city. It was through his art, which then spread to Genoa and Pisa, that the Sienese province came to have a central effect on the course of the 16th century and a final influence on baroque painting on the threshold of the 17th. Meanwhile, Giulio Romano, who had left Rome in 1524 to work for the Gonzagas in Mantua, acting directly on Raphaelesque premises, gave his buildings, the Palazzo Ducale and the Palazzo del Te (XII, PL. 53), and the sumptuous frescoes that lined their interiors, the impress of a romantic emotionalism, in an accent no less lyrical, if lacking in subtle intellectualism. The rugged vitality of nature was imposed on the more elaborate forms of these buildings, where the bossage of the *opus rusticum* became rough rock from which the arch or column appeared to emerge only with difficulty. Painting partook of similar effects, as in the terrifying illusionistic scheme of the Sala dei Giganti (PL. 298) and the sweeping perspectives of the Sala di Troia, works that prefigure the great baroque illusionistic inventions of Pietro da Cortona and Giovanni Battista Tiepolo (qq.v.).

Thus, between 1520 and 1530 the *bella maniera* of Raphael completed an evolution productive of the richest diversification of effects, rhythmic coherence always remaining the basis of its artistic idiom. The new style, to which the term "manneri-sm" can be applied only in the most conventional sense, was thus different from the sterile imitation to which early criticism reduced it — but likewise from the anticlassical polemic into which modern criticism shaped it. It was on the one hand the ultimate development of the dynamic freedom achieved by Florentine form and on the other the ultimate possibility derivable from Raphaelesque rhythmic design, both basic components of High Renaissance style. The great expressive achievement of a whole civilization was neither discarded nor traduced. Rather, it was redirected; abandoning the Leonardesque crisis of the problems of knowledge that had made art in the two preceding centuries the standard-bearer of the new science, mannerism fostered the poesy that, in the field of art as in the field of literature, was the true goal and glorious achievement of the Italian 16th century.

The stylistic crisis of the decade 1520–30 appears to have been the precise statement of these aims through the mastery by then achieved of an artistic idiom equal to every expressive demand. It was not the crisis of a fettered classicism but the evolution of a new classical tendency, equal to the ancient in elevation of style but with motive forces more various and real. Between 1520 and 1530 the new style became universal, not only because of the exodus of artists from Rome after the Sack of 1527 and the resulting dissemination of Roman style, but also because all bents of inspiration found in this mature artistic idiom the possibility of poetic expression, and Rome became, as Florence had been, the *scuola del mondo*, to which all must go for a necessary formative experience. The rich casuistry of the later *maniera* resulted from this confluence of styles, upon which the *maniera* itself acted as both catalyst and solvent.

What is called "mannerism" was the beginning of this new dialectic, which though it first asserted itself in painting infiltrated the whole domain of art.

For example, Baldassare Peruzzi (q.v.), stimulated by the example of Raphael's architecture, turned away from the still 15th-century regularity of the Farnesina to the fanciful developments of plan, structure, and chiaroscuro effect evident in the Palazzo Massimo alle Colonne (begun 1532; XI, PL. 121; XII, PL. 52) and in his innumerable designs and projects, which are even more revelatory of his eager quest for new expression than those actually built. He seems also to have furnished Sebastiano Serlio (q.v.) the material for the *Regole generali di architettura* (1st ed., Venice, 1537), which appears to be a codification of the workings of a taste that is not yet a style and tries every means of defining a goal. Though Vitruvius (q.v.) remained the enduring paradigm, Serlio betrays also a subtle delight in departing from him in that "bizzarria nelle cose miste, et licentiose" in which he indulged in order to please the "uomini bizzarri, che cercano novità." The preferred model was no longer the severe architecture of Bramante or the Sangallos, but that "copiosa di lumi," pervaded with chromatic effect, which in Venice found a matchless exponent in Jacopo Sansovino and which, elsewhere, in his rich illustration of portals, Serlio, like Giulio Romano, sought instead in the "opera di natura," its bossage like living rock rather than cut stone. Serlio's work does not yet exhibit a mature architectural sense: his complicated designs would be almost impossible to build. The much more radical return to form in the following generation was required for architecture to renew its own true idiom. Explicit in this generation, too, and always under the impetus of Raphael, was the new lyric way, which was still one of aspiration and quest but was capable of being diverted into the most varied areas (and distorted into intellectualism), the contradictions that make it difficult for art historians to extract a single direction for mannerism. Such contradictions are, however, inevitable when not only is the working out of an artistic idiom in process but also the mind of the time is seeking to relieve its own inquietude in the certainty of abundant inspiration.

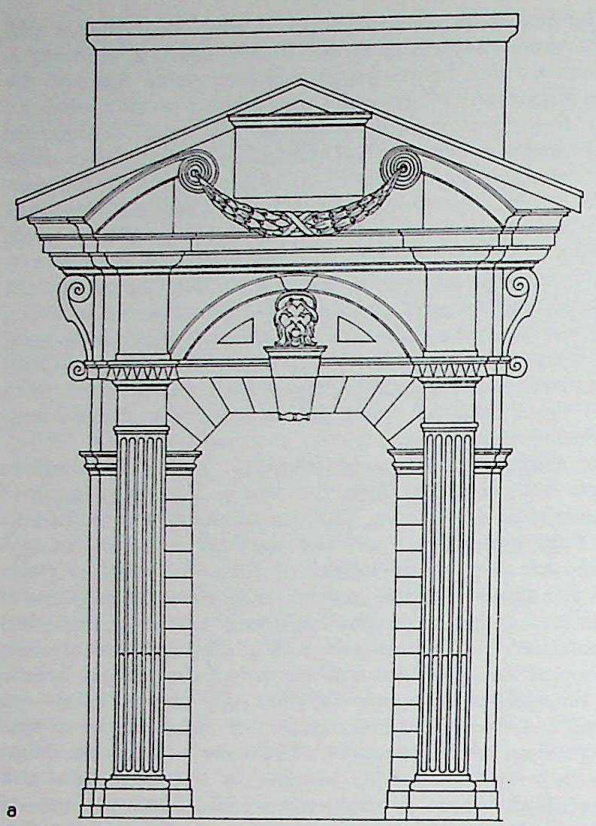
The clarifying synthesis of a great personality was needed, and this is one aspect of the enormous importance of Michelangelo. Vasari, who formulated the most acute definition of the *maniera*, recognized the aloofness of Michelangelo, who separated himself from what was demiurgic in it. For in him alone the problem of form, as the Renaissance had posed it, maintained the driving impetus of a continuing search. Throughout his long life (1475–1564) he strove with it, though contemporary developments, flowing round him like waves round a rock, drew from his work deductions that never went to the essence of the problem — that essence of which he remained the sole repository. In the decades immediately following Raphael's death, Raphael's influence had determined stylistic development, and Michelangelo increasingly appeared the antithesis of this. Though the Sistine ceiling had been the object of an almost bewildering admiration that had estranged rather than attracted other artists, the very adoption of Michelangelo's motifs had been possible only through Raphaelesque interpretation. But in later years, surviving to tower alone over the artistic scene, Michelangelo seemed the very symbol of the contradiction of it, the awesome standard of comparison between the totality of a problem and partial solution. This contradiction entered all the phases of artistic life that he restlessly undertook and triumphed in; thus he was, perforce, dissociated from the diametrically opposed currents of Florence and of Rome.

In 1522 Michelangelo transferred his base of operations back to his native Florence (which he had left early in the century) because of the commission given him in 1520 by Leo X and Cardinal Giulio de' Medici (later Clement VII) for the family mortuary chapel in the Medici Church of S. Lorenzo. It was in this period — in the Medici Chapel, where the architecture itself assumed a somber emotive tone through the constriction of great classical members within a small space, and the figures of *Dawn* and *Night* (PL. 531) seemed the afflicted prisoners of harmonic rhythms rarefied to an unendurable degree — that this extraordinary artistic individuality shows the effects of the *maniera*. These, however, soon became for him the "aspra catena" ("the harsh bond"), the new bar to the ultimate "superamento," the "non finito" ("unfinished") already foreshadowed in the nearly formless masses of the *Day* and the *Evening* of the Medici Chapel (PL. 530; XII, PL. 60). Other sculptures born of this new expressive phase were the Medici *Madonna*, the *Genius of Victory*, and the *Dying Slaves* (PL. 529) for that ever less realizable project, the tomb of Julius II. But the Florentine artists were not aware that these sculptures achieved in solitude — virtually an artistic testament — would remain forever in that state of unconcluded struggle for liberation. The new Florentine models, replacing the worn-out battle cartoons, were thus those labored reactions of Michelangelo against the *maniera*: the Medici tombs and the projects for colossal figure groups, such as the *Hercules and Antaeus*, the current steps in the deepening of his ever-resurgent concern with structure. These models were a source of confusion to Pontormo, who, with the problems there embodied, complicated a style that had by then reached the heights of his *Supper at Emmaus* (1525) and the S. Felicita *Deposition* (1526–28; PL. 288), tormenting himself with them up to the disastrous outcome of the lost frescoes of S. Lorenzo. They deflected Baccio Bandinelli (1493–1560; PL. 307) from the feeling for chiaroscuro derived from his first Leonardesque master, Giovan Francesco Rustici, to the elegant stylizations but vacuous athleticisms of his sculptured figures. Benvenuto Cellini (q.v.), returned from his post as sculptor and goldsmith at Fontainebleau, was the severe critic of this trend, opposing to it the slender grace of his *Perseus* (Florence, Loggia della Signoria); it was the mannerist critics who recognized his ductile harmony of design as very different from such intellectualistic purism. Yet the residue of this consciousness of form in Florence determined the use of color in the work of Bronzino (q.v.; PLS. 292, 296) to achieve the abstract sublimation of form, the very essence of his remarkable portraits. Cellini made an exception of Bronzino when he pronounced himself in favor of sculpture over painting in Benedetto Varchi's referendum (1546) among the leading artists of the day on which of the two arts held primacy. Among the many answers, only Cellini's specified the true significance of sculpture: he contrasted contemporary painters, "in tra fioralisi, con molte compositioni di vari colori qual sono uno inganna contadini" ("drowned among nosegays and employing themselves with many varicolored compositions which can only cheat the simple"), with the sculptors, whose work could be enjoyed from innumerable points of view in the unfolding beauty of its rhythm — the "figura serpentinata" that was later, for Lomazzo, the mannerist canon par excellence. Thus the intellectualizing dissociation of form and color, no longer reconciled on the evidence of reality, was adumbrated in the comparison of the two arts. Michelangelo, almost annoyed at being called as a witness in a matter that did not concern him, made short shrift of the question, reverting to the Albertian definition of sculpture "per forza di levare" ("by cutting away"), the actual freeing of form from the block.

In Rome Michelangelo had completed his *Last Judgment* (1541; PL. 536), in which form and space unite, carried along by a tremendous figural tension, and the restless, vague, lyrical anxiety of the *maniera* yields before the awesome inspirational power of an individual drama that has found definitive and universal religious motivation. Precisely through understanding the late style of Michelangelo as an ascent, not a retrenchment or a decline, Dvořák interpreted it as an expression of the mystical impulse animating the Counter Reformation, the culmination of that trend — ever imminent in a Renaissance entangled in its own knowledge — which for Dvořák was mannerism. But in Michelangelo it was really the Renaissance that reached the heights of discovery in this free, ideal functionalism of form. It was not one single current but the whole development of art that experienced its catharsis in Michelangelo's late works.

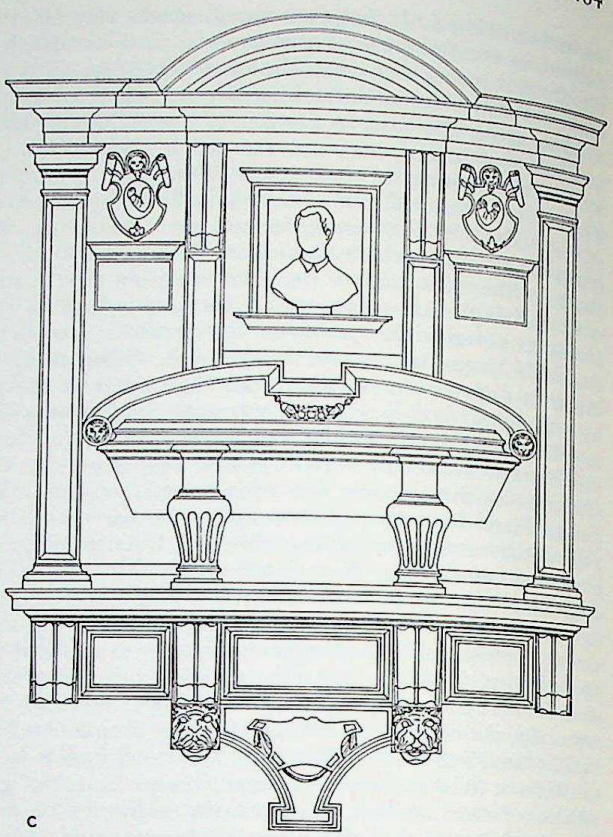
Inevitably, the conclusions drawn from Michelangelo were limited and one-sided. Only the formal and compositional

dynamism of the *Last Judgment* was grasped. And from it were derived, in the free play of the *maniera*, plastic attempts which complicated mannerism with abnormal strainings, with an inert heaviness that arrested its animated rhythmic flow, and which were to prove the utter confusion of the followers, that later generation of mannerists most scorned by the critics. Yet in some of the sounder of these artists it inspired a grave and anguished tone that is sometimes lyrically resolved, as in the case of Daniele Ricciarelli, known as Daniele da Volterra (1509–66; PL. 294), whose *Deposition* (Trinità dei Monti, Rome) raises to the threshold of religious tragedy the nonrealistic scheme of Il Rosso's treatment of the same subject in Volterra. Increased severity also pervades the persisting recollection of Raphael's Logge in the decoration of S. Giovanni Decollato, begun in 1535 and carried on until the middle of the century by a group of artists who are currently undergoing scholarly reevaluation: the Florentines Jacopino del Conte (1510–98) and Francesco Salviati (1510–63; PLS. 294, 309), the Venetian Giovanni Battista Franco (ca. 1510–61; PL. 300), and the Neapolitan Pirro Ligorio (1514–ca. 1583). In their work first appeared the expressive pathos that the Counter Reformation, now sure of its direction (until 1545 this was still being formulated by the Council of Trent), began to require of religious painting, directing it to the celebration of the transcendental, a trend which made that anticipatory example, the *Transfiguration* of Raphael, far closer and more comprehensible. And F. Zeri has rightly pointed out (1957) how, at this time especially, the altarpieces of Sebastiano del Piombo (1485–1547), notably the *Birth of the Virgin* in S. Maria del Popolo (ca. 1532), so different in their chromatic emotiveness from the gay nonrealism of the *maniera*, assumed the authority of examples. Plastic effects were intensified with contrasts of chiaroscuro. As A. Venturi recognized, the importance of the Lombard Marcello Venusti (ca. 1512–79) lay in providing, by way of the vestigial Leonardism of his early training, " the chromatic solution to the formal principles of Michelangelo." The new plasticity was also built up by means of color that gained strength in reaching toward the very substance of things, as in the inspired work, already prebaroque, of Pellegrino Tibaldi (1527–96) — especially the decorations that he carried out in the Palazzo Poggio (Palazzo dell'Università) in Bologna (PL. 298; XI, PL. 100) after going there from Rome, which contain the germs of the reform of the Carraccis. External criticism of the *maniera*, which only later took shape in the open hostility of the Counter Reformation, began in this incipient self-criticism. The whimsically pictorial effect was no longer satisfactory if what was sought was to go beyond illusion to dynamic structural reality. And about 1540 the problems that had been felt principally in painting were demanding solution in the field of architecture as well (PLS. 311–314).



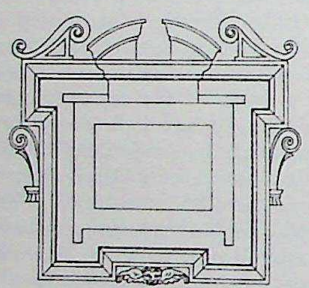
The revival of Vitruvian studies was symptomatic. Interest in this canonical text of classicism had been lively throughout the 16th century; as early as 1521 the first printed translation appeared in Venice, followed by that of Francesco Lucio da Castel Durante (1524) and, in 1556, by another, the celebrated rendering by Daniele Barbaro, the Patriarch of Aquileia. While in the Venetian milieu this interest in architecture never lost the character of an aristocratic diversion, in Rome it assumed a more rigorously scientific direction with the foundation, in 1542, of the Accademia Vitruviana, whose program ranged from the production of a critical edition of Vitruvius and a lexiconlike exegesis of his technical terms and a comparison of the Vitruvian text with extant classical monuments to an actual census of all surviving Roman antiquities. A program seemingly antiquarian, it answered a very different esthetic need — to judge from the list of artists (among them some of the greatest of the 16th century, for example, Vignola) who from their youth participated in it — the need, that is, for a new interpretation of the nature of the classical itself in order to base new creations on solid structural experience.

Michelangelo, too, turned to architecture in the years following the *Last Judgment*, but, as always, acting through the motivations of his exceptional personality. He experienced again in the exigency of his own art the common exigency of all artists; he cast it in the lucid form of a problem that is still the Renaissance problem of form. In the realm of pure architectonic abstraction he reaffirmed his concept of form as the ultimate liberation, not now the overcoming of all limitation, the *non finito*, but the revelation of the actual energy of this overcoming — even in the closed balance of the centralized plan on which, from Bramante on, the problem of the construction of St. Peter's had been based. Michelangelo was able to resolve this, thus concluding a half century of discussion, precisely by returning to the clear harmonies of Bramante — divested of the pictorial complications of Raphael and of the compromises of Antonio da Sangallo — and converting them, through the unifying power of the colossal order, to a great block of articulated members culminating in the dome. And the organization of surrounding space itself was, for him, form — as in the Piazza del Campidoglio, unitary and tense with untrammeled dynamism.



This complete mastery of structural reality indicated to architects a surer means than the now totally spent mode of classicism. For this reason, only in architecture was Michelangelo fully understood (and not partially imitated) as representing the new consciousness of form in which stylistic aspiration attained creative power. The final convergence of the tendencies that from the beginning of the century had been polarized in Michelangelo and in Raphael, the ultimate statement of the problem and its articulation in an artistic idiom, the style and the *maniera*, were only now achieved — as they had not been in the encounters of artists between 1520 and 1530 from which mannerism had issued victorious. Mannerism had now fulfilled its purpose as the basis of a new creative idiom. That it attained in architecture to some of the most exalted artistic expressions of the Italian 16th century has frustrated all critical attempts, from Wölfflin to the present, to make of this phase of architecture a secondary or transitional phenomenon in a historical sequence polarized exclusively between the antithetical premises of Renaissance and baroque, or to consider it (by extension of the mannerist formulation in painting) as a separate entity based on the polemical reversal of Renaissance static rationality and therefore doomed to an ambiguous if not flatly negative evaluation. That masters such as Vignola and Palladio have been regarded as mannerists has had the positive virtue of setting them apart from a presumed academic classicism and from a tentative baroque, thus eliminating the inadequate bases of judgment that for centuries had beclouded the comprehension of their art, if not the consistent appreciation of their greatness. But this last is really what places them outside any specific category, at the very center of a style of which they represent the highest reaches. The premises of the *maniera* survived in them, but they directed themselves confidently toward their own goal, ridding it of every vestige of uncertain aspiration, of indecisive procedure, which gradually made it generate differences within the vaguer and more evocative designation of mannerism, to emerge now in the established certainty of style.

Yet, certain isolated manifestations scattered throughout the century must be classified as mannerist concessions to the taste for the fantastic, the exceptional, the abnormal: the Palazzina of Pius IV, built by Pirro Ligorio in the Vatican Gardens (VIII, PL. 429; XII, PL. 89), in which structural clarity is submerged in a mass of relief sculpture; the house ("capriccio poetico") that Federico Zuccari built for himself in 1593 in Rome (now the Biblioteca Hertziana), where doors and windows are the wide-open mouths of horrid monsters (PL. 314); and that obscure assemblage of *invenzioni* of literary inspiration, the park of the Palazzo Orsini, Bomarzo, near Viterbo (X, PL. 137). This classification does not include, as has been said, the work of the greater masters, such as Vignola and Palladio, in whom every ambiguity of this style was resolved in the bold surge of inspiration.



If the weakness of the mannerists lay in the preponderance of illusion over structural reality, they were, on the other hand, powerful creators of structural forms that were to be elaborated but not surpassed for centuries. They achieved this through an experience that for both the Emilian Vignola and the Ve-

netian Palladio was possible only in Rome, in the formative confluence of the direct study of the antique and of a basic artistic idiom embracing, besides the *maniera*, the great architecture of Bramante, of the Sangallos, and of Raphael, and, finally, the living example of Michelangelo. As new and original as the interpretation of this background in their buildings is its reflection in theory. In the *Regola delli cinque ordini d'architettura*, published by Vignola in 1562, then in 1570, and countless other times as the canonical text of modern architecture, there is an exhaustive inquiry into the classical law of proportion, the Palazzo Chiericati (XI, PL. 30) in Vicenza and of the organic clarity of the Venetian churches of the Redentore (XI, PLS. 34, 35) and S. Giorgio Maggiore (VIII, PL. 227; XI, PL. 34; XII, PL 49). The villas, open through airy porticoes to the countryside, reveal a sublimation of classical rhythms enlivened by the lyric impulses of the day, as does the Teatro Olimpico of Vicenza (FIG. 465), where the taut classical auditorium is designed like an instrument to vibrate with resonance. Not even Vincenzo Scamozzi (q.v.), the puristic corrector of Palladio, escaped his lyric suggestion when he completed that theater with the diverg-

but in his view the classical orders were "ornaments" of structure, not a determining factor. Thus the *Regola* is only an exposition of his own architecture — of its foundation on a measured rhythmic flow; it can tell us nothing of the tremendous force of imagination that rendered Vignola able to shape the plastic mass of a wall into the great semicircular exedra of the Villa of Julius III (Villa Giulia; XII, PL. 89), to conceive the magnificent Bramantesque trabeation of the round courtyard of the Palazzo Farnese at Caprarola (FIG. 465; I, PL. 388), and to resolve the great longitudinal space of the Church of the Gesù (1568; PL. 312) through the enormous rhythmic tension in the centralizing force of the dome.

So, too, in *I quattro libri dell'Architettura*, which Palladio published in Venice in 1570, the classical city inspired by Vitruvius was not a scholarly reconstruction but a poetic dream. For that now-distant world of form passed in Palladio into the coloristic vision that was for centuries the architecture of Venice: the opening up of areas of shade between the articulation of the members, the rhythmic punctuation of façades rather than the concentration of solid masses. Here is the source of the Palazzo della Ragione (called the "Basilica") and ing illusionistic perspectives of an unreal city beyond the space of the actual stage (PL. 312; XI, PL. 36).

Italy was transformed by this new architecture. Vicenza became the near realization of Palladio's ideal city, and Genoa acquired a new aspect through Galeazzo Alessi (ca. 1512–72), not so much by way of the monuments constructed by him — the Church of S. Maria di Carignano, the palaces, and the suburban villas — as by way of the artistic current deriving from him, which took in Giovanni Battista Castello, Rocco Lurago, and Pantaleone and Benedetto Calvi (father and son), the builders, with Alessi, of the palaces with their façades aligned in a fantastic scenic "fugue" along the Strada Nuova (now Via Garibaldi), a prospect admired by Rubens and recalled in his later work. In Milan, Pellegrino Tibaldi, though he was the originator, while in the service of the Counter-Reformation purposes of Cardinal Federigo Borromeo, of austere church structures and palaces such as the Collegio Borromeo (FIG. 467), took note, as a painter working in the Cathedral, of the impressive chiaroscuro of the Gothic building and carried it over into the decoration of the chancel ambulatory and the portals of the façade.

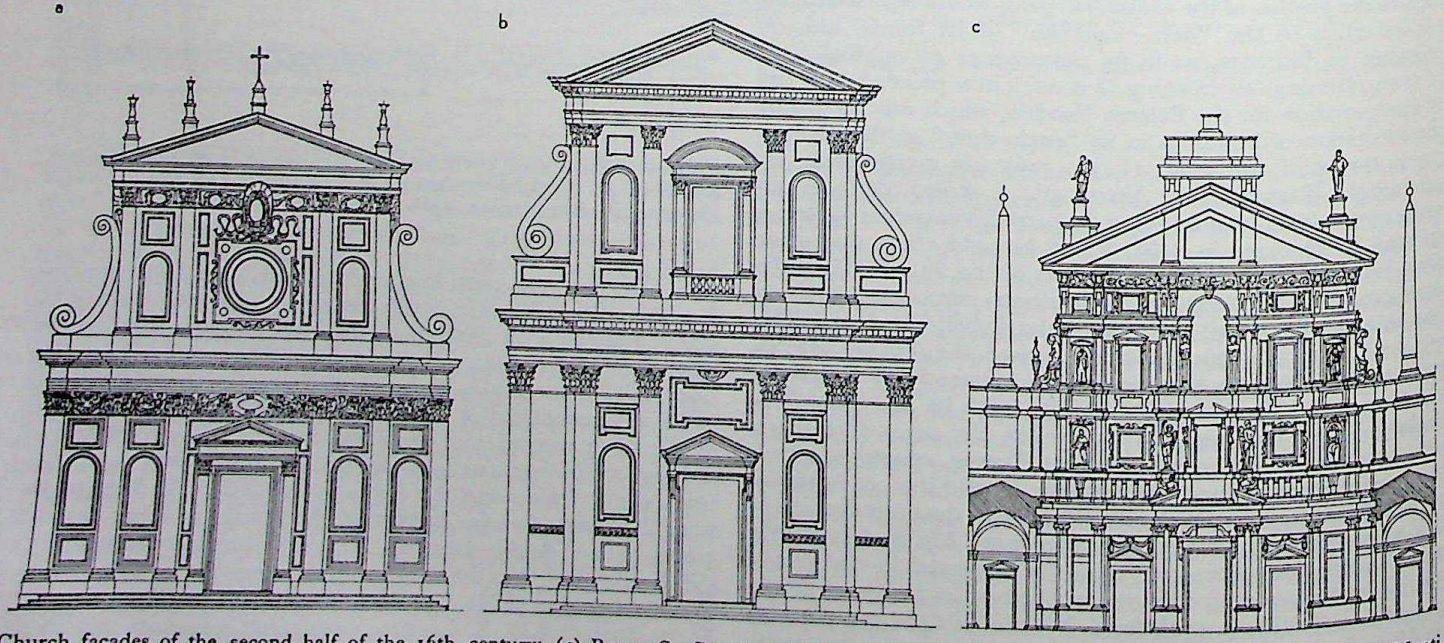
The architecture of the second half of the 16th century attained an assured maturity of style equaled only by Venetian painting, which continued in the inexhaustible vein opened up by Giorgione, celebrating the harmony between man and nature, that harmony reached in the course of time which had been the poetic warrant for the great Renaissance invention of tonal painting, the penetration of color by the ever-moving play of light. The hard-won achievements of the *maniera* were readily absorbed into this sureness of principle, accentuating and enriching but not substantially altering it. Mannerist contributions were particularly centered, aside from the sporadic passages through Venice of Florentine and Roman artists — among them Il Rosso and later F. Salviati and Vasari, and, at the end of the century, Federico Zuccari — in the influence of the nearer centers: Mantua, dominated by the impetuous romanticism of Giulio Romano, and Emilia, where the whimsical elaboration of Parmigianino's style appeared in the art of Primaticcio and Lelio Orsi (PL. 301). It is known that the study of Parmigianino's drawings was fundamental for the great Venetian sculptor Alessandro Vittoria (1525–1608), modifying his innate and rather harsh plastic vigor into the almost evanescent elegances of the stuccoes on the ceiling of the Scala d'Oro in the Doges' Palace and also into the strong chiaroscuro of his statues — for example the *St. Jerome* of S. Maria Gloriosa dei Frari (ca. 1565; XII, PL. 86) and the *Daniel* of S. Giuliano (ca. 1584) — in which sculpture too became an expression in the highest degree pictorial. Also following in this direction was the painting of Andrea Medolla, known as Lo Schiavone; later the naturalism of the Bassanos (q.v.) was to emerge. In the painting of Paolo Veronese (q.v.), whose symphonic orchestration of color (so different from the evasive subtleties of the *maniera*) represents the mainstream of Venetian art, the more robust accents of the still Raphaelesque style of Giulio Romano and the example of Palladian architecture are regarded as more influential than the grace of Parmigianino. The sheer simplicity of Veronese, whose painting seems most felicitous in encompassing this color tradition, has caused him always to be compared, and often preferred, to Tintoretto, who drove himself to the adoption in color — the resonant, almost diffused color of the late Titian — of the nonrealistic

effects of the *maniera*. But with his program "disegno di Michelangelo e colorito di Tiziano" — too often interpreted as the statement of an eclectic compromise — his work appears impelled far beyond the *maniera* to the point of the intense figural dynamism of the *Last Judgment*, from which derived that heightening of inspiration which made him feel the tonal balance of Giorgione as a restraint to be broken by the apotheosis of light. He created a new Venetian lyricism, no longer the celebration of a Pandean identification with nature but the impassioned vision of another world of ultrareality. This explains why even to Venetian critics Tintoretto's painting seemed an abnormal phenomenon and required for its full acceptance the baroque sensibility of Antonio Maria Zanetti.

In Venetian painting, as in Venetian architecture, the *maniera* represented only the enriching of the existing visual tradition with a new feeling for life necessary to a new classicism of style, differing from that of the early 16th century precisely in the more complex and refined spirituality implicit in it. Thus, the current tendency to circumscribe this central chapter of Italian art within the confines of a mannerism opposed to the Renaissance, down to its very premises, involves the arbitrary dissolution of a synthesis that is, on the contrary, so complete and definitive just because of its reaffirmation of the basic Renaissance premises of organic form. Along with this mainstream of style, the course of the *maniera* was henceforward virtually that of a survival which gradually used itself up, but not without producing consummate elaborations from which the great lyric creations that continued from the 16th into the 17th century could still draw sustenance.

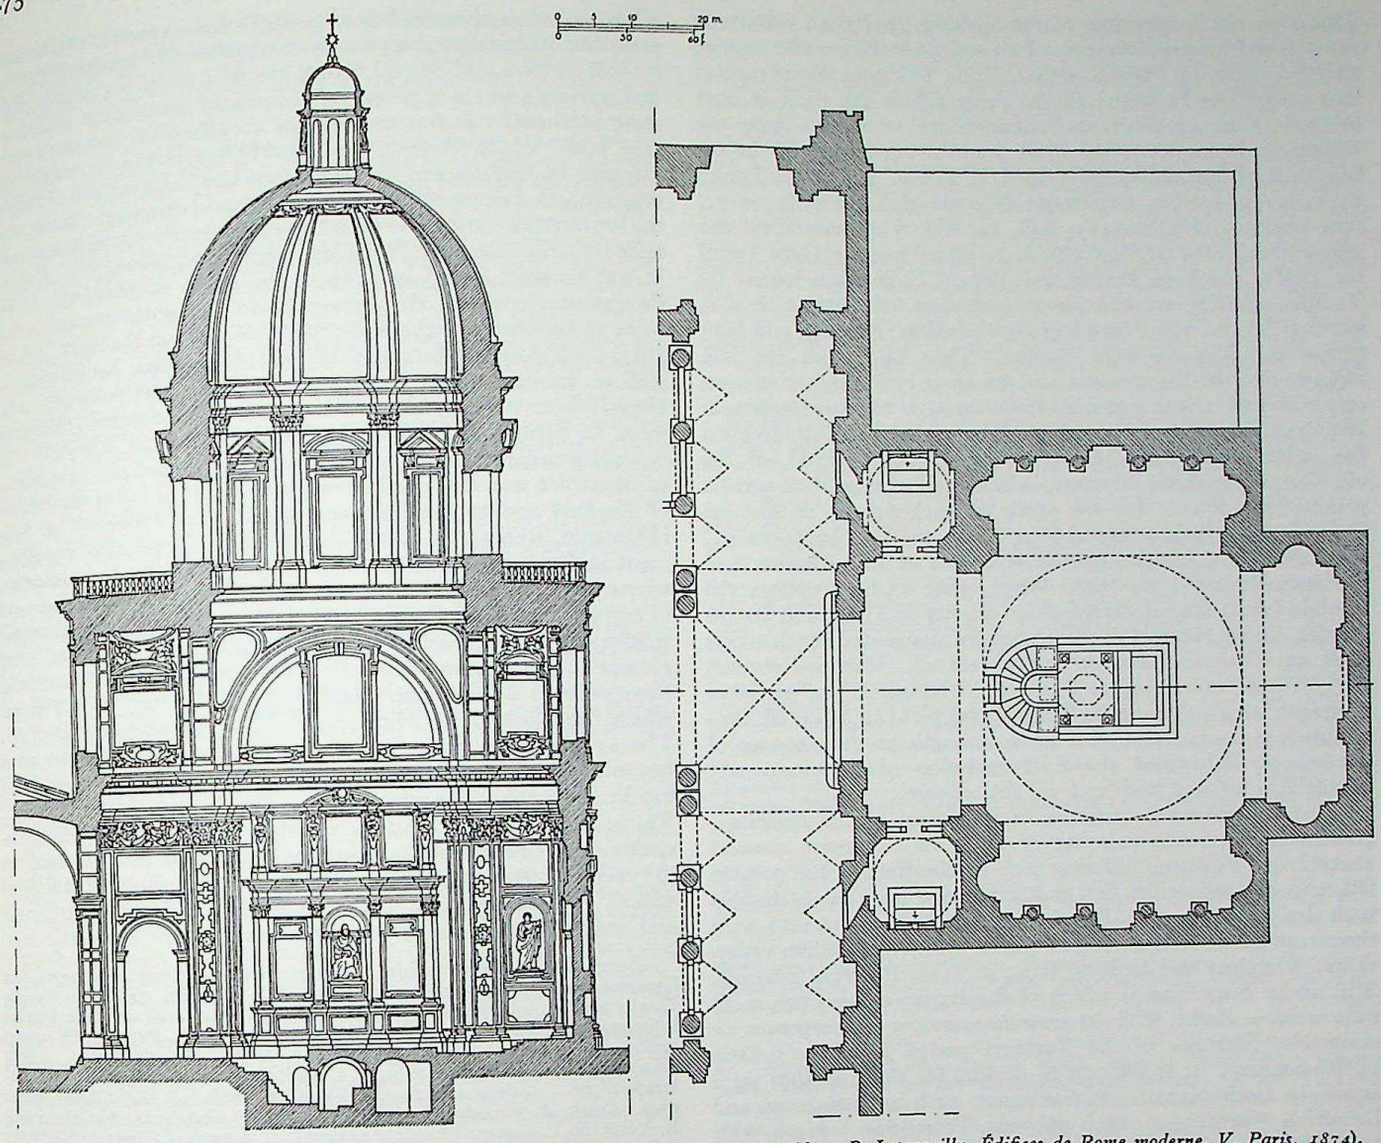
In contrast to this major development, Florence in the second half of the century seemed to withdraw ever further into subtle intellectualism. The *maniera* was not for Florentine artists a means of experimentation toward a new conclusion: rather, it was an end in itself, elaborated to the utmost with all the resources of a high artistic tradition, even though in the provincial isolation of Florentine life, this tended to descend to the level of an artisanlike — if indeed most expert — skill. With Michelangelo in Rome, Pontormo gone from the scene, and Giorgio Vasari, architect of the Grand Dukes from 1555 (FIG. 470), in control of Florentine art, this trend no longer met with any resistance. Vasari covered the walls of the rooms and apartments of the new Medici residence, the Palazzo Vecchio, with the whole repertory drawn from the incredible graphic erudition acquired in his travels throughout Italy (II, PL. 28; VIII, PLS. 102, 103). This display would not have been redeemed as art had he not had working alongside him, in the Sala dell'Udienza, that master of *disegno*, Francesco Salviati. But Vasari was also capable of creations such as the portico of the Uffizi (PL. 312), whose significance lay not so much in the "new classicism" of its forms, hitherto unknown in Florence, as in its character as an original piece of town planning, establishing as it did a new point of view and of interpretation for the Palazzo Vecchio, which was framed by the succession of buildings in an "angle shot," so that the dynamic thrust of the tower (I, PL. 396) was accentuated. By summoning Bartolommeo Ammanati, a skilled designer already expert from long building practice in Venice and in Rome, to work in Florence in 1560, Vasari brought about that other town-planning project, the courtyard of the Palazzo Pitti, the most beautiful of Florentine 16th-century structures, open on one side to the green prospect of the Boboli Gardens (VIII, PL. 429). Vasari's famous corridor over the Ponte Vecchio connected the Palazzo Vecchio and the Palazzo Pitti. Similarly, via Ammanati's Bridge of Sta Trinita, with its marvelous Michelangelesque tensions, the old walled city seemed to reach out, over the river, to the pleasant Tuscan countryside that the patient labor of man had virtually formed into an immense park. This return to the countryside, one of the most characteristic phenomena of 16th-century Florentine life, was in subtle accord with the naturalistic vein that appeared in the architecture itself; however, its force, vivified by a purity of form, was felt especially in sculpture. Niccolò Tribolo and Pierino da Vinci had already given their best in the slender fountains of the Villa di Castello (VIII, PL. 431) and the Villa della Petraia (XII, PL. 57); now Ammanati placed in the fountain before the Palazzo Vecchio the festive group of fauns and naiads, almost bounding on the rim of the basin, thus redeeming the inert gigantism of the Neptune, the "Biancone" of popular irony (VIII, PL. 210). And Giambologna (q.v.), who arrived in Florence proficient in the agile style of Fontainebleau, found in this fresh naturalism a contemporary accent for his virtuoso elaborations of form, such as the great *serpentinato* group of the *Rape of the Sabines* and the *Neptune* (PL. 308). His best works were the *Venus* for the Fontana della Petraia and one for the grotto of the Boboli Gardens built by Bernardo Buontalenti (VIII, PL. 430). His followers, among them Pietro Francavilla, Taddeo Landini (VIII, PL. 206), Valerio Cioli (VII, PL. 384; X, PL. 137), and G. B. Caccini, were to elaborate on this rustic vein, which seemed to revive ancient sources of 15th-century

Florence, Palazzo degli Uffizi (architect, G. Vasari), partial elevation and plan (*from A. Haupt, Architettura dei palazzi dell'Italia settentrionale e della Toscana, IV, Rome, Milan, n.d.*).



inspiration — suggestions that were to be taken up by 17th-century sculpture.

This Florentine phase of mannerism was significant precisely because of the freedom with which artists worked within it. In the *studiolo* of the Palazzo Vecchio (VIII, PL. 103), designed about 1570 by Vasari, in conformity with the fanciful and romantic taste of the Grand Duke Francesco I, the little scenes painted by a group of artists — besides Vasari himself, Alessandro Allori, Francesco Morandini (Il Poppi), the Fleming Jan van der Straet (Stradanus), and, among the ablest, Mirabello Cavalori and Girolamo Macchietti — reevoked a whole tradition in their subtle variations on themes drawn from human activity, from mythology, and from the new allegory, all held together by the slender thread of an admirable rhythmic coherence. This represents the last residue of the great cult of form, still so deep in the artistic consciousness as to moderate the capricious and the arbitrary. Buontalenti was the creator, again for Francesco I, of the Galleria of the Uffizi, in the decoration of which a group of artists directed by Alessandro Allori (PL. 293) revived the Raphaelesque motif of grotesquerie in a charming fantasia of themes: animals, little figures wittily satirized, small genre scenes. He was also the imaginative author of theatrical interludes, of festival decorations, even of fireworks displays — the last interpreter of that which in mannerism had lighted the flame of lyricism and which in Florence alone still produced a poetical result.



But Florence paid a much greater tribute to the 16th century, not through the practice of art but through art history. The *Vite* of Vasari (1550; 1568) put into focus the events of two centuries of art from the point of view of the *maniera*, in which the great masters of the past seemed unsurpassable. Vasari vividly reevoked the lives of those artists, inspired to the point of torment, who were, as he acutely discerned, not of the 16th century only but had their precursors in the two preceding centuries — an instance of historical perception not diminished by the ceremonious courtesy that makes Vasari do honor, on the other hand, to the members of the Accademia del Disegno founded in Florence through his own efforts in 1562. The formal abstraction of the *maniera* established itself in a secure position there, as in a last stand, popularizing with didactic aim the residue of the great ideal *norma* of the Renaissance. But in Florence this could still be resolved in the cadences of rhythmic design. In Rome, on the other hand, and elsewhere, the dilemma in the *maniera* between extreme abstraction and the progressive return to reality, to which color opened the way, was sharpened.

As early as 1564, the very year of Michelangelo's death, there appeared, in the treatise of G. A. Giglio (see TREATISES), the first denunciation of the *maniera*; it is symptomatic that this opposition was advanced in the name of the religious rigors of the Counter Reformation, which sought in art an instrument to further its purposes. Many art historians have seen in this repressive and total opposition the cause of the final decline of the *maniera*. But, as F. Zeri has with good reason cautioned, the precedents for the artistic events of the end of the century had long existed in purely devotional painting, especially in the severe design and restrained feeling of the new altarpieces, from the time of Sebastiano del Piombo. The reaction to the *maniera* may assuredly have had these motivations, but the most profound causes came from within, now that the idiom evolved from it was spoken in more poetic accents by the great masters. The *maniera* lost, therefore, its active function, retreating into itself and taking on, in varying combinations, all the aspects assumed in its dissemination throughout Italy and beyond. Its greatest exponents — Vasari, for example, and, toward the end of the century, Federico Zuccari — were indefatigable travelers, and from every part of Europe artists flocked to share in the Roman cultural experience. The results of this exchange, the circumstances of which cannot even be outlined within the scope of the present discussion, are to be seen in Rome, where there were innumerable opportunities, in the decoration of palaces and noble villas, for anyone possessed of technical proficiency and versed in the artistic repertory which had never ceased to grow within the rhythmic canon established by Raphael. The practice of art in Rome in the latter half of the century was controlled by the Zuccaris (Taddeo and, after his death in 1566, Federico), the decorators of Caprarola (PL. 310) and later the continuers of the Raphaelesque tradition in the Vatican. The Accademia Romana was founded in 1577 by Federico Zuccari, and he also attempted — in his *Idea de' scultori, pittori e architetti*, a sort of updating of the old Renaissance Platonism in the light of an exclusively religious motivation, in which the influence of the Counter Reformation was crucial — a theoretical justification of contemporary working practices. By now, however, far more valid experiments were taking place in painting: while the Zuccaris and their heir, the Cavalier d'Arpino (d. 1640; PL. 303), were dragging out the *maniera*, by this time merely a decorative system, well into the 17th century, the Carraccis and Caravaggio (q.v.) were already working; it was in comparison with the new directions indicated by them that Giovanni Pietro Bellori formulated his condemnation of the *maniera*.

Roman architecture, on the other hand, in which for some time already a new style had been asserting itself, could never be called mannerist, not even on the basis of those new formal types, the greatest of which was the Gesù of Vignola (1568).

Church façades of the second half of the 16th century: (*a*) Rome, S. Caterina dei Funari (architect, G. Guidetti); (*b*) Rome, Madonna dei Monti (architect, Giacomo della Porta); (*c*) Milan, S. Maria presso S. Celso.

Rome, S. Maria Maggiore, Sistine Chapel (architect, D. Fontana), section and plan (*from P. Letarouilly, Édifices de Rome moderne, V, Paris, 1874*).

The work of Giacomo della Porta (ca. 1537–1602; FIG. 471), who completed the dome of St. Peter's and designed the façade of the Gesù (PL. 312), and of the dynasties of Lombard builders, the Longhis and the Fontanas (FIG. 473), as well as of other able artists, gave to the city its architectural character, not only through the creation of individual monuments but through the organization of the whole, the great city plan that Domenico Fontana laid out for Sixtus V, the implementation of which has been pursued, one might say, down to our day. Here was a new classicism, by this time sure enough of itself to discount the classicism of antiquity, to face unhesitatingly even the possible destruction of the Colosseum when it was a question of the requirements of one of the great axial streets connecting the basilicas.

Thus at the end of the century the Roman and the Florentine course of mannerism appeared vastly different. In Rome mannerism exhausted itself in practical performance, for progressing alongside it by this time was that return to reality which, as a reinvigorated sense of form, had determined the new architecture; in painting, gradually taking on the motivations of the Counter Reformation, mannerism assumed the aspect of a devotional production which, if still illumined by the impetuous fantasy of a Giuseppe Valeriani, had its typical exponent in the God-fearing Scipione Pulzone (PL. 297) and soon ceded to the imminent Caravaggesque reform. In Florence, on the other hand, the late *maniera* remained a style of rarefied lyricism, the harmonic elaboration of a rhythm that found only within itself fitting motives and was even able to gather in other art forms, in that synthesis of representation and music that was shortly to become the opera.

But it was in this extreme lyric outpouring that Florentine art came into accord with developments on the international scene, where the diffusion of Italian mannerism was proceeding on a grand scale. It can be said that only through mannerism was a total unification of artistic idiom achieved — from France to Flanders, to Bohemia, to Germany, to Spain — in lands, that is, where Gothic premises had persisted right up to the 16th century and the Renaissance had never put down solid roots. In some critical circles this has been taken to demonstrate the anti-Renaissance nature of mannerism, which was thus interpreted as the last phase not of Renaissance but of Gothic evolution. This deduction appears less valid when one considers that the artistic idiom of the Renaissance itself originated in the contest of a dialectic between Gothic art and the new problems that had been posed and worked out in Italy. And mannerism was still a comprehensible means of communication, through which distant kinships were rediscovered, permitting Italian and northern European art now to proceed in the same direction. Leonardo and Andrea del Sarto, called to France by Francis I, did not find there a favorable terrain, still less a following, whereas Il Rosso, working from 1530 on at Fontainebleau, was soon surrounded by artists who constituted for decades a genuine stylistic current, the Fontainebleau school (PL. 304; V, PLS. 392, 395, 396; XII, PL. 100).

This was not a question of establishing an Italian colony; it represented the transplanting of an artistic tradition that opened new horizons to French artists. The felicitous convergences that took place in Rome in the years before the Sack of 1527 seemed to be repeated at Fontainebleau when, in 1532, the Bolognese Primaticcio, the most graceful interpreter of the refinement of Parmigianino, joined Il Rosso. He was followed in 1551–52 by the Modenese Niccolò dell'Abate (1509–71; PLS. 299, 301; IV, PL. 415; XII, PL. 81), who maintained the glowing colorism of Ferrarese derivation, and by Luca Penni (d. 1556), pupil of Perino del Vaga. They were joined by Tribolo; Cellini worked there (saltcellar of Francis I, IV, PL. 414; VI, PL. 269; *Nymph of Fontainebleau*, PL. 307); and later Serlio and Vignola were visitors. Thus in France the free stylistic flow of the *maniera* and its great lyric power (so soon opposed and misdirected in Italy through the persistence of Renaissance problems posed by Michelangelo) continued; on the other hand, there was a resurgence, unhindered, of the old Gothic rhythmic heritage, which yielded a profuse artistic production, notable for the work of such figures as Antoine Caron (1515–93; PL. 315) and Jean Cousin the Younger (1522–94) and, above all, for the refined sculpture of Jean Goujon and Germain Pilon (V, PL. 395). When, after an interruption, the Fontainebleau school resumed its activity and renewed its influence, under Henry IV, working there alongside French artists such as Toussaint Dubreuil (1561–1602), Martin Fréminet (1567–1619), and François Bunel the Younger (1522–99) were Flemings such as Ambroise Dubois (1563–1614), who, by contributing a more solid chromatic strength to the elegance of the school, influenced the final evolution of "international" mannerism toward the end of the century.

The controversial question of the effect of the Fontainebleau school on the painting of the Low Countries remains unresolved. F. Antal, differing with H. Kauffmann, has pointed out as more decisive the new contacts arising from the exchanges with Italy: Dutch and Flemish artists flocked there to vary their experience and stayed to work, while, too, Italian artists visited Flanders and Holland (e.g., in 1574, Federico Zuccari). Still under discussion is which of the Italian centers was more influential — Rome with its countless artistic convergences or mannerist Florence of the Vasarian period after the middle of the century. It is difficult to decide, for the Flemings were active in both places; but for some, such as Stradanus and Friedrich Sustris (ca. 1540–99), the Florentine sojourn with Vasari was longer and more decisive. A survey of the activity of the artists at work in the Low Countries — such as Marten de Vos (1532–1603), Hieronymus Francken (1540–1610), and Anthonie van Blocklandt (1532–83), all pupils of the Romanist Frans Floris de Vriendt (1516–70; XII, PL. 98), as well as Abraham Bloemaert (1564–1651; PL. 305), Cornelis Cornelisz. van Haarlem (1562–1638; V, PL. 297), Joachim Wittewael (1566–1638), Hendrik Goltzius (q.v.), and, surpassing all, Bartholomaeus Spranger (1546–1611; PL. 316; XII, PL. 122) — and a comparison with the activity centering in the Medici court in Florence and in the late Humanistic circle of Cardinal Alessandro Farnese in Caprarola, near Rome, reveal a common foundation of artistic idiom in which all the ramifications of mannerism are now combined. It was inevitable that this should happen in the realm of Vasari and the Zuccaris, for whom the *maniera* was an idiom that could by then be taught and learned in the academies, without insistence on its problems, which had now, it seemed, found definitive solutions suited to all expressive occasions. This standardization of the style makes it difficult to assess the relative importance of Florence and Rome, especially since the great arbiters of art traveled freely from one country to another and did not hesitate before any task (even the terrifying one of completing the masterpieces of the Renaissance, as when Vasari and then Federico Zuccari covered the inside of Brunelleschi's dome of the Cathedral of Florence with frescoes, or when the Cavalier d'Arpino prepared the mosaics for the dome of St. Peter's; X, PL. 192).

By this time the artistic idiom was the same in Florence and in Rome, but the Flemish masters, like the Florentine masters of the *studiolo*, in addition to learning it, understood its possibilities not as rhetoric but as poetry of the unreal, of the improbable, which placed on the same plane of whimsical diversion topical matters and legend, erudition and fresh invention, formal purism and the caprices of chromatic dissonance and dazzling luminosity. It was even easier to take this approach outside Italy, where Humanistic culture was not a heritage but a recent acquisition and the persistent Gothic note could freely intervene as a component of that magical interplay. Such was the art of these masters — which the greatest of them, Spranger, raised to the plane of Arcadian, almost 18th-century, poesy. It was he who, called in 1583 to the court of Rudolph II in Prague, made it, on the threshold of the 17th century, the most active center of the style, with Hans von Aachen (1552–1615) and Josef Heintz the Elder (1564–1609), architects as well as painters, Hans Vredeman de Vries (1527–1604?), and Hans Mont working there. Active at the court of Bavaria were L. Sustris and Pieter de Witte (known as Candid). It is understandable that, by using these manifestations as a point of departure and tracing their origins to Rome after the death of Raphael and to the Florence of the first followers of Michelangelo, transalpine critics were led to frame this development in Gothic terms rather than in terms of the Renaissance, whose art was regarded as an art only of rational definition and of *regola*. But at the heart of the Italian origins of this extreme refinement of the *maniera* was the conquest of the *moto* [*che*] *è causa di ogni vita*, to which the Humanistic study of form had been devoted in Florence since the 15th century and toward which Leonardo and Michelangelo had consciously striven. The 15th century made use of this conquest in order to pass beyond toward the unknown regions where poetic sense alone can be the guide. The 16th century was the century of Ariosto, Tasso, and Cervantes, and astride its boundaries stood Shakespeare. Alongside their consummate achievements stand, in the realm of the visual arts, the universal utterances of Raphael and of Michelangelo and, even though less lofty, the authentic and genuine utterances of the mannerists.

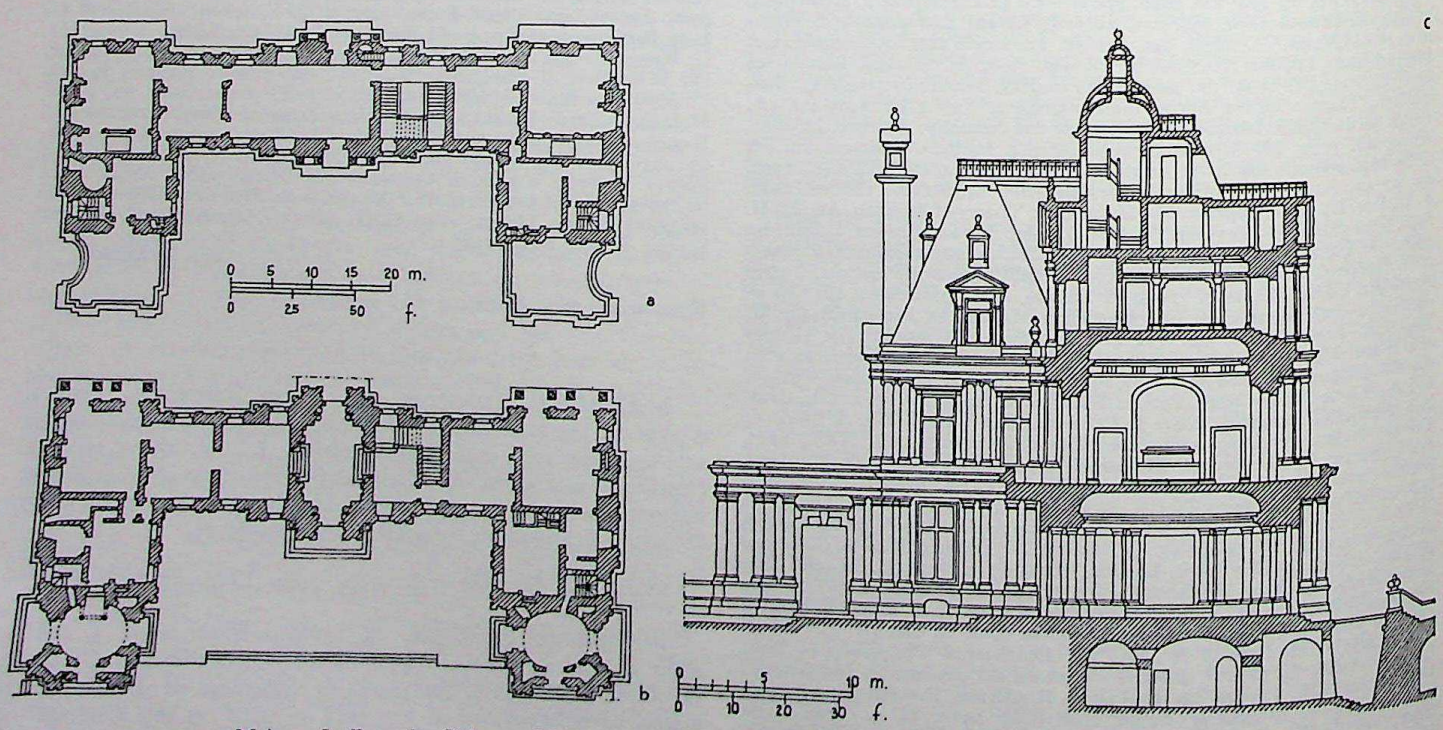
MANSART, FRANÇOIS AND JULES HARDOUIN. French architects, the two greatest names in a family of French artists active in the 17th and 18th centuries. Like many of the old families of architects, the Mansarts (whose name was frequently written Mansard) formed a veritable dynasty related to other families of architects, painters, and sculptors.

SUMMARY. François (col. 478). Jules Hardouin (col. 481).

FRANÇOIS (b. Paris, Jan. 13, 1598; d. Paris, Sept. 3, 1666). After a brief apprenticeship with his brother-in-law, Germain Gaultier, he became the pupil of Salomon de Brosse, with whom he collaborated at the end of 1618 on the Château of Coulommiers.



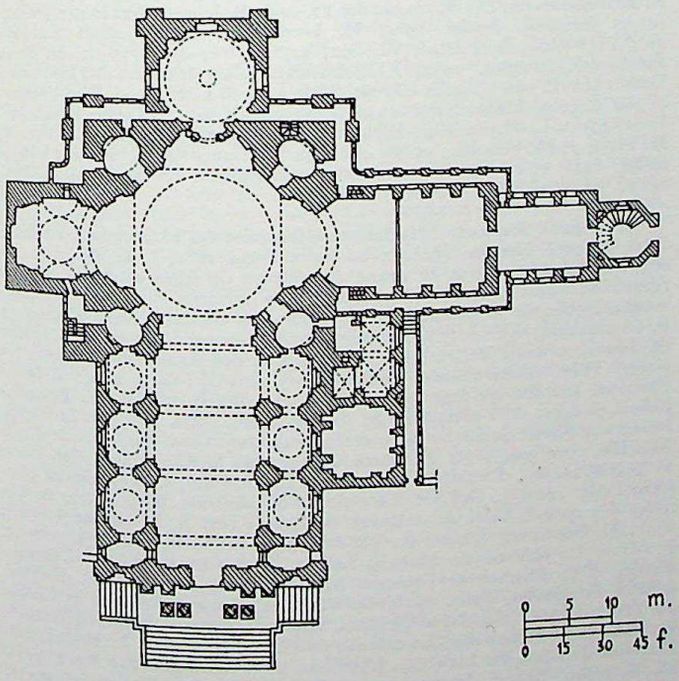
Although François was appointed architect to the king in 1636, he worked chiefly for the aristocracy and the rich Parisian bourgeoisie. His style marks the period of transition from Renaissance forms, which had already been appreciably modified by Salomon de Brosse, to those of classicism, which were to triumph in France after 1650. François Mansart's formative period occurred at the beginning of the 17th century, and his earliest works reveal his admiration for the masters of the 16th century. He never went to Rome, but he learned about the great Italians from engravings and books; he knew of Bramante's perspective and his treatment of vaults, and the bulging friezes of Serlio. That he was well aware of the development of the centralized plan can be observed in his Convent of the Visitation, in the chapel at Fresnes, and in the Val-de-Grâce. Mansart also knew Vignola's entablature style and the Palladian taste in the disposition of decorative figures on pediments. He studied the illustrations by Jean Goujon for Jean Martin's translation of Vitruvius and imitated the Corinthian capitals he found there. He was inspired particularly by Philibert Delorme (q.v.) and imitated his rhythmic treatment of bays, his expanded columns, and his hemispherical domes (IV, PLS. 163–165). Mansart also shared Delorme's taste for stereotomic feats, beautiful and involved squinches, sophisticated staircases, and careful masonry.

He maintained the traditional arrangements that he had learned from Salomon de Brosse: the châteaux of rectangular plan, with a triumphal entry on one side; double pavilions; windows with alternating segmented and triangular pediments; embossments; ironwork; and separate roofs over each section of a building.

He was animated, as were so many of his contemporaries, by an enthusiasm for certain baroque traits. He loved decoration, sometimes abundant decoration, and employed types derived from Flemish as well as Italian sources. His was a sculptural *décor*, developed in space, which took advantage of the play of light and shadow. He evidently enjoyed using curves, as may be seen in the plans of his churches and in some oval rooms such as that at the Hôtel de la Vrillière and in the porticoes of the Berny and Blois châteaux. He was fond of perspective effects in, for instance, sequences of rooms in an interior or in the scenographic disposition of buildings articulated on various planes, such as the façade of the Church of the Minims. He opened vertical views and made light burst forth from the tops of domes and staircases.

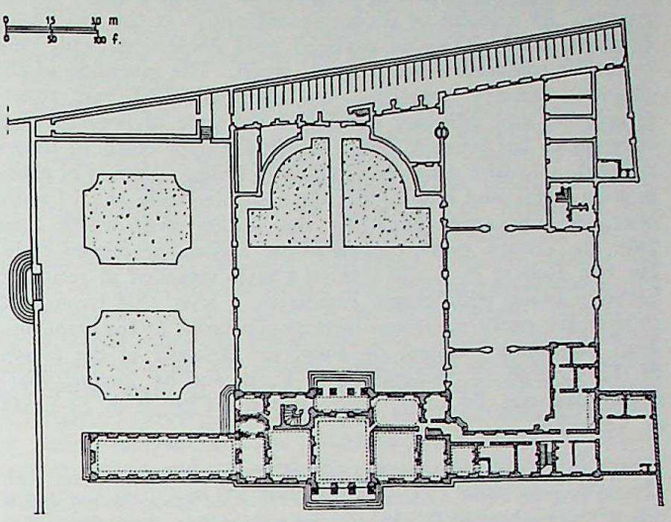
However, unlike the baroque architects, François Mansart never overdid the decoration, making it subordinate to the architecture as a whole. As he matured he steadily eliminated all superfluous features, reducing, for example, the wings of a château such as that at Maisons-Laffitte (PL. 317) to massive pavilions, as he strove for simplicity and unity of structure. He purified the forms, joined various parts by great horizontals, and covered them with a single roof; he imposed geometric schemes and harmonious proportions on his compositions, dividing them into halves. He was, thus, one of the creators of the classicism that was to reign in France to the end of his life. His influence remained important into the 18th century and came to the fore again when J.-F. Blondel and his friends reacted against the rococo; even in the 19th century the eclectics drew inspiration from his works for building town houses and châteaux.

WORKS. 1618: Château of Coulommiers (Seine-et-Marne), where he collaborated with Salomon de Brosse and built a staircase. – 1623: Nov. 27, contract with Pierre Brulart, viscount of Puisieux, for the construction of the Château of Berny (Seine). – 1624–29: Paris, portal of the Chapel of the Feuillants, begun by Father Estienne de St-Ignace ca. 1600. – 1630: Paris, Hôtel Bouthillier, near the Hôtel St-Pol, built for Léon Bouthillier, Count of Chavigny. – 1632: Paris, the Convents of the Visitation on the Rue St-Jacques (destroyed) and on the Rue St-Antoine (the chapel of which is now a Protestant church). – 1635: Paris, Hôtel de la Vrillière, built for Louis Phélypeaux de la Vrillière (altered, 1713, by Robert de Cotte; again, after 1870, by C. A. Questel; now Banque de France); additions to the Château of Blois for Gaston d'Orléans, brother of Louis XIII (PL. 317). – 1636: Paris, Hôtel de Macé de la Bazinière on the Quai Malaquais (transformed; now part of École des Beaux-Arts). – 1640: Paris, Chapel of the Dames de Ste-Marie, Chaillot; Paris, his own house in the Rue Payenne. – 1642: Maisons-Laffitte (Seine-et-Oise), Château of Maisons, for the president of the parliament of Paris, René de Longueil (PL. 317; FIG. 479). – 1645: Paris, enlargement of the Hôtel Tubeuf for Cardinal Mazarin. (The building was previously the Hôtel de Chevry, built 1635, by Jean Thiriot; it was sold in 1641 to Jacques Tubeuf, who had it enlarged by Pierre Le Muet and rented it in 1643 to Mazarin. Mansart constructed two superposed galleries and decorated the apartments. Mazarin sold the Hôtel on Aug. 30, 1649. The stables and library are the work of Le Muet. Today the Hôtel is part of the Bibliothèque Nationale.) – 1645–47; Paris, the Val-de-Grâce (II, PL. 151; FIG. 481; the plans were modified by Le Muet in 1654). – 1648: Paris, Hôtel Le Jars on the Rue de Richelieu (destroyed late 18th cent.). – 1640–50: Paris, Hôtel for Charles de l'Aubespine on the Rue Coquillère; and perhaps the Aubespine family tomb in the Cathedral of Bourges; Paris, Hôtel d'Albret on the Rue des Francs-Bourgeois; Paris, Hôtel Fieubet on the Quai des Célestins (now transformed), finished in 1650; Paris, Hôtel de Nevers, remod-



Maisons-Laffitte, the Château of Maisons: (*a*) Plan of second floor; (*b*) plan of ground floor; (*c*) section.

eled for Guénégaud (in 1670 it became the Hôtel de Conti; now the Mint). – ca. 1651: Paris, house for Guénégaud in the Rue du Grand-Chantier; Fresnes (Seine-et-Marne), Château for Guénégaud. – 1655–61: Paris, remodeling of the Hôtel Carnavalet; Paris, remodeling of the Hôtel d'Aumont on the Rue de Jouy (after 1655; originally built by Le Vau before 1649). – 1657: Paris, portal of the Church of the Minims, near the Place Royale (the work was interrupted in 1665 but resumed with modifications by Pierre Thévenot in 1672). – 1664: Projects for the Louvre. – 1665: St-Denis, projects for the Bourbon funerary chapel. – *Uncertain date*: Paris, altar of the Church of St-Martin-des-Champs. – *Unproved or erroneous attributions*: Châteaux at Cany, Chantelou, Daubeuf (Seine-Maritime), Dampierre (Aube), Balleroy (Calvados), La Ferté–Saint-Aubin (Loiret), Chamarande (Seine-et-Oise), and many others.



Jules Hardouin (b. Paris, April, 1646; d. Marly, May 11, 1708). He was the grandnephew of François, whose family name he took and with whom he studied for a period; he also studied drawing with Charles Poerson the Elder and architecture with Libéral Bruant. Jules was the favorite architect of Louis XIV, being awarded the titles of Intendant des Bâtiments du Roi (1685), Premier Architecte du Roi (1686), Inspecteur Général des Bâtiments du Roi (1691), Surintendent des Bâtiments du Roi (1699). A great part of his career was dedicated to the completion of the Château of Versailles, the construction of houses for the nobility, and other works of restoration and reconstruction, although his urban projects, the design of various notable squares and parks of Paris, such as the Place Vendôme and the Place des Victoires, and the plan and design of the dome of Les Invalides (PL. 318; II, PL. 150), are no less important.

The style of Jules Hardouin Mansart developed through study of the works of others to an expression that was clearly his own. He certainly remembered the lessons of his great uncle, for at Clagny forms derived from Maisons and Blois are unmistakable. In the first project for the royal chapel of the Château of Versailles François's influence is evident, and in both the plan and the section of the dome of Les Invalides there is a dependence upon François's project for the Bourbon chapel at Saint-Denis, both in the method of drawing and in

Paris, Val-de-Grâce, plan.

the proportions. At Clagny there are also motifs taken from Le Vau, such as the opening of vestibules onto peristyles. Jules must have collaborated with Lebrun (q.v.) until about 1685; the Hall of Mirrors (Galerie des Glaces) at Versailles (II, PL. 212; V, PL. 409) and the painted façades of Marly were the result. Mansart's taste for scenographic effects and daring perspective may also be the result of this collaboration. Mansart was also faithful to certain long-standing French traditions; for example, he preserved the characteristic château plan at Boufflers, and at Versailles he wished to crown the building with great roofs, a typically French feature. At the Orangerie of Versailles and in the famous flat vault of the Arles city hall,

Saint-Germain-en-Laye, Hôtel de Noailles, plan of ground floor from the original project (*from J. Mariette, L'architecture française, Paris, 1727*).

he showed his love for the art of stonecutting, an inheritance from the master craftsmen of earlier times.

Despite his reliance on tradition and receptivity to contemporary architecture, however, Jules Hardouin Mansart, even in his earliest works, was an innovator. At the Château du Val and at the Hôtel de Noailles at Saint-Germain-en-Laye (FIG. 482) he established the type of long, low edifice with horizontal accents that he revived at the Grand Trianon of Versailles. He replaced the rectangular windows of Le Vau with bays topped by semicircular arches, a type which survived until the 18th century; for the Hôtel de Lorges he used bays with depressed arches, an innovation erroneously attributed to Charles-Augustin d'Aviler. In the Place Vendôme (X, PL. 153) he surmounted the arcades of the ground floor with a two-story colossal order, producing an original interpretation of a 16th-century Italian idea.

Jules Hardouin Mansart had a sense of rhythm, symmetry, and grandeur, as well as versatility and variety. From the time of the Château du Val he gave different plans to neighboring rooms. While respecting an underlying geometric arrangement, he abandoned the rigidity of rectangular schemes in favor of polygons, circles, and ovals, which also appear in his great "Places Royales," often imitated in the 18th century. He knew how to unite a taste for majesty with a care for elegance, for example, in the colonnade of the park at Versailles. Like many French architects, Jules respected comfort and created practical arrangements of rooms; he heated various apartments with stoves set in the walls and installed the most compact and ingeniously arranged systems of fireplaces. In the Hôtel de Lorges he provided a covered entryway for guests arriving in carriages. His ability to resolve technical problems arising from his complicated style was already recognized by his contemporaries. Jacques-François Blondel credited Mansart with the distinction of introducing a logical rapport between façades and the surroundings. He designed façades that were almost bare (as Bruant and Pierre Bullet were then doing) and established the building type that in the 18th century inspired his students and the Gabriels. According to his collaborators he was a perfect draftsman.

Jules Hardouin Mansart modified the accepted scheme of interior decoration. While Lebrun, a painter who controlled French taste for many years, loved polychrome, large pictures, tapestries, and rich materials, Mansart, as an architect, limited

painted decorations to vaults and domes, and in the Church of Les Invalides and the chapel at Versailles, erected after Lebrun's fall from favor, he left the stone white in order to give to the supporting elements their full architectural value. In salons he devised a similar scheme, using, instead of compartmented wall coverings, arcaded orders surmounted by a cornice, coving, and a ceiling ornamented within a single central rosette. As a result of economic difficulties at the end of the reign of Louis XIV, he replaced gold decorations with light colors or sometimes with natural wood. The invention of the oblique chimney permitted the elimination of vast superstructures, and Mansart developed the type of fireplace that survives to the present, above which a mirror could be incorporated, a feature made possible by technical advances in glassmaking. He used new motifs on a smaller scale and of more charming character, including the scallop shell which later gave its French name *coquille* to the *rocaille* or rococo style. He and Robert de Cotte created a style intended to reconcile baroque grace with classic regularity, a style that triumphed in the 18th century. It was directly continued by his grandson, Jean Hardouin Mansart de Jouy, the designer of the façade of the Church of St-Eustache in Paris, and by Jacques Hardouin Mansart de Levy, who built the Church of St-Louis at Versailles.

Works. 1666: Paris, Hôtel de Vendôme in collaboration with Libéral Bruant; Paris, a staircase at the Hôtel de Lasseville in collaboration with his brother, Michel Hardouin (1647–87). – 1671: Versailles, work on the Hôtel de Créqui. – 1674: Saint-Germain-en-Laye, work on the royal Château: in the park he began the Château du Val; in the town the Hôtel de Noailles, finished 1679 (fig. 482). – 1675: Paris, plan for a pavilion for the Hôtel d'Aligre on the Rue St-Antoine; probably work began on his own house on the Rue des Tournelles and the Hôtel de Lorges on the Rue St-Augustin; designs for the city hall of Arles (Bouches-du-Rhône); a project for an administrative center in Lyons. – 1675–77: Versailles, the Bosquet des Dômes in the park. – 1676–81: Paris, second Hôtel Fieubet on the Quai des Célestins. – 1676–83: Versailles, Château of Clagny for Madame de Montespan. – 1677: Saint-Cloud, the first works for the king's brother. – 1678–79: Works at Fontainebleau. – 1678–81: Versailles, modifications of Le Vau's Cour de Marbre and construction of the south wing of the Château on the park; projects for the Château of Meudon, acquired by the Marquis de Louvois. – 1678–84: Versailles, rebuilding of Le Vau's park façade of the Château and work on the Hall of Mirrors (V, pl. 409) and certain apartments. – 1679–84: Beaucaire (Gard), project for the city hall. – 1679–86: Versailles, construction of the stables and kennels; Marly, Château. – 1680: Paris, model for the dome of Les Invalides (executed 1680–1706; pl. 318); Dampierre (Seine-et-Oise), Château for the Duc de Luynes (pl. 320). – 1680–83: Chantilly, Orangerie. – 1681–86: Versailles, Orangerie. – 1682: Work at Chambord. – 1682–84: Versailles, Grand Commun and the royal garden. – 1684: Paris, projects for the Pont-Royal; Arles, completion of the flat vault in the city hall. – 1684–86: Versailles, colonnade in the park; plan for the city; construction of the Church of Notre-Dame. – 1684–89: Versailles, north wing of the Château on the park. – 1685: Maintenon (Eure-et-Loir), wings of the Château; Moulins (Allier), a bridge. – 1685–86: Paris, Place des Victoires and projects for the Place Vendôme. – 1686: Saint-Cyr, Collège; Dijon projects for the Palais des Etats; Montpellier (Hérault), drawings for a statue of the king; Chantilly, reconstruction of the Château; Châlons-sur-Marne, high altar of the Cathedral of St-Etienne; Navarre (Eure), Château for the Duc de Bouillon. – 1687: Versailles, Grand Trianon (pl. 320); Tours, arch of triumph (demolished, 1774); Grignan (Drôme), wing of the Château. – 1690: Laigle (Orne), Château; projects for a canal from the Marne to the Seine. – 1691: Gaillon (Eure), gallery in the Château for Nicolas Colbert, archbishop of Rouen. – 1692: Paris, work in the royal palace for the king's brother. – 1694: Orléans, jube of the Cathedral of Ste-Croix. – 1695–99: Work at Marly. – 1697–1710: Versailles, royal chapel at the Château (pl. 319). – 1698–1700: Versailles, Zoo, in the park. – 1698–1704: Work on the Château of Meudon, which was bought by the Dauphin. – 1699: Versailles, remodeling of some apartments; Orléans, woodwork in the Cathedral. – 1699–1708: Paris, projects for the choir of Notre-Dame, executed by Robert de Cotte, 1708–14. – 1700: Versailles, remodeling of the Grand Trianon; Lyons, plans for the city hall; Nancy, plans for the archbishop's palace and a palace for the Duc de Lorraine. – 1701: Saint-Omer (Pas-de-Calais), bishop's palace (now Palais de Justice). – 1704: Moulins, new bridge; Versailles, works in the park (Salle des Marroniers, Bosquet des Bains d'Apollon, gardens of Trianon). – 1705: Poissy (Seine-et-Oise), restoration of the abbey; Paris, Chapel of the Virgin in the Church of St-Roch. – 1708: Paris, high altar of the Novitiate of the Jesuits; plans for rebuilding the Collège de France. – *Uncertain date*: Paris, Hôtel de Choiseul-Beaupré on the Rue des Archives; Paris, work on the Hôtel de Cavoye on Rue des Sts-Pères; Paris, Church of St-Paul-et-St-Louis, altar; Bordeaux, Maison Daurade; Pinon (Aisne), Château; Boufflers (Aisne), Château; Plessis-Piquet (Seine), Château; Château du Pin (Orne), constructed (1716–28) after his death; Castres, bishops' palace (now city hall); Saint-Denis, project for the Church of the Annunciation; Châlons-sur-Marne, project for the Convent of the Dames de Ste-Marie. – *Uncertain attributions*: Châteaux of Louvois near Reims (Marne), Montfrin (Gard), Verneuil-sur-Indre (Indre-et-Loire), Yville-sur-Seine (Seine-Maritime), and Serrant (Marne-et-Loire), right wing.

MANTEGNA, ANDREA. Italian painter and engraver. Because the village in which he was born, Isola di Carturo, belonged at that time to the territory of Vicenza, Mantegna is called Andrea "de Vicentia" in some of the documents of his Paduan period. His birth date, probably 1431, is deduced from an inscription on the lost altarpiece he executed in 1448 for the Church of Sta Sofia in Padua. Transcribed by Bernardino Scardeone, it reads: "Andrea Mantinea Pat. an. septem et decem natus sua manu pinxit MCCCCXLVIII." He died in Mantua in 1506.

Second son of a certain Biagio, woodworker, Andrea was enrolled in the guild of Paduan painters sometime between 1441 and 1445 as the adopted son of the painter Francesco Squarcione, with whom he remained for six years. In 1448, no longer willing to work for someone else, Mantegna left the studio of this curious Paduan master. During his lawsuit against Squarcione in 1455, Mantegna declared before the judges of Padua that his service had brought substantial profit to his master, "to the sum of 400 ducats and more." Although the arbitrated decision recognized Mantegna's right to reimbursement of only 200 ducats, Squarcione opposed it, citing agreements made in Venice on Jan. 26, 1448; the subsequent judgment, however, pronounced by the Quarantia Criminale of Venice on Jan. 2, 1456, recognized the validity of Mantegna's claims and nullified the conditions "deceitfully and cunningly" imposed by Squarcione in the agreement of 1448.

Unfortunately, no evidence of Mantegna's youthful activity in Squarcione's studio remains; but on the basis of his claim, it must have been of considerable importance. Lost also is the Sta Sofia altarpiece mentioned above, depicting the Virgin "and sundry other images," which was probably the first work executed by Mantegna after leaving Squarcione's shop. In its inscription the young man expresses conscious pride in his artistic identity, justified, it seems, for he had already received considerable recognition in Padua. This fact is clearly demonstrated by the commission entrusted to him in the same year together with three well-known and mature masters — Giovanni d'Alemagna, Antonio Vivarini, and Nicolò Pizzolo — to decorate a chapel in the Church of the Eremitani in Padua. Provision for the decoration of this chapel with scenes from the lives of SS. James and Christopher had been made in the will of Antonio Ovetari, drawn up in 1443. An agreement with Ovetari's widow, Madonna Imperatrice, was signed for Andrea, still a minor, by his brother Tomaso on May 16, 1448. It stipulated that half of the chapel was to be decorated by Giovanni d'Alemagna and Antonio Vivarini, while the other half, as well as a sculptured altarpiece, was entrusted to Nicolò Pizzolo and Andrea Mantegna.

The four artists were to have finished the decoration of the Ovetari Chapel by 1450, but Mantegna's personality asserted itself from the very beginning so peremptorily that the program set forth in the original agreement was soon radically changed. Giovanni d'Alemagna and Antonio Vivarini were to have decorated the right wall of the chapel with scenes from the life of St. Christopher and the large vault crossing with the figures of the four Evangelists. Further, these two artists were to paint a large Passion of Christ on the inner wall above the entrance arch, figures of saints in the intrados of the arch, and a frieze on the outer wall. The themes for the other half of the chapel are not stipulated in the contract. A year after work was begun, differences between Pizzolo and Mantegna led to an explicit statement of their respective parts, which were defined by the arbitrator, Pietro Morosini, on Sept. 27, 1449. The first decision concerned the sculptured altarpiece; it may thus be considered one of the chief causes of dissension. Mantegna — who, according to contemporary witnesses (e.g., G. C. Scaligero), was also a sculptor — wanted to participate in this work. In it he would have been able to give expression to his bent toward the direct modeling of figures, a tendency obvious in the emphatic sculptural qualities of his painting style. The decision, however, was in favor of Pizzolo, giving him the right to complete the altarpiece and specifically excluding any intervention on Mantegna's part. As for the frescoes, Pizzolo's task was limited to the execution of the last

episode of St. James, the decoration on the right-hand section of the triumphal arch that separates the apse from the main room, and the right-hand side of the apse, except for the figures of SS. Peter, Paul, and Christopher. These had already been partly painted by Mantegna, who was obliged to complete them. Besides these three figures of saints, Mantegna was to execute the decoration of the left-hand portion of the triumphal arch and five of the six scenes from the life of St. James on the left wall.

Actually the decoration of the chapel took a very different course: Of the part entrusted to Giovanni d'Alemagna and Vivarini, only the crossing was executed by them, and the death of Giovanni in 1450 afforded Vivarini an opportunity to free himself of the obligation. His subsequent participation in the chapel was limited to completing the decoration of the crossing left unfinished by Giovanni d'Alemagna, as evidenced in the appraisal made in May, 1450, of the work already executed. Vivarini finished this work before Nov. 27, 1451. Pizzolo executed the altarpiece of the Madonna Enthroned with saints, but of the paintings assigned to him, he completed only the frescoes of God the Father and of St. James, on the conch of the apse, already begun before the decision of 1449, and the four Fathers of the Church in perspective in the oculi. He also decorated the right side of the triumphal arch with a great head, perhaps a self-portrait, like that painted by Mantegna on the other side of the same arch. After Pizzolo's death, when Squarcione and Giovanni Storlato, in February, 1454, appraised the works he had executed, it was found that the last scene of St. James was not even begun. In addition, Pizzolo had left blank the apsidal wall behind the altar, intended for the Assumption, while the Apostles below, which were also to have been done by him, had already been painted by Mantegna. The decorations assigned to Pizzolo were not, however, left incomplete because of his violent death in 1453; he would have had ample opportunity to finish them between June, 1452, the date of his last payment for work in the chapel, and his death. The explanation is, rather, to be found in Mantegna's dominant personality. After having finished the subjects assigned to him in the arbitration (except the fifth episode of the St. James cycle), Mantegna painted, soon after Pizzolo's death, the Apostles, and then the Assumption, and finally the two remaining scenes with St. James.

The St. Christopher series, on the right wall of the chapel, was begun after the death of Giovanni d'Alemagna; the first four episodes must have been completed by Oct. 30, 1451, when Ansuino da Forlì received payment for the fourth scene signed by him, which depicted the preaching of St. Christopher. The third episode, St. Christopher ferrying the Christ child, had already been painted by Bono da Ferrara, who, on July 30, 1451, received final payment for it. The first two scenes, St. Christopher before the king and St. Christopher refusing to follow the Devil (appearing as a king on horseback), were executed toward the end of 1450. They are attributed to Ansuino da Forlì by Fiocco (1927). However, on the basis of their formal character, it seems more likely that they should be assigned to two different artists, as Longhi noted (1926), although his attribution of the scene of St. Christopher before the king to Girolamo di Giovanni da Camerino is not entirely convincing. The third and last register of the cycle of St. Christopher, in which the martyrdom and death of the saint are represented in a single scene, was painted by Mantegna (PL. 324); the date of execution of this great fresco, however, is uncertain.

The chronological problem of the Eremitani frescoes is complex, and the opinions of various historians continue to differ rather sharply, even after the publication of some fundamental documents by E. Rigoni (1949). According to the most recent opinions, the frescoes, begun in 1449, were finished in 1455, the last date mentioned in the list of payments for the Ovetari Chapel. The major disagreement concerns the dating of the last scenes of the St. James cycle and of the St. Christopher fresco and arises from differing critical interpretations of the course of Mantegna's stylistic development. According to Vasari, the episodes of the martyrdom and death of St. Christopher were painted last. This view, shared by many scholars, among them Kristeller (1902) and Fiocco, has been reaffirmed by Martin Davies. But other historians — Eisler, Rigoni, Tietze-Conrat (1955), and Pallucchini — maintain that the last scenes painted by Mantegna were those of St. James led to his death and the martyrdom of St. James, on the opposite wall. In their opinion these were not executed before 1454. The fresco of the martyrdom and death of St. Christopher would thus precede the last two of the St. James cycle and would have been completed in 1451 or 1452 (Rigoni, Tietze-Conrat, Pallucchini). Various justifications for such an early dating of the St. Christopher fresco have been offered: its chromatic quality, reminiscent of that of late-14th-century painting (Eisler); the perspective system, which, unlike those of the last episodes of St. James, does not take into account the spectator's point of view (Tietze-Conrat); above all, its striking similarity to Tuscan painting, which does not occur with the same intensity in the subsequent works of Mantegna (Ragghianti). These diverse reasons, formulated from fragmentary though sometimes acute observations, lead to a conclusion that does not seem justified. Vasari, always sensitive to changes of style, was well aware of the substantial difference between the two last scenes of the St. Christopher frescoes and the others. He explained it by relating the famous anecdote concerning Squarcione's spiteful judgment: "these pictures had not the semblance of living things, but of antique statues of marble." Vasari says that Mantegna, in reaction to this criticism, demonstrated in the great St. Christopher fresco "that he knew not less how to extract the good from living and natural things, than from those made by art." Divested of its literary embellishments Vasari's opinion remains valid, and the dating of the St. Christopher fresco as the last of the works in the Ovetari Chapel seems correct. The style is, in fact, much closer to that of the *S. Zeno Altarpiece* (finished in 1459; PL. 322) and even to the works of the Mantuan period than to the other decorations in the Ovetari Chapel.

Unfortunately, almost all the paintings in the Ovetari Chapel were destroyed in World War II. There remain *The Assumption*, *The Martyrdom of St. Christopher* (PL. 324), and some parts of *The Martyrdom of St. James* (restored; XII, PL. 140). These had been removed for restoration and escaped the fate of the other frescoes.

In the period between 1449 and 1455, during which the decoration of the chapel was executed, Mantegna also painted a little picture, now lost, incorporating portraits of Lionello d'Este and Folco di Villafora, done during a brief stay in Ferrara in 1448. Others of this period include the fresco in the lunette over the main portal of S. Antonio in Padua, depicting SS. Bernardino and Anthony holding the Sacred Name of Christ, signed and dated 1452 (subsequently detached; now Mus. Antoniano); the polyptych of St. Luke for the Church of S. Giustina (Milan, Brera), for which payments were made in 1453–54; and the signed and dated *St. Euphemia* (1454; Naples, Mus. di Capodimonte). After the completion of the Ermitani frescoes, the major work undertaken by Mantegna between 1457 and 1459 was the great altarpiece for the Church of S. Zeno in Verona, the last documented work of the Padua period.

In this first decade of his activity Mantegna's style matured, and in the *S. Zeno Altarpiece* (PL. 322) he realized the extraordinarily incisive concept of form, fully articulated along classical lines, that remains evident in the early Mantuan works. The difference between this artistic idiom and that of the first frescoes in the Ovetari Chapel is truly remarkable. The SS. Peter, Paul, and Christopher, painted in 1449 in the apse of the chapel, possessed a rough spontaneity, but a strained quality was also present, for although the artist established a connection with the studio of Donatello in Padua and although he was influenced by the works of the other great Tuscan artists who had worked in the Veneto — Andrea del Castagno, Filippo Lippi, Paolo Uccello — it was obvious that he had difficulty in assimilating the new style. Yet the violent self-portrait on the left side of the triumphal arch, painted with rapid, sure strokes that suggest the marks of the modeling tool in fresh clay, already fully revealed the sculptural force that is the source

of Mantegna's style. The two half lunettes with the calling of James and John and the preaching of St. James, executed almost contemporaneously with the saints in the apse, indicated a similar situation: suggestions of Castagno prevailed in the first, where the strong figures and splintered landscape had the sharp savor of a primeval nature; and the mannerisms of Lippi appeared in the other. The latter was Mantegna's first attempt at an architectonic composition; within it the dramatic movement of the figures appeared to run tangentially in the lower part of the painting.

After these first compositions Mantegna felt the need to discipline his instinctive sense of three-dimensionality by means of rigid formal logic. It is likely that he interrupted the decoration of the chapel for some time, perhaps for a trip to Ferrara, which would have made possible an acquaintance with the works of Piero della Francesca. He had studied antique sculpture in the workshop of Squarcione, and he now acquired a knowledge of classical architecture, stimulated, as Fiocco has noted, by his contacts with Jacopo Bellini. The second register of the St. James cycle is the product — at first sight disconcerting because of its apparent academicism — of the rigorous discipline to which Mantegna subjected himself in this period in order to achieve a calculated compositional relation between sculptural mass and perspective space. The scenes of the baptism of Hermogenes and St. James brought before Herod Agrippa were painted in an experimental interlude, during which Mantegna made a voluntary break from the idiom of the cruder but spontaneous earlier frescoes. These later scenes were dominated by the artist's intellectual pursuit of a perspective structure formed by rhythmic spatial connections between the various compositional elements. The figures had a cold immobility, for they were assimilated into their architectural setting, but some lively details stood out in the midst of the rigid framework. Squarcione's sharp criticism, which must have referred particularly to these frescoes, was not entirely unjustified. Mantegna was aware of the necessities that impelled him toward these researches and could be proud of his accomplishment, for the painters who were working on the other wall quickly took up his classical references, notably Ansuino da Forlì in the preaching of St. Christopher. The program of experiments conducted in these two scenes of the St. James cycle were essential to the development of Mantegna's classicism, which reached full maturity in the fresco showing St. James led to execution. The lowered viewpoint in this painting allowed the artist to give an absolute spatial unity to the composition, and the architectural elements, although grandiose, do not overpower the figures, which are crowded into the foreground as onto a narrow stage. The sudden growth and expansion of the masses in acute foreshortening confers on the images a sculptural power that is reinforced in the vigorous membering of the great barrel vault, itself a vast echo of the heroic dimensions given by Mantegna to the protagonist of these scenes.

In the writer's opinion, this episode of the St. James series should be dated about 1454, shortly after the Apostles in the apse of the Ovetari Chapel. The perspective scheme of these two scenes, in which the viewpoint is below the frame of the composition, was first used in the lunette of S. Antonio in Padua. The fact that the lunette has been considerably repainted makes a quality judgment difficult, but the composition, because of the perfect accord of its elements with the architectural structure, is one of great effectiveness. The upper and lower parts of the altar wall of the Ovetari Chapel were not done at the same time: the Assumption scene above was painted after Squarcione's appraisal in February, 1454, while the Apostles had evidently already been painted by that time, since reference was made to a difficulty that had arisen, probably fomented by Squarcione himself, over the reduced number of Apostles, which Madonna Imperatrice considered a breach of contract. The different perspective viewpoint of the two parts emphasizes the rude sculptural quality of the eight Apostles, a number Mantegna considered sufficient for esthetic purposes.

The *St. Euphemia*, executed in 1454, returns to the scheme of *The Assumption*, but the style seems closer to the intense chromaticism that characterizes the great St. Luke polyptych painted for the Church of S. Giustina in Padua in this same period. (Judgment is difficult, however, because the *St. Euphemia* has been blackened by fire.) The *St. Luke Altarpiece* (now in Milan, Brera) is formed of 12 panels arranged in two registers: In the lower are represented St. Luke in the center, seated on a cathedra and writing; SS. Scholastica and Prosdocimus at the left; and SS. Benedict and Justina at the right. In the upper register are the Dead Christ between the Virgin and St. John in the center; at the left, SS. Daniel and Jerome; and at the right, SS. Augustine and Sebastian. This work, one of the greatest achievements of Mantegna's Padua period, reveals a resurgence of his interest in Tuscan painting, in particular in the works of Andrea del Castagno and Piero della Francesca. Although the *St. Luke Altarpiece* is still basically Gothic in composition (this arrangement appears in the earlier polyptychs of Antonio Vivarini), Mantegna effected a radical change by making the gold ground the equivalent of atmospheric space (as did Piero della Francesca in the *Madonna of Mercy*; XI, PL. 157) and freely disposing the figures along perspective orthogonals converging upon the central figure of St. Luke. The five full-length figures of the lower register stand on a marble pavement that recedes sharply toward a background which, together with the vertical elements of the frame, forms a porticolike architectural setting; the half figures of the upper register are seen slightly from below, as if they were standing at the windows of the same building. The original frame has unfortunately disappeared, but it probably formed the first plane of this architectural structure, to which the orthogonals of the figures were related according to compositional ideas developed in the *S. Zeno Altarpiece*.

The sixth episode of the St. James cycle (XII, PL. 140) in the Ovetari Chapel, representing the death of the saint, was probably executed after the St. Luke polyptych; and the two payments of December, 1454, and January, 1455, which are the last indicated in the memorandum published on the progress of work in the chapel, would then refer to this fresco and to *The Assumption*. This scene is the most intense and exalted in expression of the whole cycle, and its splendid landscape setting, pictorially inspired by Mantegna's interest in the work of Andrea del Castagno and Piero della Francesca but reflecting also a certain northern quality derived from Pisanello, was repeated by Mantegna in the Camera degli Sposi in Mantua.

The last documented work of Mantegna's Padua period was the altarpiece painted between 1457 and 1459 for the Church of S. Zeno in Verona (PL. 322). In this composition, inspired by Donatello's high altar in S. Antonio, there is no trace of the traditional arrangement that had survived in the St. Luke polyptych. Further, the great architectural frame that encloses the altarpiece is so intimately related to the paintings that the term "polyptych" seems inappropriate, so complete is the organic unity. The enthroned Madonna and Child at the perspective center of the composition, with SS. Peter, Paul, John the Evangelist, and Zeno at the left, and Benedict, Lawrence, Gregory, and John the Baptist at the right, are assembled within the open space of an ideal classical temple with richly decorated entablatures resting on stout piers, behind which the luminous depth of the sky appears. To the piers that constitute the first plane of the painted composition are attached the fluted Corinthian columns of the frame supporting the entablature and tympanum of the temple. Thus three-dimensional and pictorial elements are joined in a perspective unity; the architectural structures in relief connect the imaginary space of the painting with real space, thus emphasizing the illusion of depth. In this altarpiece Mantegna fully developed his "archaeological mysticism," which recomposed in Humanistic terms the scattered fragments of the classical world, creating a hallucinatory intellectualized reality. The relation between figures and architecture is precisely measured around the central axis of the Madonna's throne, and the varied placement of the figures in relation to the picture plane, emphasized by strong chromatic contrasts, seems to enlarge and articulate the interior space of the edifice. The near perfection

of this masterpiece is sustained by a dramatic stylistic tension derived from vividness of form and a radical approach to modeling that gives the picture surface a lapidary hardness. This quality may be seen particularly in the severity of the composition within the classical temple, but it is also apparent in the three compartments of the predella, which represent the Crucifixion (PL. 323), the Agony in the Garden, and the Resurrection (the two last, Tours, Mus. B.A.). In the first two, which are among Mantegna's most intensely poetic expressions, this violence of style becomes almost inhuman, especially in the tragic immobility of the Crucifixion, where the figures, as if turned to stone by a sudden cataclysm, rise like archaeological remains of a blasted world within a landscape of jagged rocks. The desolation is rendered even more acute by the light that flickers over the empty city on the hill and models the bodies of the crucified, cruelly exposing the most minute details.

The almost unfailingly high quality of Mantegna's pictorial style from this time on precludes a precise chronological arrangement of his numerous undated works. It seems certain, however, that the *St. Sebastian* (Vienna, Kunsthist. Mus.) belongs to the Padua period and was probably painted during the same years as the *S. Zeno Altarpiece*, since the highly sculptural idiom of these two works is identical. *St. Sebastian* was perhaps that small work to which the podesta of Padua, Jacopo Antonio Marcello, referred in his letter to Ludovico Gonzaga of March, 1459, asking that Mantegna be permitted to delay his departure for Mantua by some days, so that he might finish a painting. In January of 1457 Mantegna had agreed to enter the service of the Gonzaga family, but his obligations for the *S. Zeno Altarpiece* and other works had forced him several times to postpone his departure for Mantua. It was not until 1460 that he was finally permanently established there. However, in the second half of 1459 he may have made a brief visit to Mantua to give directions for the architecture of the chapel of the Castello di S. Giorgio, the decoration of which was the first large work commissioned from him by Ludovico Gonzaga. In the years between the completion of the *S. Zeno Altarpiece* and the decoration of the chapel, Mantegna painted a number of small pictures of great intensity, including *The Agony in the Garden* (London, Nat. Gall.), *The Adoration of the Shepherds* (New York, Met. Mus.), *Madonna and Child* (Milan, Mus. Poldi Pezzoli), *Madonna and Child* (Bergamo, Acc. Carrara), *Madonna and Sleeping Child* (Berlin, Staat. Mus.), and the portraits of Cardinal Mezzarota (Berlin, Staat. Mus.) and Cardinal Francesco Gonzaga (XI, PL. 217). The style of these works is characterized by strong chromatic relationships and bold modeling in an incisive, almost Flemish draftsmanship.

The most important work of Mantegna's first years in Mantua was the decoration (now lost) of the chapel of the Castello di S. Giorgio. Some scanty information regarding this decoration is contained in a letter of June, 1458, in which Ludovico asks the artist to come to Mantua to discuss the architecture of the chapel, and in a letter from Mantegna to Ludovico of 1464, stating that the pictures for the "chapeleta" could not be put in place because the gilding of the frames was not yet finished. Thus the decoration of the chapel must have consisted of small panel paintings and not frescoes or large-scale works (as Tietze-Conrat thought). This is also confirmed by Vasari, who, in 1565, referred to the existence in the chapel of a small picture or altarpiece (*tavoletta*) with scenes that were "not very large, but most beautiful." Possibly the decoration took the form of an architectural structure of gilded wood — that contained the painted panels — a structure that would represent an intermediary phase between the compositional ideas of the *S. Zeno Altarpiece* and those later developed in the Camera degli Sposi. Nothing is known about the disappearance of these pictures, which, in 1492, were mentioned by Giovanni Francesco II Gonzaga as among Mantegna's most admirable pictorial accomplishments. It is possible that the loss of the panels and the destruction of the chapel took place in the 16th century, when the interior of the castle was radically transformed by Giulio Romano and his followers.

Some of Mantegna's extant panel pictures — such as the so-called "Triptych" in the Uffizi (consisting of a curved center panel, *The Adoration of the Magi*, flanked by two rectangular panels, *The Ascension* and *The Circumcision*) and *The Death of the Virgin* (PL. 326) — may, however, have come from this chapel. The identical dimensions of the panels of *The Ascension*, *The Circumcision*, and *The Death of the Virgin*, and the curved form of the panel of *The Adoration of the Magi* suggest, in fact, that these formed part of a single decorative complex composed of episodes from the life of Christ and the Virgin and of subjects taken from the Gospels. It is interesting to note, in this connection, the dates of the earliest historical information referring to the panels in the Uffizi and that in the Prado: in 1587, the "Triptych" of the Uffizi was indicated as belonging to Don Antonio de' Medici, while *The Death of the Virgin* was recorded in the list of paintings restored between 1586 and 1588 by Sebastiano Filippi in the chapel of the ducal palace of Ferrara. Thus, this might be the period when any pictures still in the chapel of the Castello of Mantua were quietly dispersed. The three panels of the Uffizi were joined to form a triptych in 1827. It is evident that Mantegna did not intend the present juxtaposition of *The Ascension* and *The Circumcision* with *The Adoration of the Magi*, since there is no direct connection between the figural elements and the perspective structures of the three compositions. Furthermore, as Tietze-Conrat has pointed out, *The Ascension* and *The Adoration of the Magi* seem some years earlier than *The Circumcision*. On the basis of the stylistic data yielded by these works, it could be maintained that the decoration of the chapel was begun about 1460 with *The Nativity*, which would have been very close in style to the *S. Zeno Altarpiece*, and that it was finished, after Mantegna's Florentine sojourn, with *The Circumcision* and other scenes having a related architectural motif, for example, representations of Christ among the doctors, or Christ and the woman of Samaria, both cited among the lost works of Mantegna. Longhi, who has felicitously reunited the Prado *Death of the Virgin* with its missing upper fragment (representing Christ carrying the soul of the Virgin to heaven), which he discovered in the Vendeghini Collection in Ferrara, thought that this panel had once been part of the triptych and that it had subsequently been replaced by *The Circumcision* (which has the same dimensions) either for iconographic reasons or because the lighting came from the wrong direction. This hypothesis, however, is not only iconographically incongruous but is contradicted by the lack of compositional unity among the three paintings.

In the decade between 1460 and 1470, the period of Mantegna's finest small-scale works, often characterized by an unexpected lyric abandon and an unusual serenity, should be placed some pictures that, like *The Circumcision* of the Uffizi, emerged from a vivid renewal of Mantegna's experiences with Tuscan art during his trips to Florence and Pisa in 1466–67. *The Presentation in the Temple* (PL. 321), generally considered a Paduan work of about 1454 (but recognized in 1937 by Fiocco and C. Gamba as belonging to the first decade of Mantegna's activity in Mantua) is perhaps one of the first of Mantegna's pictures to be executed in the new spiritual climate of classic serenity inspired by his contact with great Tuscan masters, whom he met now on equal terms and even with the proud awareness of his own greater modernity. Without losing its incisive strength, his style became broader and simpler. There was more stress on functional compositional relations, as in the lyric meter of the figures in the Berlin *Presentation*. An even more intense lyricism is found in the later *St. George* (Venice, Accademia), one of the most fascinating of Mantegna's works, in which the serene Apollonian beauty of the saint, softened by the gentle luminous tones of the landscape, embodies the artist's most ecstatic and romantic vision of his classical ideal. The compositional relation between the figures of the Berlin *Presentation* and those of the Venice *St. George* and the painted marble frames surrounding them may be the result of Mantegna's study of Castagno's frescoes in the Cenacolo di S. Apollonia (I, PL. 238, 240, 242–44) and in the Villa Pandolfini in Soffiano (I, PL. 245; XII, PL. 27), which are firmly

installed within the architectural rhythm of rectangular classical niches.

Also to this period may belong *The Virgin of the Quarries* (Uffizi), although Vasari says that it was painted in Rome about 1489. This painting, almost miniature in size, nevertheless conveys an effect of monumentality because of the relation between the luminous void of the sky and the heaviness of the Virgin and Child, who seem carved from the rocks of the background. Another work of these years, possibly painted in Florence in 1466, is the noble portrait of Carlo de' Medici (Uffizi), one of the first expressions of the spiritual depth that Mantegna's style took on in the portraits of the Camera degli Sposi (PL. 328). This great pictorial cycle is heralded in the *St. Sebastian*, formerly in Notre-Dame, Aigueperse (Louvre, PL. 325), where it must have been taken in 1481 by Chiara Gonzaga when she married Gilbert de Bourbon, Count of Mentpensier. The painting has often been thought to date from the Padua period, but the profound compassion of St. Sebastian's expression and the accord established among the elements of the composition — the body of the saint, the column to which he is bound, and the landscape — seem closer to the narrative power that Mantegna attained later, in the Camera degli Sposi. The early *St. Sebastian* (Vienna, Kunsthist. Mus.), like a chained Prometheus in its exaggerated statuary hardness and angular form, is quite different from the *St. Sebastian* in the Louvre, with its broad bodily articulation and the softer, more vibrant chiaroscuro that creates an almost elegaic quality.

The decoration of the Camera degli Sposi (PLS. 328, 329) in the Palazzo Ducale of Mantua was finished in 1474, according to the date of Mantegna's inscription in which he dedicated this masterpiece of his maturity to Ludovico Gonzaga and his wife, Barbara of Brandenburg. It is not known for certain, however, when he began the work. Some historians believe that it was executed in the extremely brief time of little more than a year. Others believe that it required nearly a decade, because the date 1465 is scratched into the embrasure of a window and supposedly indicates the beginning of the decoration. However, this cycle could not have been done before Mantegna's Tuscan trips of 1466–67, and it is probable that it was executed between 1471 and 1474. A letter written by Ludovico in October, 1471, indicates that Mantegna was already working on this room, which Carlo Ridolfi, accepting a provocative traditional name, called the "Camera degli Sposi," but which is referred to in the old documents as the "Camera picta." In the paintings here Mantegna returned to the compositional theme set forth in the *S. Zeno Altarpiece*, which he must have developed further in the chapel of the Castello di S. Giorgio. Now, however, after direct study of the great Tuscan pictorial cycles, particularly those of Andrea del Castagno and Piero della Francesca, Mantegna's perspective became more dynamic, and all distinction between real and pictorial space was discarded. The perspective orthogonals of all the paintings on the walls of the room are made to converge upon a single point, thus placing the spectator within the unified space formed by these perspective projections. The real architectural space is a square room covered with a coved vault that springs from the walls and is articulated by three lunettes on each side of the room. Two corner windows illuminate two adjacent walls with beams of light, while the opposite two remain in shadow. The finely worked architraves over the two doors, the classical frieze on the mantel, and the corbel brackets on which the vault rests complete the architectural features. The functional connection with the pictorial decoration indicates the explicit instructions furnished by Mantegna as to the kind of structure and plastic elements he required. The artist imagined a pavilion supported by piers joined together in the vault, with three arches on each side. The pavilion was closed on two sides (the shadowed walls) by curtains of gilded leather and open on the other two (the illuminated walls, on which the principal narrative episodes appear) to the free-flowing space of an airy landscape and to a courtyard paved with fine marbles. The surface of the coved vault of the room is transformed by pictorial illusion into a hemispherical calotte. Against its gold ground stand out in clear illusionistic relief the simultated stucco decoration, ribs, portraits of the Caesars upheld by putti, and scenes with Hercules, Orpheus, Arion, and Periander. From the center of the vault light seems to pour into the interior from a painted oculus, around which drastically foreshortened ladies and putti appear against the luminous background of the sky (PL. 329). The architectural, sculptural, and pictorial elements of the composition form graduated perspective areas, with unexpected passages that give to the space an extraordinary viability and to the persons represented on the walls the tangibility of living beings within the environment of the spectator himself. The two scenes on the main walls, one depicting the Gonzaga family and the other the return of Cardinal Francesco to his family, seem to stand out in bold relief; in view of their representational power, the controversy over their precise meaning in terms of Renaissance court life seems trivial. The portraits of the personages, revealed by Mantegna's incisive vision in their naked human essence, create a flow of internal narrative.

There is little information regarding the artist's activities in the years 1474–85, between the completion of the Camera degli Sposi and the beginning of the pictorial cycle *The Triumph of Caesar*. However, at the end of this decade may be placed the lively and highly sculptural composition *The Madonna and Child with Cherubim* (Milan, Brera). These were certainly difficult years for Mantegna, for during them occurred the death of his favorite son and, one after another, of the nobles who esteemed him and protected him from the enemies made by his difficult personality. The grave moral and material distress of these years led Mantegna to contemplate moving to Florence under the patronage of Lorenzo the Magnificent, who had visited his studio and of whom he was forced to ask financial aid in 1484. These plans, however, were discarded, for with the accession of young Francesco II in 1484 the Gonzaga patronage was revived.

The nine great canvases of *The Triumph of Caesar* (XII, PL. 32), preserved at Hampton Court, were the first fruits of this patronage. Mantegna must have meditated at length on this subject, which was inspired by literary sources, particularly the *De re militari* of Valturius (Verona, 1472). The misfortunes of the Gonzaga family, however, had not permitted him to apply himself to it before 1485. By August of 1486 some parts had already been painted, but the series was not finished before 1492. The episodes of *The Triumph of Caesar*, which present a turbulent succession of trumpeters, bearers of emblems, carriers of booty, sacrificial oxen, elephants, armor bearers, prisoners, musicians, and the triumphal chariot of Caesar, were conceived as a continuous pictorial decoration, seen from below through an architectural structure of piers placed between one canvas and the next. Thus the compositional scheme of the Camera degli Sposi was developed into a dramatic movement through the flow of the triumphal procession, with a unity of form and content that was maintained in the nine canvases without interruption. The strong color (now unfortunately greatly altered) that set the figures in vivid three-dimensional clarity against an extensive landscape, the stately rhythm, and the heroic severity of this great composition combine to produce the most exalted Humanistic expression of Mantegna's art. In spite of the damage these canvases have undergone from the 18th century on, the evocative power of Mantegna's idiom still remains so vivid that one can well understand the great impression the work made on his contemporaries.

From 1488 to 1490 Mantegna must have interrupted work on the *Triumph* to journey to Rome, where he had been called by Innocent VIII to decorate the Pope's private chapel in the Belvedere (destroyed 1780). This little chapel, preceded by a small sacristy painted with cupboards and trompe l'oeil objects, was, according to an early detailed description, extraordinarily rich in figural decoration. Its dome was divided by a latticework of vegetation seen against the luminous background of the sky. This arboreal motif, of which Mantegna's funerary chapel in the Church of S. Andrea in Mantua is a pale reflection, was developed further in the arbor of the *Madonna della Vittoria* (Louvre), which was ordered by Marchese Fran-

cesco in 1496 to commemorate the Battle of Fornovo. The heroic figural conception of this *Madonna*, the most important altarpiece of the period, is still that of the *Triumph*, but the relation of the latticework to the pearly tones of the sky (a motif later employed by Correggio in the Camera di S. Paolo in Parma; III, PL. 465) reveals in Mantegna's style a new emphasis, tending toward the tonalism of 16th-century painting. The free disposition of the figures, in a space no longer restricted by the severity of geometric perspective, as well as the volume of the forms and the brilliant glaze of the color, are characteristics of the late style of Mantegna that recur, differently developed but with a similar tonality, in other religious canvases: *The Madonna and Child with Saints and Angels*, painted in 1497 for the Church of S. Maria in Organo in Verona (Milan, Castello Sforzesco); *The Holy Family* (Dresden, Gemäldegal.); and *The Madonna and Child with SS. John the Baptist and Mary Magdalene* and *The Holy Family with St. John* (both London, Nat. Gall.). However, the subjects in which the artist fully expressed the tragic sense of life that emerged from the depths of his experience in this period were those of the *Christ Seated on a Sarcophagus* (Copenhagen, Statens Mus. for Kunst), the *St. Sebastian* of the Ca d'Oro in Venice (PL. 325; IV, PL. 403), and the *Dead Christ* of the Brera (PL. 321). In these works of the last decade of the century Mantegna reached the ultimate development of the original elements of his poetic idiom. The heroic tone of the *Triumph* becomes in the Copenhagen *Christ Seated on a Sarcophagus* an almost Ferrarese hardness of expression; here Mantegna's native sculptural force appears again in full vigor, and the subject is rendered still more pathetic by the livid landscape and by the static balance of the composition. The inspiration of the *St. Sebastian* of the Ca d'Oro is similar. There the theme of pain without respite is developed to its tragic extreme in the contrast between the internal energy manifested by the strained volumes and tortured outlines of the titanic figure and the inexorable geometric rigidity of the restricted architectural space, within which the saint is pierced by arrows crossing the picture plane from all directions.

The dating of the Brera *Dead Christ* is disputed. According to some scholars (Tietze-Conrat, 1955), the invention of this boldly foreshortened composition may date from the early Paduan period (and the *Dead Christ* of the Brera would thus be a late replica), or it may be related to Mantegna's experiments after seeing the works of Andrea del Castagno during his Florentine trip of 1466. On the other hand, a much later and final contact with Castagno is evident in such late works of Mantegna as the Copenhagen *Christ* and the *St. Sebastian* in the Ca d'Oro; and the tragic distortion of the Brera *Dead Christ* — even if it was inspired by Castagno's lost fresco of the Death of the Virgin for S. Egidio in Florence — is more likely a reflection of that sense of stark and absolute truth common to the late works of Mantegna.

In the last years of his life Mantegna painted for the *studiolo* of Isabella d'Este two mythological canvases: the so-called "Parnassus" (1497; PL. 327; X, PL. 249), which really represents, according to an inventory of 1547, "Mars and Venus amusing themselves with a Vulcan and an Orpheus playing, and nine nymphs dancing"; and *Minerva Expelling the Vices from the Garden of Virtue* (1502; PL. 327; III, PL. 211). A third canvas, with the legend of the god Comus (Louvre), was unfinished when the artist died on Sept. 13, 1506, and was completed by Lorenzo Costa. In treating these mythological tales, dictated by the fashionable Humanistic culture of the court of Isabella d'Este, Mantegna achieved a fluency of formal expression and a subtle range of color relationships that were fundamental for the development of 16th-century classicism. If he had satirical intentions toward this world of theatrical artifice, they were diffused in the Pandean spirit of landscape, which is the true subject of these pictures.

The great monochrome *Scipio Receiving Cybele* (London, Nat. Gall.; I, PL. 307), which represents the introduction of the cult of Cybele in Rome, was ordered from Mantegna by the Venetian Francesco Cornaro in 1504. This canvas, which on the master's death remained in the possession of his son Francesco, sums up in its sculptural rhythm, inspired by antique reliefs, the ultimate development of Mantegna's classicism, upon which Giulio Romano and his pupils were to draw extensively. Other monochromes on canvas of this period (conceived as simulated bas-reliefs), in which sculptural figures are usually seen against a background plane of colored marble, represent episodes from the Old Testament and must have been intended as decoration for a specific location. Among these small pictures, the uneven quality of which indicates the participation of studio assistants, are *Samson and Delilah* (PL. 330), *The Sacrifice of Abraham* and *David with the Head of Goliath* (Vienna, Kunsthist. Mus.), *The Judgment of Solomon* (Louvre), a *Judith* in Dublin (Nat. Gall. of Ireland) and another in Montreal (Mus. of Fine Arts), and *Esther and Mordecai* (Cincinnati, Art Mus.). The London *Samson and Delilah* is of particular interest, for its highly refined style is similar in its Humanistic tone and its high quality to that of the "Parnassus." Mantegna treated the Judith theme several times — for instance, in a painting which he probably presented in 1484 to Lorenzo the Magnificent, among whose effects it figured in 1492, and which some historians identify with the little picture in the National Gallery in Washington, D.C. A very beautiful drawing of Judith (1491; Uffizi) reflects a subsequent development of this theme and is considered one of Mantegna's greatest graphic expressions.

The sculptural emphasis of Mantegna's style is directly and forcefully manifested in the exceptional graphic power of his stroke, which gives a clear and sharp relief to his unfortunately rare drawings and to the famous engravings of religious and mythological subjects that became widely known in his time (IV, PL. 424; VII, PL. 379; see ENGRAVINGS AND OTHER PRINT MEDIA).

MANUHAR. Indian miniaturist to the court of the Moghul sovereigns, active in the late 16th and the first half of the 17th century. Although he was not included in the list of court artists compiled by Abū'l-Faḍl 'Allāmī, the prime minister of Akbar the Great, Manuhar left many drawings and paintings, which once belonged to the great collections of the palaces of Agra and Delhi and have since been divided among various museums and private collections. His work was done primarily between 1581 and 1620, during the reigns of Akbar, Jahāngīr, and Shah Jahān. An examination of the signed works, as well as those which can almost certainly be attributed to Manuhar, reveals a multiplicity of interests and modes of expression. The greater part of his works are portraits of emperors or courtiers, nocturnal scenes of a fanciful nature, or animal studies. In all of these, the quality of the draftsmanship is exceptional, the details precisely rendered, the colors vivid and brilliant, and the arabesques in the backgrounds or borders extremely fine and often gilded.

His most beautiful portrait subjects include: Akbar, receiving guests in a splendid palace setting; Jahāngīr, holding an antelope by a leash while one of his servants leads a black buck (Br. Mus.); Prince Khurram, the future Shah Jahān, receiving orders from his father, Jahāngīr, in the presence of other dignitaries; and Amīr Mīrzā Gazi Beg, holding a flower in his right hand. The details, especially of the costumes are always scrupulously accurate; for example, in a miniature depicting the Ilkhan sovereign Hūlāgū, a historical figure included among various persons of the court of Jahāngīr, the artist has taken care to dress the Moghul courtiers in the regional garb of the time, while Hūlāgū wears Mongol attire.

At the school of the court of Jahāngīr, in whose service he worked for a lengthy period, even though his name is not among those cited in the memoirs of the emperor, Manuhar and the painter al-Manṣūr were specifically charged with executing studies of animals. The animals, however, were to be represented as court ornaments, not as beasts roaming in their native environment. The conventional limitations imposed upon the artists notwithstanding, the bird studies of Manuhar and al-Manṣūr are excellent examples of careful scientific observation allied with a superb elegance of form. Among animal subjects, Manuhar seems to favor the deer, which recurs very often in his miniatures. A handsome black buck appears in a portrait of Jahāngīr, and two splendid studies of a black buck are preserved in the British Museum and in the Wantage Collection of the Victoria and Albert Museum.

Another recurring theme in the works of Moghul painters is the night scene. A fine example of Manuhar's work in this genre, representing a fairy garden with a prince visited at night by winged genii, was probably painted about 1595 (PL. 331). The delicate gold border designs of this miniature accentuate the dark tones of the garden and of the figures, whose faces are drawn with great finesse and subtlety.

A Manuhar portrait of a bearded man (Louvre) shows clear European influence. The standing figure, treated in a

three-quarter view, holds a book. He is dressed in a long garment, fastened by a row of small buttons, and has a belt around his waist; an ample cape and large hat complete the costume, which is certainly not an Oriental fashion. Stchoukine's suggestion (1929) that this might be a Portuguese missionary seems plausible, since the presence of European Jesuits, and especially Portuguese, at the Moghul court has been documented (cf. X, PL. 121). Moreover, in another miniature depicting Jahāngīr surrounded by courtiers, there appears a figure very similar to the one in Manuhar's portrait.

Maclagan (1932) has pointed out that many European paintings were imported into India and copied by the court artists of Akbar and Jahāngīr, under the guidance of Jesuit fathers who made certain that the originals were reproduced faithfully, especially the religious subjects. In this way Indian artists learned chiaroscuro and Western perspective, and among all the painters of the era, it was undoubtedly Manuhar who benefited most from the lessons. He mastered the new techniques to such a degree as to create some works in which the only Oriental element remaining was the subject. Two of his drawings in the Gulistan Museum, Teheran, furnish examples of this style. The first is a pastiche depicting a woman playing a lyre, surrounded by maidens and sheltered by an elaborate structure. Here the theme of the "concert in the garden" so frequent in Indian miniatures has clearly been adapted to a European interior. The maidens' costumes are in the style of the 16th century, and their hair is arranged according to the Western fashion of the period. The second drawing depicts Laylā visiting Majnūn in the desert, and the female figures are similar to the maidens in the other drawing. Majnūn has been reinterpreted along the lines of the European motif of the dance of death. A miniature portrait of Jahāngīr (Dublin, Chester Beatty Lib.) attributed by critics to Manuhar seems to reveal a Dutch influence.

The finest works of Manuhar are undoubtedly the scenes of palace life crowded with figures, each of them clearly distinguishable, the great audiences of the sovereigns, the delicate drawings of gardens in bloom, and the magnificent studies of animals, in which turquoise, blue-green, and bright red are mingled or contrasted with gold backgrounds and blue-gray margins with elegance and incomparable grace.

MANUSCRIPT ILLUMINATION. See MINIATURES AND ILLUMINATION.

MARC, FRANZ. German painter and graphic artist (b. Munich, Feb. 8, 1880; d. near Verdun, Mar. 4, 1916). A leading member and the cofounder (with Kandinsky) of the Blaue Reiter branch of expressionism (q.v.), Marc began to practice his art about 1900 as an academically influenced painter of naturalistic landscapes and portraits. Soon he was influenced by the decorative qualities of Jugendstil as well. By 1903 he had visited Paris and had made a few impressionist sketches and evidenced his awareness of modern color possibilities; his abiding interest in Oriental philosophy and religious ideas also began to emerge. His first animal drawings appeared in 1905, marking the beginning of his efforts to relate all animal (and human) figures to Nature in a broad pantheistic sense. An increasing emphasis on rhythmic effects, the influence of Jugendstil art, was frequently accompanied by the use of large areas of decorative and symbolic color — the symbolic intent related to the postimpressionism of Van Gogh and Gauguin. To achieve these new ends, color became less naturalistic, more generalized in application, and subjective in choice, always accompanied by flowing linear patterns.

In 1909 he came into contact with a Russian emigré group of nonrepresentational artists living in Munich (including Jawlensky and Werefkin), participants in the recently established Neue Künstlervereinigung (New Artists' Federation). At this time his friendship with Heinrich Campendonk and August Macke also developed. About 1910 he had his first one-man show, and then encountered Kandinsky. The hostile reaction of the newspapers to the second Federation exhibit (1910) persuaded Marc to join the struggle actively in defense of modern art. By 1911 it was quite clear that he had arrived at a personal and mature form of expression, characterized by the already mentioned nonnaturalistic line and nondescriptive (that is, symbolic) color: thus the red, yellow, or blue horses and other animals are expressly emotive, their generous billowing outlines rhythmically and symbolically related to the backgrounds that represent Nature itself. Although continuing the Gauguin-Fauve-Brücke concern with living beings and their relation to Nature, he substituted animals for humans; moreover, he sought to convey a variety of emotions and philosophical ideas through his choice of animals. Thus, in the *Blue Horse* (1911; Berlin, B. Koehler Coll.) a young animal is painted in blue and white, with deep blue shadows — the colors symbolizing belief and infinity, a mood appropriate to this youthful creature. The *Yellow Cow* (1911; Hofheim, Vom Rath Coll.) presents a more joyous note of affirmation, stemming from the new-found happiness of the painter's marriage. Whatever the animal or idea chosen, man no longer played any role in Marc's art. During 1912 he moved toward a more blocklike, geometric formulation under the influence of the facet cubism of Picasso and Braque (V, PL. 209); but the vivid color range was peculiarly his own.

In 1912 there appeared the one and only number of *Der Blaue Reiter*, jointly edited by Marc and Kandinsky, in which Marc set forth his anti-impressionist views. From December, 1911, to January, 1912, the great Blaue Reiter group show was presented; it has since come to be judged an important influence in the history of modern art. In 1912 Marc's visit to Paris, where he met Delaunay, prepared the way for his progression from facet cubism toward analytical cubism. Since this new method involved fragmentation of the various forms, Marc was able to effect a more complete union of his creatures with Nature by literally dissolving them into their backgrounds, yet always retaining his own lambent and symbolic color, such as in the *Deer in the Forest* (V, PL. 127). In 1914 he began to work in an abstract, almost nonobjective, vein of lyricism, in an apparent search for elemental organic forms symbolizing the genesis of all life. This new turn in his art was cut short when Marc, who had enlisted at the outbreak of war, was killed in action on March 4, 1916.

Bernard S. MYERS

MARIN, JOHN. American painter (b. Rutherford, N.J., Dec. 23, 1870; d. Cape Split, Maine, Oct. 1, 1953). Marin's early training was architectural, with one year at Stevens Institute of Technology, Hoboken, and four years as an architectural draftsman. At the age of twenty-nine he began serious study of art at the Pennsylvania Academy of the Fine Arts, Philadelphia (1899–1901), and went on to the Art Students League, New York (1901–03). He was in Paris during most of the period from 1905 to 1911. This European sojourn was important, though Marin remained curiously unaware of many of the significant contemporary European developments and

did not even come in contact with the works of Cézanne until his return to the United States. An oil, *The Mills of Meaux*, was purchased by the Musée du Luxembourg of Paris in 1908. Also in 1908, he exhibited in the Salon d'Automne in Paris, and in 1909 at the Salon des Indépendants.

In Paris, during 1909, Marin met Alfred Stieglitz, who from 1909 held annual exhibitions of Marin's work in New York and proclaimed him the greatest American water-colorist. After Marin's return to the United States, he lived in Cliffside, New Jersey, and passed his summers in New England and, less frequently, in Taos and Santa Fe, New Mexico.

Marin's early etchings on architectural subjects, influenced by Whistler, were sensitive and exacting. As early as 1908 his water colors suggested some relationship with the postimpressionists, but Marin seems to have developed independently in this direction. On his return from Europe he soon established the boundaries of his artistic world: the pulsing movement and vitality of New York City and the wind-swept energy of the Maine coast. His buildings turn and topple with uneasy life, as full of angular movement as his figures, qualities exemplified in *Movement — Fifth Avenue* (1912; Chicago, Art Inst.). His method was one of immediate visual contact, and he developed an absolute mastery of the transparent water color and a peculiarly effective kind of symbolic pictorial shorthand. A favorite compositional device plays circular and rectangular rhythms against each other; while often the angular boundaries start a kind of chain reaction, they never seem to be limiting factors. The works are large in their suggestive power though small in actual scale, such as the *Maine Islands* (1922; Washington, D.C., Phillips Coll.). Marin also found stimulating motifs in circus activities and Indian scenes of the Southwest.

In the 1930s Marin returned to the oil medium. Most of these works were also seascapes, in which he realized the tumultuous movement of great masses of water, the tossing lightness of sailboats, and the changing character of clouds. Often a kind of jagged tracery was superimposed on the paintings, as in *Movement — Boat and Sea in Grey* (1952; New York, Joseph H. Hirshhorn Coll.). A curiously personal feature of the late paintings is their carved and colored frames, designed and executed by the artist. Marin's art remained independent and essentially original. Though he reflected many of the preoccupations of the abstract trend, a strong involvement with the specific visual experience was clearly manifest in all his work (I, PL. 118).

Allen S. WELLER

MARINI, MARINO. Italian sculptor (b. Pistoia, Feb. 27, 1901). Trained at the Accademia di Belle Arti in Florence, Marino Marini worked at painting and etching until about 1928, when sculpture became his main interest. From 1929 to 1940 Marini taught at the Villa Reale art school in Monza, then at the Accademia di Belle Arti in Milan. He visited and lived in Paris for long periods, and during World War II he moved to Switzerland. Although he has traveled widely in later years, Milan remains his home. From 1935 onward, Marini began to receive recognition and awards, and since 1946 he has achieved international fame.

With few exceptions, Marini has always worked in clay, with the finished form in terra cotta or bronze. From the beginning his sculpture has been in the great tradition of Rodin and Medardo Rosso — the tradition of impressionistic realism, with its attention to animated pose, textured surface, and the effects of light and shadow on the modeled form. Early in his career, following strong 20th-century trends of classic revival (Maillol, for instance) and toward the archaic and primitive, Marini began to develop a figural style of rounded volume, as in classical torsos, but with rough, broken surfaces.

His early figures, such as the *Juggler* (1933), often have blank facial expressions and an aura of loneliness. Marini seems to have derived the stark, dispassionate quality of his work from Etruscan terra-cotta tomb figures and, perhaps, from certain Roman portrait heads and steles. The double figure group *People* (1929) is clearly inspired by an Etruscan sarcophagus, and the portrait of the sculptor Melotti (1937) is reminiscent of Roman republican sculpture. The *Horseman* (1936), a full-scale representation of a horse and rider, is handled with a remarkable combination of ingenuous naturalism and hieratic rigidity that evokes the magic of a primitive idol. *Pugilist* (1935), a seated nude with head thrown back and one arm crooked over an invisible rope, is an early example of Marini's interest in the dynamic and often contorted pose, which appears in so many of his later male figures, particularly the *Horse and Rider* (V, PL. 143). This subject, for which the sculptor is best known, is treated in a series of works of varying sizes from about a foot high to nearly life size.

His female nudes are usually less distorted, with bodies reminiscent of the Maillol prototype, but generally shorter and plumper and with rough, sketchy texture. In fact, the surface of nearly all Marini's bronzes is subjected to special treatment, making it quite different from the usual patina of bronze. The metal, rough and irregular, shows file marks and grid patterns apparently introduced into the mold deliberately. Fragments of white plaster remain in the incisions, and occasionally there are touches of gold, so that the work has a polychromatic effect. These qualities of texture and color suggest his early interest in painting. His later portraits are powerfully expressive and often distorted, qualities exemplified in the portrait of Stravinsky (1950) and, especially, the head of Curt Valentin (1954).

Henry R. HOPE

MARTINI, SIMONE. Italian painter (b. Siena, ca. 1284; d. Avignon, July, 1344), son of a certain Martino. His earliest known work is identified by his signature and the date 1315, in his hand, on the great fresco of the *Maestà* (or *Majestas*) in the Palazzo Pubblico in Siena. Probably because of the immediate prestige this fresco procured for Simone, he was shortly afterward summoned to the Angevin court of Naples, where he must have created works of exceptional value, since the king, Robert of Anjou, knighted him and awarded him an annual stipend of 50 ounces of gold, according to a documented receipt dated July 23, 1317. To this period is attributed the signed altarpiece showing St. Louis of Toulouse crowning King Robert (PL. 336; originally in the Church of S. Chiara in Naples, now in the Mus. di Capodimonte), painted about 1317, the year of the canonization of St. Louis.

Simone's stay in Naples probably lasted until he moved to Pisa, where in 1319 he executed, along with other works now lost, the large signed polyptych for the Dominican church of S. Caterina. In Orvieto the following year, again for the Dominicans, Simone painted the polyptych, signed and dated 1320, commissioned by the bishop of Soana, Trasmondo Monaldeschi; five panels of the work are conserved in the Museo dell'Opera del Duomo in Orvieto. In 1321–22 the artist worked in Siena on the restoration of portions of the *Maestà* that had been damaged and painted other works, now lost, including a Madonna for the chapel in the Palazzo Pubblico (1321), some unspecified paintings for the same chapel and for the Loggia of the Palazzo Pubblico (1322), and a St. Christopher with the coat of arms of the podesta in the Biccherna (1322). In 1324 Simone married Giovanna, the daughter of the painter Memmo di Filippuccio and sister of his collaborator, Lippo Memmi.

No dates have been recorded for Simone's sojourn in Assisi, during which he created the frescoes in S. Francesco, or for the stay in Florence noted by Vasari, but many documents give details of his work in Siena before his departure for Avignon, about 1340. They testify to an unspecified painting of 1325 in the Palazzo del Capitano del Popolo; a standard for the

Duke of Calabria in 1326; some work with gilded lilies and lions in 1327; two angels for the chapel altar in the Palazzo Pubblico in 1329; the figure of Marcus Atilius Regulus for the Sala del Concistoro of the Palazzo Pubblico in 1330; the pedestal of a cross for the Consiglio dei Nove in 1332; and a Virgin Enthroned with the Saviour and angels (1335), on the façade of a house — all lost works. The surviving paintings from this period are the fresco of the *condottiere* Guidoriccio da Fogliano (PL. 334), on the wall facing the *Maestà* in the chapel of the Palazzo Pubblico of Siena, executed in 1328; and *The Annunciation* (Uffizi), painted in 1333 in collaboration with Lippo Memmi (the two saints of the side panels are Lippo's) for the Cathedral of Siena.

What little information exists regarding Simone's activity after 1335 refers to his stay in Avignon, the dates of which are generally given as 1339–44. However, the beginning of the period at Avignon cannot be earlier than the end of 1340, inasmuch as two documents published by André Péter (1939), dated May 27, 1340, and Oct. 24, 1340, show that in October of 1340 Simone had not yet left Siena. During his stay in Avignon Simone maintained a close friendship with Petrarch, for whom he executed a miniature with a portrait (now lost) of Laura and the frontispiece of Petrarch's Vergil, (PL. 337), now in the Biblioteca Ambrosiana, Milan. His last surviving signed and dated work is the *Holy Family* (1342) now in the Walker Art Gallery, Liverpool.

Nothing is known of Simone's work during the first thirty years of his life, that is, prior to the *Maestà* in the Palazzo Pubblico of Siena (1315; PL. 332). It is probable that he worked in Siena from the first years of the 14th century, and that he received his early training in the studio of Duccio di Buoninsegna, as maintained by George H. Edgell (1946) and Luigi Coletti (1949). Nevertheless, the question has remained unsolved, even though several paintings have been attributed to this period, such as the *Christ Blessing* (Vat. Mus.), *St. John the Evangelist* (New York, Met. Mus.), *SS. Nicholas and Gregory* (Boston, Mus. of Fine Arts), *Christ Blessing* (Naples, Mus. di Capodimonte), *SS. Catherine and Lucy* (Settignano, Berenson Foundation), the *Maestà* in Massa Marittima (Mus. Civ.), and others. In fact, some of these works were not painted by Simone, while those which can more credibly be attributed to him, such as the *Christ Blessing* in the Vatican and the *St. John the Evangelist* in New York, reveal stylistic traits that would make them of a later date than the *Maestà* of 1315, which therefore remains the earliest authenticated work of the artist. Although the traces of Duccio recognizable in it confirm Simone's early Sienese training, it is fundamentally a mature and original work, markedly different from Duccio's masterpiece, which, just a few years earlier, in 1311, the Sienese had accompanied in a solemn procession from the artist's studio to the Cathedral. A new conception of life and of art is expressed by Simone's *Maestà*; the depth of its composition is in sharp contrast with the architectural hierarchy of the sacred personages in Duccio's *Maestà*, placed in one symmetrically balanced plane flanking the central figure of the Madonna. Simone's fresco is conceived, first of all, as a painting within a splendid framework. There is a vivid naturalistic sense of space in the composition of the work, with the figures arranged in perspective, following the lines of the steps and the poles of the canopy, which recede toward the background of the sky. The space suggested by the canopy set against the sky, the disposal of the figures in a circle round the throne, and the modeling of each separate figure combine to form a harmonious whole in which each part contributes to the rhythmic and spatial relationship. These new compositional values, born of a renewed interest in natural phenomena, are indicative of Simone's affinity, from the time of his first masterpiece, with the popular traits of Giotto.

The most important element in the novelty of style in the Siena *Maestà*, however, is clearly the influence of the French Gothic manner, which is not discernible in the work of any other Italian painter of this period. It is possible that Simone's contact with French culture came about through the wide diffusion of illuminations, textiles, goldsmiths' work and ivories, with their refined and worldly expression of beauty. But the influence is so strongly revealed in Simone's *Maestà* that it renders attractive C. Gnudi's hypothesis (1956) of a direct contact with French culture, possibly made during a trip to France during the undocumented period before 1315, for it was during this period that Simone's style reached the unprecedented maturity of expression so fully consummated in the Sienese masterpiece. Conceivably, during the reign of Clement V, Simone may have gone to the papal court at Avignon in the retinue of some high-ranking art-loving prelate, such as one of the Orsini or the Stefaneschi families, with whom he was later connected. This would better explain the total lack of information about the artist in Siena at the time, as well as the strong impression that his new style must have made, inducing the administrators of the city of Siena to commission from him, rather than from Duccio, the *Maestà* for the Palazzo Pubblico. Moreover, the fact that Simone was called to the Francophile court of King Robert of Anjou in Naples, immediately after he had completed the *Maestà*, is a testimony to the modernity and sophistication of this seminal work, one of the most advanced of its period.

About 1317, in the atmosphere of refined culture engendered by the Angevin court, the artist painted the beautiful predella for the *St. Louis of Toulouse Crowning Robert of Anjou King of Naples* (PL. 336). By the knowing application of diverse techniques, Simone imparted silvery refractions to the colors and a subtle fluidity to the line. Unfortunately, the grave damage suffered by the surfaces of both the *Maestà* of Siena and the *St. Louis* of Naples has forever marred the original chromatic splendor that won Simone immediate fame among his contemporaries as the finest colorist of his day.

However, in the polyptych of the *Madonna and Saints*, executed in Pisa in 1319 for the Church of S. Caterina (PL. 335), the purity of Simone's color is displayed in all its splendor, like some molten, fiery substance. The articulation of the figures in space, almost in opposition to the Giottesque modeling, is achieved by differentiation of the delicate surface texture through the use of shadows in complementary tones and intensification of the pigments adjacent to the flowing contours of the figures. The volumes thus become weightless, with iridescent forms like blown glass, absorbed and reflected in the luminous and incorporeal space of the gold background. There is an acute sensitivity and a severe sense of form in the large figures and in the gentle variations of the predella, with its wonderful chromatic embellishment. The exquisite sensitivity of the figures of Mary Magdalene and St. Catherine in the Pisa polyptych also appears in the lovely *Madonna and Child* discovered at Lucignano d'Arbia by Enzo Carli (1958), who dates it about 1321.

Simone's activity at Orvieto probably began with the polyptych executed in 1320 for the Dominican monastery, the five remaining panels of which depict the Madonna and Child and four saints (Orvieto, Museo dell'Opera del Duomo). It is difficult to evaluate accurately this Orvieto period, since collaboration is clearly evident in the paintings attributed to Simone for these years: the polyptych with SS. Michael, Ambrose, and Augustine in the Fitzwilliam Museum, Cambridge, Eng.; the polyptych with the Madonna and four saints in the Isabella Stewart Gardner Museum, Boston; the *Madonna and Child* in the Museo dell'Opera del Duomo, Orvieto; the *St. Catherine*, formerly in the Liechtenstein Gallery, Vienna; the little *Crucifixion* in the Fogg Art Museum, Cambridge, Mass.; and the *Crucifixion* in the Church of the Misericordia in San Casciano, Val di Pesa. In the autograph works of this period the figures have greater weight and volume in relation to the plane in which they are situated, and a greater compactness of volumes, while the line moves with increased firmness and assurance.

All this points to a renewed exposure to the art of Giotto, as may be seen in such works as the polyptych painted in the early 1330s in Florence, the remaining panels of which are the *St. Stephen* (Florence, Fondazione Horne), *Angel of the Annunciation* (Washington D.C., Nat. Gall.), and the *SS. John the Evangelist and Lawrence* (Chaâlis, Mus. Jacquemart-André). Nothing has survived with which to evaluate Simone's Florentine works discussed amply by Vasari: a Madonna with St. Luke and other saints in the Gondi Chapel of S. Maria Novella has been lost; the scenes of the Passion of Christ frescoed in

the chapter house of the Augustinian church of Sto Spirito were destroyed in 1560, according to Vasari; and perhaps the "many fresco works" believed to have been painted by Simone and Lippo Memmi in Sta Croce suffered the same fate. It is highly probable that between 1320 and 1325 the cultural climate of Florence favored a meeting of minds between these two "modern" painters, even though their artistic and moral worlds were as diverse as those of Dante and Petrarch in the contemporary literature.

So far as Simone is concerned, there is no doubt that the spatial structure of the scenes from the life of St. Martin, his greatest and most complex work, constituting the pictorial decoration of the Chapel of St. Martin in the Lower Church of S. Francesco in Assisi, is similar to that in Giotto's frescoes of the Peruzzi and Bardi Chapels in Sta Croce, Florence. For this reason, also, the controversial date of the St. Martin frescoes can be fixed as just subsequent to Giotto's frescoes at Sta Croce (i.e., about 1325–26). The St. Martin frescoes comprise 8 full-length saints on the underside of the entrance arch, the dedication of the chapel on the wall above the entrance arch, 18 busts of saints in the embrasures of three large windows (for which the stained glass was designed by Simone), and 10 episodes from the life of St. Martin, on the two side walls and in the vault. These episodes represent the saint dividing his cloak with the beggar, Christ appearing to St. Martin, the saint armed as a cavalier, St. Martin abandoning his arms (PL. 333), the meditation, the Mass, the saint raising a boy from the dead, the miracle of fire, the death, and the funeral of the saint.

The five busts of SS. Francis, Louis of Toulouse, Elizabeth of Hungary, Clare, and Louis of France, painted by Simone in the transept of S. Francesco, are also stylistically of the same period as the decoration of the Chapel of St. Martin. Apparently belonging to an earlier period is another painting in the transept, the *Madonna and Child between Two Saints*, perhaps executed by Simone upon his return from Naples.

The two last scenes, according to the narrative order of the life of St. Martin, that is, the death and funeral, painted in the vault, were very likely — because of the normal procedure in fresco painting of working from the top toward the bottom — Simone's first works in the chapel. In these frescoes the images are drawn in clearer volumes, set off by the subtle spatial scheme of the lines; the buildings, placed on parallel planes sloping toward the background, give breadth and a sense of perspective; the position of the figures, seen frontally, in profile, and in three-quarter view, the hands painted in perspective, and the roundness of the tonsured heads, all tend to create continuous links in depth among the different planes of the composition. During this period Simone achieved the greatest volumetric emphasis permitted by the intact purity of his planes of color. There is an evident similarity to the broad, careful harmony of style and subtlety of color notable in Giotto's Florentine work of the same years. Simone's modern and receptive spirit could not remain unaffected by the innovations of Giotto, to which he had been attracted since the period of the *Maestà* of Siena and the *St. Louis* of Naples; however, he did challenge Giotto by interpreting his perspective solutions in a completely different manner. Thus, the comparable stratifying of the buildings on parallel planes in Giotto's work sets a solemn tone in the sculptural and spatial unity of the composition, while in Simone's the fluid tapering off of forms toward a distant point leading into the deepest planes creates a serene atmosphere of vision filtered through a poetic memory.

This is the most felicitous period of Simone's art; here, in the decorations of the Chapel of St. Martin, he assumed full command of that cultivated and aristocratic style of up-to-date French traits which had fascinated him since his youthful introduction to the French Gothic. Splendid scenes of an inexhaustible tonal richness, becoming increasingly intense in each succeeding episode, follow one another on these walls, culminating in the ecstatic lyrical concentration of the saint's meditation and the prodigious harmony of the saint armed as a cavalier and the abandoning of arms (PL. 333). In these scenes, the last in temporal and stylistic order, Simone achieved a poetic and human equilibrium of the fundamental tendencies of his spirit: the unfailing regard for formal values; consummate mastery of style; continuing interest in new ways of expression; and, at the same time, a freshness of view, an ever-youthful wonder, that was the source of his abiding gift for pure color and fluid linear grace.

Also attributed to Simone's Assisi period, about 1326, is the small tempera painting of St. Ladislaus, King of Hungary, in the Church of S. Maria della Consolazione at Altomonte (Calabria) — a brief, exquisite lyric, which, in its alternating division of the pictorial passage, suggests the condensed rhythm of a sonnet and achieves the same lofty poetic value as some of the unforgettable images in the Chapel of St. Martin. Closely related stylistically to the *St. Ladislaus* of Altomonte are the two saints, painted on octagonal panels — perhaps part of a predella — in Birmingham (Barber Inst. of Fine Arts) and in Boston (Mus. of Fine Arts), respectively. The large panel in the Church of S. Agostino in Siena, depicting the Blessed Agostino Novello and four of his miracles, was most likely executed directly following the frescoes of Assisi. The accentuated plasticity of the scenes of St. Martin is softened in this new masterpiece, and the fairy-tale space of the small paintings is achieved by the relationship of the planes, limpid and luminous in color. Simone maintains the same lofty lyrical vein in his retelling of the four miracles: the child attacked by a wolf, the child fallen from the balcony, the knight fallen into the ravine, and the child fallen from his cradle. In each he described with inexpressible tenderness the life of the people of his neighborhood. His brush lingers over every detail with the same affectionate attention as he fixes each action and transforms it into a miracle of color.

The poetic feeling for landscape which runs throughout the story of the Blessed Agostino Novello reaches its most intense and solemn expression of those years in the large fresco of 1328, depicting the *condottiere* Guidoriccio da Fogliano (PL. 334), which commemorates the reconquest of the rebel towns of Montemassi and Sassoforte. Simone here displays a vivid, naturalistic power of observation in rendering the encampment, the tents, and the palisades, as well as the banners, lances, and shields that suggest the hidden presence of soldiers in the rugged hills. Etched against the sky, the walls, houses, and empty towers of the besieged fortresses seem immersed in a terrified silence. The solitude of the landscape is permeated by an aura of fantasy and suspense, and the figures of Guidoriccio and his elaborately caparisoned steed are lyrically transfigured into a single equestrian emblem, strange and disquieting; this image seems to ride, phantomlike, in a dark night sky rather than across those bare desert crags, scarcely grazed by the horse's hoofs.

In the emblematic abstraction that confers on the spacious colored surfaces of this fresco the aspect of a large tapestry, the characteristics of Simone's late style make their appearance, but they are fully revealed only after an interval of five years — during which nothing is known of the painter's activities — in the freedom and rhythmic cadence of the Uffizi *Annunciation* (PL. 339), painted in 1333 for the Cathedral of Siena. Certain scholars have been negative in their judgment of this exquisite painting and of others painted by Simone in the last years of his life at Avignon; their extreme purity, to which Simone's style tended from the very beginning, has been unjustly mistaken for a virtuoso emphasis on formalism, in which poetry gave way to decadent mannerism. Petrarch was not of that opinion. In an analysis that is still substantially valid, he perceived in the Avignon works particularly an affinity between his own poetic world and the supreme lyricism of Simone's late style, in which pictorial emotion is expressed in terms of ideal and aristocratic beauty with a serene but ecstatic rhythm. Rarely has another painter achieved the ethereal and radiant lyricism of the Uffizi *Annunciation*, with its angel all iridescent splendor and the shadowy Virgin bowed and withdrawn in her sweet melancholy. The breadth of luminous space in this painting is not that of reality; rather, it is the lyrical internal measure of the images, expressed in the faces and in the liquescent forms and the color cadences of the garments, playing in striking patterns against the over-all vibrant tone of gold.

The contradictory critical evaluations of Simone's work in Avignon are a consequence of the meager and inexact state

of knowledge that has continued to the present. A better understanding might be gained from the recovery of the surviving fragments, damaged as they are, of the frescoes he executed in the Cathedral of Notre-Dame-des-Doms. These frescoes, harmoniously enclosed within the beautiful Romanesque architecture of the porch, are still worthy of study. They express a monumental conception skillfully related to the available space. Detachment and restoration of these frescoes would not only save the remaining fragments of the surface but would also uncover the magnificent sinopias that are visible in exposed areas. Irrevocably lost is the St. George killing the dragon, which still existed in 1818 but was destroyed ten years later (Eugène Müntz, 1884). Still surviving are some surface areas of the underside of the entrance arch, decorated with ornamental motifs and angel heads, and other parts of the frescoes above the portal of the church: in the lunette, the Madonna and Child with two kneeling angels (one perhaps representing Cardinal Jacopo Stefaneschi, who died at Avignon in 1341); and in the gable, Christ Blessing, surrounded by six angels.

Other works attributed to the Avignon period include the frontispiece of Vergil in the Biblioteca Ambrosiana (PL. 337); the *Virgin of the Annunciation* in The Hermitage, Leningrad; the *Holy Family* in the Walker Art Gallery, Liverpool; and the dramatically vivid little polyptych of the Passion, its panels now divided among the Musée Royal des Beaux-Arts of Antwerp, the Staatliche Museen of Berlin, and the Louvre. In Antwerp are *The Archangel Gabriel*, *The Virgin of the Annunciation* (PL. 338), *The Crucifixion*, and *The Deposition* (PL. 340); in Berlin *The Entombment*; at the Louvre *The Way to Calvary* (VI, PL. 378), bearing on its reverse side the Orsini family's coat of arms. The stylistic and iconographic relationships of the Passion polyptych seem so close to the Giotto of Assisi and Padua and the Duccio of the *Maestà* that the attribution of this work to Simone's last years seems unjustifiable. It seems instead that in the very novelty of these beautiful compositions — so close in their enamellike purity of color to the predella of the Pisa polyptych — archaic formal modes appear with innovations, while still reflecting the early Duccio training that remained perceptible in Simone's works until the Orvieto period. Moreover, the range of color, in which the figures are bathed in light and shadows of varying iridescent hues — for example, a light yellow with a shadow of rose or blue or brick red, a light red with a violet shadow — is closer to that of the Pisa and Orvieto works than it is to the subtle tonal values of light in the Avignon paintings. Even the minutest linear details, precise as a jeweler's design (e.g., the jewels of the Antwerp *Archangel Gabriel*), resemble those of the polyptych of Pisa or that of the Fitzwilliam Museum. The slender white stem of the lily in the Antwerp Archangel's hand has a subtle line like that of the fragile light rays touching the angels' fingers in the Fitzwilliam Museum work, and the delicate ornamental motifs are cut into the gold instead of impressed with the burin, as in the late works. In the other Avignon paintings the artist's style has a cadence of line and a delicate, airy use of color that create a virtually musical rhythm. The pictorial subtlety of the Vergil frontispiece may reflect something of the quality that elicited Petrarch's enthusiasm for the irrecoverable portrait of Laura painted by Simone for the great poet.

The course of Simone's art reaches its conclusion in the warm colors of the *Holy Family* (Liverpool, Walker Art Gall.), in 1342; its lyric intimacy is conveyed in well-defined, flowing, economical lines that seem already to predict the worldly elegance of the International Gothic style.

MASACCIO (Tommaso di Giovanni, called "Masaccio"). Painter (b. San Giovanni Valdarno, Dec. 21, 1401), son of Ser Giovanni di Mone. Masaccio died in Rome, perhaps in the autumn of 1428 "at about the age of twenty-seven," according to the 15th-century writer Antonio Manetti.

On the whole, modern scholarship discounts the reports in 16th-century sources of a formal apprenticeship of the young Masaccio to Masolino. Mario Salmi considers that Masaccio's early formation showed rather close ties with the late Gothic style of Gentile da Fabriano and Arcangelo di Cola da Camerino and even an initial influence from the Arno Valley painters, such as Mariotto di Cristofano. Roberto Longhi, however, asserts that the very nature of Masaccio's genius would have prevented him from benefiting from the achievements of the Gothic artists of his own or earlier periods. There are even some who, bearing in mind considerations of chronology, maintain that the manner of Masaccio can be explained historically by reference to the results already achieved by Brunelleschi and Donatello. Ugo Procacci has ascertained that Masolino came from the same area as Masaccio, a fact that might support the assertions of the 16th-century sources, but any early relationship of Masaccio to Masolino would have been limited to a mere preliminary technical instruction.

Luciano Berti's attribution (1961) to Masaccio of the triptych discovered in the Church of S. Giovanale at Cascia di Reggello seems entirely correct. The triptych, *The Madonna Enthroned with Saints and Two Adoring Angels*, is dated Apr. 23, 1422, the same year in which Masaccio was enrolled in the Arte dei Medici e Speziali in Florence. If this discovery does not fully clarify his artistic formation, it does place it within the broad context of traditional Florentine culture. According to Procacci, Masaccio was already in Florence by about 1417. The Cascia di Reggello triptych reveals certain important facts: there is no influence of Masolino here; instead there appears the common Florentine tradition, along with innovations (from Giotto to Donatello to the perspective of Brunelleschi).

The placement of this triptych at the outset of Masaccio's career seems to dispose of the hypothesis, first advanced by G. Magherini-Graziani (1904), and variously discussed and accepted by art historians, that the fresco *The Enthroned Madonna and Child with SS. Michael and John the Baptist*, in the rural shrine near Montemarciano, is an early work of Masaccio. Rather, comparison with the S. Giovenale altarpiece makes it evident that the Montemarciano fresco must be assigned to Francesco d'Antonio, as Henrik Lindberg (1931) and more recently Longhi (1940), Procacci (1951), and Berti (1961) have concluded. However, the attribution to Masaccio has been upheld by Schmarsow, Berenson, Toesca, Venturi, Somarè, Salmi, and Pittaluga.

With the S. Giovenale triptych as a reference point, a new and more convincing chronology emerges for the Uffizi *Virgin and Child with St. Anne* (formerly, Florence, S. Ambrogio; pl. 341). The date of 1420 proposed by Procacci (1951), who regards it as Masaccio's earliest known work, can no longer be sustained. Since the date would have to follow that of the triptych of 1422, it must then fall during the period of the first collaboration between Masaccio and Masolino in 1424 in S. Maria del Carmine, Florence, as Longhi (1940) discerned. Berti concurred with this view, but restricted the beginning of the collaboration to the period from the end of 1424, when Masolino returned from Empoli, until September of 1425, when Masolino left Florence for Hungary.

Following Vasari, who in the second edition of the *Vite* (1568) attributed the execution of the Uffizi panel to Masaccio, subsequent historians considered the work to be his alone. Only the most recent findings, taking advantage of the extensive restoration of 1935–54, have demonstrated the evidence of a collaboration between Masolino and Masaccio.

In the commentary to his edition of Vasari, Giovanni Masselli had observed (1832) that if the Uffizi painting was actually by Masaccio it must be considered one of his earliest. G. B. Cavalcaselle, beginning the comparative exegesis of the Uffizi panel (1864), found in it an affinity to Masolino's work at Castiglione Olona. Working along the same lines, August Schmarsow (1895) saw a relationship with the fresco in which St. Peter heals a cripple and raises Tabitha (pl. 374) in S. Maria del Carmine and attributed that as well as the other frescoes to Masaccio; but today it is known to be by Masolino. In Berenson's first edition of his lists of Italian painters (1896), the Uffizi work was cited as a Masaccio. Later he used it as a secure basis for eliminating works previously assigned to Masaccio and giving them instead to Masolino.

The first to distinguish in the Uffizi painting "two distinct styles, two completely diverse ways of painting" was Paolo D'Ancona (1903), who separated the "soft and graceful" manner (in the faces of the Madonna and of the angels and in the garment folds) from the "full, rather crude forms" (the Christ child and the St. Anne). Pietro Toesca (1908) did not agree with this distinction that suggested the possibility of a collaboration with Masolino. He concluded that the angels, reminiscent as they are of Masolino in their light coloring and lack of relief and their slender and insubstantial form, are the key to the solution of any attributive controversy; they are the sign of a relatively youthful stage of Masaccio's art, in which he failed to understand Masolino's style, even though he was making use of its formulas.

The question of Masolino's collaboration in *The Virgin and Child with St. Anne* was studied by Adolfo Venturi (1911), K. Escher (1922), and O. H. Giglioli (1921), but always with the conclusion that it was completely by Masaccio. Later (1929) Giglioli held that the resemblances to Masolino in the panel, believed to indicate so marked a difference between the two artists, were superficial and fleeting.

Jacques Mesnil (1927) once again pointed out the influence of Masolino in the type of the angels, with their tapering fingers, in the elongated face of the Virgin, as well in the general tonality, and reconfirmed as Masaccio's innovation the composition conceived as a unified entity. Raimond van Marle had no reservation in assigning the work to Masaccio. But Lindberg (1931), making a detailed comparison of elements, studied the paintings and frescoes of the two artists and concluded that the Uffizi painting was the result of a collaboration. Later Robert Oertel (1933) and Mary Pittaluga (1935) reaffirmed Masaccio's sole authorship.

In 1940 Longhi reexamined the problem. Having studied the Uffizi panel during the cleaning, he attributed the Virgin and Child and the angel in the upper right to Masaccio. The remainder he assigned to Masolino. He considered that Masaccio was an independent assistant to Masolino, from whom the painting had perhaps been commissioned.

Scholars have agreed almost unanimously that a stylistic distinction exists in the Uffizi panel. They disagree only in regard to the figure of St. Anne. Salmi, who had previously noted (1932) the influence of Masolino on Masaccio "for the first and only time" (in the "delicate and pure blond heads of the angels"), expressed (in the second edition of his monograph, 1947) his doubt concerning the St. Anne. This figure establishes an over-all unity with the other figures in the construction of a composition which, he felt, could have been conceived only by Masaccio, so that Masolino's role was subordinate in the esthetic whole. C. L. Ragghianti (1949) considered that the foreshortened head of the angel at the top of the panel should also be attributed to Masaccio.

Procacci, who as early as 1936 had declared that the painting was in part by Masolino, accepted (1946) the distinction made by Longhi regarding the Virgin and Child and the angels but remained uncertain (1951) with respect to the figure of St. Anne, because of its poor state of preservation. However, he held that the conception of the central group of three figures was Masaccio's. Roberto Salvini (1952) associated himself with this view, stating that St. Anne could be the work of Masaccio because of "her hand, which seems to explore the depth of the picture space."

Two Masaccio documents of minor but specific interest — a payment of 2 lire on Oct. 6, 1422, to the steward of the Arte dei Medici e Speziali and the enrollment in 1424 in the Compagnia di S. Luca — are very important in establishing chronology. Another document is the commission by Ser

Giuliano di Colino degli Scarsi da San Giusto for Masaccio to paint a large altarpiece for a chapel in S. Maria del Carmine at Pisa for the sum of 80 florins. The commission is dated Feb. 19, 1426. The execution of the altarpiece, according to the testimony of the various payments on account, including the closing one, continued until Dec. 26, 1426.

The Pisan polyptych was dismembered and dispersed in the 18th century; to date 11 parts have been found and identified in museums and private collections. The discoveries of *The Virgin and Child Enthroned* (PL. 344), now in the National Gallery, London (Berenson saw it in 1907 in the Sutton Collection of Brant Broughton, Lincolnshire, labeled with the name of Gentile da Fabriano), and the *Crucifixion* (PL. 343), now in the Museo di Capodimonte, Naples (Wilhelm Suida, 1906; Venturi, 1911), were essential for the partial reconstruction of the work. The other parts are: *St. Paul* (PL. 342) in the Museo Nazionale, Pisa (related to the polyptych by Cavalcaselle, who, despite the traditional attribution to Masaccio, saw in it the hand of Andrea di Giusto); *St. Andrew*, Lanckoronski Collection, Vienna (Schmarsow); and in Berlin (Staat. Mus.), four small figures of saints (Schubring) and three parts of the predella containing five scenes: *Adoration of the Magi* (PL. 346; Cavalcaselle), *Crucifixion of St. Peter* and *Beheading of the Baptist* (PL. 346), and *Scenes from the Life of St. Julian* and the *Miracle of St. Nicholas* (von Hadeln, with an attribution to Andrea di Giusto).

In the 15th century Antonio Manetti recorded that Masaccio had worked in Pisa, and in his *Vite* Vasari described the work in some detail: "In a chapel in the church of the Carmine at Pisa there is a painting of the Madonna and Child with angels at their feet playing musical instruments. One of them is giving rapt attention to the harmony he is producing. St. Peter and St. John the Baptist are on one side of the Virgin, and St. Julian and St. Nicholas on the other. On the predella beneath are little scenes from the lives of these saints; in the center is an Adoration of Christ. There are horses in this part of the work which are so beautiful that nothing better could be desired. The persons of the train of the three Magi are dressed in the fashionable clothes of the time. Over all are various Saints in several compartments, placed around a Crucifix." Upon this description — which is the only source — is based all research regarding the tentative reconstruction, the location, and the identification of the various parts.

A graphic scheme of the ensemble — made before the discovery of the London *Virgin and Child Enthroned* — was published by Suida in 1906. The most exact and reasoned reconstruction is that of Salmi (1932 and 1947), who has put forth an interesting hypothesis concerning the still missing lateral panels: the SS. Peter and John the Baptist and the SS. Julian and Nicholas. He suggests that an approximate idea of their appearance can be drawn from the two panels in the Museo Bandini at Fiesole by Giovanni del Ponte (Giovanni di Marco), which, in spite of Gothic-Ghibertian accents, are unquestionably inspired by Masaccio, or from the four saints that flank the Virgin and Child in a Louvre terra cotta attributed to Luca della Robbia. With the exception of two predella scenes — the *St. Julian* and *St. Nicholas* in Berlin, which all scholars agree are workshop pieces by Andrea di Giusto or by Scheggia — the extant panels of the polyptych are generally accepted as Masaccio's. Cavalcaselle, Bode, and Poggi, however, assign the *St. Paul* of Pisa (PL. 342) to Andrea di Giusto.

It is important to note that in 1426 Donatello was also in Pisa, where he was working with Michelozzo on the monument of Cardinal Rinaldo Brancacci for the Church of S. Angelo a Nilo in Naples. Documents prove Donatello's presence on July 24 and Dec. 18 of that year, when payments were made to Masaccio for the Carmine polyptych.

Critics have noted various relationships in Masaccio's early work to the sculpture of Donatello. Donatello's influence is certainly a major factor in Masaccio's first experiments with perspective and modeling, from the triptych of S. Giovenale, as Berti has pointed out, to *The Tribute Money* (PL. 348) — from the initial flattened perspective to the open three-dimensional space of the architecture and the grouping in *The Raising of the Son of Theophilus* and *The Trinity* (PL. 345) in the Brancacci Chapel of S. Maria Novella, Florence, with their Brunelleschian perspective.

Donatello's influence, particularly in the central part of the Pisan polyptych and the *Crucifixion* above it, has been pointed out by Salmi, who found a relationship especially in Masaccio's manner of accentuating contrasts in his modeling, frequently stressing the contours with light in the fashion of Donatello. One can see, even in the triptych of 1422, that it was through Donatello that Masaccio entered the Renaissance.

Scholars tend to believe that before the Pisan polyptych Masaccio painted the great fresco of the *Sagra del Carmine* in the cloister of S. Maria del Carmine in Florence. The *Sagra* was destroyed toward the end of the 16th century, when a new cloister was constructed. It represented the consecration of the church on Apr. 19, 1422, and is recorded in the 15th-century sources (Manetti and Billi), as well as by Vasari, who spoke of it as one of Masaccio's masterpieces. There are 16th-century drawings that partially reproduce the groups of figures in the great procession filing by the church. Fiocco believed that an over-all idea of the *Sagra* might be given by *The Consecration of S. Egidio*, which Bicci di Lorenzo painted on the façade of that church in Florence and which, in Fiocco's opinion, was inspired by the *Sagra*. Salmi opposed this hypothesis on the grounds that Bicci's composition failed to demonstrate any relationship between the figures and the space and neglected the principles of perspective so clearly defined in Vasari's description of the Masaccio work. Salmi places the *Sagra* fresco at about 1425 because it included Lorenzo Ridolfi, who was "in those times," according to Vasari, Florentine ambassador to Venice. This dating seems reasonable, although a date of 1424, if not earlier, has also been advanced by Procacci. Berti seems to find in the *Sagra* the most plausible and logical point of departure for the collaboration between Masolino and Masaccio in the Brancacci Chapel.

Three paintings — two portraits and a Madonna — are placed by some scholars in direct relationship with the *Sagra*, both as to date and to the personages portrayed. Others, however, rule these works out of the strict listing of Masaccio's *œuvre*. The first of the portraits is a young man in profile in the National Gallery, Washington, D.C., first attributed to Masaccio in the 19th century and since renominated by Salmi (Schmarsow proposed Masolino or Paolo Uccello). The second portrait is a profile of a man in the Isabella Stewart Gardner Museum, Boston, first attributed to Masaccio by Berenson. The attribution is accepted by a majority of the scholars, the exceptions being Langton Douglas, Giglioli, and Mesnil; Salmi related it to the two attendants on the left in the fresco *St. Peter Baptizing* (Brancacci Chapel) and suggested, with reference to the *Sagra*, a date of 1425 for its execution. Also from Salmi is the supposition that this portrait is the one cited by Vasari as being in the house of Simone Corsi. The third work, *The Madonna of Humility* in the National Gallery, Washington, D.C., was attributed to Masaccio by Berenson (1929) and dated not later than 1425, that is, before the Madonna of the Pisan polyptych. In general the critics agree that it is by Masaccio and are inclined to date it prior to 1424, as suggested by Salmi. However, L. Venturi placed it closer in time to the fresco of Montemarciano; and Longhi, because of its poor state of preservation and extensive modern restoration, did not attempt to date it. Because of this restoration Procacci stated that no judgment was possible before removal of the repainting which covers the entire surface of the panel. In any case, the elements of its composition seemed, in Procacci's view, to exclude any possibility that it could have been conceived by Masaccio.

The *Scenes from the Life of St. Julian* (Florence, Fondazione Horne), although in bad condition, is nevertheless fairly distinct, and most scholars uphold the attribution to Masaccio. It is the relationship of the *St. Julian* to the Carnesecchi triptych of S. Maria Maggiore in Florence (see MASOLINO) that divides the art historians. Longhi considered the *St. Julian* to be a first version of the same subject for the predella of the Pisan polyptych, later discarded because of the patrons' dissatisfaction.

Salmi rejects this theory, as well as the proposition that it belonged to the S. Maria Maggiore triptych, because it does not completely correspond to the description given by Vasari, and because its dimensions would have necessitated the elimination from the predella of an episode of the legend of St. Nicholas — which, given the presence of this saint in one of the compartments of the triptych, could not have been left out. Procacci returned to the hypothesis propounded by Gamba that credence should be given to Vasari's statement (first edition of the *Vite*) that only the predella of the S. Maria Maggiore triptych was by Masaccio. Among the elements suggested as having belonged to the triptych, some scholars propose the St. Julian predella panel in the Musée Ingres in Montauban, which is a certain work of Masolino.

After the document of Dec. 26, 1426, which records the final payment for the polyptych of Pisa, no other record appears until July 29, 1427, the day on which Masaccio and his brother registered a property declaration. At about this time — some think 1426 and others later — Masaccio began work in the Brancacci Chapel. As previously mentioned, Berti has convincingly proposed a new chronology for the Brancacci Chapel frescoes. He advances the theory that the beginning of the collaboration of Masaccio and Masolino was sometime before August, 1425. Masolino himself may have recommended Masaccio to the monks or to the patron. As Masolino had to leave Florence on Sept. 1, 1425, for Hungary (Procacci), he did not wish to leave the work in the chapel completely abandoned; he had himself already completed the frescoes in the vault and those of the upper sections of the wall. It is probable that the substitution of Masaccio was accepted with good grace by the monks and the patron because, as noted above, he had perhaps already painted the *Sagra* fresco in the cloister. On this assumption the following chronology would result: From the first months of 1425 until August of the same year, Masaccio's work on *St. Peter Baptizing*, *The Expulsion from the Garden of Eden* (PL. 350), and *The Tribute Money* (PLS. 348, 349) paralleled Masolino's execution of *The Preaching of St. Peter* and *The Original Sin*; and Masolino, aided by Masaccio, painted the fresco of St. Peter healing a cripple and raising Tabitha. From the latter part of 1425 and into 1426 Masaccio painted *St. Peter Healing the Sick with His Shadow* and *SS. Peter and John Distributing Alms* (PL. 347). Masolino was in Hungary the entire year of 1426, not returning to Italy until July, 1427, and Masaccio left the Brancacci Chapel during 1426 to work on the Pisan polyptych. Since the monks of the Carmine also commissioned the polyptych, it was probably easy for Masaccio to obtain permission to leave the Brancacci Chapel. (Salmi has pointed out that the assistant prior of the Pisan monks at that time was a Florentine, Fra Bartolomeo da Firenze.) In 1427 Masaccio worked on *The Raising of the Son of Theophilus*, which was left unfinished.

Except for minor variations, the sequence given above is basically the same as the one first proposed by Salmi and generally accepted. Although Salmi accepted 1425 as the beginning of the collaboration of Masaccio and Masolino, perhaps on one of the wall lunettes, now destroyed, he placed the *St. Peter Baptizing* in 1426, *The Expulsion from the Garden of Eden*, *The Tribute Money*, and *St. Peter Healing the Sick with His Shadow* in 1427, and *SS. Peter and John Distributing Alms* and *The Raising of the Son of Theophilus* in 1427–28.

Procacci's chronology differs substantially from the proposals of Salmi and Berti. He maintains that until about Sept. 1, 1425, Masolino worked alone on the vault and the upper tier (both destroyed during the redecoration of 1748). Procacci believes that all work on the chapel was suspended during the entire period of Masolino's absence and was not resumed until about August, 1427. Then began the collaboration between Masolino and Masaccio, after which Masaccio continued alone until the autumn of 1428, when he left Florence for Rome. Procacci's theory regarding the fresco sequence also diverges from those of Berti and Salmi. He established the following order: *St. Peter Baptizing*, *The Tribute Money*, *The Expulsion from the Garden of Eden* (which seems more logical for technical reasons related to the use of scaffolding and follows a more precise work plan), *SS. Peter and John Distributing Alms*, *St. Peter Heals a Cripple and Raises Tabitha*, *and The Raising of the Son of Theophilus*. He posits that the first three frescoes were painted by Masaccio — with Masolino working beside him — and the last three by Masaccio after Masolino had left for Rome.

Scholars today are in agreement, barring a few exceptions to be discussed below, as to Filippino Lippi's part in the Brancacci Chapel as distinguished from the work of Masaccio and Masolino. This agreement has been arrived at through a new appraisal of the first edition of Vasari's text, as well as through the undertaking of more precise studies and a resulting increase of knowledge. A definite contribution has been made toward the solution of one of the most debated problems in 19th- and early-20th-century art criticism.

Other divergences of opinion concerning chronology arise over presumed intermediate or antecedent trips to Rome taken by Masaccio with Masolino. Longhi believed that after a period of work together in S. Maria del Carmine in 1424–25, they went to Rome in 1425, during the Jubilee; that they both worked in Rome on the Chapel of St. Catherine in S. Clemente and later on the triptych (painted on both sides) for S. Maria Maggiore. In 1427, according to Longhi, Masaccio returned to Florence to work alone in the Brancacci Chapel.

Although the theories of Schmarsow and Oertel regarding the Brancacci Chapel are inadmissible, their two systematic studies of Masaccio should be mentioned. Schmarsow saw in the Brancacci frescoes a demonstration of two modes of painting, which he explained as a well-defined stylistic evolution in Masaccio's work. Schmarsow believed the whole fresco cycle to be by Masaccio (under Masolino's influence) and dated it before 1422, preceding the other known works, which he arranged chronologically from 1426. Oertel considered Masaccio to be a pupil of Lorenzo Monaco and believed that he painted the *Madonna* of Bremen (Kunsthalle) in 1423 (yet even if the numerous objections by the majority of scholars to this attribution were not sufficient, the publication of the S. Giovenale altarpiece clearly reveals its impossibility). Oertel established the following chronology: 1422–23, the Roman works now generally agreed to be by Masolino (excepting some minor contributions by Masaccio); 1424–25, the early frescoes (actually by Masolino) in the Brancacci Chapel; 1427, completion of the Brancacci Chapel frescoes following Masaccio's return to Florence, after painting the Pisan altarpiece.

The Carmine frescoes, which were noted by all the 15th-century sources, were, according to Vasari, commissioned by Antonio Brancacci, but through documents discovered by modern scholars (M. Amari, D. Catellacci, C. Carnesecchi, H. Brockhaus) the true name of the patron was found to be Felice di Michele Brancacci. Toward the end of the 17th century all the frescoes were in danger of being destroyed as a result of a reconstruction scheme planned for the whole chapel. That they were saved was due to Vittoria della Rovere, widow of Ferdinand II and mother of the Grand Duke Cosimo II, to whom members of the Accademia del Disegno, together with many others, turned for help.

Later, between 1746 and 1748, during the partial redecoration, Masolino's frescoes in the vault and in the lunettes were demolished and replaced by new decorations by Vincenzo Meucci and Carlo Sacconi. A new marble altar was erected, a large rectangular window replaced the former two-lighted window, and the Gothic arch over the entrance, perhaps decorated by Masolino, was modified with a semicircular arch. During the night of Jan. 28, 1771, fire raged in the church (Procacci gives a precise account), but the chapel frescoes were saved, only two pieces of plaster falling from the left wall where *The Tribute Money* and *The Raising of the Son of Theophilus* are located. The frescoes were, however, much blackened by the smoke, a condition recently confirmed when two marble projections were removed from either side of the altar, revealing small areas of the painting as it was originally, in Masaccio's *St. Peter Baptizing* and *The Preaching of St. Peter* by Masolino. In these areas the colors, with their luminous whites, appear much clearer, in striking contrast to the other painted surfaces,

which have a rather leaden tonality. Cleaning of the entire chapel should reveal the true chromatic values and luminosity of the frescoes.

The identification of *St. Peter Baptizing* as the first fresco Masaccio painted in the chapel is unquestioned (excluding the previously noted theories of Schmarsow and Oertel and the confusion surrounding Masaccio and Masolino in the 19th century). Longhi and Salmi, however, believed that Filippino Lippi repainted the head of St. Peter, and Longhi would also have included the heads of the two young men behind the saint. Procacci refuted Longhi's theory with persuasive technical reasons. In his view the three heads were painted by Masolino.

The Tribute Money (PLS. 348, 349) is the key fresco, the one that has in general received the highest praise: from Vasari, who stressed the psychological aspect of the personages portrayed, and Cavalcaselle, for whom it marked the opening of the High Renaissance — that is, of the compositional balance of Raphael and Fra Bartolommeo — down to the most recent scholars who have studied it exhaustively for its dating, its innovations, its sources, its achievements, and its connections. Most scholars consider it completely by Masaccio's hand, but Lindberg believed that the figure of St. Peter, seen on the left as he removes the money from the fish's mouth — an area of the highest quality — was the work of Andrea di Giusto. More recently Longhi advanced the theory that the head of Christ, which is less strongly modeled, was the work of Masolino, who painted only this head before he left the work in 1424. Salmi rejected this theory, agreeing with Toesca's earlier opinion that Masaccio had attempted to paint Christ's face in the manner of Masolino but the results only superficially suggest Masolino. Salmi's hypothesis is supported by a technical analysis of the fresco surface and the sequence of the adjacent painted areas, which exclude Longhi's thesis. The fresco depicts in a continuous narrative three episodes of Christ's entrance into Capernaum (Matt. 17:24–27).

The Expulsion from the Garden of Eden (PL. 350) is completely autographic except for the leaves around the loins of the nude figures and a few other areas of retouching and repainting of the surface. There are evident traces of restoration in the architrave and in the lower area of *St. Peter Healing the Sick with His Shadow* (Acts 5:12–16), which is also completely by Masaccio. Vasari stated that the man wearing a red headdress between the saint and the man standing in prayer is a portrait of Masolino, although this has not been proved.

It is also probable that the bearded man between the two saints in *SS. Peter and John Distributing Alms* (PL. 347) is also a portrait of Masolino. This fresco (cf. Acts 4:32–37 and 5:1–6) is also an autographic work. Except for a large part of the figure of Ananias, which has been redone, the fresco is one of the best-preserved in the chapel. Salmi believes the last profile on the right to be that of Masaccio's brother.

The iconography of *The Raising of the Son of Theophilus* with *St. Peter in Cathedra* (PL. 347) is derived from an episode in the *Golden Legend* (xliv), and the separation of the sections painted by Masaccio from those painted by Filippino Lippi has long been a subject of dispute. It was Cavalcaselle who, after Vasari, accurately noted that the central group was painted by Filippino. The group on the left he attributed to Filippino, except for the profile head of the Carmelite, which he gave to Masaccio. Although the group is composed of five figures, only eight feet are shown; this anomaly, together with the strange isolation from the rest of the group of the figure painted by Masaccio, would suggest the acceptance, at least in part, of Brockhaus's theory that the entire scene was painted by Masaccio and that in 1436 the sections containing portraits of the Brancacci were destroyed when the family was declared rebel and exiled by Cosimo de' Medici. It seems more probable, however, that Masaccio, although leaving the fresco unfinished, had painted in this section figures (perhaps portraits of the Brancacci) which were destroyed at a subsequent period and that the space was thereafter filled in by Filippino with other portraits of noted personages.

Filippino's contribution, dated in accordance with Berti as 1481–83 rather than 1484–88, can be readily observed in the rest of the fresco: it consists of the eight figures to the right in the central scene of the miracle, comprising the figures from the Carmelite in profile to the figure in green with the cap; in addition, the lower part of the fresco, which includes the resurrected boy, the child next to him, the clothing of the figure in green, the body of St. Paul and the raised hand of St. Peter, and, probably the paneled wall behind the figures. The head at the extreme right seems to be neither by Masaccio nor Filippino but rather a later addition, perhaps of the early 19th century, or quite possibly painted following the fire of 1771. Filippino's well-placed and unified figures might be explained by Salmi's hypothesis that he used the sinopias drawn by Masaccio on the plaster.

Some scholars give Masaccio a share in sections of the frescoes painted by Masolino. Among several of such theories the most tenable is that of Longhi; reviving a hypothesis of Gamba, he maintained that Masaccio had executed the architectural background of the square and the small figures that enliven it in the scenes where St. Peter heals a cripple and raises Tabitha. Salmi and Procacci (in part) concur in Longhi's attribution. The suggestion is also put forth by Longhi that in *The Preaching of St. Peter* Masaccio painted the figure of the saint and the three young men behind him.

The attribution to Masaccio of *The Birth Plate* (Berlin, Staat. Mus.), was made at a relatively late date, 1834, when the work formed part of the Ciampi Collection at San Giovanni Valdarno. It may be dated about 1427, after the Pisan altarpiece. G. Morelli assigned it to Andrea di Giusto, but E. Müntz reaffirmed the attribution to Masaccio. Not all scholars concur: Brandi gives it to Domenico di Bartolo, Ragghianti to Domenico Veneziano, and Procacci, without specifying an artist, dates it to the fourth decade of the 15th century, that is, after Masaccio's death. Lindberg, accepting the work as by Masaccio, dated it 1425 because the lost Annunciation for S. Niccolò oltr'Arno, which he assigned to the same year, also had a colonnade in perspective (a thesis which, as Salmi states, is impossible to prove). However, the majority of scholars accept Mesnil's dating of 1427.

If Masaccio's conception of perspective in his early frescoes of the Brancacci Chapel, from *St. Peter Baptizing* to *The Tribute Money*, is derived from that of Donatello as exemplified in the bas-relief of St. George (1419; IV, PL. 242) — as Berti has written in his summary of the most noteworthy deductions by scholars on this theme — the last phase of the Brancacci cycle, *The Raising of the Son of Theophilus*, reveals a grasp of perspective that reflects Brunelleschi's theories. This new awareness of perspective found full realization in *The Trinity, with the Virgin, St. John, and Donors* in S. Maria Novella (PL. 345), painted at the culmination of Masaccio's activity in Florence. Salmi dates it 1427, between *St. Peter Healing the Sick with His Shadow* and *SS. Peter and John Distributing Alms* and *The Raising of the Son of Theophilus*. The scholars have generally accepted this date; Procacci, less plausibly, places it before the entire fresco cycle of the Brancacci Chapel.

The *Trinity* fresco was commissioned by Don Lorenzo Cardoni. The work was first mentioned in the *Libro* of Antonio Billi and subsequently by Albertini, Vasari, and others. After the construction of the altars (1570), it was covered by Vasari's *Madonna of the Rosary*. The *Trinity* came to light again in the second half of the 19th century during the course of the restoration of the 16th-century altars. In 1861 the *Trinity* was detached and transferred to the interior wall of the façade on the left of the main entrance of the church.

Statements in the *Libro* of Antonio Billi, in both surviving versions, as well as the Anonimo Magliabechiano, that an image of Death could be seen at the base of the fresco led Procacci to investigate the wall of the third altar on the left, where the fresco had been originally located. His investigation resulted in the uncovering of the lower section of the fresco, which depicts the skeleton of Adam lying on a tomb between paired columns. The perspective employed in this section corresponded to that of the *Trinity*, which was then redetached and returned to its original location. The two parts are separated by a narrow breach made by the insertion of an altar top

into the wall. The question that arose when Procacci supervised the relocation of the fresco, of whether Masaccio had intended the insertion of an altar, has not been discussed in print. But it would seem logical that the fresco originally had an altar painted in perspective in accordance with the rest of the work. It would have been a votive altar, rather than an actual altar, although later, and as yet unpublished, documents note that an actual altar, adapted for liturgical rites, existed in the second half of the 15th century. The present writer believes that the altar top was inserted after the death of Masaccio. That Brunelleschi himself assisted Masaccio in painting the architectural elements of the *Trinity* has long been debated. M. Reymond proposed an intervention by Paolo Uccello. Brunelleschi's participation was strongly championed by J. Kern, accepted by H. Wieleitner and K. Frey, but refuted by Mesnil and Oertel. Although today no one accepts this theory, it is apparent that Masaccio was directly influenced by Brunelleschi's architecture (Salmi cited the Barbadori Chapel in S. Felicita) and by the tabernacle of Donatello and Michelozzo in Orsanmichele (as W. Bode has observed).

Returning to the scaffolding of S. Maria del Carmine after completing the *Trinity* fresco, Masaccio began *The Raising of the Son of Theophilus*, but left it incomplete when Masolino — who presumably was already in Rome in the autumn of 1427 — summoned him to Rome.

Although critics have attempted, on the basis of Vasari's attribution, to identify Masaccio's hand in the S. Clemente frescoes in Rome, the results have been inconclusive (for the hypothesis, see MASOLINO). Also Longhi's recent thesis that in 1425 Masaccio helped in the painting of the *Crucifixion* has not been universally accepted.

Longhi, following a proposal of K. Clark, dates, during this conjectural first visit to Rome, Masaccio's assistance in painting the *SS. Jerome and John the Baptist* on the left side of the S. Maria Maggiore triptych, now in the National Gallery, London. Clark believes that the triptych was begun by Masaccio alone in 1425 and finished by Masolino in 1428. The date proposed by Longhi and Clark for Masaccio's work on the triptych follows Vasari's hypothesis that Masaccio was in Rome during the Jubilee of 1425. Salmi rejects this dating and proposes instead that the whole triptych was done during 1428, explaining as concessions to contemporary Roman taste (Gentile da Fabriano) those stylistic characteristics which seem less developed than in the Pisan polyptych. Procacci, although his first judgment was negative, now seems to agree to a limited participation of Masaccio in the triptych, reinforcing his opinion with reasoning based on quite convincing historical considerations. Brandi also concurs in the attribution to Masaccio.

M. Meiss dates Masaccio's part in the triptych 1422–23, with which F. P. Hartt agrees, maintaining that the work was begun in Florence and finished by Masolino in Rome. Rather than Masaccio, Martin Davies sees in the London panel, among other currents, the influence of Fra Angelico. His dating is in agreement with that of Ulrich Middeldorf, who places it about 1435 and sees in it, besides, a pictorial sensibility suggesting Domenico Veneziano.

When Berti turned to the problem of the London panel, he declared his agreement with Salmi that it was Masaccio's last work. In addition to its moral-physical power, Berti saw in the sloping flowered earth, the leg of John the Baptist, and the book in perspective with curling leaves, the extreme refinement that entered Florentine painting much later in the work of Domenico Veneziano, Fra Angelico, and Andrea del Castagno.

Of the vast catalogue of works formerly attributed to Masaccio — and some still attributed to him — those that are no longer seriously considered by the critics are not included here. However, the small *Madonna and Child* exhibited among the art works recovered from Germany should be mentioned, as it is under study. Longhi attributed it to the youthful period.

Reference has been made above to the *Sagra* of S. Maria del Carmine in Florence and the missing panels of the Pisan polyptych (St. Peter and St. John the Baptist, St. Julian and St. Nicholas) and to other figures as works now lost that had been cited by 15th-century sources as well as by Vasari. To this group should be added: a fresco of St. Paul, also from S. Maria del Carmine, lost in 1675 when a new chapel was erected in honor of St. Andrea Corsini; St. Yves of Brittany, a fresco in the Church of the Badia, detached from the wall in 1625 and since disappeared; a panel painting of the Annunciation for the Church of S. Niccolò (its identification with the *Annunciation* in the National Gallery in Washington, D.C., is not convincing, as it does not correspond to Vasari's detailed description); two panels of St. Peter and St. Paul and a birth plate with a combat scene listed in the inventory drawn up at the death of Lorenzo the Magnificent in 1492; a portrait of Bartolomeo Valori and other portraits, cited by Vasari as being in the house of Simone Corsi; a Last Judgment (?) fresco from the monastery of S. Maria degli Angeli, cited by Albertini; a panel of a nude man and woman, cited by Vasari as in the Palazzo Rucellai; a panel depicting Christ healing the possessed man, cited as in the collection of Ridolfo Ghirlandajo (an identification has been suggested with the small panel attributed to Andrea di Giusto in Philadelphia, Mus. of Art, Johnson Coll.).

MASKS. There are very few societies, whether ancient or modern, primitive or civilized, in which masks are unknown, for their use springs from instinctive beliefs common to all mankind. For an understanding of the role of masks in art, their meanings and functions must first be known.

The ancient Greek and Latin terms for mask indicate their original classical meaning. The Greek word is *prosōpon* ("face"); the Latin word is *persona* ("mask"), literally, the mask over the face through which (*per-*) the actor sounds forth (*sonat*). The relatively recent word "mask" comes from Italian *maschera*, German *maske*, French *masque*, which derive from Late Latin *masca*, *mascha*, *mascus*, and Arabic *maskharah*. The Arabic word is usually translated "buffoon," but Geoffrey Parrinder states: "The transformation of men into animals is expressed by a special word (*maskh*)" (*Witchcraft*, Harmondsworth, 1958, p. 121). This is of especial interest in the light of the personification, transformation, and identifying function of certain masks, to be discussed below. A mask is frequently called a "false face," but this term applies only to such masks as those worn by members of the Falseface Society of certain northeastern Algonquian Indian tribes and those worn by children for fun, by Halloween merrymakers, at masquerade parties, and the like.

Aside from the meanings of the word "mask" itself, all masks signify whatever they are designed to represent: ancestors, deities, demons, and other supernatural beings, the souls of the dead, spirits of good and evil, spirits of nature, of game animals, of corn and other crops, of rain, of disease, drought, fertility, and abundance, of death. Masks also have represented heroes and characters in drama and story. Funeral masks and theater masks are fully discussed below.

The full meaning of any specific mask, even when one knows what it represents, cannot be revealed or understood apart from its function. The functions of masks might be indicated in gen-

eral as follows: (1) to evoke certain reactions in the beholder, for instance, awe of the god represented, fear in an enemy, or ecstasy of the wearer, culminating in possession or trance; (2) to cure disease (in men, cattle, crops) by impersonating the supernatural curer, or to dispel disease and evil by exorcising the demons causing them; (3) to impersonate and identify with certain supernatural beings in order to effect some individual or communal good, for instance, fertility (e.g., fecundity of domestic and game animals and of women and crops); (4) to enhance the self, as by wearing the mask of privileged secret societies or by representing clan or family totems or other heraldry; (5) to criticize, and thereby control or alleviate, social wrongs by terrorizing wrongdoers or, by satire and buffoonery, ridiculing them.

SUMMARY. Mythical and ritual origins (col. 521). Antiquity (col. 525): *From the full head to the mask; Heads and masks of deities and other supernatural beings; Funeral masks; Ceremonial masks and ritual masquerades; Theater masks; Apotropaic masks; The fear of masks and death; Ornamental masks.* Folk masks in Europe (col. 530). The modern mask since the Renaissance (col. 538). The Orient (col. 543): *India; China; Japan.* Primitive masks (col. 547): *Africa; South Pacific; The Americas.*

MYTHICAL AND RITUAL ORIGINS. Ceremonial nakedness greatly increases the magico-religious power of woman, and the chief attribute of the Great Mother is her nakedness. In her body, by her body, the goddess reveals the mystery of inexhaustible creation on all levels of life in the cosmos. Every woman shares the essence and the import of the goddess in this archetypal nakedness. The ancient concept involved here has never wholly disappeared, even in very highly evolved religions. For the Hindus, for example, every nude woman incarnates *prakṛti*, nature, matter, the primordial substance, and the prototype of woman.

Man, on the contrary, increases his magico-religious possibilities by hiding his face and concealing his body. When he puts on a mask, he ceases to be himself; at least, he seemingly, if not actually, becomes another. This amounts to saying that, at least after a certain period in history, a man knows himself as a man precisely by changing himself into something other than himself. By wearing a mask he becomes what he is resolved to be: *homo religiosus* and *zoon politikon*. Such behavior has a good deal of bearing on the history of culture.

There are three general kinds of masks with three different purposes: ritual masks, war masks, and masks for spectacles. However, all masks are ritual in origin. War masks are fashioned to frighten and paralyze the enemy; they represent terrifying monstrous faces. Their magical function is unmistakable; it derives from the practice of painting the head and body, the earliest known magico-religious disguise. The cultural origin and function of dance and spectacle masks are plain enough.

Ritual use of masks is extremely varied, but two important classes of marks may be distinguished: those worn by the living and the masks of the dead.

It is worth stressing the almost world-wide diffusion, the antiquity, and the continuity of masks. There are masks attested as early as paleolithic times; in Europe they have a history of more than 30,000 years, and there are villages where masks are to this day worn in ritual. Paleolithic hunters' masks represent wild beasts. The cultural heirs of neolithic man, the modern European peasantry, use, together with masks of stags, wolves, and bears, also masks of domestic animals and (these probably of urban origin) human faces. Certainly the religious role of the mask was different for paleolithic hunters from what it was for neolithic farmers. Still, the cultural role of stag masks and bear masks in central and eastern Europe is a continuation of traditions originating in the religious ideas of paleolithic man.

Some fifty-five paleolithic representations of men in animal disguises are known. From Teyjat in Dordogne there are antlers carved with three figures disguised as chamois; and from Lourdes comes a slate plaque showing a man in deerskin, antlers, and a long horse's tail. But the religious function of the mask in paleolithic hunting cultures is most plainly revealed by the great "sorcerer" of the Trois-Frères cave (X, PL. 133). Thirty inches high, deeply carved in the rock, the sorcerer dominates the many animal figures on the walls. He has a stag's head topped with immense antlers, an owl's face, ears like a wolf's, a long goat's beard, uplifted arms ending in bear paws, and a long horse's tail.

This sorcerer may represent a human being or perhaps a supernatural being, a hunters' god in the guise of a paleolithic sorcerer. A. C. Blanc has compared him to a Melanesian spirit with fish in the place of its head, hands, and feet. This Melanesian spirit is protector both of sea creatures and of fishermen; he fills nets but can also do harm. Whatever the Trois-Frères figure represents, it is certain that paleolithic sorcerer-priests used animal disguises like this for the purpose of raising themselves to a superhuman state.

There are many modern examples of magico-religious transformation brought about by wearing a mask. The Eskimos believe that the wearer is mysteriously impregnated with the spirit represented by the mask: to put on the mask representing a totem is to become that totem. Certain aspects of shamanism contribute to a better understanding of the function of the Trois-Frères sorcerer. In their trances Siberian shamans wear costumes with animal motifs, among others. Along with bird motifs (of an obvious symbolism) appear deer and reindeer antlers. The costumes of Altaic and Tungusic shamans include furs and hides and ribbons and scarves representing serpents. The shaman possesses, among other powers, the ability to identify himself with an animal or magically to transform himself into an animal. In certain places, the shaman represents the Lord of the Beasts, playing an important role in the community hunt.

True masks are rather rare among Siberian shamans, but among the Eskimos, especially in Alaska, where the influence of American Indian cultures is strong, the shamans do use masks. However, shamanic dress is in itself and in origin a mask. Mask or dress, the function is the same: to proclaim the incarnation of a mythological figure — a god, ancestor, or mystic animal. The mask effects the transubstantiation of the shaman, transforming him before everyone's eyes into the supernatural being he is impersonating.

A similar transformation takes place in the ceremonies of certain mask societies, but the magico-religious experience involved here is different from the shaman's or from the paleolithic hunter's. In this case it is bound up with a community rite of ancestor worship. The masks represent the ancestors; by wearing masks the members of the secret society personify the ancestors. By means of masks, the dead return to life. It is no longer the mask-wearers who perform the rite but the mythico-ritual beings whom they have become. For the dead are mythico-ritual beings absorbed into the mythical First Ancestor, the first man to know death. In other words, when members of the secret society wear the masks, they act out a myth of beginnings: how in days primordial the Ancestor met his death — changed his state and became "other" — and afterward revealed to the people the mysteries of death and resurrection through the dramatic ceremonies of initiation. All mask societies are based on origin myths. Therefore the mythical event that gave birth to the secret society is periodically reenacted in its ceremonies.

It is likely that mythico-ritual ceremonies involving the ritual presence of ancestors (represented by masked initiates in the guise of wild beasts) were common among primitive men on a cultural par with paleolithic hunters. In some African initiation ceremonies the officiants are clad in lion and leopard skins, complete with claws, and the circumcision knives are furnished with hooks. Circumcision symbolizes the destruction of the genitals by the animal patron of the initiation. The officiants are sometimes called "lions," and circumcision is expressed by the verb "kill." Afterward the neophytes are themselves "masked," that is, dressed in leopard or lion skins. In other words, they are assimilated to the divine essence of the initiation animal and hence are reborn in him.

The masks — the ancestors — terrify women and the uninitiated and impose severe tests on the neophytes during their initiation. For example, the cruelties of the Duk-duk society of New Britain are well known. The maskers harass, attack, and sometimes kill those whom they meet in their way. The behavior of wild beasts is the model of certain men's societies.

The members enjoy a predatory privilege that associates them with the carnivores. In the secret brotherhoods of the Japanese and of the Germanic tribes of antiquity, the masks, the indescribable uproar, and the barking of dogs (ritually become "wolves") testify to the ancestors' presence, the return of the dead. Because of the terror they inspire, masked brotherhoods sometimes come to have a certain political power. Some carnivorous animal — such as the wolf in central Asia and in Europe, the leopard in Africa — constitutes the model both of the perfect hunter and formidable warrior and of the invincible conqueror and absolute master. It is through masks that this power is constituted and maintained.

Initiation into this sort of secret society necessarily involves, however, the disclosure of the purely human nature of the wearers of the masks. In Ubangi country, this revelation has a dramatic character. An old man, costumed and masked, comes out of the bush, runs and leaps upon the freshly circumcised neophytes, lashes them with a whip, and then disappears. At the close of the rites, the neophytes, encouraged by the leader of the initiation, seize the masked one, take away his whip, unmask him, and recognize the face of an old man of the village. From then on, they know. They have learned not only that the masked one is a human being but how to go about striking terror into the uninitiated. They have learned the secret of incarnating the spirits of the dead by smearing themselves with paint and wearing masks. This knowledge does not do away with the sense of mystery, for even while knowing the nature of his mask, the member of a secret brotherhood continues to look upon the masks of superior members as truly supernatural beings. Moreover, the mask-wearer finally becomes fascinated with his own mask and by the fear that it elicits. "He no longer knows himself, a monstrous cry escapes his throat, the cry of a beast or a god, a superhuman outcry, a pure emanation of battle force, of creative passion, of boundless magic power by which he believes himself — by which he is, in this moment — possessed" (G. Buraud, *Les Masques*, Paris, 1948, p. 101).

The morphology of terror-producing masks is extremely rich. Principal sources of inspiration are the world of nightmares, death myths, demonology, and images relating to the process by which a cadaver is transformed into a skeleton. All these images of terror express the otherness of the dead, the different ways of becoming "other" (cadaver, skeleton, ghost, demon). The masks used in the "devil dances" (Tibet, China, Ceylon) are related both to the ritual for expelling demons (souls of the dead) and to that of initiation. In Tibet masks represent certain demonic beings that the soul meets after death. By attending the ritual dances, onlookers learn to overcome their fear of the death journey; they are prepared for encounters beyond the grave.

Sometimes masks represent superhuman beings not *in concreto* but in spirit. The best-known examples are the Zuñi kachina masks. The kachinas are spirits of the dead, more or less identified with ancestors. According to myth, they periodically used to return to visit the living; and whenever they took their leave, women followed them. The kachinas then decided to come no longer in person but in spirit. They commanded that masks be made resembling the ones they wore themselves in the other world and declared that they would be present in spirit in these masks. The masked dances are a re-creation of mythical times; they reproduce certain deeds performed by the kachinas at the dawn of time. The masks are neither theriomorphic nor terrifying. They are geometrical faces, abstractions. The geometrical design expresses the remote, the nonhuman, the transcendent. This is to say that the kachinas are exemplars, archetypes existing in another world, who, while remaining in touch with our own, transcend it.

The periodic visit of the kachinas has a religious function: they bring rain and bless the harvest. Among farming peoples, masked processions are believed to have a beneficent influence on cattle and crops. The Slavic and Balkan *kolyadi* are groups of young people, sometimes masked, who visit houses, singing and dancing, during the Twelve Days of Christmas. Their songs (*kolyadki*) invoke the harvest's abundance and the cattle's increase. But the association with the spirits of the dead is plain: if they enter a house in which the family has lately lost a member, the *kolyedari* bring news of the departed. In fact, some Bulgarian masks simulate a death's head. The *kolyedari* and their counterparts in other parts of central Europe are masked, carry trappings shaped like goats or horses, and make noise with bells or other instruments. Their masks are theriomorphic (stags, goats, foxes, eagles, and so on) or represent various figures from Christian folklore (the Devil, for example). The procession takes place during the 12 days between Christmas and Epiphany or during carnival.

These masked processions carry animal effigies curiously vestigial of Dionysiac processions, and in so far as elements of cults of the dead and of agricultural religion are present in the Dionysiac tradition, this resemblance in folk custom is easily explainable. But the mask is still more closely linked with the cult of Dionysos, for it played a leading role in the origin of tragedy. In this case the mask is anthropomorphous, but the human element is transfigured by the mask's very structure; the rigidity, the fixity, and immobility of feature do not belong to an ordinary man; only gods or the dead present such immobility of expression, while still being able to speak, to communicate their desires and their thoughts. The context here is that of another cultural sphere, the expression of another level of consciousness. Despite its anthropomorphism, the Greek mask, too, depicts an archetype, an exemplar. The play — whether tragedy or comedy — reenacts a fabulous deed performed by type characters in paradigmatic situations. The actor temporarily loses his identity: he becomes another, he *is* the character he enacts. Masks used in Japanese drama have a like function: they help to transcend earthly space and time and lead the audience into a world where it is not men who move, but types.

Gold funerary masks are attested from as long ago as the 2d millennium B.C. in the Cretan-Mycenaean age (IV, PLS. 73, 449). Perhaps they should be thought of as portraits, specifically death portraits, since the fine gold leaf was surely molded on the dead man's face. The Romans molded faces in wax and painted them in natural colors; these were used during the rites for the dead and were preserved later (see below). But long before molds were employed to preserve a likeness of the dead, there were funerary masks. They are found in gold, silver, bronze, or terra cotta, from Mesopotamia and Phoenicia to England, in the valley of the Danube, and in the Crimea. The idea is everywhere the same: the preservation of the dead person. The means and meaning of the preservation vary from culture to culture. In the Minusinsk region (the Tashtyk culture), plaster masks were made to preserve the individuality of the dead man, along with his soul substance (derived from the ancestors), which was retained in his bones or ashes.

Some death masks were, in fact, supplementary to mummification and later became a substitution for it. In front of or upon the case in which a body was mummified, the ancient Peruvians placed a rude wooden image, fashioned while a man was still alive and usually painted and adorned with human hair or a headdress. In Melanesia the skull itself served as a mask during the sacred dances. Obviously, in this case, it was no longer a matter of making a death mask, a portrait or representation of the dead. The skull itself represented the departed and preserved the essentials. Closer to the idea of a portrait mask are Etruscan funerary urns in the shape of a human face (e.g., those from Chiusi, 7th cent. B.C.; PL. 352; V, PL. 28), a variant of the anthropomorphous urn. The attempt was to preserve the identity of the man's ashes, or, more exactly, to connect them with the face that was shown to his fellows in his lifetime.

Masks, then, are always, in one way or another, bound up with the idea of time. Whatever sort of mask is worn, the wearer transcends earthly time. Whether ritual, funerary, or for any spectacle, the mask is an instrument of ecstasy. He who wears one is no longer himself, since he is projected beyond his personal temporal identity. He becomes "other," even when the mask is his own portrait.

The mask's capacity for existence on another time level perhaps explains its dual function: alienation of the personality (ritual and theater masks), and preservation of the personality (death masks and portraits). Both cases exemplify a reactiva-

tion of past time: primordial time in the case of ritual and spectacle masks; historic and personal time in the case of death masks and portraits. Primordial mythological time, reactualized by ritual and spectacle masks, can be *lived*, but only by means of changing the personality and becoming "other." On the other hand, death masks and portraits reactualize historic time, which is not only past but dead, for no one can relive the inner life of anyone else. In either case, the time implied by the mask is ecstatic time, removed from the here and now. Whatever its type, every mask proclaims the presence of some being who does not belong to the everyday world.

Mircea ELIADE

ANTIQUITY: *From the full head to the mask.* As is well known, the detached head, be it human or animal, still covered with skin, embalmed, or stripped of flesh to the skull, has played an important role in universal belief ever since prehistoric times.

In accordance with the principle of *pars pro toto*, it stands for the entire being of which it is the principal part, the seat of life, of the soul and its faculties, of the individual character. Even though dead, the head preserves its properties, which may be exploited by the living. The face (the "mask") especially expresses personality, through the eyes (the "windows of the soul"), through the mouth, by which communication with others is possible, and through the various other features. Once again *pars pro toto*, the face stands for the entire head. One more simplification: the eye, as the most meaningful part, in itself often suffices to represent both the head and the face, as well as the entire person.

To hide the face symbolizes withdrawal from the normal world of the living. In ancient Egypt the face of a criminal being led to execution was veiled, and the order "let his face be covered" was tantamount to the death sentence. The faces of the dying were veiled, and this isolation veil was used in many situations: Cyrenaic funeral busts of dead persons or chthonian deities consisted of a head with hair but without facial features (VII, PL. 406). The dead were also shown without mouths, for they do not speak, with closed eyes, for they do not see; they are eternally mute and blind in the darkness, solitude, and silence of the other world. A face devoid of these features is not of this world.

Examples of this transition from preserved head and skull to artificial masks are still to be found in primitive cultures. Heads are preserved in various ways: the skull is covered with clay or some other substance, which is molded, painted, and decorated in the semblance of a face. The back of the skull may be removed, leaving only the front part, which is covered with clay and shaped into a face, thus turning it into a half-natural, half-artificial mask.

In art forms the same correspondence exists between the whole head, the mask, and the eyes. In Egypt, the custom of laying a mask over the face of the dead body (PLS. 351, 353), which appeared at the beginning of the Middle Kingdom, originated in the ritual practice of placing substitute heads of stone in 4th-dynasty tombs. This progressive simplification may be followed also in the treatment of the Greek Gorgon. It is shown either standing or simply as a head, the gorgoneion; in black-figure vase paintings this mask is reduced to two eyes, eyebrows, and a nose, then to the apotropaic image of two eyes only (PL. 245). These various forms all possess the same virtues and, because of the image's magic power, correspond to the actual being they are meant to represent. (Regarding the identification of the model with its figural representation, see MAGIC.)

Heads and masks of deities and other supernatural beings. Deities may be depicted in the form of isolated heads. The Greek herms consisted of a head set on a pillar which also bore a phallus; it was not a sacred and aniconic stone or pillar that had evolved into an anthropomorphic image, nor was it a statue in a simplified form. The essential element was not the pillar, but rather the two emblems of life, the head and the phallus, of which the pillar was merely the support, as Macrobius pointed out. In the archaic period, Dionysos was often represented by a bearded mask attached to the top of a wooden pole or pillar, hung with robes, into which branches were stuck to signify his role as a god of vegetation and tree god. There are many such examples in Greek vase paintings, and stone masks of the god have also been found. Here too the important thing is not the pillar but the mask; Dionysos appears as a "mask god." Until the end of antiquity, masks of Dionysos were used to decorate reliefs and were applied to vases and to various other objects. Since masks had a ritual function in the cult of the god, his companions, the sileni and satyrs, were also represented by masks. Among many other mythological deities whose masks are known were Acheloos, Oceanus, and Zeus Ammon. In Celtic Gaul, even after it was Romanized, deities were personified by stone heads on busts or large pedestals and by repoussé metal masks mounted on wooden stakes (cf. III, PL. 111). Everywhere masks were also used to represent demonic beings (e.g., in Greece, the gorgoneion; VII, PLS. 38, 52) and spirits of water, trees, mountains, and so forth — in general, the spirits of terrestrial fertility, subterranean spirits, and spirits of the dead. Thus masks embody, beneath the features assigned to them, the innumerable supernatural and invisible beings who surround the living, beings who represent for the living another world, maleficent or benign.

Funeral masks. Dionysos was not only a god of vegetation; he was also a god of the dead, the notions of life and death having always been closely associated. He was commonly represented by a mask, just as everywhere, certainly since paleolithic times, the spirits of the dead, the souls of ancestors, have been represented by masks or appeared as masked beings. Such beings have been worshiped and appeased in rites during which they were personified by masked figures who performed dances or pantomimes. These rites were one of the sources of theatrical representations, for example, in Greece, the Dionysiac rites.

The effigy of a dead person could take the form of a half statue, a bust cut off at the midriff (IV, PL. 339). Such busts appeared to be still half buried in the ground, only partially protruding. This sort of funeral monument always had the same meaning, even in Roman art, where the form was secularized and used to commemorate the living. There were also busts of underworld deities, guardians of the dead, who seemed to rise up out of the earth.

The deceased was frequently represented by the head alone. In Egypt substitute heads of stone were placed in tombs to assure the departed person's continued existence; a stone head of the deceased, as well as a bust, was placed above the false door of the tomb. In Greece gravestones consisted of a human head at the top of a pillar. Among the innumerable examples of funeral masks those of pre-Hellenic Mycenae and of Trebenište (Yugoslavia, 6th cent. B.C.) are notable. The mask may be placed directly over the face of the dead, since it is frequently only a thin sheet of pressed gold foil that covers either the whole face or just the eyes and the mouth. Both kinds have been found in Syrian necropolises such as that in Emesa (mod. Homs), from the 1st century of our era. Masks were buried next to the body, attached to the coffin (Mycenae), or carved and molded on the lid of the sarcophagus over the spot where the head of the body lay (PL. 352; IV, PL. 449). Funeral masks have been interpreted in various ways: because of their durable and sometimes incorruptible material (such as gold), they preserve the features of the deceased, effaced by death; they afford the tangible substitute that is indispensable to funeral rites; they enable the dead person to remain in contact with the living; they help him to exist in the other world, and on his final journey they ward off evil spirits who, failing to recognize him, leave him in peace. A man's funeral mask protects him and, when placed on his face, may take the form of a guardian deity. But the underlying principle, basic to all these various meanings, is that the mask, like the head, is regarded as the seat of life of the soul.

Masks of divinities, of grimacing demons — like the Punic masks — and theater masks were put into the tomb to protect it; they were hung on the door of the vault, on the funeral shrine, or carved on the sarcophagus. From prehistoric Troy through the Roman period, urns with human faces or Etruscan canopic

vases surmounted by heads (V, PL. 28) and containing the ashes of the dead represented either the dead person himself or some mortuary deity. Phalli were sometimes molded on the side of the urn, thus uniting, as in the Greek herms, the vital parts, the head and the reproductive organ.

Such masks were not always conventional but were intended to reproduce the real lineaments of the deceased, as is evident as early as some of the Mycenaean gold masks, and especially when they were made by taking a mold of the dead person's face.

Funeral rites as practiced in Rome offer a typical example. A cast was taken of the dead man's face. When the body was laid out in state, the death mask thus obtained was placed over the face; during the funeral procession, it was worn by an actor, who thus took on the identity of the deceased. It was then placed in the tomb. (Two such masks, in wax, were found in a Cumaean tomb along with the remains of skeletons.) After burial a copy of this mask, mounted on a bust, was set up in the atrium together with those of other members of the family who had died before. These latter, worn by actors, were also carried in the funeral procession. The busts formed a gallery of ancestors, the *imagines majorum*, and proud was the family who possessed the *jus imaginum*. This custom of using death masks as mementos and substitutes for the deceased has been observed down to modern times, for example, in the funerals of the French kings. At the death of Henry IV of France, a mold taken of his face was used for casting a wax bust that was fastened to a dummy dressed in the royal robes, laid out in state, then later displayed in the funeral procession. It was also used as a model for numerous portraits of the king. Even today the faces of people one wants to remember are cast in plaster.

Ceremonial masks and ritual masquerades. Just as with the apparel of a god or the skin of a sacred animal, the mask, in accordance with the principle of sympathetic magic, transforms its bearer into whomever it personifies. The being so portrayed temporarily assimilates the wearer and invests him with his powers. So a mask is worn not so much to imitate or to deceive as to take on another identity. This is the origin, in primitive as well as in ancient and modern civilizations, of many ritual masquerades accompanied by dancing, which aroused a state of mystic ecstasy and facilitated this identity with the attitudes and actions of the model, the purpose being to make the model a real presence.

In Greece, the terra-cotta masks in the temple of Artemis Orthia at Sparta, dating from the 7th–6th century B.C., are votive masks but are copied from wooden cult masks. At Pheneos, in Arcadia, the priest of Demeter Kidaria put on the mask of the goddess and beat the ground with a stick to scourge the spirits of the underworld. The mask of Artemis was worn in the Laconian cults of Artemis Korythalia in Sparta, of Artemis Alpheia in Pisatis, and of another Laconian Artemis who took the shape of ugly women. During the Karneia in Sparta, youths would pursue a masked figure who undoubtedly represented Apollo Karneios.

Animal masks caused men to be mystically changed into animals. Masquerades of animal masks are common in primitive cultures and date from prehistoric times. The "sorcerer" of the Trois-Frères cave mentioned above is a good example. Animal masks existed in Mesopotamia, in Egypt, in Greece, both pre-Hellenic (for example, a Mycenaean fresco showing men with donkey heads; on gems) and Hellenic. In Dionysiac rites, masks in human and animal forms (bull and he-goat) were worn to represent the god and his companions, and even at the time of Demosthenes one could take part in Dionysiac processions only if wearing a face mask. These ritual masks were also known to certain Roman cults. Men disguised themselves as animals, but the animals also took on human guises, and it is sometimes difficult to make a clear distinction between the various forms and meanings. Some animals were able to impersonate others. In the tombs of Pazyryk (Altai) horses were given headpieces in the shape of elk and reindeer masks, that they might symbolize these animals as escorts to guide the dead to the other world, or to combine the psychopomp roles of horse and deer.

These masquerades achieved various effects. They honored the beings represented by the masks in either human or animal form; they appeased and propitiated them in the rites of gods or demons and in the offerings to ancestral spirits or to the dead. During the hunt — and this was particularly the case with primitive and prehistoric masquerades — the masks not only identified the wearer with the quarry, thus enabling him to approach it without arousing suspicion, but because of the occult power inherent in the masks, they also acted on the prey, making it easy to kill or causing it to appear in abundance. Masquerades induced fecundity, the vegetal, animal, and human fertility imparted by the god. Those associated with Laconian Artemis cults and the worship of Dionysos were actually vegetation and fertility rites. They also played a role in the rites of probation and initiation of adolescents. They guarded against evil and warded off its power.

Masquerades have survived in Christianity. The Church has accepted some, condemned others as heathen and diabolic; but many maquerades still bear traces of their original meaning, although others have become mere nonreligious pastimes.

Theater masks. In some countries, actors never appeared on stage without masks: in Japan, in Java, in ancient Greece, for tragedies, comedies, and satirical plays, and in Rome, for pantomimes as well (PLS. 360, 361, 364). This practice was everywhere derived from the ritual masquerades discussed above with relation to god cults and the veneration of the dead. In Greece theatrical representations originated in the cult masquerades of Dionysos, as the god of vegetation and of death and resurrection, and in other funeral rites. In Rome theater masks were also related to religious ceremonies; in the autumn festivities of Tellus and Silvanus the peasants would smear their faces with minium or put on masks of bark and amuse themselves by exchanging coarse jokes, as in the Bacchic Comus. With time, the original meaning became obscured, but theater masks continued to be used, divorced from religion, personifying the nonreligious characters required by the action. They nevertheless kept their original apotropaic function and were still used in mortuary decoration.

Apotropaic masks. That the human head, whether whole, in its natural state, or reduced to a skull, a mask, or even the eye, possesses apotropaic powers is one of man's instinctive beliefs; and the human head has fulfilled this function from prehistoric times down through the ages. Artificial masks derived from the head were endowed with the same powers, in addition to those possessed by the particular being represented and to the ritual use to which they were put. Such masks represented gods and other supernatural and mythical beings — Dionysos, sileni and satyrs, or demons, such as the Gorgon — and theatrical identities, tragic (and the term is used here also in the modern sense, pertaining to the terrible and frightening) or comic, which warded off evil through laughter. And there were many, many others. They were used wherever their protection was deemed useful; masks of Gorgons, of sileni, satyrs, and others adorned antefixes, acroteria, and pediments of temples and other religious, funerary, and nonreligious buildings (V, PL. 38). They were placed on tombs and on personal belongings, and in fields and gardens they watched over the harvest. Some masks guarded against and cured illnesses and warded off the evil spirits that caused them, according to a primitive belief by which illness was chased away through the sympathetic, homeopathic practice of reproducing the outward effects of the disease in question. War masks protected warriors by means of the expressions and attributes depicted; they transmitted the powers of the subjects represented and terrorized the enemy. Face helmets, chiefly Roman, and battle and ceremonial arms were also related to funeral masks and placed in tombs; they belong to the same category. There were disciplinary and penal masks — avenging spirits often appeared masked — worn to enforce the observance of social laws. On punitive expeditions the guilty party was forced to wear a mask as a penalty for certain misdemeanors.

The fear of masks and death. Given the relation between masks and deities (especially chthonian deities), demons, and the often malicious spirits of the dead, the fear that masks inspire is understandable, for they evoke a world of mystery and threat. They summon up the idea of death, which they not only represent but can even bring about, like the mask of the Gorgon which turned whoever gazed upon it to stone. They resemble the faces of dead people, possessing the same rigidity, the same set expression, the livid pallor and chalky complexion. For this reason, in the theater Thespis made use of a mask of the same white plaster that was used for death masks, a material serving also in various funeral and mystic initiation rites.

Children, and many adults, are still afraid of masks. According to popular tradition, masks representing demons and souls of the dead frighten children, and parents sometimes resort to them as threats when children are disobedient. Plutarch remarked that when a small child is afraid of masks, his fear can be calmed by placing them in his hand and turning them around to be seen from all sides. On Roman sarcophagi a child is shown completely hidden by a large silenus mask; all that can be seen of the child is his hand sticking out of the mouth, as though he had been eaten. He amuses himself by terrifying a small companion standing in front, trembling with fright. This is not a simple game, for the mask of the man-eating monster symbolizes the annual death and resurrection of the cult of Dionysos. A statue in the Villa Albani, Rome, repeats this motif, and it is undoubtedly funerary. Pliny recounts that the comic actor Marcus Ofilius Hilarius gave a birthday dinner after having scored a great public success; during the meal, he fixed his gaze on the mask he had always worn on stage, removed his festive wreath, and died without anyone realizing it. On gravestones the dead person is shown carrying a theater mask in his hand or gazing at one set up in front of him. On a sarcophagus relief, a young woman is shown on her deathbed, surrounded by relatives and friends in mourning; behind her is a small cupboard containing a theater mask, undoubtedly representing, as a sort of anticipation, the images that would be carried in the procession. In the light of their origins, theater masks often have a funerary meaning, and for this reason often appear alone on many sarcophagi and reliefs and are even placed inside tombs.

Ornamental masks. Like many other objects that in time lost their original meaning, the mask was often used, even in ancient times, as an ornament, a decorative motif (PL. 365), or for entertainment, without thought of the ideas which had produced it.

The artist had numerous possibilities for depicting masks in a wide range of concepts and types, but masks have done more than provide the artist with an abundant repertory; they have influenced the rendering of the human face in art, acting as a vehicle for realism, by differentiating one face from another through individual characteristics of expression, contrary to the idealism that led to a certain uniformity.

Spirits were frequently thought of as hideous and terrifying, an aspect which masks have rendered with sometimes remarkable intensity. In antiquity the masks used in the sanctuary of Artemis Orthia and those found in Punic tombs, and in modern times carnival masks, are examples of this. Masks focus the artist's attention on the ugliness and deformities of the human face, which are no less interesting than its beauties. Theater masks have also contributed to this differentiation process, as is clear from a study of Greek literature and figural monuments. They have not only characterized human types through facial expression, establishing the distinguishing features of sex, age, and social condition, but they have also enabled men to give expression to emotions and passion, from the tragic to the comic, from sadness and despair to effusive joy and laughter. Masks have participated in the trend toward a realism, not only physical but moral, which, so long as idealism reigned supreme in Greek art, showed up only vaguely and was limited to certain specific subjects, until it gained ascendancy and imposed its influence during the 4th century B.C., notably in the Hellenistic period. Death masks stimulated individual realism in portrait sculpture especially through the procedure of making molds of the faces of the deceased, a process known in Egypt, Carthage, and Greece, where its invention was attributed to Lysistratos, the brother of Lysippos. It was also known in Etruria and in Rome, where the image taken from the mold of the dead person's face led to the well-known realism of Roman portraits, some of which seem to have been copied directly from death masks. It is interesting to note that this same process of casting a person's face after death also gave rise to realism in portraiture in the Middle Ages (at the end of the 13th or the beginning of the 14th century) and during the Renaissance.

Waldemar DEONNA

FOLK MASKS IN EUROPE. A knowledge of ancient civilizations and a comparative study of primitive civilizations facilitates understanding of many of the masked ceremonies of European peoples.

Masked folk ceremonies are always held at specific times: at the beginning or the end of the year, according to the dates calculated by the various ancient calendar systems, or at the beginning or end of the cycle of the seasons. From earliest times the intercalary days between the last month of the old period and the first month of the new have been considered a particularly dangerous time. The supernatural world was unleashed. The souls of the dead returned from beyond the grave to punish the misdeeds of the living or to bring good luck. For thousands of years men have chosen this period as a time for ritualistic masquerade. By assuming the forms of demons and the ghosts of their ancestors, they have kept in contact with the supernatural world and at the same time, by their sinister behavior, have managed to intimidate the other members of their clan or social group. The right to masquerade was later taken over by younger people, and this remains true to this day.

The primitive ritual ceremonies, which here and there developed into primitive drama, were aimed at preventing the souls of the dead or other evil spirits from causing harm. At the same time they were intended to win the spirits' favor. That is, the peoples hoped, by means of homeopathic magic, to eliminate evil and assure good for the new period about to begin. It was necessary to do penance in atonement for past misdeeds, and it seems that gifts gathered at the compulsory collection served as propitiatory offerings, and public condemnation of the vices of the community helped to banish evil. Evil itself was often personified and represented by a dummy that might be hanged, buried, or burned. The actions of a symbolic couple — actions which nowadays would be considered obscene, since they imitated coitus in public (*coram publico*) and childbirth — were, in fact, ritualistic magic used to guarantee fecundity. The same idea lay behind the customary sprinkling of water and ashes, the soiling, the blows and beatings, and so on. The costumes assumed to represent the spirits of the dead reflected the popular concepts of beings from the other world. These were terrifying forms that always expressed the numina, whether they represented animals (theriomorphic forms) or purely supernatural beings (usually anthropomorphic), or whether the costume was simply white. The behavior of the maskers tended also to create the impression of supernatural beings: their rhythmic gait or dance, loud noises made with bells or jingles, and utter silence on the part of the figures, who remained mute as silent shades (*umbrae silentes*) or spoke only in a high falsetto.

With the decline of the Roman Empire and of the religious world of antiquity, the old rites, which were a product of pagan mythology, were transformed into playful travesties. The Byzantine mimes advanced this process by standardizing certain typical characters, which were quickly absorbed into folk ceremonies. Thus the Balkan Peninsula, placed midway between the civilizations of the Levant and the Near East and those of western Europe, became the point of departure for influences and ideas which, thanks to the mimes, spread thoughout the domain of the ancient Roman Empire. This explains the striking similarities, the same types of characters, the same ritualistic traits that are found all over continental Europe from the Balkans to England and into the Scandinavian countries. How-

ever, the majority of peoples have also developed their own variations on these themes, variations related to their own traditions and the conditions created by the Middle Ages, the Renaissance, and even modern times. Everywhere folk masquerades have been the exclusive privilege of men. The intrusion of women is a sign of the breaking up of the tradition. Everywhere the seasonal masked processions revolve around a central character who personifies the past period and who is often replaced by a dummy. Sometimes he is accompanied by a female character (a young man in women's garb).

The Balkans, which were separated from the rest of Western civilization under the Ottoman empire, preserved their ancient forms even when they accepted certain Turkish elements. Archaic forms are preserved up to the present day in the folk ceremonies of Greece, Macedonia, Bulgaria, Serbia, and Romania. They make their appearance during the Twelve Days of Christmas and the end of carnival. Everywhere the participants recall the ancient satyrs. They dress in goatskins and assume anthropomorphic or theriomorphic shapes; bells on the belt are *de rigueur*, and a bag of ashes is frequently carried. The principal character is accompanied by his "spouse." The couple are known in Greece as the Kalogheroi, among the Slavs as the Kuker (or Kuk) and the Kukerica (Ded and Baba; the Old Man and Old Woman). In Romania the Cuci corresponds to the Slavic Kuker. The man's disguise is much the same everywhere: goatskins, mask, or hat-mask with characteristic ornaments (two branches for horns decorated with feathers or perhaps even crows' wings), a belt with cowbells, and a large wooden phallus painted red. Here and there one finds in the group a king and queen, a doctor, a pope, a Jew, and in recent times, Gypsies, brigands, Albanians, Moors, and devils. Among the theriomorphic characters the Bear is very widespread, as is also the Camel, though a little less so. But by far the most interesting is the Goat.

The Goat is a particular characteristic of Romanian processions, but it is also very widespread throughout a large part of northern Europe. In the Romanian version of this seasonal drama, the Goat is called Brezaia but is known also as Turcă or just Capră (Goat). Usually it is accompanied by a hunchback, known as the Old Man (Moş, Moşul). The Brezaia is both goat and wife at the same time and stands out by reason of the bright colors of the costume (neckerchief, blanket), which is sometimes made simply of many-colored rags. These derive from the *centunculus*, or patchwork garment of the ancient Roman *mimus*. The majority of the processions, with their terrific noise of bells and their singing and dancing the *kolo* (a round dance), are associated with taking up a collection, but the maskers also perform their little dramas retaining vestiges of more ancient primitive spectacles. Very often one of the characters is killed in order to be resuscitated by the Doctor. In the eastern Balkans, ritual plowing of the land is also presented. Very often the representations and performances are rather free. Sometimes there are ritual mimes in which quite remarkable battles spring up between certain masked groups when they meet. Originally the dead were buried in a special graveyard, but the killers in this ritual combat were never punished. The wearer of the Brezaia mask in Romania was considered excommunicated for seven years.

One can easily trace the same traditions among the Serbs and Croats. There the two old people, the ritual buffoon couple, are called Djed and Baba, and the processions are often called D(j)edovi. The Turica appears in Dubrovnik and has counterparts in Poland and Romania. He frightens children with his cracking jaw. In Bosnia the Old Man, accompanied by Jews, leads the Goat. On the frontiers of Slovenia and in the Croatian region around Kastav, the maskers are the Zvončari. All these, with goatskins on their backs, bells on their rumps, skin hat-masks on their heads, a cudgel (the old phallus?) in one hand, and a bag of ashes in the other, form a link in the chain of tradition that stretches from the Balkans to beyond the Alps. In the Croatian region of Slavonia ritual plowing takes place on Shrove Tuesday and, as is more often the case, on Ash Wednesday. The custom is the continuation of a ceremony that is well known in Bulgaria and Romania. In Croatia Carnival himself (Pust, Krnjo) is put on trial and, after a satirical defense speech, is condemned to be drowned, hanged, or burned — a cultural trait that must be considered Western rather than Eastern.

In Slovenia there are numerous characters who dress in sheepskin coats worn inside out, with bells hanging from their belts, and wear skin masks that are frequently decorated with horns. The most remarkable are the Kurenti from around Ptuj. These maskers bear a startling resemblance to those called Kukeri in the Balkans. Moreover, they also perform ritual plowing, and a fight breaks out when two rival groups happen to meet. The Laufarji at Cerkno, also in Slovenia, are interesting for their wooden masks; Carnival (Pust), in the guise of the Wild Man, is condemned on the spot and executed. There is usually a funeral for him, and this gives rise to new inventiveness. In masked ceremonies, the Bear and the Horse make their appearance. The Horse is represented by one or often two persons and has various names: Camel (Kamela, Gambela), Horse (Rusa), Doe (Košuta). Masked processions take place during carnival; the Šeme of the Bohinj Valley in the Alps make their rounds during the New Year celebration.

In Slovenian territory, at the extreme west of Yugoslavia, is found a mythical (and carnival) character, Perhta, who is similar to the Italian Befana and seems to be a result of the mingling of two mythological streams: the Illyrian-Slav (basically Greco-Roman) and the Germanic, especially as represented by the Bavarian. From the 8th-century duchy of Carantania, Perhta has spread all along the northern frontier of present-day Slovenian territory and has penetrated the German regions of the eastern Alps (Austria, Bavaria) as far as Bohemia. In folk imagination Perhta is a horrible personage dressed as a terrifying old woman with a frightful mask. On the eve of Epiphany she is chased through the streets by children making as much noise as they can. In northeast Slovenia Perhta takes the form of Lucija or Luca (Lucy), an equally frightening spirit who sets children atremble on St. Lucy's Day. Perhta has thus enriched the folk traditions in central Europe since the Middle Ages (8th cent.?). Another masked character in Slovenia is the famous Green George (Zeleni Jurij), a youth enveloped in green branches, who in the past was led through Slovene villages and neighboring Croat districts on St. George's Day. In olden days the processions of St. Nicholas were very impressive, and bands of singers masked as the Three Kings were numerous.

Slovene masks are a foretaste of the wealth of masked ceremonies that exist in the Alps and still preserve the typology of a common heritage. The Austrian regions (Styria, Carinthia, Salzburg, Tirol), Switzerland, and the German lands (particularly Bavaria) excel in masks. The masquerades take place at carnival, but there are also New Year's maskers who "hunt the Perchten" and maskers in St. Nicholas processions (influenced by the cult of the saint and propagated by St. Gall in Switzerland). Then there are the spectacles presented by singers representing Christmas and the Three Kings.

In the heart of the Alps the Perchten predominate. There are two kinds: ugly and evil ones (Schiachenperchten), and beneficent and beautiful ones (Schönperchten). The ugly ones are personages with frightening wooden masks who wear sheepskins and have many bells hanging from their belts. They create a terrific noise and perform frenzied dances. Perchten are still found in northern Carinthia (Mölltal), though only the ugly ones are known there, but the best-known Perchten are found in Salzburg and the Tirol. In Salzburg the Perchtenlaufen of Pongau and Gastein have become important tourist attractions. The headdresses of the beautiful ones are 4 to 5 ft. tall and are exuberantly decorated with loops, ribbons, and flowers, and their masks have a sweet expression. Along with the Perchten of both types, there are also certain familiar masked characters: the farcical couple, the Bird with the Long Beak (Schnabelpercht), the Hobbyhorse (Schimmelreiter), the Devil, the Quack Doctor, the Capuchin Monk, the Gypsy, the Turk, the Jester (dressed in white), and the Wild Man. Ritual plowing of the land takes place. In the Tirol both the beautiful and the ugly Perchten are assisted by the Huttler, who are dressed

in multicolored rags like the *centunculus*, and by Wild Men. In some places other shaggy, running mummers parallel the Perchten: the Klöpfler (Tirol) and the Schemen (Salzburg).

In the German-Swabian territory Perchta is replaced by St. Nicholas, known as Klas or Kläuse in eastern Switzerland. The Klausen stand out by reason of their headdress, a miter, often with ribbons (as in Appenzell) recalling the decorative headdresses of the Perchten. In Glarus canton these headdresses are illuminated. The Germanic-Swiss influence spreads into neighboring Germany (Swabia, Württemberg, Baden), where the ceremony is known as Klausengehen, and to the north, where St. Nicholas is accompanied by Knecht Ruprecht, the German Christmas character, and the Christ child (Christkind). They are assisted by the Horse, the Bear (Erbsenbär, dressed in pea vines), the Goat (she-goat or he-goat), and the Stork. The Swiss-German influence is also felt in Austria. The headdresses of the Glöckler of Aussee (Styria) and of the Salzkammergut (Salzburg) are simply stylizations of the miter of St. Nicholas. After 1850 in some parts of Salzburg and Styria, Perchta was completely replaced by St. Nicholas, and the devil was used only to frighten children. The good saint finds himself in the company of the Deer, the Ox, the Goat, the Fox, and the Bear.

With the coming of carnival, frightening masks make their appearance once again under different names. There are quite a considerable number associated with the ritual plowing in Styria (Unzmarkt) and especially in the Tirol. Here the most important ceremony (Schemenlaufen) takes place at Imst, at Thaur, and at Telfs. The Wild Men, the Harlequins (Huttler, Zottler at Hall), and ritual plowing are recurring elements. Bavaria has the same thing, with the important masquerades of Garmisch-Partenkirchen, the Lake Constance area (Überlingen, with its Hänsele, or harlequins), and Donaueschingen, with Hanseli, Blätzlebue (harlequins), Wild Man, and the Horse. The Horse is the most important character in the carnivals of Württemberg (Tübingen). In the company of the Bear he is killed and then brought back to life (or buried). More or less identical ceremonies exist in Westphalia.

In a few of the most isolated valleys of Switzerland, the old carnival masks have been preserved. The most famous are those of the Roitschäggäten of Lötschental, Valais (Wallis) canton, who are dressed in sheepskins, with their faces hidden by typical frightening wooden masks (PL. 359), and make a loud din with bells tied to their belts. Very similar to these are the masks found in the region near Sargans. Here the harlequins are called Huttli or Plätzlimannli. The types of masquerade found in Einsiedeln (Mummerie, Hörelibajasse, Johee) are characterized by beautiful smiling masks; here also little cakes are distributed to the crowd. Finally, at the cowherd's fair (Älplerkilbi) in the region of Lake Lucerne, people disguise themselves as Wild Men (Tschämeler), and, after a railing criticism of the neighborhood, there is a repast of sweets. Also worthy of note are the masked ceremonies of spring: the Fête Feuillu in Geneva canton and the May Bear (Maibär) of Bad Ragaz, which is like the Slovene Green George.

North Germany seems more austere. However, the Goat, the Bear, and among the Sorbs of Lusatia (Lausitz) the Bear, the Horse, and the Camel still take part in the carnival season.

Impressive carnival observances are held in certain large towns. In Switzerland there is a traditional procession at Basel with the Lion, the Wild Man, and the Griffon. In Germany King Carnival rules not only in Cologne but also in Mainz, Düsseldorf, and elsewhere. The Schönbartlaufen (or Schembartlaufen) of Nürnberg (begun in 1348–49) is a famous, picturesque, and historical carnival, though it is not strictly within the folk category.

Alpine elements spread to the neighboring Slav area and were partly adopted by the Hungarians, who were also subject to Balkan influences. Perchta, for example, went to Bohemia (Perechta, Šperechta), along with her Slovenian counterpart, Lucy. She is characterized by a long beak and white mantle, but she also appears with other terrifying masks and sometimes even with a horse's head. Sometimes she is accompanied by the Goat. Another influence in Bohemia that has come from the West is the St. Nicholas procession. At one time it was an occasion to bring out the full repertory of the masks: the Old Man and the Old Woman, the "Cracker" (either Goat or Horse; each has a mobile, snapping jaw), the Brigand, the Turk, Death, the Hussar, the Dragon, and St. Nicholas with his pageboy. The procession was led by a Herald (Laufr). These same characters can be found outside the St. Nicholas procession, during the Christmas period as well as at carnival. Theriomorphic characters are very frequent and recall the Horse and the Goat (Koza); the Bear is also very popular. The disguise of the Little Singers of the Kings is like that of central Europe. The carol singers make their rounds with a little portable crib (*betlehem*) and enact the roles of the shepherds adoring the Christ child.

A branch of the Alpine elements extends into Hungary, which has its Lucies (though without the assimilation to Perchta) and its St. Nicholas processions. The Kings' Singers are very popular, especially those with the portable crib and, sometimes, masked shepherds. The Hungarians also have adopted the Goat (Koza, Turka), and they enjoy celebrating the funeral of Winter. The Catholic Croatian population of southern Hungary, the Šokci, formerly used wooden masks (Busó) representing anthropomorphic characters, often horned. The carnival ceremonies (loud noises, drum beating, etc.) recall those of the Balkans, but the masks testify to Alpine origins.

The Goat seems to be the most popular mask in Poland. A wooden goat's head, with real horns, bells, and a tow beard, is fixed to the end of a stick. Multicolored cloth, decorated with ornaments, is used to cover a young boy, who bends down and leans on the stick while walking and turning somersaults. One variation of the Goat figure type is called Tur or Turoń, which means urus (*Bos primigenius*). Since this animal became extinct in the 17th century, the mask is very indefinite and variable. Sometimes it resembles the Goat, sometimes the Ox, and sometimes even the Ram. It should be noted that Goat and Tur never appear together in a procession. It is significant that in Poland the archaic mask of the Goat should be associated with the carol singers. A young boy who carries the star and another with the portable crib (*szopka*) are accompanied by a third, who represents the Goat. With the aid of a musician they sing a *kolenda* (carol), and afterward the Goat does some clowning. Often the Bear, led by a Gypsy, also takes part in the procession. In some places the Bear is wrapped up in straw, sometimes even in pea vines, as is the custom in northern Germany. In the evening the older boys come with the Tur, who is led by the Old Man (Dziad) and accompanied by the Jew. The presence of the Tur excludes that of the Bear, a fact that is not without interest. The jokes are vulgar and are aimed particularly at the young girls. Among the Polish masks are found the Crane and the Stork, which occur among all the northern Slavs as far as the Finnish Ostyaks of Siberia. They are masks with long cracking beaks. The Cock, it seems, belongs to the same family. The Horse (Koń, Konik) does not appear except in areas where the Bear is known, and except for the head, his costume is no different from that of the Goat.

It is not difficult to follow the same kinds of masks farther north, across Russia. They are found even among the civilizations of the Caucasus, where Balkan and Near Eastern influences are frequent. The Russian regions have their masked ceremonies generally around the Christmas period. Masks are also found at nuptial feasts. The Goat and the Bear are the characters that are most widespread in White Russia and Little Russia. The Goat appears in the company of the Old Man (Ded) and sometimes a Gypsy. In one short scene, the Goat falls dead and the Old Man brings him back to life. Masking at wedding celebrations is usually limited to blackening the face with soot and wearing clothes of the opposite sex.

The common heritage of masked ceremonies has found full development in Italy, and from there it has spread to influence other neighboring peoples. In Italy, too, the people like to put on disguises at the end of the yearly cycle (Carnevale), or at the end of the cycle of the seasons (Calendimaggio). The central character personifies the past period or represents the chief of the ancestors who have returned from the grave.

The local names of this character differ, but just as the annual cycle superseded the seasonal cycle, so now the name Carnevale is common everywhere. Demonic masks were at first represented in Italy by devil masks. One type, Pulcinella (Punchinello), became for some time the characteristic mask of Italian carnival. (In time Pulcinella became a character of the *commedia dell'arte* and lost his diabolic connotations, but the costume remains; the English Punch, however, is quite a devil.) His black mask, beaked nose, white garb, hood, and stridulous voice were perfectly suited for imitating the soul of a dead man. Later he became localized around Naples, and today southern Italy is his kingdom. Usually he is assisted by other devils, and, as everywhere else, they wear sheepskins and black masks or have their faces made up with soot. They also create a great din with the bells that are hung from their belts. Devils also appear in central Italy (Abruzzi, Molise, the Marches, Tuscany). The islands, too, have demon masks at carnival and Easter. Sicily has some special examples (Mazzamurieddu, Varvarieddu, Zuppiddu), with whom are found devils (*diavolazzi*) and Jews, while groups of Pulcinellas take up the collection. The Mamutones of Sardinia are of particular interest, with their black masks and heavy bells on their belts. The realm of Harlequin is northern Italy and Piedmont. The Harlequin type existed before the *commedia dell'arte*, and because of his character he was the traditional demon par excellence. His costume can be recognized as the stylized form of the ragged suit which was inherited from the *centunculus* and which appeared all over Europe. In Lombardy and the Veneto, there is his counterpart Zanni, who also antedates the *commedia dell'arte*. He wears a red-and-white tunic and a pointed hat decorated with ribbons and cock feathers. His trousers are also red and white, and he has a bell attached to his rump. Generally speaking, the name Carnevale has imposed itself along with the regional and traditional names. Local spirit has often assigned separate proper names to Carnevale: Tomè, Giorgio, Paolinu, Biagio. It is he who undergoes, either in person or in effigy, the trial at which he is condemned to death and either burned or drowned. In northern and central Italy he is often accompanied by a female character: the Old Woman (La Vecchia), Befana, Quaresima (Lent). In the countryside, Carnevale is frequently replaced by the Bear (e.g., in the Friuli and Irpinia areas) and, in Alpine areas, by the Wild Man. The provinces of Italy are also familiar with the other characters of the common tradition: the Goat (Capra, in Monferrato, Mentana, Sicily), the buffoon couple (Lo Sposo and La Sposa), Death (La Morte, in Campania), the horned King with his Queen, the Doctor, the Priest (Corsica). But the *befanate*, or Befana and her husband Befano, and certain other masked characters of the villages are peculiar to Italy. Ritual plowing is customary in the Trentino, where the Zanni pull the plow. Italian maskers take up a collection, too, and claim the right to steal, as do all the maskers of Europe.

In France, folk masking for carnival is on the decline. There are some areas where masks are no longer found (Brittany, Touraine, Poitou, Vendée, Limousin, Berry, Orléanais), or where they are but rarely found (Guyenne, Gascony). "The disguises are simple, atypical and not individualized" (Van Gennep). The remains of an ancient heritage can be recognized in the Horse, which in France is called Bidoche or Bourrique, or else (after the manner of dissimulation) quite simply Échelle (Lyonnais, Languedoc, the Basque provinces, and Provence). The Bear (Pyrénées) and the Wild Man (Homme des Bois) are characters from primitive scenes still generally known. It is also very popular to present different categories of artisans or mock weddings in the processions. There are even the two different types of mask: the beautiful and the ugly, the Reds and the Blacks (Basque provinces). As elsewhere, the maskers take up a collection, soil passers-by, and sprinkle them with ashes, corn, or confetti. Carnival usually appears under the name of Caramantran. Very often he is replaced by an effigy which has to be buried or burned. It sometimes happens, though very rarely, that two groups of maskers will start to fight. As a general rule, however, when the tour has been completed, a communal feast is held. The famous Carnaval of Nice is based on a folk tradition of the Corporation of fishermen, but since 1860 it has became a fashionable manifestation like the carnival of Cologne and others.

The Iberian Peninsula still preserves some folk traditions that will soon be a thing of the past in France. The Spanish and Portuguese countrysides are familiar with the archaic devil masks that are found almost everywhere in Europe. In northeast Portugal the masks are made of wood, metal, and leather and depict anthropomorphic types, always frightening. They are decorated with animal elements, such as horns, hair, and serpents. It is curious, however, that the theriomorphic mask does not appear. The masked processions of the Caretas, the Chocalheiros, and others take place around Christmas time. The people taking part have costumes made of skins or tatters. They wear belts with bells and are armed with sticks with pigs' bladders attached. On the feast of St. Stephen (or at the Epiphany) the young men have their *festa dos rapazes*, when processions of young men dressed in sheepskins and with metal masks pass through the villages giving brief shows and finishing off the celebration with a community feast. On Ash Wednesday two masked figures, the Devil and Death, approach passers-by and force them to kneel down before them. The Spanish processions are more likely to enact the mock marriage ceremony or present spectacles of the death and resurrection of a hero. Once again figures of devils and spirits of the dead play important roles. The burial of the Rey del Mal Humor (King of Evil) is also a feature of Spanish carnival.

Belgium has managed to preserve what France is rapidly losing. This is due primarily to the ancient ceremony of the Big Fire (of Lent), around which center the Walloon mask customs. It appears, though, that the traditional disguises are vanishing. The young people are more and more contenting themselves with a military type of uniform and abandoning real masks. There still exists the tradition of the Old Woman and the Old Man, however, and certain beautiful and ugly characters (Barbençon). The life of the town is criticized in satirical lampoons, and ancient ritualistic battles still take place, though they are infrequent and lack conviction. The climax of all the ceremonies is the burning of an effigy (the Bolome, Jean Caton) suspended from a stake above the pyre. Besides these rustic ceremonies, there are carnivals in two small towns in Wallonia which have become famous: Fosse and, especially, Binche. In Fosse the townspeople have refined the costumes and the headdresses of the Chinels (short for Polichinelles), who are characterized by two humps, one on the back and the other on the chest. The Sapeurs of Fosse, in spite of their white aprons and trousers, show a clear relationship with the Wild Men by their jackets covered with ivy leaves. The carnival of Binche, with its famous Gilles, is more elaborate and more picturesque, even though it is slightly more sophisticated. The Binche mummers have also developed white costumes of an urban refinement (e.g., splendid headdresses made from ostrich plumes). They have, however, retained the belt with small bells attached to it, a bell on the breast, and the old-style wooden shoes. Tradition preserves the dances accompanied by a drum and hurdy-gurdy (*viole*), just as it preserves the custom of throwing fruit. In these days oranges are used.

In Flanders and the Netherlands, the Klaasen processions recall the St. Nicholas festivals of central Europe. In Flanders the masked processions are reduced to a few wagonloads of clowns (the Hoera, Sintrums, and Gekken) dressed in ragged costumes, who distribute clouts with pigs' bladders to the passers-by and throw confetti. In Brabant the traditional carnival is vanishing. Elsewhere, too, the observance is reduced to youngsters with the *rommelpot* collecting money. There is still the tradition of the right to steal and the burial of an effigy called Jan Poef.

The Baltic countries also share in the common mumming heritage of Europe. In Lithuania, the masked processions are made up of characters dressed in sheepskins and often with straw humps. Dressing in female attire is also very popular. There are grotesque masks made of bark or sheepskin, but for the most part the masks are of wood and are handed down from

father to son. Certain masked characters are referred to as "Jews." They pretend to be businessmen and to buy "cows," that is, young girls and women. As they pass they create a terrible noise, cracking whips and so on. In the houses they "steal" whatever they can find, especially food. If two groups happen to meet, there is bound to be a fight. Of the theriomorphic characters, the Horse, the Goat, and the Crane are the most popular. The Bear has vanished, but Death and the Devil are often seen. In general, the processions center around a dummy mounted on a sleigh. Sometimes it represents a woman with large breasts (the Little Mother), and sometimes it is a man (the Old Man or the Uncle). At midnight the dummy is either burned or thrown into the river.

The maskers of Latvia are called in some places Martins (Martini) or Kaladi (Russ., *kolyada*; L., *kalendae*). Masks as such are little used; the face is either blackened or covered with a cloth. Masks of bark occur rarely. The disguises often depict a family whose head is the Old Man, the father. However, it is more popular to have a betrothed couple with their train of Gypsies, Jews, representatives of the various trades, the Devil, Death, and ghosts. The Bear, the Crane, the Horse, and the Goat (he-goat or she-goat) are frequently found. The behavior of the maskers is traditional; they make a great din, steal, hand out blows, and throw water. Obscene jokes and gestures are universal.

The Nordic zone shows some rather particular elements. The Christmas Goat (Julbock) is found most frequently there, while all the rest seems to have faded. In Denmark the ram mask is not much used, even though carnival masquerades are popular in the towns along the sea. In Sweden masked processions are few, but those connected with Christmas are widespread throughout the whole country and are found also in Finland. The main character, the Christmas Goat, or in some places the Ram, has now largely been replaced by Jultomten (Father Christmas). Carnival masquerades take place only in the seaside towns of southern Sweden, a fact which would seem to point to Danish influence. Remaining from the old traditions are the ancient disguises for St. Lucia's Day, when the sexes exchange clothes. The costumes of the young men represent monsters or ghosts (white shirts, straw on the legs and arms — the Staffan is covered all over with straw). The Barber and the Doctor also appear. Bells are still used in northern Sweden, and ritual plowing is still performed in central Sweden. The maskers of St. Knut's Day (Knutsfolk) blacken their faces. Masked characters appear also at wedding festivals. In Norway, masked processions are known only at Christmas. Under the influence of Germany, Father Christmas (Julenisse) was introduced about 1900, and gradually he eliminated the old Christmas Goat. The latter, known as Julbock, was sometimes accompanied by the Christmas she-goat (Julgeita). The Goats wore horns, and their masks were made of skins, birch bark, cloth, or wood.

Beyond the English Channel some of the same characters appear. It is true that the English have not taken over the Continental carnival, but traditional disguises abound, especially around Christmas time and in the month of May. In December, for example, at Haxey in Lincolnshire the kingdom is taken over for one day by a Fool and his 12 companions (Boggins), who are dressed in red, wear high hats decorated with flowers, and have their faces painted black and red. On Plough Monday, in January, ritual plowing is carried out by young men called Plough Stots or Plough Bullocks. They are accompanied by the Fool with his female companion, Bessy (a boy dressed in women's clothes). With the plowing there are often sword dances and other spectacles presented by the mummers. In May, processions are organized with a young couple dressed in flowers (the King and Queen of the May, for example). The English counterpart of Green George is called Jack-in-the-Green. He too is covered with green branches.

The most important theriomorphic character in England is the famous Hobbyhorse. He is prominent in Cornwall; round as a round table, black as the devil, he parades through the village preceded by a choir of young girls and accompanied by the Teaser and his Horse Pairs. In the autumn festivities in Cheshire appears the archaic form of the Horse (the Wild Horse), who has a real horse's head and is covered with a real horsehide. On All Souls' Day, in the procession of the Soulers, there is a character with a ram's head who wears a sheepskin. The most famous instance of theriomorphic elements is to be found in the Abbots Bromley Antler (or Horn) Dance. Six dancers hold before their faces magnificent stag antlers. The rest of the troupe is made up of the Fool with his female companion, along with a Hobbyhorse who makes a cracking sound with his lower jaw. In England masks also appear in the mummers' plays, a form of traditional folk drama not unlike the Balkan Kukeri. Usually the hero, for example St. George, kills his adversary (the Turk), who is then brought back to life by the Fool or the Doctor. Also on stage are devils, a stuffed character (Humpty), the Sweep with his brush, and so on. Another typical English mask is that of the Dragon, but it is in the process of vanishing.

Related to the masquerades discussed above are the folk dances, such as those of the Morris dancers (the English form of the various European *moriscas*), the numerous sword dances, as well as the processional giants which are still paraded in Flanders, are known in Italy, Austria, and Spain, and were once familiar also in France.

Niko Kuret

The modern mask since the Renaissance. The prevalently religious subject matter of 15th-century painting and sculpture made the theme of the mask relatively rare (pl. 366). It is chiefly in Venetian art, in the late 15th and early 16th centuries, that masks begin to occur in secular and allegorical representations. In a *Ceres* by a follower of Giorgione (Berlin, Staat. Mus.), the head of a ram appears prominently in the foreground on the podium on which the goddess is seated; undoubtedly it has an allegorical function and can be classed as a mask. Similar functions are exercised by the bust of a Roman emperor in Titian's *Christ Crowned with Thorns* (Louvre), by the classic head in the foreground of Lotto's *Portrait of Andrea Odoni* (pl. 208), and by the small skull among the scattered rose petals in the same artist's *Portrait of a Man* (Rome, Gall. Borghese).

Dürer, in the *St. Jerome* (Lisbon, Mus. Nacional de Arte Antiga) and in various engravings, established a clear relationship between the human face and the skull, wherein the former almost assumed the artificial character of a mask.

Important examples of the adoption of the mask with ethico-religious values in the 16th-century art of northern Europe are found in the works of Bosch, and later of Bruegel, in such works as *The Battle between Carnival and Lent* (II, pl. 357).

In mannerist works of an allegorical nature, bucrania and masks appear in pictorial decorations, drawings (e.g., those by Giulio Romano in Turin, Bib. Reale), and in architectural decoration (e.g., the keystones of the arches of Bartolommeo Ammanati's Sta Trinita bridge in Florence — rebuilt after World War II). In the drawings of Luca Cambiaso, masks are a recurrent motif (e.g., *The Masks of Satan*, Brno, Czechoslovakia, Mus.). In an engraving by Agostino Carracci, the actor Giovanni Gabrielli is portrayed with a mask in his hand as the attribute of his profession. By the second half of the 16th century, representations of masks for characters in farces and comedies (Zanni, Pantalone, etc.) appear frequently. Examples include ceiling frescoes by Alexander Paduano (Alessandro Scalzi) in the Castle of Trausnitz, near Landshut, Bavaria, and collections such as the *Habitus variarum orbis gentium* (1581) by Jean Jacques Boissard, with engravings by Julius Goltzius, and the *Diversarum nationum habitus* . . . (Padua, 1594), with engravings by Pietro Bertelli. (In this last work, the types of masks have a definite relationship with the depiction of various social types, as in the *Arti di Bologna* of Annibale Carracci, 1646.) The Nationalmuseum in Stockholm contains a collection of 44 16th-century engravings depicting Zanni, Pantalone, Franceschina, and others. Zanni is frequently portrayed in the frontispieces of 17th-century editions of *commedia dell'arte* texts. Vignette illustrations in editions of theatrical works became common, especially in the second half of the 16th century (e.g., *Amfiparnasso* of Orazio Vecchi, Venice, 1587). This represents the beginning

of a tradition that reached its peak in the 18th-century editions of Molière's plays. In these works the depictions of mimes and masks had an essentially illustrative character without particular allegorical intentions.

Counter Reformation painters regarded the human skull as a mask with an eschatological significance. Through the use of strong realism and dramatic light effects, it often assumed a preeminent role in the composition, for instance, in Caravaggio's *St. Jerome* (Valletta, Malta, Cathedral) or in *The Magdalen with a Night Light* by Georges de La Tour (PL. 91). The skull has the same significance in allegorical scenes such as the *Melancholy* of Domenico Fetti (Louvre). In *The Knight's Dream* by Antonio Pereda (Madrid, Acad. de S. Fernando), a carnival mask and a skull are contrasted symbolically. Depictions of masks of a moralizing and allegoric eschatological character, such as the 17th-century engravings of Giuseppe Maria Mitelli (with legends such as "The comedy is ended"), were derived from the long ecclesiastical polemic of the Counter Reformation against plays and masques, which lasted from the end of the 16th century through the whole of the 17th.

The engravings by Jacques Callot (q.v.) frequently contain types of masks from the contemporary *commedia dell'arte*, such as those in the series of caprices, hunchbacks, and Italian comedians. Masks also often appear in the graphic work of Stefano della Bella (1610–60). Both Callot and Stefano treated them with whimsical significance, fantastic inventiveness, humor, and caprice. The same spirit appears in the *pulcinellate* (buffooneries) of Pier Leone Ghezzi, the comic aspects of which are closely related to caricature in 17th-century art (see COMIC ART AND CARICATURE). In other 17th-century depictions of *commedia dell'arte* masks, such as those of Pantalone and Zanni by J. Honervogt, an interest in social typology and in folk art seems to prevail. The mask as a typical attribute of comedy is shown in Simonin's *Le vray Portrait de M. de Molière en Habit de Sganarelle* (Paris, Bib. Nat.).

The 17th century also saw the use of the mask to indicate duplicity, or a fictitious and illusionary reality superimposed on true reality with the intention of deceiving. An example is the allegorical representation of the activity of the forger Pietro Vecchia in an engraving in *La carta del navegar pitoresco* by Marco Boschini (Venice, 1660). This tendency was fully developed in the 18th century in relation to the increasing interest and research in psychological situations and typology.

The depiction of characters from the Italian *commedia dell'arte*, known all over Europe, is particularly common in 18th-century painting. In the paintings of Alessandro Magnasco, the mask characters (e.g., *Pulcinella Playing the Guitar*, Venice, Coll. Gatti-Casazza heirs) retain the imaginative and free inventive values they had in the works of Callot. In Antonio Cifrondi's work they are depicted with an accentuated characterization (*A Figure from the Commedia dell'Arte*, Milan, Coll. F. Castelbarco Albani). In a not very different way, Claude Gillot repeatedly represented Pulcinella, Arlecchino (Harlequin), Lelio, Tartaglia, and numerous other characters of the Italian comedy (e.g., *Scène "des deux carrosses,"* Louvre). They also appear in the work of Nicolas Lancret (*Les acteurs de la Comédie italienne*, Strasbourg, Mus. B. A.), of François Joullain (*Scene from Italian Comedy*, Paris, David-Weill Coll.), and of Pierre Lacour (*Portrait of an Actor in the Part of Crispin*, 1784; Bordeaux, Mus. B. A.).

In Watteau's works, masks assume a significance related to the psychological analysis found in the contemporary French and English novel. That is, Watteau depicted a human type of mask, revealing the fundamental contradiction between the stereotyped theatrical character and the human feelings of the actor who plays the part, as in *Gilles* (Louvre; XIV, PL. 407). In addition, the mask (even a carnival mask) played an important part in the amorous games of his *fêtes galantes*, as suggested by the poem which forms the caption for an engraved copy by H. S. Thomassin the Younger (1725) of a Harlequin and Columbine by Watteau (London, Wallace Coll.): "Voulez-vous triompher des Belles? | Débitez-leur des bagatelles, | Parlez d'un ton facétieux | Et gardez-vous bien auprès d'elles | De prendre un masque sérieux. | L'Amour demande qu'on l'amuse; | Il est enfant; toute la ruse, | Pour lui plaire est d'être badin, | Et souvent au Sage il refuse | Tout ce qu'obtient un Arlequin."

Masked characters in the work of Giovanni Battista and Giovanni Domenico Tiepolo, and in a different way in the works of Pietro Longhi, present episodes typical of the contemporary social scene. In the Tiepolo drawings the masked scenes are rendered in terms of caricature and comic situation, like the buffooneries of Ghezzi described above. Examples of this are seen in *The Charlatan* (1756) and in *The Ballet* (both, Barcelona, Mus. de Bellas Artes de Cataluña), both painted for the Palazzo Papadopoli in Venice, apparently by Giovanni Domenico Tiepolo, in his frescoes in Ca' Rezzonico (Venice), and in the guest chambers of the Palazzo Valmarana in Vicenza. Examples can also be seen in frescoes by an unknown painter in the Palazzo Grassi in Venice and in the hall of the castle of Krumlov in Czechoslovakia. Here the figures are more or less connected with the characters of the popular theater, especially the plays of Carlo Goldoni. A peculiarity of such characters is that they tend to merge with the spectators, who become part of the action, as Goethe noted in his *Italian Journey* (Oct. 4, 1786).

Characters from the *commedia dell'arte*, very fully illustrated in engravings of the period by Abraham Bosse, Francesco Bartolozzi, and others, frequently appear on 18th-century ornamental objects, especially porcelain figures, such as the series of 16 characters from Italian comedy by Franz Anton Bustelli (second half of 18th cent.), made in the Nymphenburg porcelain factory. (The greater part of this series is in the Bayerisches National-museum in Munich.) Similar figures were made in Vienna in the factory directed by Claudius Innocentius Du Paquier. Sometimes the masked characters have a satirical intent and refer to social or political events, as in a print of 1797, in which Harlequin proclaims the rights of man in Venice.

The face mask was often used by Watteau to depict human duplicity, reviving the classic motif of the bifront (double face) derived from antiquity. This trend was naturally connected with the study of physiognomy that was so fashionable in the 18th century, by which human character was interpreted from the somatic configuration of the face, which in turn was considered to be determined by the moral nature of the individual. William Hogarth (q.v.) developed his characters along these lines, relying on his own physiognomic observations to create the masks and theatrical characters in his caricatures of the manners and morals of his day (*Masquerades and Operas*, *A Scene from the Beggars' Opera*, etc.). A new typology of masks was thus evolved, based on the more common physiognomic categories, as promulgated especially by Johann Kaspar Lavater (*Physiognomische Fragmente*, 1775–78). Goya (q.v.) also linked the mask to physiognomy. In pages from the *Madrid Sketchbook*, the word *mascara* ("masked man," "mummer") is used in referring to carnival and burlesque scenes, which take on the value of enlightened criticism of the ethical and natural abnormality of contemporary society. In his *Caprichos* and later in the *Disparates*, the bifront theme reappears, and the mask signifies duplicity and deceit. The *Entierro de la Sardina* (Madrid, Acad. de S. Fernando) demonstrates the irrational popular exaltation of artificiality in a mask. Here, as in the *Disparates*, the theme of the masks and of the ambiguity of the bifront becomes a revelation of the unconscious or preconscious areas of human personality.

Masks appear in the 19th-century Roman carnival scenes (cf. IV, PL. 441) of Bartolomeo Pinelli (Rome, Mus. di Roma; London, Vict. and Alb.), as an exaltation of Roman folklore. In general, however, the neoclassic and romantic movements — except in book illustrations, such as *Scènes de la vie privée et publique des animaux*, by J. I. I. Gérard (Grandville), Paris, 1842 — represented dramatic rather than comic subjects. Moreover, by the second half of the 18th century the *commedia dell'arte* had begun to vanish from the European stage, and in the trend toward realism the old characters were represented with a new, introspective approach, stressing the human side rather than the old emphasis on social typology. Honoré Daumier (q.v.) depicted Pierrot several times (e.g., *Pierrot Chantant*; Winterthur, Switzerland, Oskar Reinhart Coll.); Scapin and Crispin also appear in his graphic works. Similar characters appear in

the art of Chardin (q.v.), both in oil and water-color paintings, as well as in various graphic series of the 19th century: *École des Pierrots* (1851), *Manteau d'Arlequin* (1852), *Nuits de Paris* (1862), along with the carnival masks depicted in the series *Dessins de la Mode* (1831), *Carnaval à Paris* (1842), and *Foire des Amours* (1852), in which the true tragic element of carnival is completely revealed. Paul Gavarni's illustrations were a model for the French 19th-century graphic style.

Edouard Manet painted *Le Polichinelle* in 1873 (Paris, Coll. Lecomte), and in the pastels of Hilaire Degas, motifs of mime and mask occur frequently (Harlequin and Columbine, etc.). Cézanne also touched upon this theme in his *Pierrot et Arlequin*, or *Mardi Gras* (Moscow, Mus. of Mod. Western Art). Often during this period, exotic, abnormal, and fantastic values were emphasized (sometimes merely to provide a pretext for color effects). Masks acquire a grotesque fantastic character in works by Gustave Doré such as those in his illustrations to Balzac's *Contes Drolatiques* (1855) and for Cervantes' *Don Quixote* (edition of 1865).

The mask has a fundamental expressive importance in the painting of James Ensor (q.v.), which shows explicit references to Bosch and Bruegel. The mask theme is interwoven with that of the skeleton, signifying unreality and ineluctable decay. Ensor's intent was violent satire against the society of his time, as in *The Entry of Christ into Brussels* (V, PL. 122), which caused such a furore that the painter was expelled from the group of artists called Les XX. This satirical intent is again evident in his *Masks and Death* (1897) and in *Maskers Quarreling over a Hanged Man* (V, PL. 203), which combines skulls with Oriental masks. In his *Portrait of the Artist with a Mask* (1899; Antwerp, Coll. C. Jussiant), Ensor attempted to assimilate the mask to his own features, expressing at the same time a sense of vanity and grotesque exaggeration of appearance.

In symbolist art, masks are also frequent in a complex counterpoint of meaning and allusions, as in the works of Aubrey Beardsley and, in a different way, in those of Odilon Redon, Gustav Klimt, and Egon Schiele. In Alfred Kubin's graphic works the mask is related to presurrealist themes, in an exploration of the zones of the unconscious, as it is also with a definite, but poorer and more circumscribed imagery, in the graphic works of Alberto Martini, which partake of the demonic quality in the work of Edgar Allan Poe, whose stories he illustrated. His form is related to that of the world of Beardsley.

The clowns of the Moulin Rouge and other Parisian cabarets were depicted by Toulouse-Lautrec, both in lithographs (see L. Delteil, *Le peintre-graveur illustré*, X, XI, Paris, 1920, nos. 180, 205, etc.) and in paintings (e.g., *At the Moulin Rouge: The Clown Mlle. Cha-U-Kao*, 1895; Winterthur, Oskar Reinhart Coll.), emphasizing their human values without reference to any moral judgment. Hermengildo Anglada y Camarasa and the young Picasso (e.g., *Au Lapin Agile*, 1904; New York, Coll. Mr. & Mrs. Charles S. Payson) also depicted clowns from this point of view. In the work of Emil Nolde, who took up the forms of Ensor, the mask is charged, in violent and grotesque expressionistic distortion, with mystic significance and with a dramatic social comment (*Still Life of Masks*, 1911, New York, Curt Valentin Coll.; and *Wooden Figure and Mask*, 1913, Basel, Kunstmus.). Other German expressionists, such as Erich Heckel (*Clown and Doll*, 1912; formerly in the collection of the artist) and Ernst Ludwig Kirchner, made similar use of the theme. The primitive mask with its exotic overtones also became subject matter for the expressionists (see EXOTICISM). It had already appeared in the paintings of Paul Gauguin and is found in Nolde's *Wooden Figure and Mask*, already mentioned, and in Max Pechstein's *Still Life* (1913; Mannheim, Städt. Kunsthalle), where it is related to contemporary psychoanalytical research. (Freud's *Totem and Tabu* was published in 1913.) August Macke wrote an article on masks in the *Blaue Reiter Almanac* of 1912.

The themes of Pierrot, of Harlequin, and of the clown had a great vogue in the first decades of the 20th century, frequently as a vehicle for cubist analytical forms and chromatic patterns. Masks played an important part in Dadaism and later in surrealism. Noteworthy examples in Dadaist art are the mechanical mask (1919) by Raoul Hausmann and Sophie Taeuber-Arp's *Dada Head* (1920), a painted wooden hat block. In the art of George Grosz and the works of the left wing of the *Neue Sachlichkeit*, the mask is directly linked to motifs of social criticism. In surrealist art it assumes the peculiar values of ambiguity and unreality, often having an eschatological significance, as in the work of Salvador Dali, Yves Tanguy, and R. Magritte. In 1929 E. L. T. Mesens created a photomontage, *Mask for Insulting Esthetes*, applying a collage as a mask over a face.

Paul Klee used the mask as a symbolic reduction of the human image to an ideograph for psychological phenomena and the unconscious; in his later works it reveals his own preoccupation with death.

The theme of the human face reduced to a sculptured mask occurs in Picasso's painting in *The Red Tablecloth* (1924; New York, private coll.) and that of the human skull in *Still Life with Skull* (1945; collection of the artist); the same theme appears perhaps in a more decorative sense in the work of Georges Braque.

The reduction of the human face to a mask and the assimilation of one into the other are typical and characteristic of the associative and imaginative process of Chagall (q.v.), as in *I and the Village* (1911; New York, Mus. Mod. Art). He revived with great intensity the theme of the bifront, as in the *Two-Faced Bride* (1927; Bern, private coll.), with allusions of a fantastic, unconscious, and almost ancestral nature, related to the imagery of Russian folk art (see Chagall, *Ma Vie*, Paris, 1957).

In the figural painting of the period between the two World Wars, the clown theme appears frequently, depicted with its various traditional significances, in the works of Walt Kuhn, Jean Metzinger, André Derain, Karl Hofer, and Gino Severini.

In contemporary art, from as early as 1942 in the *Barbara* of Jacques Lipchitz (Northampton, Mass., Smith College Mus. of Art), and especially in abstract art, there has been a tendency toward the complete assimilation of the mask, of the human countenance, and of its entire somatic aspect into a single grotesque concept. No longer is it a question of setting these elements side by side to show their similarities and differences, but rather an effective and unequivocal coincidence and superimposition of the mask and face, as in Willem de Kooning's *Marilyn Monroe* (ca. 1952); Jean Dubuffet's series, *Mirobolus Macadam & Cie.* (1946); and more recent works of A. Jorn and others.

Enrico CRISPOLTI

The cinema has had recourse to the mask in various ways. Its effectiveness for "thrillers" and horror themes has often been exploited, as in *The Laughing Mask*, directed by Louis Gasnier and starring Pearl White; *The Mask of Fu-Manchu* (1932) by Charles J. Brabin; and *The Mystery of the Wax Museum* (1933) by Michael Curtiz. Man Ray satirized the adventure film in 1929 with *Les Mystères du Château de Des*, making use of masked actors. Carnival masks contributed to telling scenes of revelry and confusion in both Jacques Feyder's *Carnival in Flanders* and M. Carné's *Les Enfants du Paradis*, and in the latter the repertory of the popular pantomine was adopted for both comic and tragic effect. Documentary and semi-documentary films have made use of primitive masks both for educational and dramatic purposes, as in Paul Haesaerts' *Sous le masque noir* (1958), on African masks, and the Canadian film *The Loon's Necklace* (1950), on North American Indian masks.

While the trend of the modern theater has not favored the wide use of masks, they have at times been introduced (cf. PL. 368) and have aroused interest in the sphere of art. The Bauhaus included in its study program an investigation of the semantic phenomenology of the mask, and Oskar Schlemmer posed a problem intended to develop a new repertory appropriate for contemporary scenic requirements. During the 1920s the theater masks of W. T. Benda, a Polish-American artist, enjoyed a considerable vogue and were exhibited as a collection.

• •

THE ORIENT. *India.* Masks in India are much less common than might be expected. At present they are found only in areas untouched by Hindu civilization (among the jungle tribes of eastern India, e.g., the Gonds, Konds, Baigas, Murias, Pardhans, Agarias, Bhuiyas) or where its development was arrested at an early date (in the Himalaya, especially Kulu, and in Malabar, Kerala, and Ceylon). Masks are connected with the cults of spirits by whom the masked dancers become possessed. These spirits (yakshas and yakshis: male and female spirits of the soil, fertility, and wealth, local godlings associated with the hills; rakshasas: monstrous devouring demons; nagas and naginis: male and female semihuman water-serpent deities; pretas: spirits of the dead, ghosts; vetalas: evil spirits or ghosts animating corpses) were the object of the cults of the pre-Aryan population from Afghanistan to the far south. They brought droughts, thunderstorms and floods, sterility, diseases, and death, but also wealth and fertility, rich harvests, increase of cattle, and many children. Many spirits acted as incubi or succubi, offering the utmost sexual pleasure but draining away the life of their victims. Their cults required bloody sacrifices (buffalo, goat, cock, even human) and gifts of rice, *yantras* (mystic geometric diagrams made of thread, straw, and other fibers), magic games, riddles, and ecstatic dances under the influence of narcotics or intoxicants, ending in sexual excesses. On certain occasions images of demons, made of straw, wood, or clay and covered with resin, were burned.

This tradition is best preserved in Ceylon. The yaku (plural of yaka) are spirits of the dead, who in their alien or punitive aspects can represent diseases (Kālu-Yaka, Kālukumāra, Aimāna, Kōla-sanniya, etc.). They can appear in many disguises: as yogi, donkey, snake, wolf, South Indian (enemy of the Singhalese). Others are vampires (e.g., Hiri-yaka, Mahāsōhana, the great cemetery demon, and Aturu-sanniya, the corpse devourer), archaic Hindu deities (Śiva as rakshasa, Skanda or Subraḥmaṇya; Bhaīravi as earth goddess), former heroes or heroines who met a tragic end (Paṭṭinī Devī, a wife who committed suicide in order to preserve her chastity), or bastards (e.g., Kālu-Yaka, son of the Indian prince Vijaya, founder of the Singhalese kingdom). All these figures are represented by dancers wearing huge, carved, wooden masks (demon faces with protruding eyes and tongue, surrounded by snakes, subsidiary human or animal heads, and immense crowns and ear ornaments), painted in bright colors (yellow, fire red, and grass green) and varnished.

In Kerala and Malabar similar demons (e.g., Kuttichattān) are represented by the Thaivam dancers, and the bloodthirsty mother goddess Kālī (also known, among her countless names, as Cāmuṇḍā, who destroyed two demons, and as Bhūdēvī) is invoked at the Tira festival. Often elaborate crowns are worn here, and the face, instead of being masked, is heavily made up, especially when benevolent deities are represented, for example the goddess Bhāgavatī (the Lady, another epithet of Devī) as Prasanna-Rūpī (she of radiant beauty).

The masks of the jungle tribes of eastern India represent rakshasas and Bhūdevī (the earth goddess) and are somewhat similar to masks in Africa and New Guinea. Among the more Hinduized Bhils of Central India (in the Vindhya Mountains and Maikal Range), the masks have completely degenerated and represent the classic Hindu gods Śiva and Pārvatī.

Dance masks are not known elsewhere in India, but there is indirect evidence that once they must have been common. Literary and archaeological sources show that the yaksha, rakshasa, and naga cults had been very common until at least the 3d–4th century, when Hinduism absorbed most of these godlings as aspects of various Hindu high gods, especially of Śiva and Kālī. Those who could not be transformed were incorporated into the heavenly host of gandharvas, apsarases, *gaṇas*, and so on, or were reduced to the status of evil spirits and ghosts who could be exorcised only by Tantric magicians. But in Kulu and the adjoining Hindu parts of the Himalaya, where the yaksha cult is still alive, these deities (devatas, called *bīrs*, from Skr. *vīra*, hero; or *brahms*) are venerated in the form of brass or silver masks mounted on poles and hung with rags. Inscriptions show that some of these deities were regarded as heroes of epic times (e.g., Hiḍimba, an apsaras of the *Mahābhārata*), deceased princes and princesses (e.g., Mujanī Devī, queen of Raja Hemaprakāśa of Nirmaṇḍ, 9th–10th cent.), or even orthodox Hindu gods such as Mahadeo (Śiva) and Cāmuṇḍā-Kālī. To what extent prehistoric funeral masks of bronze and gold, found in Mysore, belong to a similar tradition is uncertain. On the other hand, the mask on the pole seems to have been the prototype of the *mukhaliṅgam*, a rather early representation of the god Śiva. The lingam represents not only the male sexual member — thus depicted until the 4th century — but also, in the form of an erect stone or pole, the seat of the local deity (i.e., yaksha). As an erect stone it has become the orthodox form, the pole type surviving only occasionally, as in the pillar lingam of Draksarama (Godavari delta) or in the Stambhēśvarī (Lady of the Pole) cult of Orissa. The face on the lingam dates from the 5th century, when the genital character of the lingam was suppressed. In this form it corresponds to the Greek herm, a combination of a post with a mask and a male genital. Often the face (*mukha*) or four faces (*caturmukha*) form a separate metal cap only temporarily put on the lingam. In the Himalaya a silver mask is put on the face of the idols of Naga temples on the occasion of the Nagapanchami festival. The trance dances once executed by priestess-prostitutes at the yaksha festivals have disappeared, but the Kathak dance of north Indian prostitute-dancing girls has preserved the giddy whirling spin and the stamping footwork met with in such dances among other primitive peoples.

The identification of some of the yaksha godlings with gods or deceased heroes has led to the development of the secular dramatic dance. In Ceylon the demon dancers perform also some epic tales and Jātaka stories and even use, on such occasions, secular masks (king, queen, minister, hero, tradesman, etc.). The Baigas, also perform masked dances on the occasion of the Cherta festival, in which they make fun of their Hindu visitors, especially yogis and tradesmen. Otherwise practically the only masked dramas in northern India are the *Kṛṣṇa-līlā* and especially the *Rām-līlā*. The first celebrates the victories of the young god Kṛṣṇa over the demons sent by the evil King Kansa of Mathura and his love sports with the milkmaids (*gopīs*) at Brindaban. The second dramatizes the victorious campaign of Rāma (incarnation of Viṣṇu) and his brother Lakṣmaṇa to deliver, with the help of devoted monkey and bear tribes, his abducted wife Sītā from the demon king Rāvaṇa of Laṅkā. In both *līlās* the heroes appear without masks, but the demons and the monkey and bear characters wear masks. In both cases, however, the masks seem to go back to a now forgotten connection with the yaksha cult. For Kṛṣṇa of Mathura was, in the popular histories of the Purānas, the savior and upholder of the mountain Govardhana and later became the Kṛṣṇa of Dwarka. The *Rām-līlā* ends with the burning of a huge effigy of the many-headed Rāvāṇa, a feature unknown in the *Rāmāyaṇa*, on which the story of the drama is based. As the *Rām-līlā* is celebrated in spring, and as the burning of a demon figure in spring is a common feature in many primitive religions (e.g., in some villages in India at the Holī festival), it seems that the *Rām-līlā*, celebrating the victory of the Hindu gods of social order over the yakshas and rakshasas, has superseded an earlier pre-Aryan festival. A similar case seems to be the Kathakālī ballet of the Malabar Coast, the subjects of which are those of orthodox Hindu mythology, its technique borrowed from the classic Bhāratā-nāṭyam; the quaint make-up of the dancers and their huge circular headdresses and elaborate costumes still survive, although the painted masks are gradually disappearing. Thus it appears that in absorbing the primitive cults, the later Hindus moderated the masked dances connected with them and adapted them to orthodox themes.

Hermann GOETZ

China. Chinese masks have played an important part in artistic and religious activities, in the theater, in myth, and in war. The earliest masks are found on the bronzes of the Chou dynasty (1027–256 B.C.). Some of them, the *t'ao-t'ieh* (known since the preceding Shang-Yin period, 1523–1028 B.C.), probably formed part of the equipment of exorcists or shamans. According

to Mircea Eliade's hypothesis, the use of shamanist masks was not widely diffused over the whole Asiatic continent, but it is very probable that they were used in China. There are many Chinese literary references from various periods (the *Chou-li*, the *Shuo-wên*, the *Han-shu*, the *Sui-shu*, and the *T'ang-shu*), which all confirm the custom of wearing masks to exorcise evil spirits or to drive away the influences of pestilences. Such disguises were often protested by orthodox Confucians; for example, the writer Li Yü complains that "people wear masks which depict animals" during the New Year festivities in northern China. Some historical texts also mention the ceremony known as "No," during which each participant wore a special two-colored disguise and a wooden mask (*mu-mien*) with an animal's head.

The use of the disguise or mask was intended to identify the wearer with the figure he represented. In the ceremony of the Pa-cha, for example, the representative of the deceased (*shih*), generally a young close relative, wore a mask reproducing the features of the dead person; in the same ceremony certain animals were also honored and some of the participants were disguised as animals. A Chinese proverb warned that the representative of the deceased must wear the mask because "the soul of the deceased goes wandering and masks are made to hold it." The mask, therefore, in certain cases is the means whereby the soul can be brought back to the world of the living; if the representative were not masked, the rite of evocation might be hindered. Similarly the mask is able to "hold" the animal or supernatural being that it represents.

In China the mask also has an apotropaic value. Even in very remote times, masks of grotesque or hideous appearance were used to drive away pestilences.

According to the heterodox Confucian philosopher Hsün Tzŭ (300–235 B.C.), Confucius had a face similar to the mask of a *fang-hsiang-shih* (exorcist).

The use of apotropaic masks is documented also in peripheral zones. On the island of Hainan, for example, cowhide masks of a type locally called *niu-ma-mien* (ox mask) were used to frighten away both wild beasts and evil spirits. According to another theory, these masks were totemic images similar to those found in certain Indonesian cultures.

In more recent times apotropaic masks have been applied to cuirasses to frighten the enemy.

Recent excavations of certain Manchurian sites have uncovered silver and copper masks. Some authorities believe that they date from the Ch'in (221–206 B.C.) or Han (206 B.C.–A.D. 221) dynasty; others assign them to the Liao dynasty (907–1125; PL. 352). These masks were certainly mortuary, and a text of the Sung dynasty (960–1279), the *Lu-t'ing shih-shih* of Wên Wei-chien, provides proof of this usage.

Masks have had a preponderant part in the Chinese theater. According to some authors the very origins of the Chinese theater are connected with the pantomimes or dances of the shamans and with ceremonies in honor of the souls of the dead. It is probable, therefore, that Chinese theatrical make-up is derived from masks. Moreover, the make-up of the Chinese actor, unlike that in other countries, communicates to the audience the personality of the person he portrays, as well as identifying a particular character in the play. Certain colors and designs of the make-up also have special meaning.

A few specimens of buffoon masks and narrator masks have been preserved. Both are theatrical masks and are sometimes rendered in a grotesque but realistic style, with a second face modeled on the forehead between the eyebrows. This kind of mask is typical of northern China: it has certain similarities to Tibetan masks and is generally made of papier-mâché or painted cardboard.

Lionello LANCIOTTI

Japan. The use of the mask was introduced into Japan from the eastern regions of the Asiatic continent, from China, or more directly, from the Korean peninsula, during the 6th–7th century of our era. Originally it was closely connected with a kind of mime dance performed during Buddhist religious festivities. The oldest masks were those of the Gigaku (PL. 362; VIII, PL. 278), a spectacle generally performed outdoors in front of temples. The varied repertory of these performances required a variety of costumes and masks. The masks were very large, covering all or the greater part of the head. They were carved from wood or made of layer upon layer of lacquer; the earliest ones were probably made by foreign craftsmen, chiefly Koreans. Ancient examples of such masks are preserved in the Shōsōin (Nara) and in some temples, such as the Hōryūji and the Tōdaiji (Nara). The facial features are often caricatured or grotesque, with strongly arched eyes, long noses, large ears with elongated lobes, and mouths with curved beaks. They are highly expressive, often with a leering, grotesque, or ferocious expression. Sometimes these characteristics are combined with a comic zoomorphic effect, as well as certain elements and characterizations of a terseness of description that is a departure from the figural expressions of Far Eastern art. This has led certain scholars to conclude that the origin of these masks is more Western than Chinese, and some think it possible that they may reflect distant Greek and Hellenistic figural motifs.

The Bugaku performances, which probably go back to the 8th century, also consisted essentially of dances of Buddhist religious inspiration, often in courts or temples. The Bugaku masks (VIII, PL. 278) differed from the Gigaku, particularly in their size and form, since they covered only the face. The other differences are chiefly stylistic: a marked symbolism of the images, a tendency toward decorative, highly stylized facial features, and a general idealization of the forms that attenuates even such features as are intentionally realistic. Many examples, however, are derived directly from the Gigaku masks, retaining various similarities in the repertory of characters represented. The oldest are from the 15th century; those of the so-called "twelve deities," preserved in the Tōji (Kyoto), are dated 1486. Some experts believe that the Bugaku masks, too, have an ancient foreign origin.

A special category among masks of the early periods is that of the Gyōdō masks, used in processions and other Buddhist ceremonies. Their resemblance to the iconographical types of religious statuary show them to be directly derived from Buddhist sculpture, which they sometimes reproduce very faithfully.

From the 9th–10th century, masks were increasingly used in the traditional dances and in the ancient Shinto agrestic rites. These merged with certain Buddhist cult rites and ceremonies, thus giving rise to particular types of spectacle from which the No dramas and the comic Kyōgen were derived.

The No and Kyōgen plays and dances had their greatest development after the 13th–14th century. Specific rules were laid down for the use of masks, and the iconographical types conformed to the dramatic repertory, which, through the centuries, remained virtually unaltered. The masks represent male and female characters of different ages and conditions, supernatural beings, divine and demonic, and imaginary and monstrous animals. The old repertory of masks from former times remained in existence, but it became enriched with new types which clearly reveal a new figural concept. In addition to the traditional monstrous, terrible, and grotesque masks, new types with more human expressions were developed. In the No drama (PL. 362) they were pathetic, dramatic, or tragic; in the Kyōgen they were humorous and comic. The place held originally by supernatural beings was taken over by man, and the supernatural itself became transformed, chiefly into an outward expression of an inner state of mind, sentiment, or passion. As they lost their religious significance, masks acquired the function of conveying character by realistic traits, which became progressively more human, though retaining the stylization of types required by their theatrical nature. Such masks sometimes have a stylistic resemblance to certain contemporaneous sculptures — particularly those of the Kamakura period (1185–1333) — in which is evident a search for a less formal and symbolic idiom. Generally, however, masks representing human beings did not represent real types. The idealization of the character required that the mask represent abstract and stylized types; generic physiognomies were rendered with essential features only slightly characterized, and often

they were intentionally expressionless but ready to be brought to life by the actor to express the whole gamut of sensations and moods required by the drama. This is the reason for the frequent ambiguity of expression found in certain types of masks, not representing sadness, indifference, or joy, but lending themselves to the expression of any one of these emotions.

The masks cover only the face and are often smaller than the average face. They are carved in wood, then lacquered and painted. They may also be modeled in cloth, covered with lacquer, and then colored. Often the seal of the artist who created them is found inside.

The best specimens of No and Kyōgen masks are generally the oldest, dating from the 13th and 14th centuries. They were often the work of great artists such as Shakuzuru, Tatsuemon, Zōami Hisatsugu, and many others, who created types that remained established and almost unvaried for centuries.

Adolfo TAMBURELLO

PRIMITIVE MASKS. Masks have always been conspicuous cultural elements among the majority of primitive peoples the world over. Few Negro tribes in West and Central Africa and few island peoples of the southwestern Pacific Ocean were without them. They were not so ubiquitous, however, among the North American Indians and were relatively unknown on the Polynesian islands in the central and eastern Pacific.

It is not surprising, therefore, to find that primitive peoples have devised a wide variety of masks, in the fashioning of which such materials as wood, shell, bark, leather, bark cloth, cornhusks, bronze, copper, and even the pith of reeds were used. Many masks were life-size, but some were only an inch high, and others were over 3 ft. high. They were often painted, either in a single color or, frequently, with a rich polychromy of three or more bright colors. Various materials, such as shells, seeds, hair, or feathers, were sometimes affixed to masks that were usually worn or used with prescribed costumes. The carved or fabricated face or head was therefore only a part of the total complex of the mask, and to see masks without these attachments and costumes, as they usually appear in museums and collections, gives little idea of how they were intended to appear when in use. Among some primitive peoples a new mask was made whenever one was needed and immediately afterward discarded or even destroyed, whereas other peoples used the same object again and again until it was no longer serviceable. In either case, a diversity of forms, all of them called "masks" in the broad sense, was utilized.

The form shaped to fit over the face was the most commonly used primitive mask. With it was worn a head covering and a costume that further concealed the identity of the wearer. The helmet mask, which completely enveloped the head and was often carved to represent a head, was also a widespread type. In the western Pacific this type developed into a lofty, bizarre creation. However, masks were frequently of a kind that did not hide or cover the features of the wearer, such as the numerous headpieces, carved in various human, animal, or abstract forms, which were supported on the head of a dancer, with or without a costume suspended below them. With the exception of a few exotic shapes, all the major forms of primitive masks fall within these basic types.

The use of masks was associated with all the major cultural focuses: religious, social, economic, and political. Masks usually represented specific beings, such as ancestors, spirits of various kinds, deities, or mythological personages, whose actual presence they symbolized or contained. Some masks were worn at secret rites which could be attended by only a few persons, while others were used in public ceremonials. With few exceptions they must be considered as active, dynamic art forms, since they were usually seen in violent movement with sharp contrasts of strong light and shadow, particularly when worn nocturnally around a flickering fire. In many instances, too, a vitality was given to the mask by the wearer, whose eyes flashed and moved through the perforated eye slits. A further vitality becomes apparent when one considers that many primitive peoples believed in the existence of a power or essence as a fragment of an all-pervading universal force in all animate and inanimate matter. Hence, it was believed, the materials of which the mask was made had an innate energy, and, moreover, the tools that the artist used had a comparable energy. Since this was so, great care and constant prescribed rites had to be observed to create the forms of the mask successfully and safely from these materials. As they took shape under the hands of the sculptor, and as the appearance of the being to be represented or symbolized began to emerge, these forms gave to the basic materials additional power and vitality.

The mask as an esthetic expression must be considered from three points of view: (1) its objective or physical properties, that is, the proportions, relationships, and qualities of its component parts; (2) the meaning and significance of its forms; and (3) the psychological relationships between its exterior forms and their inner content or meaning. The mask is not, therefore, merely an exotic or descriptive appearance; it is, rather, a complex combination of a variety of factors.

Africa. The primitive cultures of Negro Africa were substantially homogeneous, although innumerable differences existed among tribal groups. It is therefore possible to discern the generalized pattern of beliefs and institutions that led to the use of masks in many areas of Africa. A belief in the power of ancestors and of deities and supernatural spirits controlled religious concepts. Through the intervention of these forces, the people derived a sense of protection and general well-being. Certain fundamental needs, while common to all peoples, are particularly evident in the African institutions set up to implement them. These may be considered as (1) the need for security and survival in a world in which uncertainty was always present, and (2) the need for continuity and stability among peoples who had no written historical records and were so loosely organized that integrating elements were essential to them.

African rites involving the use of masks were those enacted to ensure fertility and increase of crops and those performed to obtain protection or health. These rites were substantially motivated by the drive for security and survival. Other ceremonies, which centered around ancestors, the initiation of youth into adulthood of the tribe, and the performance of mythological plays (the great oral literature of Africa), were, on the other hand, directed toward the maintenance of continuity and tribal stability.

All the varied types of primitive masks were used in Africa; wood — with or without polychromy — was the most common material. Costumes were generally worn with the mask, and in some instances extraneous materials were attached to both the mask and the costume, although this was not so common in Africa as in the western Pacific islands. The basic representations were derived from human and animal forms and were sometimes combined in a seminaturalistic or grotesque manner; only in a few cases does the mask approach an abstract design. Throughout Africa certain kinds and styles of masks were standard. A study of those used by related tribes in such large areas as the western Sudan and the central Congo reveals that numerous art elements were shared in common. Although stylistic analogies may be noted in the art forms of peoples far removed from one another geographically, it is nevertheless profitable to classify the mask by broad geographical areas.

Among the largely agricultural tribes of the western Sudan (Mali, Upper Volta, Niger) the spirits of animals and ancestors were closely associated with fertility and the protection of crops. Some animals were of near-totemic character, and their importance for the welfare of human beings stemmed from the days of creation or from later mythological times. In this context, the animal was often a transformation from human form, endowed with human thought and actions and, as such, had either ancestor status or close affinity with the ancestors.

Representative of a form peculiar to this region are the Segoni-kun masks of the Bambara tribes, worn by members of the Tji-wara society. These are three-dimensional sculptures of antelopes attached to round basketry caps and worn on top of the head (XIII, PL. 329). A costume of shredded raffia

is suspended from the cap to the knees of the wearer. The numerous differences in these antelope representations, each peculiar to one of the Bambara subtribes, range from a somewhat naturalistic carving of the full animal form to a highly stylized concentration on the neck, mane, head, and horns. During the sowing season Segoni-kun masks are worn in pairs, one depicting a male and the other a female antelope. The dancers imitate the leapings of the animal, which the Bambara believe to be the source and protector of fertility, since it symbolizes the fabulous mythical animal which brought them the knowledge of agriculture.

These masks are usually given a dull black surface, largely by searing with a hot iron, and are intended to be seen as three-dimensional forms moving in space. Their design emphasizes by sweeping curves and contrasts of sharp angles, together with piercing and a volumetric handling of shapes, their dynamic expression and function. Regardless of proportions or the varied shapes involved, stress is placed upon an open form, frequently oriented vertically, in which such characteristic antelope features as the neck, head, ears, and horns are dramatically and freely rendered. The body — if it is expressed — is often shown as a tense, static form of a simple horizontal shape with four stubby vertical supports for the legs. Movement is sometimes implied in the legs by a conventionalized sharp-angled articulation. It is also implicit in the male Tji-wara masks by the upward curve of the neck and mane, which is counterbalanced by the downward thrust of the tapering head. At the junction of the neck and head two ears project upward as sharp diagonals, and above the head long, tenuously curving horns culminate the design.

The artistic effects are achieved by various combinations of a few basic geometric shapes, such as tapering cylinders, long and short curves, short and staccato angles, and long, thin parallel lines. These are rhythmically integrated into a rich and often elaborate design expressive of the selected parts of the animal form and of their vigorous movement in space. The antelope head is particularly significant in the Sudanese style. It is a very tight, contained, almost hieratic form, which often suggests an anthropomorphic rendering. Together with the body, when it is expressed, the head functions as a stabilizing element for the pierced, active forms of the neck, mane, and horns. There is in these masks a close relationship between esthetic forms and the shapes and movement of the animals from which they are derived.

Of the many masks used by Sudanese peoples, animals serve as the inspiration for the majority. The antelope frequently appears, but monkeys, sheep, and birds are not uncommonly represented. Face masks carved with human features are also prevalent. In some parts of the western Sudan, red, black, and white polychromy is characteristic.

South of the western Sudan, in the areas of Liberia, Guinea, Sierra Leone, and Ivory Coast, a profusion of masks appears. The greater number of them are worn over the face with the appropriate costumes and represent or are derived from human features, but they are distinguishable in both style and function (VII, PLS. 120, 125). In Liberia, for example, where the Poro is an all-important male secret society, the mask is worn in the performance of secret initiation rites and in the conduct of diverse public functions of a civic, religious, administrative, or social nature. Poro masks range from a few inches to well over life-size, and from a sensitive, naturalistic representation of human features to a fantastic, sometimes gruesome depiction of animal or combined animal and human forms. They are usually carved by professional sculptors in very hard wood, with the surface smoothed, blackened, and polished until it resembles black marble. When these masks were used, however, the surface was frequently smeared with clay or blood to give the proper power and appearance.

Representative of this Liberian art form is the strongly anthropomorphized bird mask used in public by the judge as he pronounced sentence. Characteristic of the style is the full-volumed handling of the forehead and huge nose, the sculptural double curve that indicates high-arched eyebrows, and the cuboidal contrast of the curving and angled planes of the lower facial area. The dramatic vitality of representation in these masks is enhanced by the glint and movement of the eyes of the wearer through the open eyeholes.

On the western margins of the Ivory Coast and in eastern Liberia, the Dan tribes also often use a refined naturalistic mask. Among them it is a sacred object, which — although worn on some occasions — functions largely as a means of addressing petitions to the ancestors and so to the gods. The masks are therefore doubly symbolic. They are greatly revered and handed down from generation to generation. Dan masks, too, are carved in hard wood and have an extremely high, deep-black polish. The forms tend to be shallow and consist of flowing surface planes that create subtle contrasts of concave and convex areas. The emphasis is frequently on large, empty, round eye sockets and on the high convex curves of the forehead.

Perhaps the best-known African masks are those of the Baule (Baoule) tribes who live in the central Ivory Coast. These masks may be divided into two groups: (1) those based on naturalistic human features, and (2) those derived from animal forms or with animal elements, such as horns, attached to human faces. The first group is by far the more common. Examples range from life-size to almost twice life-size, and frequently the shallowness of their forms and the fluidity of their surface planes relate to the Dan masks; but they differ in their elegant refinement of descriptive detail. For example, a pattern of parallel grooves in deep relief is often used to depict the hairdress; high-arched, parallel relief lines define the eyebrows; and a regularly dentated fringe, meeting below the chin in a pendant, describes a full beard. The basic shape of these Baule masks is an elegant vertical oval, somewhat wider at the top than at the narrowing base. Proportions vary from group to group, so that in some examples the oval is wider or narrower than in others.

The function of Baule masks is incompletely known; it is certain, however, that some of them were worn in religious ceremonies to represent specific deities of an extensive pantheon. For instance, a large naturalistic or stylized oxhead mask was worn at burial ceremonies to represent the deity who accompanied the soul to the hereafter. Apparently a more naturalistic type of mask was used in ceremonies of reverence to ancestors, and other so-called "masks," which were solid unpierced faces, may have been representations of ancestors or deities. When not in use, these sculptures were kept in a sacred house in each village.

At first glance Baule masks seem bilaterally symmetrical, but on closer examination it is apparent that such symmetry does not actually exist. Instead, the arch of one eyebrow is a little higher and longer than the other; the swing of the hairdress dips lower over the temple at one side; the vertical, downward sweep of the nose from the bridge is also slightly to one side; and the mouth is seldom in the exact center of the tapering lower part of the face. This quality of subtle asymmetry gives the Baule mask an esthetic richness and a vitality of expression. Only in a few instances was any color applied to these forms; they were usually monochrome, often black.

The mask was also a prominent art form in southern Nigeria, where among the Yoruba tribes two distinctive types were developed. One type, the Gelede mask, was a somewhat modified helmet form that represented the entire head and was worn horizontally on top of the head (VII, PL. 126). The other, the Epa mask, was a large full-helmet type that covered the head of the wearer and rested on his shoulder; on top of the helmet was carved a composition of several or even dozens of figures (PL. 355). The total height of the Epa masks sometimes reached 4 ft. Both the Gelede, in the central and southern areas, and the Epa, in the northern, were used in comparable dances, which were performed to ensure health and welfare for the community.

Yoruba style is clearly seen in the Gelede masks. Heavy and full-volumed forms are often so closely interrelated as to appear compressed, and facial features, carved in high relief and bold in size and scale, are spread out over the entire face area. Eyes, with heavy upper lids and a large protruding pupil, are described by wide, sharp-pointed ovals, and a short nose terminates in extremely wide, expanding nostrils, below which

a full-lipped Negroid mouth protrudes as two parallel shelflike folds that do not meet at the corners. Some Gelede masks have an elaborate, neatly grooved hairdress, and others are topped by a figure or figures, which sometimes represent genre scenes such as a boy climbing a tree for coconuts. This type of mask, unlike the African masks discussed above, is highly polychromed in nonnaturalistic colors which further stress the large scale of the features and the expanding volume of the forms.

Among the major tribes of southeastern Nigeria, the Ibo, Ibibio, and the Ijaw (Ijo), a wide variety of mask forms was developed (VII, PL. 132). In this region masks are used in a great many of the numerous public and secret ceremonies and traditional plays which have social, religious, and political significance. Polychromy — particularly in red, black, and white — is an important feature of these diverse forms and was usually applied afresh each time the mask was used, to emphasize such details as scarification marks, facial features, and hairdress.

Of the many masks of the Ibo, the Mmo, the property of a men's secret society, constitutes a distinctive form. Rituals of this society involved petitions to the ancestors, political duties, and various dance ceremonies performed at village festivals and at members' funerals. Many of these masks are life-size and carved with a thin, shell-like facial area and full cranium, often topped by an elaborate headdress. They are sewed to an enveloping harlequinlike costume, composed of numerous small areas of bright colors, which covers even the hands and feet. The cranium of the mask rests on the head of the wearer, who looks out through the open eye sockets of the carved face. The mask itself is painted red, white, and black; the facial area an over-all white, which is the color used throughout Africa to refer to the dead; lips, eye sockets, and certain scarification marks a bright red; and the hair or headdress a dull black.

The Mmo mask has numerous distinctive Ibo characteristics. The shape, for example, is a wide oval dominated at the top by a high forehead and at the base by a receding chin, above which an open mouth displays teeth. In Mmo masks there is a marked representation of the hard, bony skeletal structure of the face, and the surface is suggestive of skin tightly drawn over fleshless bone. This skeletonlike death's-head appearance is further stressed by the emphasis on empty eye sockets and on the thin, almost fleshless lips. Since the Mmo masks occur among numerous widespread Ibo tribal groups, there is a good deal of variation in both shape and precise details. Among some groups, for example, a single or double rosette appears in front of the ears as a scarification mark in low relief, and crossing diagonals with a bisecting vertical strip are carved on the forehead.

The Ibo celebrate a festival of thanksgiving at the end of the harvest season. At that time numerous plays are performed, including those which culminate the initiation period of the boys. Burlesque performances in some of the plays involve the use of particularly fine and characteristic masks. Such, for example, is the *mba*, an especially well-carved ovoid mask with a trapezoidal palette projecting above the head. The face is painted white, the nose, mouth, and forehead area red, and the hair a flat, dull black; the palette has rich geometric designs, frequently with a pinwheel motif, painted in red, white, and black. These masks are worn in pairs by boys and represent girls, whose behavior they mimic. Ibo style expressed a contained, direct, but not overly dramatic naturalism.

In contrast, the Ibibio masks of the Ekpo men's secret society are fantastic in appearance and dynamic in expression. The function of this society is to propitiate the ancestors for the general well-being of the village and to maintain the political and social status quo. In the past its rituals were so secret that any nonmember who saw them was killed. Of the varied masks used by the Ekpo society, the naturalistic black ones represent ancestors and the more grotesque ones the spirits from the underworld. Each of these spirits was portrayed in the ritual as a dangerous and irresponsible character, which was expressed in the masks by fantastic forms of strikingly malignant appearance. In some, the heavy animal-like tusks and the enormous, concentric circular eyes represent nothing human nor quite animal but successfully convey the impression of evil. Other Ekpo masks might have the lower jaw carved separately and hinged with fiber so that during the rites the mouth could be moved. The sculptured forms in Ibibio masks are large in size and scale and are carved with real mastery in the use of angled planes and contrasts of abrupt projections into space and recessions into depth to a flattened background. The emphasis is entirely upon a bold sculptural statement of shapes and not upon a refinement of line or detail. Many of the Ekpo society masks were remarkably polychromed, at times with such delicate colors as soft gray, yellow, and mauve appearing in juxtaposition. The face and semihelmet masks were by no means the only types used by the Ibo and Ibibio. Both groups had a number of carved figures or combinations of figures which were worn or carried on top of the head.

The Ijaw tribes, who live in the swampy delta of the Niger River, wore masks in the rituals they performed to propitiate the water spirits, important sources of protection and fertility. These are often very large and have grotesque facial structures composed of dynamic combinations of birds, snakes, and crocodiles. In some examples, the animal forms are carved in the round and project considerably above the abstraction of the facial shape. Eyes are rendered as long, protruding, heavy tubular forms which alone suffice to give the mask its bizarre semihuman appearance. The dramatic contrasts of rounded and projecting shapes against the flat or concave background are intensified by the frequently arbitrary bright designs in red, white, and black. These represent still another type of African mask, since they are worn horizontally on top of the head so that the carved and painted designs are exposed to the sky.

Another center of mask development is located in the Cameroun area of West Africa, immediately east of Nigeria. In this region, because of the constant intermingling of small tribes for one reason or another, the art styles have a greater degree of homogeneity than in Nigeria. Three kinds of masks were formerly used in this region: (1) a life-size and fairly naturalistic face type; (2) very large dramatic interpretations of a face or a full-head form, worn either as a helmet or as headgear angled on top of the head (II, PL. 97); and (3) large masks representing animal forms. All three types range in expression from a direct naturalism to a dynamic stylization, at times verging on abstraction, and in treatment from a vigorous sculptural statement of basic expressive shapes to a somewhat more refined and careful delineation of parts. Few of these masks are polychromed; instead they are usually painted either a monochrome dull black or light-red ocher.

In this style, the face or head is interpreted as a full expanding volume, and the large-scale facial features, somewhat as in Yoruba masks, project from but do not break into the volume of the surfaces behind them. Frequently the facial parts are dramatically expressed in a sculptural way so that each feature is a distinct entity. These features are unified either by a strong rhythmic repetition of basic shapes or by a rhythmic adzing of surfaces. Cameroun masks lack the descriptive or decorative details found in other African styles, such as the treatment of the hairdress and scarification marks. The hairdress, for example, is often defined by large and deep parallel grooves that have a marked sculptural quality. This rendition, although it varies somewhat in the depth and scale of the grooves, is found so commonly that it may be considered a characteristic of Cameroun style. Moreover, the rhythms established by the sculptural forms of the hairdress are reechoed in the roundness and contrasting depth of facial features. This is one of the most direct and purely sculptural mask styles found among primitive peoples.

Cameroun masks were largely used by semisecret confraternities of a residual totemic character; many of them had as their emblem an animal with which there was a psychological relationship. The societies, for example, emulated the qualities and powers of the animal, which they believed were accessible to them. The purposes of the societies included the protection

and welfare of the group and the punishment of social offenders. The majority of them used masks in many of their secret or public rites. In other societies, masks were used during funeral rites for the propitiation of ancestors and as symbols of societal roles (e.g., the humanoid masks worn in the secret meetings of certain military espionage groups). The precise function of many of these masks is not known, but they constitute one of the distinct features of Cameroun cultures.

To the south, in the Gabon region of equatorial Africa, and especially along the reaches of the Ogooué River, numerous life-size or slightly smaller face masks were used (PL. 356). They represent naturalistic female faces surmounted by crested hairdresses. The facial forms comprise a high, rounded, protuberant forehead, a straight and fairly thin non-Negroid nose, and slanted eyes with both lids often puffy and almost closed, giving the face a rather Oriental appearance. Mouth forms vary, although in many examples the lips are extremely realistic in shape, while the ears, in contrast, are summarily treated. Chins are usually narrow, sometimes almost sharp-pointed, and the eyebrows are carved as distinct arches. Distinctive features of these masks are the remarkably balanced expression of bone structure, the fleshy and muscular form, and the tightness of the covering membrane of skin.

Two categories are distinguishable among them: those with facial scarifications and those without. The facial scars follow a fixed pattern consisting of three rows of three rectangular forms in very high relief in front of each ear and a diamond pattern of similar forms on the forehead just above the bridge of the nose. Hairdresses vary considerably, possibly reflecting the styles of different subtribal groups; but they are all treated in a decorative manner, consisting of carved patterns of parallel lines in low relief. Whether scarified or not, the face was originally painted an over-all white, the lips, scarification designs, and sometimes the eye slits red, and the eyebrows and hairdress a flat black.

These masks were worn by secret societies, especially during the periods of initiation and burial of society members. They represented female spirits, and the rites were sometimes performed with the wearer of the mask mounted on stilts, a feature found not only in this part of Africa but also in some areas of Guinea and Liberia to the west. The purpose of the societies seems to have been to maintain the traditional social relationships through the sanction of the ancestors; hence these masks had a socioreligious significance.

In the western part of the Congo region, especially in the watershed of the Kwango River, numerous masks were used in the secret and public initiation ceremonies when youths received adult status in the tribe. The principal tribes using masks in this area were the Bapende (II, PL. 110), the Bayaka (II, PL. 109), and the Basuku.

Three types of masks were worn: the face, semihelmet, and full-helmet types. But the full-helmet mask, particularly that of the Basuku, may be singled out as the most characteristic. As usual with this type, it comprises a three-dimensional representation of the head and is slightly larger than life-size, so that it can be worn comfortably over the head of the dancer. Basuku examples express the full volume of the head shape by emphasizing rounded surfaces, such as those of the forehead, the half-closed upper eyelids, and the planes of the facial area. The nose and mouth are variable forms, but the nose is characteristically rather short and thin, and the mouth is typically a narrow, open oval with jagged, filed teeth carved within the lips. The hairdress is a flat pattern of lightly carved parallel lines, with a bird, animal, or small human figure represented in the round just above the forehead. These masks were lightly painted with black and red and were worn with an attached costume of shredded raffia. Unlike the Ogooué River masks, which have a calm and contained sobriety of expression, the Basuku masks often combine contradictory expressive elements, such as a detached quietude expressed by the half-closed eyes, and an overt aggressiveness expressed by the conspicuous open mouth with sharp teeth.

The types and styles of masks evolved in the central Congo area are distinguished by a rich coloration (II, PL. 115). The dominant color is a light red obtained by mixing ground camwood with water or oil. Though sometimes used as a monochrome, it is often combined with white, black, and various ochers ranging from yellow to orange.

The eastern branch of the Bapende tribes in this area uses numerous small masks in boys' initiation rites. These are usually much less than life-size, are often marked by sharp, wide oval faces, large heavy-lidded eyes, wide flat noses, and small mouths. The hairdress is built up into a number of knobs or points and is simply described. These masks are frequently carved in hardwood and are rubbed with camwood powder, which gives them a rich red patination. They are stitched to all-enveloping costumes, comparable to those used with the Ibo Mmo masks. The eastern Bapende also wear small face masks with short or long animal horns rising above.

Also characteristic of the central Congo area are very large polychromed masks, sometimes 2 ft. or more in height, used by various groups in socioreligious performances involving mythological characters. They are narrow in proportion to their height, which gives them a conspicuous vertical orientation, and dramatic in appearance, with their features composed of grotesque and nonhuman shapes. The eyes, for example, may be enormous and may project as sharp and long conical forms from a deeply depressed oval eye area. The nose is frequently heavy and blocky, almost cuboid in shape, and the mouth is moderately large, with a roughly ovoid open form. The headdress may be a tight caplike shape, or it may be expanded into other larger broken forms. The facial surfaces are usually a monochrome red; the depressed eye area is white with black stippling; and the eyes are often painted in stripes of yellow, black, and white. Flanking the nose, on either side of the face, there is a zoned design of small triangular geometric elements, sometimes lightly incised on the surface and always richly painted in three or four colors. The total effect is spectacular and weird but arresting in its vibrant contrast of shapes and colors.

The Basonge tribes of the east-central Congo use a unique semihelmet type of mask that has become known as the *kifwebe*. Although they vary considerably in shape and in the precise handling of the features, all *kifwebe* masks have the appearance of combined human and animal features. The design is dominated by wide parallel grooves that cover the entire surface and are painted in white and black or red and black (II, PL. 120). The forehead is often an expanding, heavy, cowl-like form, below which heavy, hooded eyes project. The nose has a cuboidal, triangular shape, and the mouth is a hollow, wide, projecting rectangular form. A long, enveloping raffia costume is suspended from the carving and almost completely covers the body of the wearer. It is said that the forms of these masks are derived from those of lion heads and that they are now used by subversive political groups. Certainly they have a leonine character, but the early accounts of their meaning and function are extremely vague (e.g., "masks used in ceremonies to welcome guests," or "masks used in important secret rites"). They have, in common with other Congo masks, a largeness of scale and a heaviness of carved forms.

The Baluba tribes in the southeastern Congo wore a large, monochrome, dark-brown helmet mask, which expressed, perhaps more successfully than other helmet masks, the contained volume of a full globular shape. The facial features are composed of wide ovoid eyes, with the upper lids sensitively rendered as almost closed, the nose as an undistinguished short blocky form, and the mouth as a protruding rectangular shape. Buffalo horns are carved on the sides of the head and curve upward slightly in front of the face. It is said that these masks were used in initiation rites, but there are no satisfactory data on their function. They constitute, however, in the thinness of the shell of their carving and in the expression of volume, one of the most esthetically appealing of African masks.

As an art form, the mask in Africa appears in a wide range of types and styles, but there is a constant reliance upon sculptured form for descriptive, expressive, or dramatic statement, so much so that color and extraneous materials appended to the mask must be considered of supplementary importance.

The basis for mask forms is deeply rooted in natural forms, both human and animal; even the fantastic and bizarre elements are found, when analyzed, to be not far removed from reality. But it is evident from a study of African masks that the ability and creative interpretation of the individual artist was responsible, as in all art, for the true masterpieces.

South Pacific. The primitive cultures of the island peoples of the central and southwestern Pacific Ocean are, in contrast to those of Negro Africa, varied to the point of heterogeneity. Of the major ethnic divisions of this vast area, only that of Melanesia in the southwestern region used masks extensively; but even in Melanesia, an area peopled by various Negroid stocks, mixed in certain areas with Polynesian and Malay elements, the mask was highly developed in certain regions and entirely absent in others. The main centers of its extensive development are: in New Guinea, the Sepik River and north-central coastal area; the Tami Island region and the central and western shores of the Papuan Gulf; the Torres Strait Islands; New Britain, particularly the northern part; New Ireland; New Hebrides; and New Caledonia.

All types of masks found in Africa were to some degree used in the Pacific, with, perhaps, the face and the helmet types most widespread. Melanesian masks, however, differ greatly from those of Africa in several important ways: in the variety of materials used in their fabrication, in the great array of other materials added to or suspended from them, and in their extremely rich polychromatic effects.

Although wood was the material used almost exclusively in some areas, in others a considerable variety of substances was employed, such as bark cloth, human facial bones or parts of them (which were then modeled or covered with a plastic substance), pith of reeds stitched to a framework in such a way as to resemble basketry, bark, turtle shell, pottery, and very sturdy, finely woven basketry. Surfaces were usually painted, often with a gessolike, transient earth pigment, bright in color, which included all the various ochers from red to yellow, and various clays from white to tinted shades of gray; in some areas, blue-green, mauve, and other delicate tones were obtained from minerals, seeds, and plant juices. Pigments were usually made volatile by mixing them with water, but in a few regions apparently an oil of some kind was used as a binder.

Besides the costume, which was usually of raffia palm, the array of materials attached to the mask included feathers of various types and colors, bright plant seeds, a wide variety of kinds and sizes of shells, fish teeth, and plant leaves. To a considerable extent, in fact, the carved or fabricated face covering accounted for only part of the total appearance of the mask.

The uses of masks in Melanesia may be grouped in diverse functional categories, some more prominent in one area than in others. Masks were almost universally used in both public and private ceremonies, and they were motivated by religious beliefs, social customs, or economic practices. The symbolic importance of the ancestor was extensive, but no great proportion of masks was made for ancestral rites as such; frequently, if the ancestor was invoked, he was of a far-distant, mythological character. Religious belief in numerous supernatural spirits led to their representation or symbolization in the majority of Melanesian masks. During initiation rites of young boys into a tribe or into membership in a secret society, supernatural spirits were frequently in charge of the procedure, specifically spirits represented by masks. Masks were also used in some areas at the harvest season to depict spirits or mythological characters to whom gratitude for a successful crop was due. Masks were used extensively, also, in funerary rites and for terroristic purposes, to maintain a social status quo. In some areas, masks were not worn but functioned as objects in their own right, representing, by large, solidly carved, and unpierced wooden faces, the visages of mythical or supernatural beings. The majority of these forms were extremely sacred objects and could be seen only by members of a restricted group.

In the range of Melanesian mask representation, there is little close reliance on natural proportions, features, and relationships. On the contrary, there is a good deal of expressive stylization of facial shapes and features, which often become grotesque and fantastic. The motivation behind these masks comes not so much from the world of physical reality as from the world of hallucinations, dreams, and states of terror and psychological unbalance. This particular content, in fact, gives to the majority of Melanesian masks their unique and often fabulous appearance.

The region of greatest diversity and richness of mask forms in Melanesia, and in the entire world of primitive peoples, is that of the Sepik River watershed and the north-central coast of New Guinea (q.v.). In this area the masks, which vary from a few inches to over 5 ft. in size, are usually carved in wood, although many remarkable forms are woven in a hard, fine basketry (PL. 442; see MELANESIAN CULTURES). There was in this region of New Guinea such a pronounced fluidity or dispersion of cultural elements that numerous components are shared in common by the many art styles. Three kinds of Sepik masks can be defined on the basis of their function and meaning: those representing (1) ancestors and used at ancestral ceremonies, (2) clan-owned mythological ancestral spirits, and (3) supernatural beings.

Ancestor masks were carved at the death of a man and used in mortuary rites in his honor. They are life-size, with a very tight and narrow ovoid shape in which there is a balanced expression of solid bone structure and of the covering membrane of skin. The forehead and facial areas are rendered in contrasting rounded surfaces and depressed flattened forms. Facial features vary in precise shaping but generally consist of small, open, oval eyes, a pierced, sharp, crescent mouth, and a very long and sometimes fleshy nose. Ears, where they appear, are summary stylizations, frequently placed as tablike forms at either temple. There is often a strong expression of a vertical division of the ovoid shape from the point of the chin to the top of the forehead; this is conveyed by the resultant ridge of the forehead, the consequence of the juncture of its two lateral planes, and is continued downward by the direction of the nose. In some examples the forehead division is a sculptured notched ridge. A realistic detail in all these sculptures is a hole carved through the nasal septum, a feature taken from reality, for these peoples wore nose sticks and other nasal decorations. Many masks were painted a monochromatic red ocher or a dull black; others were painted with the ceremonial facial designs worn by the deceased during his lifetime, thereby associating the sculptured form with a particular person.

Near the mouth of the Sepik River and in the adjacent coastal areas, ancestor masks were carved with combined bird and human forms. The forehead, for example, is shaped like a rounded cranium, the small eyes are given an upward slant, and the nose terminates in a beaklike appendage. Since it was believed that at death the soul departed as a bird, these ancestor masks combine both the physical and spiritual aspects of the deceased (PL. 358).

In the upriver Sepik region, large masks represent clan-owned mythological, ancestral, and supernatural spirits. Many of these forms were not intended to be worn but were suspended along the walls within the men's ceremonial houses as revered objects, to be seen only by the society members. They represent specific spirit beings by the components of their carved forms, by the painted designs and the colors used, and by the numerous appendages attached to them as further iconographical elements. Facial features are often dramatic in shape and in size: the nose, for example, is continued as a beaklike form that terminates in a carved bird's head or a bird figure, and the eyes, shaped like large concentric circular or ovoid forms, convey an intensity of expression. Masks play a prominent role in the extensively developed ceremonialism of this area. Through them, liaison is established with ancestor spirits for protection and general well-being and with supernatural beings for similar benefits.

Another important center of masks in New Guinea is located on Tami Island (PL. 354) and along the shores of the Huon Gulf east of the Sepik coastal area. By comparison, the Tami-Huon masks are restricted both in use and in kind. Two types, closely related in design, were used: a large and often heavy wooden mask and a somewhat smaller construction of bark cloth stretched over a palm-wood frame.

The wooden forms, sometimes over 2 ft. high, have a blocky, vertical, rectangular shape, the rounded surface being only slightly differentiated to indicate separate structural areas. The cranium is a tight, skullcap shape, below which the face is only slightly depressed. The features are connected into a single large design spread out over the facial area; the eyes as loops are joined by a thin, stylized nose with separately articulated nostrils; and the nose, in turn, is attached to the wide, oval mouth below. Characteristic of Tami masks are the triangular-shaped patches tangent to the lower and upper margin of the eyes; the bird- or fishlike forms that are carved to project from the sides of the mask; and a slightly protruding lip plug which fills the open oval of the mouth. The basic color is white, with details painted in bright red and flat black.

The Tami bark-cloth masks are similar to the wooden ones in their over-all shape and facial features, but they lack the tangential pendent forms. Both types were used to represent particular supernatural spirits which were the hereditary property of secret societies. In the past, these spirits visited the villages at ten- or twelve-year intervals for a stay of about a year. Although these masks were religiously motivated and their use brought benefits to the community, they also had strong social and political significance, since the use of them periodically reaffirmed the privileged status of the secret society; thus the use of these religiously inspired forms perpetuated the social and political organization of the people.

In southern New Guinea also, particularly in the central part of the Gulf of Papua area, bark cloth was used in the construction of masks. The bark-cloth mask was, in fact, the only type made in this area. Perhaps to a greater extent than in any other region of Melanesia, these Papuan Gulf forms were a focal element of all aspects of the culture, since they were associated with one vast communal ceremony. The preparations for this ceremony, when the necessary masks were made — and they were made anew for each ceremony — sometimes extended, depending upon the various taboos and other circumstances, over five to ten years or more. The fabrication and wearing of masks was restricted to the adult men in the society. The women, however, collaborated during the period of preparation by producing and storing the surpluses of food which were necessary for the culminating ceremony.

Of Papuan Gulf masks, the conical and the helmet types are comparable to forms found elsewhere in Melanesia, particularly in New Britain; but a third, the *hevehe*, is unique among all masks of primitive peoples. The *hevehe*, like all bark-cloth masks, was made by stretching damp bark cloth over a palmwood armature, to which it was either securely lashed or sewed; when the cloth dried, it fitted tightly over the frame. The *hevehe* consisted of two parts which were inseparable from the point of view of design: a helmetlike head with round eye perforations in the bark cloth, and a long, seemingly crocodile snout of wood attached as a mouth. Above this rose a flattened, ovoid, palette form, ranging from 6 to 15 ft. in height. On the bark-cloth surface covering the front of the palette, narrow strips of cane were sewed to form curvilinear and rectilinear geometrical designs arranged symmetrically on either side of a vertical axis. The designs on this upper part were then painted in very delicate earth and vegetable pigments, the tones frequently being within the gray register but varying from mauve to pink or yellow. The features of the helmet head below were also delineated in color, but these pigments were of a stronger red, black, and white.

The *hevehe* were the most important of the mask forms used in Papuan Gulf ceremonies. They represented first, in the shaping of the head, a supernatural being, and second, in the abstract geometric designs on the palette, mythological elements or events associated with that specific supernatural being. The ceremony in which they were used was one of considerable festivity and rejoicing, since these supernatural beings were of a completely beneficent character and were known to all the clan members, who understood that the purpose of this ceremony was both to honor the spirits and to obtain their continued support. Additional spirits, some of them totemic, were represented by helmet masks, and during the same period the conical bark-cloth masks were worn at the initiation rites of small boys. This spectacular, dramatic ceremony, therefore, had economic, social, political, and religious importance.

On some islands of Torres Strait, which lies between New Guinea and Australia, masks were also a conspicuous cultural expression. Two kinds were made: wooden and turtle-shell forms, which were generally used in harvest fertility ceremonies and in funerary rites (PLS. 251, 358, 441, 442).

The wooden masks represent a large, narrow human face which has in common with other Melanesian masks an aggressive and dynamic expression, achieved by both sculpturing and painting. Small oval eyes with an inlaid seed pupil are placed close to a long narrow nose, the sharp point of which overhangs the wide, open mouth filled with teeth. These features are close-set within the tight limits of the face and are further related by a black painted design above each eye and around the nose and mouth area. The rest of the surface is painted white with details in dark red. Sculpturally, the surface of the face is concave from the forehead to the protruding chin, with only slight modeling. Distinctive are the heavy, looped ear forms placed on a line with the eyes and given open rectangular distensions of the lobe, which in live prototypes accommodated the large ear ornaments worn in this part of the Torres Strait.

Torres Strait turtle-shell masks are a unique type in Melanesia. These were made by steaming, bending, lashing, and stitching together the shell plates. The forms differ greatly, ranging from a life-size, naturalistic human face, to fish and crocodile shapes, and to a number of fantastically elaborate composite forms consisting of human, fish, crocodile, and bird shapes, some of which were 4 ft. or more in length. Shells, seeds, and cassowary featthers are appended, and the masks are often painted with red ocher and white lime. The turtle-shell human face has many of the sharp-featured, aggressive elements seen in the wooden masks; the animal forms are realistically depicted or, in some instances, they dramatize such parts as the open jaws of the crocodile or the wings of the bird. The best examples of these are esthetically arresting and technically rank among the supreme achievements of primitive peoples.

The northern part of the island of New Britain was a center for some of the most fantastic and abstract masks in Melanesia. However, some naturalistic face masks for use in ancestor rites were modeled in a plastic material, consisting of a paste made from mashed parinarium nuts, over the frontal bones of the skulls of deceased members of the tribe. The surfaces were painted dark red, black, and white, presumably following the traditional ceremonial face painting used by the deceased during his lifetime. Several kinds of bark-cloth-covered masks were also made in this area, some in a lofty, conical shape, others in a cylindrical helmet form.

Unique to New Britain are the very large, fantastic masks of the Sulka people (PL. 449). They consist of a bamboo frame over which strips of the pith from reeds are sewed in place. Quite summary human facial features carved in wood are often attached to this surface, but in some examples a mere suggestion or an abstraction of features is worked out in pith. Characteristic of these Sulka compositions is the use of extraordinarily bright colors, such as pink-red, acid green, and yellow, with some white and black. Many of these masks are of a conical type, 3 ft. or more in height, and were worn on top of the head, the wearer looking out through a shredded fiber costume that covered his body. Other examples have a huge circular form impaled at a rakish angle on a conical base, with the undersurface of the circular form elaborately decorated in rich curvilinear designs. Some of these upper circular forms measure as much as 5 ft. in diameter. These masks were the property of secret societies and were worn largely in particularly terrifying and arduous initiation rites.

Of the bark-cloth types found in New Britain, those used by the Baining people in their noctural snake dances are the most spectacular and esthetically arresting (PL. 442). The major mask used in the dances consists of a large and rather fabulous animalistic head worn as a helmet. The forms are

dominated by a protruding cowl-shaped forehead and — within the deep concave facial area — by large concentric-circular eyes, which are made by pressing rings of cane over the bark cloth. The face terminates in a long, rather limp protrusion which suggests a tongue. These forms are elegantly painted in symbolic and descriptive designs of white, maroon, and black on the natural tan of the bark cloth. An inverted anchor-shaped design on the forehead is finely outlined in white and black stippling; the eyes are marked by maroon and black; and on the protruding tongue a herringbone design is painted in fine red lines. The true significance and function of these masks are but partly known. Several fieldworkers have agreed that they are used in ceremonies to honor an important visitor. At these dances, long bamboo tubes, also covered with bark cloth, are used by wearers of the masks to blow over the children; other dancers use live snakes somewhat as jumping ropes, a feature which suggests that fertility and apotropaic aims are inherent in such ceremonies.

North of New Britain, in the western part of New Ireland, elaborate mortuary ceremonies required the use of a great number of masks. As indicated in several previous instances, prolonged, elaborate communal rites are characteristic Melanesian cultural phenomena. In New Ireland the mortuary ritual known as the *malanggan* is, together with the *hevehe* ceremony of the Papuan Gulf, among the most spectacular. It was prepared and staged by one of the clans upon which the New Ireland social organization was based. All the design elements were clan-owned, that is, their use was the prerogative of a particular clan whose elders supervised and directed the sculptor as he prepared masks and other art forms.

Several categories of ancestors were honored in the *malanggan*: the original, legendary ancestors, such as the sun and the moon; the mythological ancestors of the remote past; and the more recent clan dead. The carvings are replete with symbols referring to these various ancestors; but since the same or similar forms are given different interpretations, according to the context in which they are found, it is practically impossible for anyone except a clan elder to interpret the full meaning of the sculptures. Basically, but with innumerable variations, the *malanggan* mask is a crested semihelmet form with attached long wings or ears flanking the face on either side. Sizes range from life-size up to nearly 6 ft. in height. Many masks, particularly the largest and heaviest examples, functioned merely as exhibition objects and were placed on shelves in an open-faced shed; some were merely supported by relatives of the deceased, who performed no dance. The life-size mask was worn in pantomimic dances throughout the celebration of the *malanggan*.

An art style unlike that found in any other Melanesian area evolved in New Ireland. This is equally evident in masks, figures, and other art forms and in ceremonial paraphernalia. Distinctive of this style is an intricate over-all openwork pattern. These pierced, three-dimensional designs are substantially sculptural definitions of structure. This, however, is very seldom allowed to remain as a clear esthetic statement. Instead, it is visually denied or even destroyed by the painting of fragmented, small-scale designs upon the structural parts. The coloration on early New Ireland masks is red, dull black, and white. Later, after German contact, some blue, yellow, and other shades of red were used. Typical of this style is the representation of the eye by an inlay of the operculum, or valve-closing plate, of the sea snail, which has swirling colors of green, brown, yellow, and white. The component design elements often combine to give a distinctly surrealistic flavor, when, for example, fish heads protrude as eyes from a grotesque, non-human face, and when snake, bird, and pig forms are combined in a single design. These forms exist so completely in an unbounded space as to be termed "aerial."

Prolonged and elaborate Melanesian ceremonies were also performed in the central and northern New Hebrides Islands and marked the advancement of an individual from one grade to another within various secular, religious, and secret societies. A New Ireland clan gained considerable prestige by staging a more elaborate and spectacular *malanggan* than had previously been given. The cultural dynamics in the New Hebrides were even more intensely exacting, since all males from the age of six or seven had to strive constantly to amass sufficient wealth and prestige for advancement within the numerous grade societies. In a culture so motivated, a status quo position was consequently untenable. The main purpose of achieving higher rank was to attain a comparable position in the hereafter, since it was believed that if sufficient rank was not achieved before death, the spirit of the ancestor would face oblivion; thus the continuity between the living and the dead, always a vital matter among primitive peoples, would be broken.

In some of these grade societies, carved, modeled, or fabricated masks indicating the presence of the ancestors were required. One type was face size and carved with close-set scowling eyes, deeply furrowed facial folds, and an open crescent mouth. Some of these, carved in a moderately soft wood, were painted brilliantly in red, white, yellow, or black; others, carved in a hard wood and having a widely looped nose, were painted in a monochrome black. In either case the features were restless and dynamic in expression. Small diamond-shaped masks were modeled over a light palm-wood armature with a compost made largely of cut and mashed vegetable fibers. Some of these were of a helmet type with multifaced sides; others were made of palm spathe and topped with a conical caplike form sometimes covered with spider webbing. In the majority of instances New Hebrides masks have an intense, alert expression and are vividly polychromed with light brick-red, pink, yellow, light mineral-green, blue-black, and white. Long strands of banana fiber or raffia serve as a short costume. The majority of these masks were made by nonprofessional artists, that is, by members of the grade to which a candidate was aspiring. If the "artist" happened to be particularly talented and experienced, the result would obviously be more accomplished and esthetically satisfying. This accounts for the unevenness in the quality of New Hebrides masks.

Two mask types were developed on the large island of New Caledonia (PL. 443). One consisted of a long, narrow, life-size face, which was carved with a handle below the chin so as to be held in front of the face. It was painted simply with black and red as further descriptions of the carved features. Fibers were attached around the edges, and a costume covered the upper body of the dancer. The other type of mask was often larger than life-size and was attached to the base of a cylinder of woven cane which fitted over the head of the wearer, and from both the cylinder and the mask a long wig and beard of human hair were suspended. This mask was worn with a short, thick, black-feather costume reaching slightly below the knees and represented a combination of aquatic and jungle supernatural spirits.

Both types are heavy-featured and menacing in appearance. An open V-shaped mouth is carved with sharp teeth; the nose is of a naturalistic, fleshy, Melanesian type and is usually given a huge beaked or hooked form, the hook sometimes describing a three-quarter circle. The eyes differ in treatment but are usually very large, with an intense expression, and are set beneath scowling brows. Rounded, heavy, protruding forms suggest cheekbone structure, and in the same way the tight treatment of the forehead expresses the hard skull area. These masks are a dull monochrome black, which is occasionally relieved by the use of red or white around the eyes and mouth. They are massive in scale and completely sculptural in their expression of intense and dramatic aggressiveness.

In view of the great diversity in kinds and styles, it is impossible to make any extensive generalizations on Melanesian masks. But it is understandable why these forms, when considered as prerequisite to the implementation of vivid ceremonials which reflected a lack of assurance and deep anxiety, were not derived from physically observed and experienced reality, as they were to a great extent in Africa. Instead, they originated during emotionally disturbed states when fantastic apparitions from an intangible and imaginary world made themselves known. This resulted in a vividly dramatic and richly symbolic art that has always appealed to 20th-century surrealists.

The Americas. Among the Indians of the Americas, the mask was an object of varying importance in the high cultures of pre-Columbian South and Middle America, as well as among the more primitive tribes of historical times. The forms included pierced and unpierced face coverings, hoods or helmets enveloping the entire head, and a costume mask covering the whole body, with or without a face covering. Stone, metal, wood, leather, fibers, basketry, and bark cloth were used in the fabrication of these varied forms.

In pre-Columbian Middle America, stone funerary masks were used at Teotihuacán and elsewhere. Finely carved in a hard stone, they were created in a strong but generalized naturalistic style to symbolize the dead, with the unpierced eyes and mouth cut into the stone in relief. It is believed that these carvings were attached to the burial shrouds of persons of rank. Various relief sculptures, such as the Maya stele on which masked figures represent the gods, furnish evidence that it was the custom to depict the gods in this manner at religious ceremonies.

In the ancient Andean area of South America, human beings wearing animal or bird masks appear on ceramics, textiles, and stone sculpture, and it would seem that these, too, denoted gods and a comparable custom of using masks at religious rites. Masked figures, for example, are prominent on the painted pottery of the Mochica, the textiles of the Nazca, and as running figures with condor masks on the stone reliefs of the famous "Gateway of the Sun" at Tiahuanaco, Bolivia (I, PL. 169). Another form of mask found in various parts of the Andean region consisted of a face made of hammered gold or silver, carved wood, or painted cloth, which was attached to mummy bundles. Larger hammered-gold masks were possibly used in this way by the Quimbaya Indians of Colombia, and small gold masks were used decoratively by persons of rank in various Andean cultures, as, for example, by the Inca, who attached them to the tops of sandals or wore them at the knees or on the shoulders.

Three types of masks are therefore prevalent in the high pre-Columbian civilizations of South America: religious ceremonial forms representing deities; mortuary faces for attachment to mummy bundles; and masks used decoratively for prestige purposes. Like their counterparts in Middle America, deity masks were intended to depict the appearance of gods, with the consequence that a descriptive style was developed in which the distinguishing features of the subject were given distinctly, and often so emphatically as to be a dramatic statement. The mortuary masks, also like those of the north, are merely symbolic forms and thus were rendered in a very simplified style to convey a generic pattern of human features; the small decorative masks stress a refinement of form and an elaboration of detail.

Among the more primitive tribal Indians of South America, some kind of mask or disguise is a culture element common to many areas. The purpose of the mask is usually to establish the identity of a spirit, either by means of face and body coverings or by the use of costume alone. Bark cloth is used extensively as a material for masks, as well as wood, bark, basketry, and hide. Costumes are made of bark cloth, bast, leaves, grasses, feathers, and shell, often in various combinations, which are accompanied, or sometimes replaced, by elaborate body painting in geometric designs. White, black, brown, yellow, and various shades of red are the colors most commonly used both for body decoration and for the painting of the mask proper.

The simplest of South American Indian disguises are the conical bark or hide masks made by the Ona Indians of Tierra del Fuego and their neighbors. These cones fit entirely over the head of the wearer, who peers through narrow rectangular slits marking the eyes, the only features defined. Ona masks are used to impersonate numerous spirits at boys' initiation rites, and they are also worn to keep the women subservient. Esthetically these forms have little to commend them. This is also true of the rudimentary masks worn by the Toba and Pilagá Indians of the Gran Chaco in their victory scalp dance; these consist merely of fiber bags stretched over large, angular wooden frames and tied under the chin to cover the head completely.

A characteristic trait of the Indian cultures of the western Amazon basin is the presence of painted bark-cloth masks. The Witoto Indians in this area wear a simple bark-cloth mask that fits over the head like a bag and hangs loosely around the neck. Facial features are sparse, consisting usually of wide, vertical, oval openings as eyes; some have large loop ears appended at right angles to the sides of the head, and an ill-shaped small slit defines the mouth. The facial area is outlined by a wide, roughly painted band, and a narrow line borders the eye openings. To the top of the mask is often attached a small bird form of bark cloth or a larger abstract open birdlike construction of thin pieces of wood; in some, a wide band of bark cloth hangs down the back. With this mask is worn a tight-fitting sleeveless garment of bark cloth extending from the neck to the hips. It is decorated on the front with large painted dentates, which curve in a sweeping arc from the shoulders to the hips, and on the back with rectangular and curvilinear designs. Although rather limited in esthetic quality, these masks, with their bold red and black surface patterns against the white of the bark cloth, are arresting in appearance. The precise purpose of these forms is not known, but they represent supernatural beings and are worn at festivals associated with planting, harvesting, and housebuilding.

The Tucuna Indians, also of the western Amazon basin, use more varied and fantastic bark-cloth masks to represent demons and animals. These forms are motivated by the need to create arresting effects and are not associated traditionally with any societies or other restraints. They are made and worn by the guests invited to the feasts held during the girls' puberty rites. The disguises consist of sleeveless robes of bark cloth which cover the entire upper part of the body and terminate in a long pliable neck and a crude grotesque head. A fringe hangs from the bottom of the costume to below the knees, and slits at the base of the fabricated neck provide eyeholes for the wearer. Tucuna masks are intended to excite by their fantastic appearance and are entirely the products of some individual's imagination. Their esthetic character therefore results from their melodramatic and exciting aspect.

Bark-cloth masks of a more elaborate and inherently esthetic kind are produced by the tribes of the northwestern Amazon region. Among the Cubeo Indians along the Vaupés River, for example, the disguises worn during mourning ceremonies are distinctive in shape and in their painted surface designs. They cover the upper part of the chest and the head of the dancer, with an attached full fringe of straw hanging down below the knees and a tufted, domical top which is formed by pulling together the upper edge of the bark cloth, as with a drawstring. The arms of the wearer protrude from the sides of this cylinderlike form, which is usually painted in bold geometric designs of lozenges, hatched or solid triangles, and crude frets rendered in black, yellow, and dark red on the white surface of the bark cloth. In some examples, a very simplified human face is painted at the top of the front surface. As is commonly the case among South American Indian tribes, these masks are not made by trained artists. They are worn at mourning ceremonies to represent the actual presence of ancestors, forest monsters, and all the beings of the world, including animals, birds, fish, and insects, all of which are symbolically depicted by abstract painted designs. The purpose of the ceremonies is to assuage grief by the presence of these beings and to drive the ghost of the deceased out of the house.

The numerous tribes of the upper Xingú River, which is south of the Amazon and empties into it in east-central Brazil, used a variety of highly developed masks until the present century. Disguises in this region included: zoomorphic headdresses of carved wood, woven straw, and painted calabashes; flat, oval masks of woven straw, with abstract surface designs painted on them or with stylized human eyes and nose modeled in wax and attached to the surface; and rectangular wooden masks, sometimes with only the forehead and nose carved, but usually with eyes and mouth also rendered, and with a bold geometric design painted across the central facial area. The lower part of the mask usually supported a long beardlike fringe of straw. The Bacaïri Indians wore below the carved mask a huge straw crinoline that covered the entire body and was at times 30 ft. in circumference.

The carved wooden masks of the upper Xingú River are best represented by those of the Mehinacu, Bacaïri, and Auetö Indians. Although these horizontally oriented rectangular forms are shaped as human faces, they depict animals, which can be identified by the abstract geometric patterns painted on the expanded middle area of the face. In the stress on triangles as design elements in their abstract symbolism, these masks bear some analogy to the Cubeo bark-cloth fabrications of the northwestern Amazon area. But, unlike them, the focal point is the carved face mask and not the entire upper part of the body. The Mehinacu and Auetö forms in particular are carefully made, with a marked bilateral symmetry on either side of a short but voluminous nose; small eyes are set high up beneath the slightly overhanging forehead, and frequently no mouth is depicted. The emphasis is clearly on the painted geometric surface pattern. Esthetically these are among the most striking of South American Indian masks. It is said that each village had its own collection and that they were probably worn in various dance cycles; but the significance of the forms and of the dance cycles is not known.

Another center of carved wooden face masks is located on the eastern slopes of the Bolivian Andes, among the Chiriguano and Chané Indians. The concentration here is on a simple representation of the human face devoid of painted surface patterns, unlike the Xingú River masks. The forms are carved in a soft wood, and the face is usually surrounded by a wide flange to hide the head of the wearer; a low rectangular palette sometimes rises behind the head. These masks have a wide horizontal oval shape and seem to fall into two types: those which represent the entire face, including the forehead; and those which are restricted to the area below the forehead. In both types, the facial plane is flat, the eyes are narrow, horizontal rectangular openings, the nose is heavy and straight, and the mouth a tight horizontal slit. When the forehead is included, it is marked off from the features below by a straight horizontal ridge, with the cranium above given as a shallow rounded form. The alignment of strongly marked verticals and horizontals within the tight oval outline of the delimited shape gives these masks a calm, contained, and undramatic expression. They are worn now for purposes of amusement at festivals and carnivals when the masked dancer collects food at the conclusion of his performance. It is believed, however, that these forms originally represented nature spirits or ghosts.

Elaborate costumes composed of grasses, leaves, basketry, bark, and feathers, which completely hide the identity of the wearer, are used alone by many South American tribes to evoke various spirits and mythological beings. Characteristic examples are those worn by the Bororo, Sherente, and Carajá Indians of eastern and central Brazil. Face masks simply cut and shaped from gourds or calabashes are also common and are frequently worn in secular dances. They differ considerably in quality and reflect the variability of skill found among all peoples without trained and professional artists.

Among the American Indians north of Mexico, the mask was an important art form only in the southwestern and eastern areas and on the North Pacific Coast. There are, moreover, no analogies either in style or function between masks from these areas. Although the incidence of masks in prehistoric sites is relatively rare, they nevertheless have been found in various regions. (It may be that they were more common than evidence indicates but were made of fragile materials, such as pottery, cloth, or vegetable fiber, and so have not survived.)

One type of mask, with summarily rendered facial forms cut in shell, was apparently put over the face of the deceased at interment. The size varied from 3 or 4 in. high to more than life-size. In some prehistoric mounds of the Ohio-Mississippi drainage, copper headdresses that fall somewhat within the mask category were discovered, and wooden face masks with carved deer antlers have been found, principally in the Spiro Mound in Oklahoma. In southwest Florida, wooden animal masks, especially of deer and alligator heads, were carved in late pre-Columbian times by the now extinct Calusa Indians. They were smaller than life-size, with clear indications that they had been painted red, white, black, and various shades of gray; shell inlay appears on some of them. Their precise usage is not known, but it seems likely that they functioned as important elements in a ceremonial complex.

A strong center of masks exists in the Pueblo area of the Southwest, especially among the Zuñi and Hopi Indians. In keeping with the general character of American Indian art, diverse materials such as tanned animal skins, wood, feathers, and animal hair are used in the creation of their masks, which are composite in character. The forms consist of a face covering, usually made of leather, to which are attached numerous materials and objects of iconographic significance pertaining to specific gods. A number of colors, including several shades of light green, bright red, blue, yellow, black, and white, are used to paint the different parts, and further polychromatic effects are achieved by the appended multicolored feathers and animal hair.

The face covering is usually designed as an undifferentiated convex surface. Often the eyes and the mouth are simple rectangular, ovoid, or circular openings; the nose is seldom represented. The designs may be elementary but naturalistic interpretations of basic human features, or they may be creations of fantastic shapes with a distorted scaling of elements within the facial area. On still other examples the face covering is treated as an abstract painted design, with unobtrusive narrow slits serving as eyeholes. Thin wooden panels, known as *tablitas*, are attached as surmounting parts to the women's headdresses in the many saints' day dances to which they give their name. These are painted with multiple symbolic forms relative to the character and function of the deity or saint they represent.

The most important masks of the Southwest, the kachinas, represent the beneficent dead (ancestors) as well as gods or supernatural beings who figure prominently in mythology and bring fertility, especially through rain, and long life, together with other benefits. The kachinas are impersonations of these spirits who, it is thought, return to earth at certain regular intervals to participate in prescribed ceremonials. It is believed that the masked kachina dancer is in actuality the supernatural being whom he impersonates.

A unique mask form was used in the southeastern United States, particularly among the Cherokee and other Indian groups of the Carolina region. These masks were carved in wood or were made of animal skins such as beaver or bear. Worn over the face, they were extremely simple and of a completely descriptive nature, representing both animal and human forms. Unfortunately, too few examples from precolonial days have survived to permit a valid characterization of this art.

In the eastern United States, the Iroquois Indians are the best-known mask-producing group, whose activity in this field has been a particular cultural feature from the time of early contact to the present. The types made fall into two categories: (1) the carved wooden forms, called the Falsefaces (PL. 357; X, PL. 361), and (2) those made of braided cornhusks, called the Shuck- or Huskfaces (see NORTH AMERICAN CULTURES). Historical accounts clearly show that both types antedate European contact. The wooden masks follow exactly prescribed patterns of composition, the meaning of which refers to specific mythological characters or supernatural beings, who through the Falseface Secret Society exorcised evil spirits responsible for disease and otherwise protected and aided the Iroquois. The masks are first roughly blocked out on a living tree, from which they are then cut free and finished in their final form. It is believed that the spirit of the tree remains in the finished sculptures, thereby imbuing them with a life essence. Cornhusk masks, made by a plaiting technique, were used at thanksgiving celebrations to promote fertility, particularly of crops.

Iroquois masks have a distinctive style. They are shallow in form with a singular statement of facial elements: the wide-open round eyes are often outlined with tin; in some, the nose is a large crooked shape; and the mouth, huge and thick-lipped, is given varied grotesque expressions. The surface planes of the face are usually broken by series of deep parallel grooves, which are powerful expressive devices. Some of these masks are painted in a monochrome red or black; others have the lateral halves painted red and black.

Among North American Indian cultures, the mask was used most extensively in the North Pacific Coast area, where all the tribes wore masks in their highly elaborate winter ceremonials. These tribes, from southern British Columbia north to southeastern Alaska, are the Kwakiutl, the Bellacoola (Bella Coola), the Tsimshian, the Tlingit, and the Haida Indians of the Queen Charlotte Islands. The sculpture of this entire area is so essentially homogeneous that tribal styles cannot be characterized without first understanding the broadly shared and commonly used art elements. This is particularly evident in the mask, the art form having the widest distribution and yet the closest relationship to individual tribal ideas.

Human, animal, and hybrid human-animal forms, often of fabulous appearance, provided the subject matter for masks. The face mask was common to the whole area, but important differences in this type must be noted. It could be, for example, a monoxylic carving of a contained ovoid shape within a sculpturally expressed outline, broken only by a few modestly projecting parts such as ears. It could also be, in contrast, a composite form, in which the outline of the shape was considerably extended by conspicuous attached parts, including bird beaks, winglike ears, bird or animal heads, or even by attached superposed forms. In addition, this type could be a movable construction, with the lower jaw carved separately and hinged to the upper part of the face so that it could be moved by the wearer; or it could be constructed as a double mask, with the two halves carved separately, hinged, and closed over another mask which remained hidden until, at a specific point in the dramatic ceremony, the wearer pulled a concealed string and revealed it. This was one of the most complex types of mask evolved by primitive peoples, as well as one having the greatest dramatic possibilities. Some of these, in fact, incorporated three representations in their final construction.

An exception to the face type was a very large form, of composite character, in which a series of bird heads of different sizes might be superposed along a vertical axis in such a manner that each head could be moved; or the body of a whale might be depicted with movable fins and tail attached. These masks, of somewhat limited distribution, were not worn but were carried or supported by a person who was concealed entirely by a covering blanket.

Northwest Coast Indian masks are based upon an initial statement of essential planes and shapes which establishes the necessary total structure of the subject represented. A final definition and expression is achieved by the carving of surfaces and by the careful delineation of features and details. Emphasis may be given to the bulk and mass of certain forms by a modeled textural surface treatment, or to their inner content or volume by tight and smooth exterior planes. These facial planes have a prominent lateral curvature and frequently a less emphatic vertical curvature of a similar kind. The sculpturally form-defining surfaces are usually fragmented into many separate and marked-off parts, which are further indicated by outlines and by the application of a flat paint.

The mask design is, therefore, usually composed of a number of clearly separate and distinct parts, such as facial features and surface patterns, which, because of their large scale, give the mask a scale incommensurate with its actual size. A bilateral vertical division, either tangibly represented or strongly implied by the prominent verticality of the nose, creates in most instances an absolute symmetry. Significantly related to this axis is the large inverted triangle which has the horizontal of the eyebrow line as its base and the tapering chin as its apex, and the downward movement of which is counteracted by the vigorous upward thrust of another triangle having its base along the horizontal of the mouth and its apex at the bridge of the nose. The resultant interlocking arrangement of triangles focuses attention on the eyes and the mouth. The sweep of the eyebrows, the emphasized chin, and the prominently sculptured mouth make this interlocking pattern strongly apparent.

Facial features and details are lucid and precise in statement and ample in scale, stressing especially the vigor and integrated character of the design. The eye is defined by a wide oval terminating in sharp points and is represented either by a fine, low-relief line or by an equally fine painted outline. The pupil is carved as a slightly protruding, circular, and pierced shape, the bounds of which are fixed by a painted or a carved relief line. Although the mouth is variously differentiated, it emphasizes the projecting, sculpturally formed lips. Incised and painted surface details, another constant style feature of the masks, are often used independently to delineate symbols, to function in a decorative manner, and to describe further the carved forms.

The use of line, both expressively and esthetically, is of great importance in all the art forms of the Northwest Coast and is particularly evident in the masks. Two types may be discerned: one, a "resultant line," is the consequence of the meeting of two planes of different angle or depth, which are usually painted in contrasting colors; the other is a "pure line," which may be carved in low relief, incised into, or painted on the surface. Pure and resultant lines are sometimes used together to enhance the statement of a given shape or area. The quality varies from fine to moderately heavy. Long, often curved lines, smoothly modulated to the surface plane, predominate and may be punctuated, though rarely, by staccato strokes. Curvilinear elements, sometimes abruptly and dramatically changing their direction, as in the eyebrow design, are an important feature of this style and may be designated as "angular curves." There is a marked tendency to use connective or closely associative linear arrangements, leading to the formation of an over-all pattern distinct from that of the carved forms. The conflict or tension thus produced between lines and sculptured forms contributes dramatically to the expressive power of the masks.

Since color was used extensively as an adjunctive element, delineated or carved surface patterns — whether employed symbolically or descriptively — were usually painted in a flat tone contrasting with that of the surrounding parts. An incised line was often filled in with a color of different shade or intensity from that of the detail or form it surrounded; pure line was also frequently painted on the surface in a conspicuously contrasting hue. Although preferences varied somewhat from tribe to tribe, the most commonly used colors were red, yellow, black, and white.

An emphatic division of form and surface must be regarded as another characteristic of the art of this region. But, whether carved or painted, the forms and surfaces tend to stress and to follow the outline of the mask. An effective unity is achieved by the interaction of carved forms and surface-design elements which are similar in shape or size, thus bringing the sculptured shapes and painted areas into a significant visual and expressive relationship.

To distinguish between the artistic production of tribal groups within the complex of the Northwest Coast, specific and subtle differences in the combinations of design and form that particularize the styles must be sought beyond the generalized pattern of shared elements. In art-historical terms, the Tsimshian mask style may be designated as "classical"; the Haida as "baroque"; the Tlingit as "rococo"; and the Kwakiutl as flamboyant "expressionist." Bellacoola masks have a style that may be considered a modified derivation of the Kwakiutl.

The term "classical," as a characterization of Tsimshian mask style, is based on the moderation and sensitive restraint evident in the interpretation of typical shapes, in the conformation of facial elements, and in the treatment of surface design motifs. Sculptured forms are given a more naturalistic and organic expression than in other styles, and there is a more lucid depiction of design elements, with a strong use of resultant line, and a harmonious unity as the primary basis of quality. This is emphasized by the careful balancing of the inner content or volume with the plasticity of mass and surface. Dramatic effect is, in fact, achieved by the Tsimshian Indians both in spite of and because of their classicism.

The Tlingit, near neighbors of the Tsimshian, have, in contrast, a style in which the smaller and more decorative design elements warrant the appellation "rococo." The scaling of parts as well as the more frequent use of inlays, including abalone shell and copper, point up the more ornate and elaborate design vocabulary (PL. 354). Another particularizing feature of this

style is the conspicuous use of a blue-green pigment together with a lighter tone of red than is found elsewhere. Animal masks were used more extensively by the Tlingit than those with human features, but in both instances the stress is placed upon the separate elements that comprise the form, rather than upon its organic unity. Tlingit masks generally emphasize the volume and lightness of forms through undifferentiated treatment of the broad surface planes in which the small and ornate design units are placed.

The Haida "baroque" style is expressed in terms of near-classical forms, which at times approximate those of the Tsimshian but are given a more dramatic and vigorous interpretation of human and, especially, of animal or animal-human features (PL. 357; X, PL. 357; see NORTH AMERICAN CULTURES). An emphatic rendering of the weight and mass inherent in heavy, bulky forms is prevalent. Combinations of diverse startling shapes and details of forms give to this style its spectacular and, sometimes, even melodramatic effects. The usually large-scale patterns of Haida design are presented in resultant and, more especially, pure line. Colors tend to be dark, although rich and vibrant, with occasional dramatic splashes of bright, contrasting tones. The subject matter inclines toward forceful animal-human representations or fantastic symbolic forms.

The Kwakiutl Indians were undoubtedly the originators of the complex, strikingly theatrical, composite masks, and many of their innovations of form were diffused throughout the whole North Pacific Coast culture area. Kwakiutl artists exploited the full realm of possibilities in the interpretation of dynamic form; vivid delineation of descriptive detail is also implicit in their style. Blatant distortions of both human and animal forms, arranged in spectacular or grotesque combinations of shapes, show an intention to achieve active and dramatic effects. These contribute to a mask style which in its totality is both flamboyant in statement and expressionistic in appearance. Movable parts are common on these masks, particularly on the large superposed types. Their powerful expression is unquestionable evidence of the important role assigned to them in the melodramatic performances characteristic of Kwakiutl dances and ceremonies (X, PL. 357).

Bellacoola mask forms were, in large measure, modified versions of certain Kwakiutl forms. Both the animal and human types which prevailed were often totally lacking in the fantastic character of the Kwakiutl forms. There is, however, a very strong sculptural expression of structural components. Of particular note is the use of a rich brick red and a bright azure blue; the two, often in juxtaposition, differentiate and stress the forms and surfaces, in which boldness of size and scale is strongly felt.

Northwest Coast masks were used largely in the winter ceremonials, when leisure time was amply available because the seasonal run of salmon, the main dietary staple of these people, was over. These rituals, of religious and secular significance, consisted of organized dramatic performances and dances, often motivated by the desire to exhibit the prerogatives of social position or rank. Among the Kwakiutl the religious performances dramatized the original encounters of the ancestors with the supernatural beings, at which time the ceremonial complexes had been learned, the right to wear masks had been granted, and the ability to perform certain sleight-of-hand tricks as supernatural miracles had been acquired. Reenactments of these experiences were performed both as theatrical exhibitions and for the purpose of initiating new members who had inherited the dance as a privilege. The dance groups were graded and, since membership was restricted, functioned as secret societies. The supernatural beings were represented with the features of animals, mythological monsters, and conventionalized human forms.

Among the Haida, Tsimshian, and Tlingit Indians to the north, although religious dances occurred, masks were worn largely to display the crests or insignia of rank at secular occasions. These animal and sometimes human forms depicted the supernatural beings who had originally permitted the wearing of such masks by selected individuals. These forms were also displayed on totem poles, boxes, spoons, and numerous other objects. Bellacoola masks, used during the winter ceremonials, portrayed deities to whom the dramatization of myths referred. They were also used to depict hereditary clan crests and legends.

Northwest Coast masks were, therefore, of great importance in the dramaturgic presentation of religious beliefs and experiences and in the demonstration of social position or rank. In either case, the masks visually manifested their expressive purpose as they were worn in the histrionic revelations of supernatural experiences. They were also powerful agents of religious and social control.

Along the Arctic littoral, the Eskimo developed various ceremonials and entertainments in which mask forms were employed. These were often given composite form with numerous attachments, including wood, bone, feathers, and shell. Many Eskimo masks of Alaska represented evil spirits of specifically therapeutic character. Other types were used as a form of caricature. The majority of Eskimo masks, however, were used either to propitiate or to humor malevolent spirits, such as those of winter and of disease. The differentiation of types and styles is considerable. Many masks are completely surrealistic in their combination of grotesque human, animal, and imaginative forms; nor is it unusual to find masks in which one side of the face is completely unlike the other, with extreme asymmetry. Other masks have the character of mobiles, with projecting or arched forms supporting bits of bone, feather, hide, or other materials in a state of suspension, which create movement when the mask is used. As is true elsewhere, they were used in dramatic performances in combination with one another. Prescribed costumes were worn to coordinate the mask and the ceremony (V, PLS. 5–7).

Any study of masks clearly reveals that very few elements can be found which are common to all of them, either from the point of view of esthetic expression or of content. The recurrence of similar kinds of masks throughout the primitive world has little relevance to a consistency of either motivation or function. Nevertheless, it can be said that the mask, wherever it is found, is basically used to conceal one identity and to create another. In actual fact, many masks are known to be composites of numerous identities associated in mythological or dramatic contexts. Often important, too, is the fact that the mask imparts anonymity to its wearer. Some investigations have revealed that the mask may become a vital or living entity in some ceremonies, at which time viewers and wearers alike experience it as an actual presence. Sometimes it is an inert but nevertheless important symbol, in which case the wearer of the mask or his identity is frequently known. Among primitive peoples, most masks functioned in a strongly dual capacity, as characters in a ceremony or performance and as cathartic agents for the viewers and frequently for the wearers.

In Africa and parts of the western Pacific it is apparent that there was an interchange or diffusion of types and formal elements; within certain limits this is also true of the American Indians. But in all areas there was a good deal of inventive freedom on the part of the artist. While it is true that mask types were dictated or controlled by convention, it was nonetheless possible, as surviving examples reveal, for the artist to give a personal, poignant, and sensitive interpretation to a traditional type.

The mask has been by far the most unifying element in the art of primitive culture groups, since it was tied closely to tradition, hence conservative, and acted as a strong cohesive element among otherwise loosely organized peoples. It must, therefore, be considered as one of the most important cultural and esthetic creations of the primitive world.

MASO DI BANCO. Italian painter and sculptor. Among 14th-century Florentine painters named Maso, a certain Maso di Banco is to be identified with the artist praised by the sources as a disciple of Giotto. Maso was living in the parish of S. Lorenzo in the year 1341 (not 1346, as Toesca wrote in 1951) when, on Sept. 29, two painted altarpiece panels were confiscated at the instance of Rodolfo de' Bardi and associates, together with various household goods and art materials. Between January and April of 1346 Maso was enrolled in the Florentine Arte dei Medici e Speziali. Since his name does not appear in a memorandum of 1347, listing the major Florentine painters worthy of executing a panel for S. Giovanni Fuorcivitas in Pistoia, it has been conjectured that by then he was dead.

Maso is called a "great master" in a document of 1392 concerning his lost *Deposition* (originally above the cemetery door of S. Pier Maggiore), which was "mended" by Niccolò di Pietro Gerini. Among the sources, Filippo Villani characterizes Maso as "delicatissimus" ("most delicate"), alluding to his pictorial manner, and in referring to his figures declares that he painted "with wonderful and incredible beauty." Ghiberti states that Maso was also a sculptor, citing a statue for the Campanile of the Cathedral (no longer identifiable), and mentions three of his paintings: a Descent of the Holy Spirit in the Augustinian church of Sto Spirito, a depiction of "Our Lady with many figures" in a tabernacle in Piazza Sto Spirito, and the legends of St. Silvester and the emperor Constantine, in a chapel in Sta Croce founded by Gualtiero di Jacopo de' Bardi di Vernio, who died in 1336. Of these works, only the frescoes in the Cappella Bardi di Vernio survive.

Cristoforo Landino mentions Maso, praising him in a general way. In Francesco Albertini's *Memoriale* (Florence, 1510) and in the *Libro* of Antonio Billi, the tabernacle in Piazza Sto Spirito is attributed to a certain Giottino, to whom are also ascribed other works not mentioned in earlier sources. Maso's name reappears in the Anonimo Magliabechiano (or Gaddiano) manuscript, where Ghiberti's list of works is slightly expanded. Finally, Giovanni Battista Gelli, writing between the appearance of the first edition of Vasari's *Lives* (1550) and 1562, briefly treats of Maso "sopradetto" (i.e., called) Giottino.

Vasari himself writes at some length of "Tommaso di Stefano, called Giottino," thus apparently amalgamating Maso with a certain Giottino di Stefano who is recorded as having worked in the Vatican in 1369. Maso's figure remains unclear in much modern art history, which has ascribed to Vasari's Giottino many very disparate works. The finest of these, which seem to belong to a unified group, include a *Coronation of the Virgin* and two scenes from the life of St. Stanislas, in the Lower Church of S. Francesco in Assisi, a *Crucifixion* in the chapter house of the monastery, and other paintings in S. Rufino and in S. Apollinare (now the Educatorio di S. Giuseppe), in Assisi. The *Deposition* from S. Remigio in Florence (Uffizi), attributed to Giottino by Vasari and highly praised by him, is often included in this group, but it was executed by another artist of a younger generation.

To reconstruct Maso di Banco's artistic personality, one must take as a point of departure the frescoes in the Cappella Bardi di Vernio in Sta Croce (PLS. 369, 370, 371). These were probably begun in the 1330s and not yet completed in 1341, which would account for the confiscation mentioned above. The legend is depicted in five scenes, which follow rather faithfully the narration of Jacobus de Voragine in *The Golden Legend*. In the first, a large lunette, Constantine appears in a spectacular chariot, flanked by knights in the foreground, and assures a group of desperate women that he has no intention of butchering 3,000 Christian children and bathing in their blood, a course of action which had been recommended to him as a cure for his leprosy. The painting, in very bad condition and partly effaced, evinces a mastery of space and figural construction that derives from Giotto, as do certain attitudes of grief in the mothers.

The lower register of this wall is occupied by a single rectangular scene, which is cut off by a tall sepulchral niche. This scene shows SS. Peter and Paul appearing to Constantine — who lies in a room constructed in oblique perspective (guards and a page in the foreground accentuate the depth of the scene) — to advise him of the means by which he might be cured. The composition, which some scholars relate to Simone Martini and Ambrogio Lorenzetti, was executed by an artist less robust and less sensitive than Maso but was certainly conceived by him.

The following scene (PL. 370), in the lunette opposite, more elevated in style, is divided into two distinct parts: The first shows Constantine enthroned in a loggia of pre-Renaissance character, solemnly receiving the Pope (St. Silvester), who, followed by a train of cardinals, displays an icon representing SS. Peter and Paul so that Constantine may recognize his visitors of the previous night. In the right-hand scene Constantine, kneeling in a porphyry tub, is baptized by St. Silvester in the presence of prelates and dignitaries, while Christ, whose head appears in a ray of light with the dove of the Holy Spirit, blesses him from above. The setting, a hall faced with marble, has an upper tier like that of the loggia in the adjoining scene, but there the upper section is set back to give spatial variation. Notable here are the balanced composition, the measured dignity of action, and the power of figural representation typical of Maso. However, the hard contrasts of light and dark in the scene showing Constantine enthroned suggest the activity of a collaborator (Toesca, 1951), possibly the painter of the frescoes in the chapter house of Sto Spirito, formerly ascribed to Maso and now to Orcagna.

The legend continues on the broad wall space below. Constantine's mother, Helen, unsympathetic to his rapid conversion, has asked for proof of the sanctity of the new religion. Before Constantine (seated between his mother and an old counselor), and to the amazement of the crowd gathered in the spacious hall, St. Silvester resuscitates with a single gesture of blessing a bull which a Jewish sorcerer had killed by his magic arts. In this scene the space is deeper and completely unified; it is punctuated by two slender columns which establish an interval between the central and the two lateral groups. The clear articulation obtained by disposing the figures in three planes, beginning with the persons in front of the balustrade, represents an expansion and enrichment of the compositional means employed in late works of Giotto and has been ascribed to the influence of Ambrogio Lorenzetti (O. Sirén, *Giotto and Some of His Followers*, I, London, 1917, p. 201), although it is possible that Maso arrived at this elaboration independently. Certainly his color sense, as revealed in this fresco — with its liquid and soft, but not saccharine color, of a purity especially striking in the details — cannot be wholly explained as a derivation either from Giotto or from Sienese artists.

Still more personal is the last composition (PLS. 369, 370, 371). At the left St. Silvester (in a trench, simply but effectively realized among broken walls) binds the jaws of a dragon whose poisonous breath had killed hundreds. At center St. Silvester, again in profile and providing a firm axis for the composition, revives two magicians poisoned by the dragon's breath. The magicians are simultaneously represented stretched out on the ground and revived, kneeling before the saint in a clearly Giottesque pose, while at the right Constantine and his retinue look on. In the figures of this fresco the color, though thinned by overcleaning, is modulated with great subtlety and refinement and impregnated with light to create solid volumes. But Maso's originality here is most apparent in his conception of the setting: wide, deep, and quite untraditional. In the foreground a single column symbolizes the antique world, now in ruins, while crumbling and irregularly disposed buildings create a harmonious spatial whole in which the figures move. The figures themselves are devoid of dramatic excesses; in the context of Maso's deliberate narrative and "delicate" (to use Villani's term) way of painting, they are imbued with a measured and human spiritual fervor.

The decoration of the chapel also includes other elements. In the rear wall a stained-glass window has figures suggesting the style of Maso. There are also frescoed images of saints, subsequently restored in part. The underside of the entrance arch is frescoed with busts in round frames; these were executed

with the help of assistants. Within the above-mentioned sepulchral niche Maso painted a Christ in Judgment seated in a mandorla surrounded by angels and, below, the expressive portrait of a risen soul among the barren crags of a desolate valley. In this work, too, there is some evidence of collaboration. The adjacent sepulchral niche (for a female member of the Bardi family) contains a Deposition attributable to Taddeo Gaddi, who worked in the Baroncelli Chapel of Sta Croce between 1332 and 1338, and to whom some scholars attribute the lesser figural ornamentation of the Cappella Bardi di Vernio.

The art of Maso combines the teaching of Giotto with some Sienese influence in composition, both factors being reinterpreted and elaborated with considerable originality. The two elements are integrated by a new way of using color, and this, together with certain perspective solutions of intensified profundity, this author considers traceable to Maso's knowledge of antique painting in Rome and Naples. Such a hypothesis is supported by the fact that Maso's hand can be recognized in the color, the details of form and handling, and the types of eleven heads that have been rediscovered in the window embrasures of the Cappella Palatina of the Castel Nuovo in Naples. Giotto is known to have frescoed this chapel with scenes from the Old and New Testaments between 1329 and 1332, and although these frescoes have entirely disappeared, the few remains in the window embrasures show that Maso numbered among the assistants. Though at this time Maso must have been quite young, he was evidently capable of profiting from the non-Tuscan experiences of his journey.

Maso's work in Naples is somewhat uneven and less refined than the Sta Croce cycle, and there are other paintings that seem to represent stages between the works in Naples and those in the Cappella Bardi di Vernio. One is a frescoed *Coronation of the Virgin*, formerly in the lunette of a side door of Sta Croce (transferred to the church museum). A softer mode of handling is found in a much-damaged polyptych in Sto Spirito (PL. 372) and in another later polyptych in Berlin (PL. 373). Originally a part of the latter was *St. Anthony of Padua*, now in the Metropolitan Museum. The frescoes of the Covoni Chapel in the Church of the Badia, Florence, show close affinities with the Sta Croce cycle, but they reveal also an attenuation of monumental values in favor of greater pictorial softness and therefore must represent the latest phase of Maso's art. These frescoes are preserved only in fragments: a Martyrdom of St. Bartholomew, a Stoning of St. Stephen, a prophet, and a few unidentifiable scene fragments are all that remain visible. Despite the many paintings ascribed to him, no other works are known by Maso. It is possible, however, that ideas derived from the lost Descent of the Holy Spirit are preserved in other 14th-century paintings and miniatures, such as Andrea da Firenze's *Pentecost* in the Spanish Chapel of S. Maria Novella.

Maso di Banco's artistic personality must have emerged and developed rapidly in the Florentine environment. (This is indicated by the presence of assistants in the St. Silvester cycle, a work which represents the full maturity of his art.) Maso, together with Taddeo and Agnolo Gaddi, represents a Florentine artistic tendency capable of development in various directions. On the one hand, Maso continues the powerful formalism of Giotto, which may have been passed on through him to Orcagna; on the other, his achievements in the use of chiaroscuro are reflected in the art of Nardo di Cione, while his coloristic innovations reappear in the work of the various personalities often confused with him, among them Giottino. Maso di Banco's works, then, confirm Ghiberti's statement that this eminent Florentine painter "had many disciples, all very skilled masters."

Mario SALMI

Illustrations: PLS. 369–373.

MASOLINO (TOMMASO DI CRISTOFANO, or CRISTOFORO, FINI, called "Masolino"). Painter (b. Panicale, near Florence, 1383; d. Florence, 1440 or 1447, if one accepts either of the death dates for a Tommaso di Cristofano registered in the Cathedral in Florence). His artistic formation, which remains insufficiently clarified, was certainly influenced by Ghiberti and contemporary sculptors, for there seems to be no evidence to discredit the sources (e.g., Vasari) that refer to Masolino as an assistant of Ghiberti on the doors of the Baptistery. There is a Maso di Cristofano cited in Ghiberti's contracts of 1403 and 1407 with the Arte dei Mercanti di Calimala (Merchants' Guild), but Gaetano Milanesi and Dominic Colnaghi have preferred to identify him with the goldsmith Tommaso di Cristofano di Braccio, who died Jan. 13, 1430. Mario Salmi has suggested that Masolino's relatively late enrollment (1423) in the Arte dei Medici e Speziali (Painters' Guild) may be indirect evidence that he was occupied in work with Ghiberti until that time.

Vasari says also that Masolino studied painting with Gherardo Starnina; since Starnina remains an almost legendary figure, the statement cannot be verified. Other artistic interrelations have been proposed by 20th-century scholars: with Lorenzo Monaco, Arcangelo di Cola da Camerino, and Gentile da Fabriano (Salmi); with Giovanni da Milano (Roberto Longhi); with an artist such as the Master of the Strauss Madonna or the Pseudo-Ambrogio di Baldese (Cesare Brandi).

Masolino's earliest known work is the little *Madonna of Humility* (Bremen, Kunsthalle) of 1423. On its attribution to Masolino (first proposed by August Schmarsow) all scholars agree except Robert Oertel, who gives it to Masaccio. Actually it shows no trace of Masaccio's style; its stylistic connections are with the artists mentioned above, and the iconographic motif is close to types in Sienese art of the Trecento and in the works of Lorenzo Monaco and others.

Probably somewhat later is the Munich *Madonna and Child* (PL. 374). Luciano Berti has proposed the date 1425, which seems probable in view of its connections with Masaccio and with Gentile da Fabriano's Quaratesi polyptych of 1425. Salmi, however, prefers to place it closer in time to the Bremen Madonna; Longhi dates it 1424, at the beginning of Masolino's collaboration with Masaccio and just before the lunette in Empoli; and Oertel dates it about 1435, in the period of the Castiglione Olona frescoes.

Documents published by Giovanni Poggi and by Odoardo H. Giglioli establish Masolino's presence and activity at Empoli in 1424. In the Church of S. Stefano, sinopias and some areas of fresco (on the wainscot, archivolt, and window embrasures) remain of episodes from *The Legend of the True Cross* that Masolino painted in the Chapel of St. Helen; these were rediscovered by Ugo Procacci. Also in S. Stefano are a fragment with a group of adoring children (rediscovered by Procacci) and a lunette depicting the Madonna with angels. In the Galleria della Collegiata di S. Andrea, Empoli, is one of the artist's most impressive works, the *Pietà*, a fresco formerly in the Baptistery.

These works, particularly the lunette, still manifest some indebtedness to Gentile da Fabriano, but their simplification of line and surface — seen especially in the sinopias — is in marked contrast to the virtuoso calligraphy typical of late Gothic painting. Indeed, the paintings at Empoli, the saints in the archivolt, for example, seem to reflect the manner of Masaccio, with whom Masolino must already have been in contact, though these reflections are transformed by Masolino's courtly and refined sensibility. Certainly neither the physical grandeur nor the emotional force of the Christ in the *Pietà* can be explained solely by a familiarity with the sculpture of Ghiberti — an opinion shared by Salmi, Toesca, and Longhi. Berti, although admitting that the two painters must at this

point have known each other, doubts the presence of a tangible influence from Masaccio; Oertel, on the other hand, follows Schmarsow in attributing the *Pietà* to Masaccio.

Another important work which appears to be of this period is the Carnesecchi triptych, executed for S. Maria Maggiore in Florence. It was dismembered in the 17th century; the parts that have been identified include the central Madonna, which was stolen from the Church of S. Maria at Novoli shortly after its discovery there by Toesca in 1923, a wing representing St. Julian (Florence, Seminario Maggiore del Cestello), and a predella panel which shows a scene from the life of St. Julian (Montauban, Mus. Ingres). Longhi (1940), Salmi, and Berti date the triptych 1425; Toesca considers it as postdating the Brancacci Chapel; Lindberg proposes the date 1428; and Ruth Kennedy assigns it, with reservations, to the period of the Castiglione Olona frescoes. Oertel attributes the entire altarpiece to Masaccio and dates it 1424–25, but denies that the Montauban predella panel belongs to it.

At the end of 1424 or the beginning of 1425 Masolino began the fresco decoration of the Brancacci Chapel — alone, according to Procacci's persuasive investigations — and executed the *Evangelists* in the vault and the *Scenes from the Life of St. Peter* in the upper lunettes. (These were destroyed when the chapel was redecorated in the 18th century.) After Masaccio arrived on the scene, Masolino executed *The Original Sin*, *The Preaching of St. Peter*, and the scene of St. Peter healing a cripple and raising Tabitha (PL. 374). Masolino departed for Hungary on Sept. 1, 1425. (For discussion of the collaboration between Masolino and Masaccio, particularly in reference to the Brancacci Chapel, see MASACCIO.) *The Original Sin* has been attributed to Masaccio by G. B. Cavalcaselle, by Schmarsow, by Raimond Van Marle, by Heinrich Brockhaus, and by Oertel. Lindberg was the first to date the Brancacci frescoes as following the paintings in Empoli, a sequence now generally accepted. Procacci is of the opinion that the extant Brancacci frescoes — both Masaccio's and Masolino's — were executed after Masolino's return from Hungary in 1427. Salmi relates the Adam and Eve of Masolino's *Original Sin* to Masaccio's lost picture of "a male and a female nude, life size" which Vasari cited as being in the Rucellai Palace, Florence.

Masolino's departure for Hungary left Masaccio (if one disregards Procacci's thesis) to continue the frescoes of the Brancacci Chapel alone. Masolino returned to Florence in July, 1427, and on July 12 was assigned the decoration of a chapel in the Church of S. Francesco, Figline Valdarno, probably never executed, as Procacci notes. Masolino's name does not appear in any Florentine document after July 20, 1427. Berti — who, like Salmi and most other scholars, does not believe that the Brancacci frescoes were executed after Masolino's return from Hungary — points to this fact in support of his view; he also notes that in the Rome works (excepting the debated *Crucifixion*) Masolino fails to sustain the advances he made in figure painting and perspective as a result of his association with Masaccio in the Brancacci Chapel.

The fresco cycle commissioned by Cardinal Branda Castiglione for the Chapel of St. Catherine in S. Clemente, Rome, has been variously dated. The cardinal was the incumbent of S. Clemente from 1411 to 1431, when he became Bishop of Porto, and a dating between 1427 and 1431 would therefore seem logical. The datings of 1420 (proposed by Wilhelm Lübke and Adolfo Venturi), 1422–23 (Oertel and Emilio Lavagnino), and 1436 (Ernst Trenkler) are unacceptable for stylistic reasons. Improbable also would seem Longhi's dating of 1425 and his hypothesis (based on a suggestion by Carlo Gamba) that Masolino and Masaccio went to Rome for the Jubilee of 1425 and that Masolino finished their joint work between 1428 and 1430. In fact, Masaccio's participation in these works (Vasari attributes to him the entire cycle) is still to be demonstrated, since no attempt to prove it has thus far been convincing.

The frescoes in S. Clemente comprise: in the vault, the *Evangelists and Doctors of the Church*; along the intrados, the *Apostles*, in half-figure; on the side of the entrance arch, *The Annunciation*; on a pilaster, *St. Christopher*; on the walls, scenes from the life of St. Ambrose (*St. Ambrose in His Cradle, St. Ambrose Named Bishop of Milan, A Miracle of St. Ambrose, St. Ambrose's Study, The Death of St. Ambrose*) and from the life of St. Catherine of Alexandria [*St. Catherine Refuses to Worship the Idol, The Conversion and Martyrdom of the Empress, St. Catherine and the Philosophers* (PL. 378), *The Miracle of the Wheel, The Martyrdom of St. Catherine*], and *The Crucifixion*.

Critical speculation has been focused especially on the large and important *Crucifixion* (X, PL. 484). Longhi has ascribed to Masaccio the distant landscape, with its tunnels of illusionistic space, and all the figures in the middle ground, which, with exception of the unsatisfactory figure of the horseman on the right, reinforce and clarify the sense of a precise and complicated spatial circulation. On the other hand, it has been suggested that Masolino was aided here by the young Domenico Veneziano. The present author shares Salmi's opinion that the entire S. Clemente fresco cycle was executed at one time and by one artist, Masolino, and that any elements resembling Masaccio's work are merely reflections of the figural solutions achieved in the Brancacci Chapel.

Another important and much-discussed Roman work is the triptych painted for S. Maria Maggiore. It was, as Schmarsow first suggested, painted on both sides. One side had as its centerpiece *The Founding of S. Maria Maggiore* (PL. 374) and at left and right, respectively, the *SS. Peter and Paul* and *John the Evangelist and Martin*, now in Philadelphia (Mus. of Art, Johnson Coll.). The other side comprised *The Assumption* (Naples, Mus. di Capodimonte), at center, and the *SS. Jerome and John the Baptist* and *SS. Liberius and Matthias* (London, Nat. Gall.), at left and right. The London panels were rediscovered only in 1951. The S. Maria Maggiore triptych is best dated 1428, but several other dates have been suggested. Longhi and Kenneth Clark connect it with Masaccio's supposed Roman sojourn of 1425; Lindberg proposes 1429, a date that would exclude the participation of Masaccio; Oertel suggests about 1423 and assigns the Philadelphia saints to the young Masaccio.

Postdating the frescoes of S. Clemente but lacking their reminiscences of Masaccio is a group of paintings which precedes Masolino's activity at Castiglione Olona. This group includes an *Annunciation* in two panels, formerly in the Kress Collection (Washington, D.C., Nat. Gall.; PL. 377); another *Annunciation*, also in Washington (Nat. Gall.), formerly in the Mellon and Goldman Collections; a fresco, *The Madonna with Two Angels*, in the Church of S. Fortunato at Todi; and a *Madonna of Humility*, formerly in the Contini Bonacossi Collection, Florence. Of these works, only the *Madonna* at Todi is securely dated (Masolino was paid for it on Nov. 1, 1432), but the others can be chronologically ranged, before and after, in the above order, from about 1430 to about 1435. The *Madonna* at Todi is also the only one of these works that recalls Masaccio (in the perspective of the throne, as if seen from below, which Longhi has pointed out). All of them, however, combine the earlier derivations from Gentile da Fabriano and the rhythms of Ghiberti with a perceptible approach to the style of Fra Angelico. In this new combination of elements, Masolino, after his more grandiose Masaccio period, reassumed his essential personality — to quote Longhi, his "character of a late little treasure" — and reintegrated the motifs of his personal poetry.

At Castiglione Olona Masolino painted two important fresco cycles, one in the Collegiata and one in the Baptistery. The frescoes of the Collegiata (comprising *The Annunciation, The Marriage of the Virgin, The Nativity, The Adoration of the Magi*, and *The Coronation of the Virgin*) are in the vault. They were at one time whitewashed but were rediscovered in 1843, and because the *Nativity* is signed, their attribution has never been disputed. What has been argued is their chronological relation to the fresco cycle of the Baptistery (comprising *The Annunciation, The Evangelists, The Doctors of the Church, God the Father with Angels*, and *Scenes from the Life of John the Baptist*), which is dated 1435. This date, on the intrados of the chancel arch, is repainted but plausible and may, as Lindberg suggests, refer to the completion of the work.

The Collegiata frescoes have been dated somewhat later than 1425 (almost contemporary with the consecration of the church) by Schmarsow; about 1423 by Toesca and A. Venturi;

in 1430 by Lavagnino; and about 1432 (just before the Baptistery frescoes) by Salmi. This last opinion is shared by Lionello Venturi, Lindberg, and Oertel. Longhi, however, dates them after the Baptistery frescoes and supposes that they were interrupted by the painter's death, which he places in 1440.

The frescoes in the Baptistery (PLS. 375, 376) have been accepted at face value by most scholars as works of Masolino, from about 1435; the notable dissenters from this opinion are Lindberg, who sees in them the presence of a different hand, and Longhi, who postulates a contribution from Il Vecchietta, by reference to the "rational" perspective of the *Zacharias Inscribing St. John's Name* and in the upper part of the *St. John in Prison*. (Vecchietta may also have worked in the Collegiata, on the wall frescoes of scenes from the lives of St. Lawrence and St. Stephen.)

Lost works by Masolino, besides those previously mentioned, include a frescoed St. Peter in S. Maria del Carmine in Florence, which Vasari cited as a preliminary to the frescoes of the Brancacci Chapel. In the Vatican Museums there is a *Crucifixion* that is at least a product of Masolino's workshop and may be a late work by his own hand; and in the Casa Castiglione in Castiglione Olona is a fresco, of which only two portraits and a fantastic landscape survive, attributed to Masolino by G. Cagnola and Salmi and considered by the latter as belonging among Masolino's latest works in Lombardy.

MASSYS, QUENTIN (also spelled Matsys or Metsys). Massys was born in Louvain between Sept. 10, 1465, and Sept. 10, 1466; he died in Antwerp between July 13 and Sept. 16, 1530. He spent the first part of his life in Louvain, according to tradition practicing the craft of his father, who was a smith. Karl van Mander asserted that Massys taught himself to paint, but his works indicate that he had formal training, very probably from one of the sons or other followers of the great Dirk Bouts, who served as official painter of Louvain from 1468 until his death in 1475. By 1491 Massys had moved to Antwerp, where he became a member of the painters' guild in that year.

No works by Massys have been definitely assigned to his early period in Louvain, but two Madonnas (Brussels, Mus. Royaux des B. A.), a *St. Christopher* (Antwerp, Mus. Royal des B. A.), and a *Madonna and Child Enthroned* (formerly Malvern, Eng., Dyson Perrins Coll.) have all been associated with this first phase of his career. His most important works are two large altarpieces painted between 1507 and 1511. The first is the St. Anne Altarpiece, or *The Holy Kinship* (Brussels, Mus. Royaux des B. A.), signed and dated 1509, which was commissioned for the Church of St-Pierre in Louvain in 1507. The other is the triptych of the Deposition (Antwerp, Mus. Royal des B. A.), ordered in 1508 by the guild of the joiners

in Antwerp for their chapel in the Cathedral and completed by Massys three years later. There are numerous other signed works by Massys, some of them dated, including the *Portrait of an Old Man* (Paris, Mus. Jacquemart-André) and *The Money Changer and His Wife* (VI, PL. 66). He is also believed to have painted a diptych of Erasmus (XII, PL. 98) and Petrus Aegidius (Salisbury, Longford Castle, Coll. Earl of Radnor), both about 1517. He collaborated with the landscape painter Joachim Patinir, providing the figures for the *Temptation of St. Anthony* (Prado). When Dürer went to Antwerp, he visited the house of Massys, which was by then one of the city's notable sights, but he did not meet the master. Two of Quentin's sons, Cornelis and Jan Massys, were also painters; and he influenced many others, particularly Joos van Cleve, Marinus van Roymerswael, and Jan Sanders van Hemessen.

The art of Massys blends the medieval Flemish tradition with the style of the Renaissance. His sweet, graceful, and elegant types display affecting but restrained emotion. His subjects are the conventional ones of his Flemish predecessors in the 15th century. He had a sure mastery of painting techniques and employed a subtle and distinctive range of colors, in which the violets, tawny yellows, and rose are especially pleasing. Soon after finishing the two great altarpieces, he seems to have become acquainted with the art of the Italian Renaissance, and especially the drawings of Leonardo da Vinci. This familiarity is evident in some Leonardesque compositions that he afterward adopted and in his development of a soft chiaroscuro. Architectural settings and richer ornament are also characteristic of his later works. (See also III, PL. 415; V, PLS. 284, 288.)

MATHURA. The name of the city (in recent times also called Muttra), once a great religious center (Μαδούρα ἡ τῶν θεῶν, Ptolemy, *Geography*, VII, i, 50), also designates the school of art that flourished there, a school that systematically and consistently opposed the reworking of classical elements in Gandharan art (see GANDHARA). The winter residence of the Kushan rulers (see KUSHAN ART), Mathura produced works that most likely reflect the taste of the dominant groups in the empire. It acted as a center for the adaptation and Indianization of those few iconographic schemes and pictorial motifs which classical Indian art adopted from the schools of the northwest. Mathura continued to be an important artistic center in the Gupta period (see GUPTA, SCHOOL OF), though its style was gradually diluted by the internationalism that characterized the new art movements. The Mathura school is noteworthy for the quality of its output during the half millennium of its development.

SUMMARY. Religious, geographical, and historical background (col. 579). Pre-Kushan period (col. 581). Kushan period (col. 582). Gupta period (col. 584). Conclusion (col. 585).

RELIGIOUS, GEOGRAPHICAL, AND HISTORICAL BACKGROUND. Situated on the Jamuna River, a sacred tributary of the Ganges, the city of Mathura was for many centuries the home of an influential school of art that owed its rise to, and in turn reflected, the city's importance as a great religious center where a variety of faiths coexisted or succeeded one another. Popular cults persisted alongside Buddhism and Jainism (qq.v.) until these two great faiths were superseded by Hinduism (q.v.), principally through the widespread veneration of Kṛṣṇa; Islam (q.v.), too, left traces, but at a later date. Although there had been some artistic activity in the region before our era, the Mathura school proper flourished from the 1st to the 4th century and remained active through the 6th and even into the medieval period; it owed its development to the number and prosperity of the Buddhist and, to a lesser degree, the Jain establishments. Geographical and historical factors also contributed to the formation and expansion of the school. Situated on the great trade route linking the Ganges basin with that of the Indus and with regions farther south, the city of Mathura was favorably located for exchanges with other centers near and far. On the one hand, direct communication with cities and religious centers to the east and south encouraged the adoption and perpetuation by Mathura of ancient Indian traditions that had developed in those regions; on the other hand, traffic with the northwestern areas (Punjab and Gandhara) and contacts with important ports along the western seaboard — which in turn communicated with the Iranian and Mediterranean regions — facilitated the introduction of foreign elements that served to renew its art. Thus, Mathura's geographical position, in addition to its importance as a place of pilgrimage, explains not only the diffusion of its works of art — found in places as far apart as Sarnath, Pataliputra (mod. Patna), Sravasti, Sanchi, and Taxila — but also the appreciable influence these works exerted both in India and beyond.

Mentioned as early as the Avadāna of Aśoka (3d cent. B.C.), the city came under the domination of the Śakas about the 1st century B.C. and then fell under the Yüeh-chih, who conquered all of northwest India in the second half of the 1st century of our era and, under Wima Kadphises, founded the powerful Kushan dynasty (see KUSHAN ART). The prosperity of Mathura and its school reflected the fortunes of the Kushan rulers, the most celebrated of whom, Kaniṣka I (2d cent.), extended his empire from the Ganges basin to regions beyond the Oxus (mod. Amu Darya) and the Pamirs. Although a few Buddhist stupas and monasteries had been built under the Śakas, their marked increase was largely due to the patronage of Kaniṣka and his successors (Vāsiṣka, Huviṣka, Vāsudeva), all of whom were favorably disposed toward Buddhism. The city became surrounded with religious establishments, both Buddhist and Jain, since the Kushan rulers tolerated concurrent development of the two great religions. Subsequent devastation, however, has left few vestiges of these buildings.

Mathura and environs, principal monuments of archaeological and artistic interest: (*a*) Mahāvidyā Ṭīlā; (*b*) Ambarīkhā Ṭīlā; (*c*) Chaurāsī Ṭīlā; (*d*) Yaśa Vihara, Katra; (*e*) Isapur; (*f*) Bhuteshar; (*g*) Gāyatrī Ṭīlā; (*h*) Vodva Stupa, Kaṅkālī Ṭīlā; (*i*) Dhruv Ṭīlā; *j*) Madhura Vanaka, Chaubara; (*k*) Guha Vihara, Saptarṣi Ṭīlā; (*l*) Huviṣka Vihara, Jamalpur (*from J. P. Vogel, La Sculpture de Mathura, Paris, Brussels, 1930*).

The domination of the region by rulers of foreign origin and the vastness of their empire inevitably affected the art of Mathura; these circumstances not only promoted the establishment of relations with the northwestern provinces, where a different style was developing, but also led to the introduction of beliefs, forms, and themes from diverse areas, as coins, sculptures, and decorative motifs variously attest. Such religious eclecticism is manifest in the variety of divinities and symbols on Kushan coins, as well as in the representation of fire altars and of flames issuing from the shoulders of monarchs. The dress of these monarchs (and that of several donors), which recalls their

Nordic origin, influenced the religious iconography and was thereafter adopted for the sun god Sūrya, known from the Vedic period. In some instances, the rulers' personal taste determined the aspect of the works. Such is the case of the dynastic portrait statues, a genre in itself unusual in India; the sober, rugged mien and the imposing severity of these figures set them apart from the numerous statues of purely Indian tradition. Nevertheless, the fact that these dynastic statues were reproduced almost identically at the two poles of the empire, at Mathura (VIII, PLS. I, 410) and at Surkh Kotal in Bactria (a group was found in the fire temple on this site; II, PL. 89), constitutes a telling demonstration of the success, however temporary, of the Kushans in rallying distant and disparate provinces, thereby briefly uniting cultures and tendencies strongly diversified and in many cases seemingly incompatible.

With the disintegration of the vast Kushan empire, undermined by struggles with the Sassanians (see SASSANIAN ART) in the mid-3d century, the bonds linking Mathura with the provinces of the northwest slackened or were broken. About 319 the province passed into the hands of the Guptas. Despite the avowed adherence of the new dynasty to Hinduism, attested by the inauguration in 380 of a temple dedicated to Śiva, Buddhism continued to flourish throughout the 5th century. On his way through Mathura about the year 400, the Chinese pilgrim Fa-hsien noted the existence of 20 Buddhist monasteries inhabited by 3,000 monks; Hsüan-tsang, who visited the city in the mid-7th century, counted the same number of monasteries but a great depopulation of the monks: the rest undoubtedly fled before the invasion of the Ephthalites, about A.D. 455. Although the 5th century marked a new era of prosperity for the sculpture workshops, their activity nevertheless seems to have come to a sudden halt toward the middle of that century. The period of flourishing was marked by a stylistic renewal related to that being effected contemporaneously in the eastern part of the country, in religious and artistic centers with which Mathura was then associated.

Although the artistic production of Mathura was most abundant and original during the period of Kushan domination, in the preceding and ensuing periods it was by no means negligible. The works antedating the Christian Era constitute the first steps in the formation of an Indian esthetic, adopted by the Mathura school, whereas those of the late phase witness the flowering of new, and sometimes alien, tendencies that mark a further stage in the evolution of Indian art.

PRE-KUSHAN PERIOD. Although Mathura must have possessed monuments of some importance as early as the Maurya and Śuṅga periods (late 3d–1st cent. B.C.), almost no trace of them remains. All that is worthy of note are a few fragments of railings (vedikas) of the type that surrounded Stupa No. 2 at Sanchi and the stupa at Bharhut (2d cent. B.C.). The medallions adorning the Mathura railings correspond in both style and motifs (lotus rosettes, Buddhist symbols, etc.) to those in low relief at Sanchi and Bharhut. The few sculptures found in the region are more characteristic of the Mathura style. Among the oldest surviving works in stone (ca. late 3d cent. B.C.) are the fragment of a colossal statue from Baroda and the statue found at Parkham (II, PL. 403), both of which are larger than life size, modeled in the round, and frontally presented. Despite its ponderous forms and rigid, archaic aspect, the Parkham image is a typically Indian work in the effect of roundness and mass, in dress (dhoti) and jewelry, and even in the yaksha type it represents. Many figures of ancient Indian art and of the Kushan period at Mathura are derived from this type.

The surviving terra-cotta figurines are far more numerous. Deriving from ancient prototypes of the 3d and 2d millenniums, they link the art of the Kushan period to pre-Vedic traditions and in their predominant type — the female tutelary figure — demonstrate the persistence of archaic beliefs. Frequently represented at Bharhut and Sanchi and perhaps even more often at Mathura, the yakshi was to remain the symbol of abundance and fertility, as the nude goddess (the earth goddess or mother goddess) must have been centuries before. A few of the figurines are of the early period; entirely modeled except for some details added by impress, they retain a certain affinity to those of the Indus Valley (see INDUS VALLEY ART). From the end of the pre-Maurya period until about the 2d century the technique changed and the quality improved. Pleasing, smiling faces were produced from molds, while the bodies of the figurines continued to be fashioned by hand; the hair was dressed with strings of beads and rosettes. During and following the Śuṅga period the figurines were entirely produced from molds, and the nude goddess was gradually superseded by abundantly bejeweled female figures dressed in the dhoti or a tunic. Both male and female figures are very similar to the types in contemporaneous stone statues. The female figures, their broad hips and opulent bosoms contrasting with slim waists, conform to the unchanging Indian ideal of female beauty. Until the beginning of the Christian Era these figures, including the colossal yakshi from Didarganj, continued to be represented frontally; it remained for the Kushan school of Mathura to give them a supple and vivacious movement. The amorous couples (*mithuna*) represented on terra-cotta plaques are likewise the precursors of many later works.

KUSHAN PERIOD. The origins of the Kushan school of Mathura, which came into being toward the end of the 1st century and continued to flourish until the 5th, are found in the sculpture of the great Buddhist centers in the neighboring regions of Bharhut, Sanchi, and Bodhgaya. There, between the 2d century B.C. and the 1st century of our era, the great traditions of ancient Indian art had developed, assimilating and transforming certain outside elements through the Gandhara school, which was developing contemporaneously under Kushan domination.

As yet few architectural remains have come to light. Mounds marking the sites of the many Buddhist and Jain establishments have frequently been excavated unsystematically. The monasteries must have corresponded to the Gandharan type of *saṅghārāma* of the plains. Among the rare surviving structural elements worthy of note are gate pillars and decorated crossbars. Various representations of monuments in relief provide slightly more information, as do some of the small votive stupas. The stupa, both Buddhist and Jain, remained of the ancient central-Indian type. The gateway (torana), with pillars and tiers of crossbars, and the railing enclosing the monument also followed the earlier tradition both in form and in details of joining, which were copied from wooden architecture. The large fragments of railings and of torana crossbars so far brought to light reveal that their decoration resembled that of the earlier works in both distribution and style. At Bhuteshar, however, the railing pillars are somewhat unusually adorned with female figures in high relief (PL. 382). Other buildings and architectural elements shown in relief carvings include an apsidal temple, sanctuaries in the form of storied towers, doorways surmounted by tiers of arches, windows framed in horseshoe arches, and columns of various shapes. Of the columns, the most usual type is that used in the earlier rock-cut monuments of Karli, Kanheri, and Nasik; it is characterized by a vase-shaped base, a polygonal shaft, and a bell-shaped capital of the Persepolitan type surmounted by addorsed animals.

The abundant and varied sculptural production comprises individual figures, steles, figures in high relief on architectural elements, narrative carvings in low relief, and a wealth of decorative carving (PLS. 379–84; VII, PLS. 447, 450). Statuary and relief carvings from Buddhist monuments are the most numerous of these works, but there are also a number of images of both Jain and Hindu dedication and others revealing the persistence of popular cults. Of more unusual inspiration are the royal effigies, which demonstrate the religious significance attached to the dynastic concept. These diversely inspired works of the Mathura school have in common both stylistic qualities and the material from which they were carved — red sandstone streaked with yellow, from the nearby quarries of Sikri. Predominant among the Buddhist works are the images of the Buddha. The question of whether the anthropomorphic (as opposed to symbolic) representations of the Buddha were first produced at Mathura or at Gandhara remains a subject of controversy (see IMAGES AND ICONOCLASM). It seems that each school created its own distinct type for the Master at about the same time. The

Gandharan Buddha type reflects elements of Hellenistic and Roman origin, while the Mathura Buddha remains within the Indian tradition and is immediately distinguishable by the rounded and smiling face and by the gossamer fabric of the clinging garment that clearly reveals the figure (VII, PLS. 134, 453). Both attitudes in which the Master is represented (seated in the Indian fashion and standing) are rigidly frontal. By their vigor and stability the two standing Buddhas from Sarnath and Sravasti, dedicated by the monk Bala at the beginning of Kaniṣka's reign, are the direct descendants of the yaksha of Parkham, despite the quality of their modeling and the skillful treatment of their drapery. The right shoulder and half the chest are bare, and the robe is arranged in a series of narrow pleats over the bent left arm, while a panel of the material is raised gracefully over the left hand. A stele found in an excellent state of preservation at Katra shows the peculiarities of the type devised for the Buddha seated in the Indian fashion (*padmāsana*). On the upper part of the body the robe is draped in the same way as that of the standing Buddhas. The hair is dressed in a manner that was discontinued later: drawn up on top of the head, it is twisted into a spiral bun which constitutes the cranial protuberance (*uṣṇīṣa*). The right hand is raised to shoulder level, the palm facing forward, in the gesture of reassurance (*abhayamudrā*), the only gesture represented in this style and during this period when the iconography was still in a formative stage. The large halo bordered with semicircles is a characteristic feature, and the throne supported by lions (*siṃhāsana*) is of a type that was already traditional. This stele, with its central Buddha framed by two smaller bodhisattvas and by little flying figures, presents all the characteristics of a composition that was to be maintained. The Master's spiritual eminence is brought out by the greater size of the figure and by the treatment in high relief. Beside these works of local character the later seated Buddhas seem rather clumsy interpretations of Gandharan models. Their monastic robes (*saṅghāṭi*) cover both shoulders, and the regular pleats are schematically indicated; the short, snail-shell curls covering the head and *uṣṇīṣa* were to become the general rule. Although nude, some of the Jain images are very similar to those of the Buddha.

Certain bodhisattvas carry on the type of the yakshas of Bharhut and Sanchi. Except for their rounded faces, they closely resemble the Gandharan bodhisattvas, both types being clothed in the princely garb of an Indian raja: a dhoti wrapped around the lower part of the body, a scarf, and a wealth of jeweled ornaments (diadem, necklaces, armlets, bracelets, and a belt). Maitreya, the future Buddha, may be distinguished by his flask (of *amṛta*, or ambrosia). The Śiva type corresponds to that of the bodhisattvas and is sometimes represented with four arms and addorsed to his phallic symbol (linga). The cult of this Hindu deity, as well as that of Kṛṣṇa, is thus attested in the region as of this period.

Though possibly of less iconographic interest, the female figures of Mathura most clearly illustrate both the progress achieved since the early period in India and the creative genius of the Indian sculptors. These tutelary beings figure mainly on railing pillars and torana brackets; their mythical mount or vehicle (*vāhana*) and the vegetation in which they are often framed are borrowed from the earlier yakshi tree goddess representations. As symbols of fertility they may be accompanied by a child; for the most part, however, these lush figures with opulent forms and in sensuously inflected attitudes (*tribhaṅga*) are represented intent on some trivial or mundane occupation, such as clasping a flowering branch, carrying a vase, fingering the end of a scarf, playing with a pet bird, or beautifying themselves. The dhoti (if present) is so transparent as to leave the body seemingly naked, the hips scarcely covered by a wide gold belt set with gems. Among a profusion of jeweled ornaments the heavy bangles around the ankles are a particularly characteristic feature. The somewhat affected charm and sensual beauty of these smiling and vivacious female figures seem to suggest a zest for life and its pleasures far removed from the Buddhist ideal of renunciation (PLS. 382–84; VII, PL. 450).

Huge images of the serpent king (Nāgarāja) indicate the persistence of the popular cult of the tutelary rain spirit. Life-size statues of this divinity were sometimes set up near fountains, as was the case of the Nāgarāja of Chargaon, the best preserved of its kind. He is represented in human form and standing in an inflected posture against a stone slab; his polycephalous reptilian nature is shown by the seven cobra heads forming a halo over him and their coils framing his body. The headless Nāgarāja in the Musée Guimet, Paris, with its supple modeling, its elegant posture, and its decorative arrangement of the cummerbund, is an excellent example of the mastery achieved by the Mathura school. The corpulent dwarf yakshas, generally represented crouching, are also connected with popular cults.

Another group of sculptures reflects the foreign origins of the Kushans. The most characteristic is the huge sculpture of three rulers, two standing and one seated, found on the site of a dynastic temple at Mat, north of Mathura. All three are dressed in Scythian fashion, similar to that of the Parthians, in a belted tunic reaching down to the knees and high, soft leather boots; in the standing image of Kaniṣka the dress is completed by a flared mantle fastened only across the chest. Some of the figures, including a few of the donors, wear high, conical caps. With their rigid posture and the simplicity of their dress — highly unusual in Indian art — the royal effigies of Mat seem related to the heavy and imposing Parthian statuary (see PARTHIAN ART). The large dynastic statues found at Surkh Kotal, which bear so striking an affinity to those of Mathura, are of Iranian origin. Introduced by the Kushans, this Iranian influence is manifest in several images of the solar god Sūrya, who is generally represented seated in a chariot drawn by rearing horses deployed in profile to either side (IV, PL. 221). The fact that the god wears (and was to retain) the Kushan dress demonstrates the importance of the solar cult in the more westerly regions.

The relief carvings on crossbars and railing pillars show less variety than the statuary. Indeed, it is almost as though, at a time when huge images of the Buddha were numerous, representations of scenes from his life and from his former incarnations had ceased to be of interest. Few episodes are illustrated and some, such as Indra's visit, are frequently repeated. The compositions are harmonious and clearly disposed and the figures skillfully handled, but the verve of the early periods has disappeared. For representations of the great Miracles of the Buddha and certain other episodes, many elements were borrowed from the Gandhara school. The decorative motifs show somewhat more variety and are of excellent workmanship; the most recurrent include architectural elements and Jain and Buddhist symbols, as well as real and mythical animals, certain of which are earlier borrowings from Iranian art. The tritons of Hellenistic origin assume a curious aspect, with their bifid tails symmetrically disposed and occasionally transformed into fantastic animals. Moreover, the Indian flora, mainly arranged on undulating boughs, is interspersed with acanthus and vine.

Certain tendencies of the Mathura style are found also in works from other localities and thus may indicate a more or less direct connection with the Mathura school. Among such works are the ivories found at Begram (VIII, PL. 241), which abound in graceful and animated female figures, and the carvings adorning rock-cut temples, such as the opulent couples in the chaitya at Karli and the regal figures at Kanheri. Similarities of dress and jewelry also indicate a certain contemporaneity.

GUPTA PERIOD. Several images of the Buddha, of bodhisattvas, and of various other divinities reveal that Mathura's artistic activity continued uninterrupted through the 5th century and the first half of the 6th. However, the sculpture produced in and around Mathura during this period is merely a by-product of the great Gupta school (see GUPTA, SCHOOL OF) that developed in the Ganges Valley and of which Sarnath was the main center. While the sculptures of the Kushan period had achieved great beauty in the lifelike rendering of flesh, particularly in the female figure and Nāgarāja, the Gupta Buddhas show a different spirit, more in keeping with Buddhist doctrine (II, PL. 380). In accordance with the transformation that occurred at Sarnath, Śākyamuni's anthropomorphic aspect was gradually idealized to suggest the deified Buddha's super-

human essence. All the formal elements tended to be refined, and the image was imbued with a spirituality previously unknown. Anatomical proportions were generally elongated, giving greater elegance to the body, which is clearly visible under the gossamer of the clinging garment. The monastic mantle that covers both shoulders is copied from Gandharan prototypes, but its pleats are so fine and are rendered so schematically as almost to be lost. The shape of the face was changed from round to ovoid, in conformity with the ideal type that was being evolved. The placid visage, with its half-closed eyes, emanates a serenity, a benevolence, and an inward concentration that later artists strove to recapture. A large and richly decorated halo adds a note of refinement to the whole. These images thus established a type of Buddha that was to reappear later with the same drapery, the same snail-shell curls, and even the same two symbolic gestures (especially in standing figures), that of reassurance (*abhayamudrā*), in which the hand is raised with the palm facing forward, and that of giving (*varadamudrā*), with the hand extended toward the worshiper. The images of bodhisattvas and Hindu divinities also reflect a high esthetic standard.

CONCLUSION. The great importance of the Mathura school in the Kushan period derived from the quality and diversity of its works and the diffusion of its influence. Heir to preestablished Indian traditions, it elaborated them and in turn transmitted them to contemporaneous and later schools. Through its contact with the workshops of Gandhara, Mathura occasionally influenced Gandharan production (as in certain Buddhas whose bodily form is more in evidence, and in the type of the bodhisattva); on the other hand, Mathura adopted, assimilated, and transmitted such Gandharan elements as decorative motifs, iconographic details, and certain specific compositions and forms for scenes from the life of the Buddha. The Mathura school thus constituted a connecting link between the art of the northwestern regions and that of the various provinces of India, in particular Amaravati; in addition, it served as a means for transmitting art forms to more distant regions, such as Serindia. Technical progress during the Kushan period enabled the "makers of forms in stone" (*śailarūpakāra*) to produce works of great dimensions, embodying the inveterate tendencies of Indian esthetics — a sense of volume and modeling, supple rendering of movement, and love of living form. No less far-reaching was the influence exerted by the Gupta school of Mathura; the idealized type of Buddha it created inspired numerous later representations, both in India and, by way of the Pala style of Nalanda (see PALA-SENA SCHOOLS), in distant regions such as Serindia and even in China.

MATISSE, HENRI. French painter and sculptor (b. Le Cateau, Nord, Dec. 31, 1869; d. Cimiez, Nice, Nov. 31, 1954). After studying law in Paris (1887), in 1889 he entered the office of a lawyer at Saint-Quentin. While convalescing from an illness in 1890, he took up painting as a distraction and, drawn to this new activity, decided to dedicate himself to it completely, despite parental opposition. He enrolled at the Ecole Quentin de Latour, directed by Croisé, where he practiced the fundamentals, making academic drawings and paintings. In 1891 he moved to Paris and, in order to prepare for the entrance examinations of the Ecole des Beaux-Arts, attended the Académie Julian. The school was directed by Adolphe William Bouguerau, whose paintings were much in vogue at the time, but who was incapable of rising above a merely academic level, either in his own work or in his teaching. Matisse soon left the school and began to attend the evening classes of the Ecole des Arts Décoratifs, where he met Albert Marquet.

In 1895 Gustave Moreau admitted Matisse to his studio at the Ecole des Beaux-Arts without requiring him to take the entrance examination. It was in Moreau's studio, the most liberal of those in which painting lessons were given, that Matisse met, among others, Georges Rouault, Henri Manguin, and Charles Camoin. In the summer of the same year Matisse went to Brittany for the first time, together with the painter Emile Wéry, whom he had met in Paris and who probably influenced him to brighten his palette. At the Louvre Matisse copied the paintings of Poussin, Philippe de Champaigne, Watteau, and Fragonard, directing his researches toward an increasing emphasis on color. Toward this end, consideration of the works of Chardin played a decisive role and marks the beginning of Matisse's attraction to impressionist and postimpressionist painting. It was in 1895 also that Ambroise Vollard held an important Cézanne exhibition, which Matisse certainly must have attended.

The following year Matisse began to exhibit his works at the Salon of the Société Nationale des Beaux-Arts and sold to the state his *Woman Reading* (Château Rambouillet), which he had painted in 1894, when he was still using darker tones. It was in 1896 that he met Pissarro and entered a long period of meditation on impressionism. His marriage to Amélie Payrayre and visits to England, Corsica, and Toulouse took place in 1898. Returning to Paris in 1899, he left Moreau's studio, the direction of which had been assumed by Fernand Cormon after the death of the master in the preceding year. Matisse next attended the Académie Carrière, where Eugène Carrière gave critiques from time to time. After reading Paul Signac's "D'Eugène Delacroix au Néo-Impressionisme," published in installments in *La Revue Blanche*, he became interested in pointillism, which was to have its effects on his art some time later, about 1904. Matisse's tastes and direction in this period can be deduced from his purchase from Vollard of a painting by Cézanne, *The Three Bathers* (donated in 1936 to Mus. du Petit-Palais,

Paris), and of a plaster portrait bust of Henri Rochefort by Rodin.

Between 1899 and 1904 Matisse executed his first sculptures, which showed first the influence of A. L. Barye and then that of Rodin (*Madeleine*, 1901; *The Slave*, 1900–03). At the beginning of the 20th century Matisse was faced with a succession of financial difficulties, and in order to help him, his wife opened a dressmaking shop. Commissioned by one Jambon, who ran a workshop for theatrical scenery, Matisse and Marquet executed a decorative frieze in the Grand-Palais, on the occasion of the Exposition Universelle of 1900.

In 1901 Matisse met Vlaminck and the critic Roger Marx; the latter presented him to Berthe Weill, in whose gallery he began to exhibit in 1902, with Marquet and Jules-Léon Flandrin. During this period Matisse produced such paintings as *A Glimpse of Notre-Dame in Late Afternoon* (1902; PL. 385), which demonstrates how color may lose its naturalistic connections and function as an independent entity, within a composition in which the buildings and bridge are deprived of all detail and become mere luminous surfaces. Generally, however, during the period 1901–04 Matisse reverted to darker-toned paintings of a considerably more realistic nature. In 1901 his work was exhibited for the first time at the Salon des Indépendants; in 1903 he participated in the first Salon d'Automne and in 1904 held his first one-man show, in the gallery of Vollard, with a presentation in the catalogue by Roger Marx. The show, however, was neither a critical nor a commercial success.

Matisse spent the summer of 1904 at Saint-Tropez in Signac's villa, together with Henri-Edmond Cross, and the contact with these two divisionist painters strongly influenced him. The interests he had held as far back as 1899 were revived; divisionism now seemed to him to have surpassed in chromatic intensity the atmospheric vibration of impressionism and to offer a possible means of arriving at chromatic abstraction, no longer bound by the need to represent the subject literally. The painting which he sent to the Salon des Indépendants, *Luxe, calme, et volupté* (Paris, private coll.), and which was bought by Signac, was executed with the division of the patches of color characteristic of pointillism. It is evident, however, that Matisse tried to avoid not only the schematism of divisionism but also the geometric surface aspect of the images that is inherent in the broken stroke of divisionist paintings. What seems to have interested him more and more was not so much the abstract sensation resulting from this painting device as the possibility of the clash that would result from the juxtaposition of two primary colors. In fact, the composition of the *Pastorale* (1905; Paris, private coll.) is more reminiscent of Cézanne than of Signac; its character is emotional rather than purely geometric.

Although the study for the painting *Joie de vivre* (1905; San Francisco, W. A. Haas Coll.) still reveals vestiges of the pointillist technique, the brush strokes have become fuller, and the final painting (1905–06; Merion, Pa., Barnes Foundation), sent to the Salon des Indépendants of 1906, is completely free of the small dabs of broken color. Color flows over the figures in broad areas, and in the originality of his technique Matisse has achieved complete artistic independence. Clearly, although Matisse had begun with divisionism and had absorbed its principles, he did not linger over variations on it. As early as 1904–05 he had evolved a new treatment of color; in 1905 he exhibited this new style at the Salon d'Automne, along with the works of those artists who were experimenting on similar lines — Braque, Derain, Manguin, Marquet, Louis Valtat, Vlaminck, Othon Friesz, and Rouault — and who comprised the "cage of wild beasts" (see FAUVES).

In this period was born a pictorial conception which was to influence many successive experiments, and which offered to modern art one of the first chances of breaking away not only from naturalistic representation but also from that variation on reality, impressionism (V, PL. 259). Hence, Guillaume Apollinaire was justified in stating, in 1910, that Matisse, along with a few other artists, had succeeded in freeing himself completely from impressionism and that he sought not to imitate nature but to express what he saw and felt through the materials of painting themselves, just as a poet makes use of the words in a dictionary to express his vision of nature and his feelings [*Chroniques d'art* (1902–18), Paris, 1960, p. 74]. It should be acknowledged, however, that experiments such as those of Matisse and the Fauve painters in 1905 would have been inconceivable without the rupture which impressionism itself had brought about in the traditional concept of space and color, even though it was Matisse himself who changed "impression" to "expression." This Fauve, furthermore, was an esthete, and again it was Apollinaire who declared in 1909 (op. cit., p. 65) that Matisse surrounded himself with ancient and modern works of art, with splendid textiles, and with sculptures by the Negroes of Guinea, Senegal, and Gabon, in which the passions of wild nature are depicted with rare purity. This Fauve was not an instinctive painter, however, but "un artiste cartésien."

Apollinaire had written of Matisse as early as 1907 in two articles, one of which appeared in *Je dis tout* on Oct. 12, the other, longer and more important, in *La Phalange* on Dec. 15. In the latter article several of Matisse's works were reproduced: a self-portrait, a portrait of his wife, *La Coiffure*, and *Le Luxe I* (op. cit., p. 452). Apollinaire's interest is particularly significant, not only for its recognition of Matisse's contribution to the avant-garde painting of the period, which was completely transforming the language of painting, but also because the poet centered his attention on the painter at the moment when an order began to appear in Matisse's work — not so rigid as that being created by the cubists in the same years, but certainly far removed from the completely instinctive approach of the Fauve expressionists.

Matisse began to draw away from his fellow artists, as did Braque. Matisse had gone to live in Collioure in 1905, and the strong light of this area was in part responsible for the explosion of color in his paintings. A memento of his visit to North Africa in 1906 is the *Blue Nude*, or *Souvenir de Biskra*, of 1907 (PL. 387), in which the distortions of form and of movement resemble those in certain sculptures executed in Collioure the same year. But gradually his figures became slimmer and subtler, as in the *Still Life with Antique Torso*, of 1908 (PL. 386), and his paintings began to reveal a nonrealistic color spread out in broad areas and a linear style that eliminated all anatomical detail. This tendency is seen in *Le Luxe I* (Paris, Mus. d'Art Moderne) and even more clearly in the second version of the painting (Copenhagen, Statens Mus. for Kunst, Coll. J. Rump). Progressing through *Red Room* and the *Game of Bowls* (both 1908; Leningrad, The Hermitage) and through certain portraits in 1909, the decorative synthesis was finally fully achieved in *The Dance* and *Music* of 1910 (both Leningrad, The Hermitage; cf. study for *The Dance*, 1909–10, PL. 385). This expansion of the chromatic planes, which had begun with the *Joie de vivre*, conferred on the image complete pictorial autonomy and established a principle, primarily regarding the treatment of two-dimensional space, which was absolutely essential to succeeding artists in their search for still greater freedom in representing an object.

In 1907 Matisse visited Italy, where he particularly admired the works of Giotto and Piero della Francesca. At the request of Sarah Stein and Hans Purrmann, in 1908 he formed a group of pupils, giving lessons first in his studio, in the expropriated Couvent des Oiseaux, in rue de Sèvres, and later at the Hôtel Biron, in the former Couvent du Sacré-Coeur. Sarah Stein collected notes from these lessons (included in A. H. Barr Jr., 1951, pp. 550–52), in which the striking element is not so much the program of instruction as the esthetic set down by the artist. For example, on the subject of still life, Matisse recommends: "To copy the objects in a still life is nothing; one must render the emotion they awaken in him. The emotion of the ensemble, the interrelation of the objects, the specific character of every object — modified by its relation to the others — all interlaced like a cord or a serpent." In December, 1908, *La Grande Revue* published Matisse's "Notes d'un peintre," a long article in which he clarified still further the goal toward which he was striving: "What I am after, above all, is expression .... Expression to my way of thinking does

not consist of the passion mirrored upon a human face or betrayed by a violent gesture. The whole arrangement of my picture is expressive. The place occupied by figures or objects, the empty spaces around them, the proportions, everything plays a part." And further: "What I dream of is an art of balance, of purity and serenity devoid of troubling or depressing subject matter, an art which might be for every mental worker, be he businessman or writer, like an appeasing influence, like a mental soother, something like a good armchair in which to rest from physical fatigue." Thus, expression is a sublimation of decoration, in which the image must have a vaster and more human significance than usual, and in which the colors should represent sensations. "A work of art," Matisse affirmed, "must carry in itself its complete significance and impose it upon the beholder even before he can identify the subject matter." This is the reason for the importance of style, of the striving for the essential, and of pictorial order, which is an order of style and ideas and therefore not a naturalistic order. On this subject, Matisse later added, in a note published by R. Escholier (1956, p. 95): "When I am in direct accord with my sensations of nature, I always feel entitled to step back from them in order to render more precisely what I feel. Experience has always proved me right."

From 1909 Matisse's fame spread throughout the world. In that year he took up residence in Issy-les-Moulineaux. In 1910 there were Matisse exhibits in New York, Moscow, and Berlin; in 1912 his sculpture was shown in New York. The following year, upon his return to Paris from Africa, where he had visited Morocco with Marquet and Camoin, the Galerie Bernheim-Jeune exhibited his Moroccan paintings and a number of sculptures. In these years a certain cubist influence appeared in Matisse's work; his use of it was original, however, and his paintings retained their intensity of color, but the space began to be ordered more geometrically, assuming a regular and rhythmic pattern. Typical of this new approach are *The Blue Window*, of 1911, and *The Piano Lesson* and *The Moroccans*, both of 1916 (all New York, Mus. of Mod. Art). In the years following — years of decline for a large sector of European painting, of a return to classicism, of the "appels d'Italie" — Matisse remained faithful to the fundamentals of his esthetic and to the brilliant colors of his odalisques (V, PL. 202), even though occasionally a highly charged decoration tended to obscure the relation of figure to background, as in the *Decorative Figure on an Ornamental Background*, of 1927 (PL. 385). In 1920 Matisse designed the settings and costumes for the Diaghilev company's production of the Stravinsky ballet *Le Rossignol*, with choreography by Léonide Massine. The following year he took up residence in Nice; in 1925 he traveled again to Italy; he was awarded first prize at the 1927 Carnegie International Exhibition, Pittsburgh. In 1930 he went to the United States, where he was commissioned by Dr. Albert C. Barnes to decorate the central hall of the Barnes Foundation building with a mural: upon his return to Nice, he began to work out its theme, the dance. Because of an error in calculation, the first version of the decoration (Paris, Mus. d'Art Moderne) turned out to be too large for the building in Merion, and Matisse designed another. At the same time he was working on engravings for the illustrations to the Skira edition of Mallarmé's *Poésies* (1932). In 1933 he went to Merion to supervise the installation of his mural, *The Dance*, at the Barnes Foundation. In 1935 he designed cartoons for the tapestries of Marie Cuttoli and in 1938 created the costumes for the ballet *Rouge et noir*, with music by Shostakovich and choreography by Massine. The *Rose nude*, of 1935 (PL. 388), shows that Matisse had recaptured his great capacity for synthesis. He continued to create illustrations for books, including those for the edition of Joyce's *Ulysses* published by George Macy (1935); and in 1941 he began to work on illustrations for the *Florilège des amours de Ronsard*, published by Skira in 1948, and Henry de Montherlant's *Pasiphaé*, published by Fabiani in 1944. In 1941 he also painted the magnificent *Still Life with Magnolia* (PL. 386), with its rich use of color and its free arrangement of objects.

At the outbreak of World War II Matisse had decided to leave France, but he changed his mind and went south to Nice. He was a member of the Emergency Rescue Committee, and in 1943 he went to live in Vence. Between 1948 and 1951 he worked on the decoration of the Chapelle du Rosaire of the Dominican nuns of Vence, the achievement closest to his heart in the last years of his life. Matisse's final style, his most simplified and abstract, is less evident in the chapel at Vence (although these works are executed in a very free style) than it is in the "gouaches découpées," as exemplified by *Zulma* (1950; PL. 386). Here Matisse returned to the rapid and economical delineation of his subject and to that juxtaposition of areas of pure color, the contrasts of which impart a luminous quality. In the final years Matisse's creative capacity remained intact. His freedom of expression (albeit following in a great tradition), the heights to which he raised the use of color, the originality of his views with regard to representation, and above all his constant fidelity to his own principles, in addition to the quality of the works themselves — these are elements which Matisse brought to art. His contribution to the development and enrichment of the language of modern painting is inestimable. (See also IV, PL. 183; V, PLS. 123, 258; VII, PL. 390.)

MA YÜAN. Chinese painter active from about 1190 to sometime after 1225. His *hao* (nickname) was Ch'in-shan; he was also called Ma Ho-chung because he was a native of Ho-chung in Shansi. In the reign of Kuang-tsung (1190–94) Ma Yüan was already a "Painter-in-Attendance" (*tai-chao*), and enjoyed the favor of Ning-tsung (1195–1224). Chou Mi (b. 1232) in his *Ch'i-tung Yeh-yü* mentions a painting of *The Three Religions* (depicting Śākyamuni, Lao-tzu, and Confucius) as "a work by Ma Yüan, the Painter-in-Attendance in the reign of Emperor Li-tsung" (1225–64).

Ma Yüan was the next-to-last and greatest painter of the Ma family. Five generations of this family are recorded:

1. Ma Fên (Pên), *tai-chao* in the Hsüan-ho Academy of the emperor Hui-tsung (r. 1101–26). Two paintings are doubt-

fully attributed to him: *The Hundred Geese* (Honolulu, Acad. of Arts), a hand scroll in ink monochrome on paper, and *Herding the Buffaloes* (formerly Peking, Palace Coll.), a hand scroll with a date of 1095.

2. Ma Hsing-tsu, *tai-chao* in the reign of Kao-tsung (1127–62). Three extremely doubtful paintings attributed to him — two album leaves and a pair of hand scrolls — are given in Sirén's annotated list (1956).

3. Ma Kung-hsien and Ma Shih-jung, both *tai-chao* in the Shaohsing Academy (1131–62) of Kao-tsung. Only one painting by Ma Kung-hsien remains, and that seems to be an autograph work: *The Hermit Yao-shan Talking to the Poet Li Po* (III, PL. 264).

4. Ma Yüan and Ma K'uei (ca. 1150–1224). The most reliable work by Ma K'uei was the fan painting in ink on silk showing a man and a boy in a boat (formerly Magoshi Coll.; destroyed in World War II).

5. Ma Lin, the son of Ma Yüan, active in the mid-13th century, and a "Painter-in-Waiting" (*chih-hou*) in the Academy of Painting. At least 20 works reasonably attributed to Ma Lin are known (see Sirén's list), the most reliable being *Evening Landscape* (III, PL. 270), a silk hanging scroll with a poem and seal of the emperor Li-tsung; *Two Blossoming Plum Branches* (Peking, Hui-hua-kuan); *Branches of Plum Blossoms and Bamboo* (Taichung, Formosa, Nat. Palace Mus.); *Fragrant Spring after Rain*, a silk album leaf in the same collection; *Rocky Shore* (III, PL. 270), showing a scholar on a stag by a lake, a silk album leaf; *Ling-chao Nü in the Snow* (Boston, Mus. of Fine Arts), a silk album leaf; and *Two Birds Sleeping on a Maple Branch* (also in Boston), a silk album leaf.

Ma Yüan was the leading master of the family. His greatness was not fully recognized by many later Chinese critics, although a Ming dynasty writer, Ch'ên K'an, in his *Ta-chiang-tsao-t'ang-chi*, wrote, "Li T'ang, Liu Sung-nien, Ma Yüan, and Hsia Kuei of the Kuang-tsung and Ning-tsung periods were collectively called the Four Great Masters of Southern Sung." Because Ma was considered a member of the "Northern School," antithetical to the accepted scholarly "Southern School," he was often criticized and was not eagerly collected in his native country. However, his works and copies of them were widely collected in Japan, where they greatly influenced Japanese painting from the 15th century on, and since Western knowledge of Chinese painting was first acquired largely from Japanese sources, Ma Yüan's name has always been high on the list of great Chinese painters known to the West. Current indications are that competent Chinese criticism today accepts in large part the Japanese and Western evaluation of Ma's art.

Ma Yüan and Hsia Kuei (q.v.) were the leading masters of their time and were closely related in their style. Hence the appropriate designation "Ma-Hsia" for that style and its followers. An excellent hand scroll in ink on paper, *Snow Landscape*, now in Shanghai, is a significant example of the close stylistic relationship between the two painters. Each section of the scroll has a poem written by the empress Yang, wife of Ning-tsung. Since many of Ma Yüan's works are recorded as having inscriptions of the empress or her younger sister Yang Wa, the Shanghai museum has attributed the work to Ma Yüan, despite the absence of a signature. But from a stylistic point of view the work seems equally close to Hsia Kuei. This is true also of a recorded, but still unidentified, scroll entitled *Returning Boats on a Snowy River*, in which "the master did some diamond-shaped short fences in the luxuriant bamboo grove. There are a few snow-covered houses partly hidden by the woods. The spirit of desolation and coldness is expressed here at its best" (Wang Shih-chêng in *Chü-i-lu*).

The Ma-Hsia style as revealed in the Shanghai scroll and other paintings is based on bold and asymmetrical compositions emphasized by the suppression of complex detail and the full use of contrasts between relatively complex ink areas and open stretches of silk or paper. The effect is romantic, even dramatic, and is markedly different from the monumental, complex, and balanced compositions of the earlier landscape painters, especially those of the great Northern Sung masters. Recent efforts to equate the Ma-Hsia style with Neo-Confucian rationalism seem abortive. Quite the contrary: the very fact that the style was largely derided by the later scholarly painters indicates its anti-rational and decorative character. This is further confirmed by the Japanese adoption of the style, for Japan's painters have always been torn between the extremes of realism and romanticism and have seldom followed the characteristically rational approach of the Chinese.

The romantic asymmetry characteristic of the Ma-Hsia style has been graphically described by Chinese critics as "one-cornered" (*not* "side-horned"). The sharpest criticism of the style, voiced by Kuo Shun — "What have I to do with their fragments of mountains and left-over streams, productions of ignoble refugees?" — is a good description if one removes the derogatory implications. It should be mentioned here that much of the harshest criticism of Ma and Hsia was due to their association with an "ignoble" dynasty when China's political fortunes were rapidly waning.

The "one-cornered" compositions with their great open spaces of silk or paper have been accepted by Westerners as characteristic of Chinese style in general, but nothing could be farther from the truth. This mistaken concept can be traced directly to the early appreciation of Chinese painting by Westerners through Japanese eyes. The famous work *Scholar Contemplating the Moon* (III, PL. 265), is an excellent example of this aspect of Ma Yüan's art, hence its enormous popularity in the West.

But Ma Yüan seems to have begun, like so many others of his contemporaries, under the towering influence of Li T'ang (d. after 1130; ranking master of the Hangchow Academy). *Rain over Trees on a Rocky Shore* (PL. 392) seems the most conservative of Ma Yüan's works and is in a style much indebted to that of Li T'ang, although ignoring much of the forcefulness of that painter. The composition is much more centralized and monumental and seems to indicate a transitional stage between the art of the earlier master and that of the fully developed Ma Yüan. This rare type of painting by Ma Yüan is known from literary sources. Wang Yü-hsien in the *Shan-shui chia-fa* states: "People say that Ma Yüan painted only one-cornered compositions, because they have not seen many works of his. But in his big paintings, which are to be found in Chekiang, there are steep mountains rising imposingly with streams winding around them and waterfalls between the trees partly hidden and partly visible. At the side of the mountains you see a far-extending lowland with a wide expanse of water and beyond it the faint contours of a pagoda. All this makes perfectly balanced pictures."

The masses of trees and foliage in the lower center of *Rain over Trees on a Rocky Shore* are, however, already painted with Ma's characteristic brush symbols. According to the *Tu-kung t'an tsüan* in *Shu-hua fang*, "His brush manner was severe and regular. He used scorched ink in painting trees and rocks. The branches and leaves are defined by outlines; the rocks he made sharp and angular with wrinkles like the scars made by a large axe, using diluted ink for these parts. Complete views by him are not common; in his small pictures the tops of the high mountains are not visible and the steep cliffs reach down, so that their bases are not seen. The near mountains touch the sky, but the distant mountains are low. He painted a single boat with a lonely man rowing on the moon-lit sea. Such were his one-cornered scenes."

The well-known picture of an angler in Tokyo (PL. 389) cannot be the picture mentioned in this quotation, but it is the finest extant example of that type of subject, rare in Ma Yüan's work. The contrasting textures of the woven boat hood, rush raincoat, wicker hat, smooth planks, hair, and the gently swirling water are as much the subject of the picture as the placement of all this on the bare silk. The original shape of the painting is not known, but it is entirely possible that this is a fragment of a hand scroll by Ma, or at least a very early Japanese copy from such a hand scroll, now lost.

The variety of Ma Yüan's brushwork and the daring nature of his compositions are probably best seen in a hand scroll called *The Four Sages of Shang-shan* (or *The Four White-Headed Ones*; PLS. 390, 391). The subject — the flight of the scholars to a wilderness retreat in the Shang mountains at the time of the

fall of the Chin dynasty — is dear to the Chinese scholarly mind, hence the 40 attached colophons, which provide the most important documentary accompaniment to any remaining work by the artist. Further corroborating evidence is provided by genuine seals of such collectors as Hsiang Yüan-pien (16th cent.), and especially the discerning Liang Ch'ing-piao (17th cent.), as well as the more recent seals of the emperor Ch'ien-lung and his successors.

In the figures of the old sages, the naillike strokes described by Chou Li-ching in his *T'ien-hsing tao-mao* are clearly seen: "There are, moreover, eighteen types of line-drawings for the folds of the garments .... The eighth type is like that of Ma Yüan and Hsia Kuei, who used a stump brush for the 'blunt-tip nail' technique." The brushwork of the rocks, trees, and water is described by Lan Ying in *Ch'i-hsiu lei-kao*: "As for Ma Yüan, his mountains are done with 'the big-axe-cut wrinkles' together with the 'nail-head and rat-tail' technique. His pine needles are of the 'cart-wheel' and 'butterfly' type. His water is of the 'fighting-water' type." Wang K'o-yü in the *Shan-hu-wang* has described the bare tree branches in the painting: "There are four types of tree branches: the 'clove-shape' branches of Fan K'uan, the 'bird-claw' branches of Kuo Hsi, the 'flame-shape' branches of Li Tsun-tao, and the 'dragged-down' branches of Ma Yüan."

These brush devices are used in *The Four Sages* as a means of producing a dramatic, crackling composition, which almost overwhelms the frailer figures in the painting. The staccato power of this scroll recalls that of Li T'ang in his hand scroll *The Virtuous Brothers Po I and Shu Ch'i Picking Herbs in the Wilderness* (Coll. Ho Kuan-wu, Hong Kong). Despite some damage and retouching, *The Four Sages* remains one of the most original and most important of Ma Yüan's paintings.

The most numerous examples of the style of Ma Yüan are the album paintings, invariably in ink and slight color on silk, and either rectangular or oblate-circular in shape. This particular type was much imitated by Chinese academic masters or artisans, Japanese painters under Chinese influence, and modern forgers. The most reliable of these album paintings, while quite romantic in mood and composition, show rich ink tones and an abbreviated but firm use of the brush. The often-reproduced and justly famous album leaf *Early Spring: Bare Willows and Distant Mountains* (Boston, Mus. of Fine Arts), despite its extremely subdued and lyrical mood, has brilliant passages of strong brushwork, notably in the far-reaching willow branches, the low-spreading plum to the right, and the bridge over the water. One cannot emphasize enough the consistency of the brushwork in the paintings mentioned above.

Ma Lin, the son of Ma Yüan, was not rated the equal of his father; but the problem of their artistic relationship is not a simple one. According to the *Hua-shih hui-k'ao*, "The artistic tradition of the Ma family, which had been handed down through several generations, reached its fulfillment in Ma Yüan. No other artist could come up to his level. Ma Lin's works were inferior to his father's but Ma Yüan loved him very much and signed such pictures as satisfied him with the name of the son. In this way Ma Lin also became famous and was appointed a *chih-hou* in the Academy."

Among the uneven works by or attributed to Ma Lin, one signed hanging scroll in particular deserves special mention, since its daring composition and suggestive use of empty silk seem to epitomize the innovations of the father. The sketchily (and rather weakly) rendered distant mountains rise above four flying swallows seen from above against gently rippling water. The emperor Li-tsung's ten-character poem, like a hanging screen, seems to mark the near pictorial plane, providing a foil for the distance and far distance below. "The [distant] mountain, in autumn colors, looks near. And for the passing swallows, the setting sun lingers."

The important later followers of Ma Yüan during the Yuan dynasty were Sun Chün-tse, Chang Yüan, and Ting Yeh-fu; during the Ming dynasty, Wang E, Chung (Ch'in)-li, Chu Tüan, and Sun K'o-kung.

Other works by Ma Yüan or convincingly close to him, in addition to those mentioned above, are: National Palace Museum, Taichung, Formosa: *A Man Carrying a Pheasant in the Snow* and *A Scholar beneath a Pine Tree*, album leaves from the *Ming-hua chi-chên; Mountains and Tall Pine Trees by a Cottage in the Snow*, hanging scroll; *An Immortal on a Dragon in Clouds and Mist*, hanging scroll; *The Feast of Lanterns*, hanging scroll. Hui-hua-kuan, Peking : *Ducks in the Water beneath an Overhanging Plum Tree*, album leaf. National Museum, Tokyo: *The Ch'an Monk Tung-shan Wading a Stream*, hanging scroll. Museum of Fine Arts, Boston: *Hsiao Ssu-hua Seated beneath a Tree Playing the Ch'in*, album leaf; *Two Sages and an Attendant beneath a Plum Tree*, album leaf. Formerly C. Edward Wells Collection, New York: *The Scholarly Gathering in the Western Gardens*, silk hand scroll.

McKIM, MEAD & WHITE. American architectural firm. Charles Follen McKim (b. Aug. 24, 1847; d. Sept. 14, 1909) spent one year at Harvard College (1866–67), worked briefly with Russell Sturgis, and attended the École des Beaux-Arts in Paris (1867–70). Following this he worked for Henry H. Richardson (q.v.) for about two years. McKim then practiced independently until 1878, when the firm of McKim, Mead & Bigelow was formed. William Rutherford Mead (b. Aug. 20, 1846; d. June 20, 1928), a graduate of Amherst College in 1867, worked as an engineer and was then employed by Russell Sturgis (1868–71). Mead practiced in New York (1872–78) before entering the partnership. When William Bigelow left the group in 1879, Stanford White became the third partner. White (b. Nov. 9, 1853; d. June 25, 1906) was trained in Richardson's office (1872–78), where his influence as residential designer was discernible. A European trip preceded his association with McKim and Mead.

Both McKim and White were designers, the latter especially gifted in decoration and interior design. Their early work was largely free of historicism and was characterized by the open planning, picturesque massing, and the textured shingle sheathing typical of the "shingle style." The Casino (1879–81) and Isaac Bell, Jr., house (1881–82; I, PL. 85 and FIG. 258), both in Newport, R. I., and the William G. Low house (1887; I, PL. 85) at Bristol, R. I., exemplify this phase. When Joseph M. Wells (1853–90), whose early death deprived the firm of a significant influence, designed the Italianate Villard houses (New York, 1883–85; I, PL. 85), a classical trend was initiated, deriving from Italian Renaissance, 18th-century American, and Roman sources. This academic reaction soon dominated American architecture.

The Boston Public Library (1887–92) marked a transition from residential work to monumental architecture, often involving large-scale planning. Characteristic was the Chicago World's Fair of 1893, where McKim influenced the over-all scheme and designed the Agricultural and New York State buildings. The firm also designed numerous buildings on the campus of Columbia University, beginning in 1893, and was active in the redevelopment of Washington, D.C. (from 1901). Clubs such as the Century, Metropolitan, and University in New York were designed by McKim, Mead & White and typified the nineties, when the firm gained preeminence. McKim was also instrumental in founding the American Academy in Rome, and its quarters were designed by the firm (1913). The period of construction of Pennsylvania Station in New York (1906–10) encompassed White's death and McKim's. Although Mead's retirement in 1919 left the firm without any of its original partners, it continued to exist until 1961.

Allen BROOKS

MEDIA, COMPOSITE. The term "composite media" is adopted here to distinguish that aspect of 20th-century art in which works of art are created, in part or wholly, by the integration of various substances or objects that were previously foreign to the fine arts and by the intermingling of materials and techniques that formerly characterized a single art or craft, frequently resulting in creations to which such traditional designations as "painting," "sculpture," and "relief" do not apply. The time-honored term "mixed media" — which has served primarily to describe such accepted combinations as oil and tempera or water color and gouache in painting and stone, wood, or metal with adjuncts of other substances in sculpture — seems inadequate to cover the ultimate development of this trend: works in which the artist's function is concerned entirely with the selection and juxtaposition or composition of prefabricated elements into a visual entity. Other more recent labels, such as "collage," "*papier collé*," "assemblage," "combine," "construction," and so on (see below), apply better to one or another of the manifestations of combined materials than to the category as a whole, because of the diversity of methods and materials adopted toward similar ends during the evolution of a new and antitraditional art.

The practice of combining materials in a single work of art is not new; it has been common since ancient times and in widely differing cultures; but only in the 20th century has the act of combining been singled out as a particular means of exploring new avenues of expression or as an art in itself, with a validity independent of conceptual content in the work. Ancient art, folk art, primitive art, and the sophisticated arts of many periods include innumerable examples of objects fashioned of a great variety of materials, chosen and united for specific functional, symbolic, representational, and even purely decorative purposes. However, the motivation of the selection and combination is quite different from that operating in the modern movement. In these other periods and cultures the material was, in general, significant for an intrinsic or symbolic value attributed to it by the society or by the patron, whereas in the modern movement the only value in any material is held to be that conferred upon it by the artist's acceptance and manipulation of it. This change in point of view is the sign of a period in which originality is viewed as the paramount artistic criterion and tradition is cast off as an impediment to the artist's personal and psychological development. Since the early years of the century, when their collages opened a phase of the revolt against traditional media and techniques, the moderns have affirmed the right and freedom of the artist to express himself in whatever materials he chooses.

Many of the materials that came to be adopted by the avant-garde are identical with those found in primitive and folk art — natural substances, such as leaves, straw, sand, pebbles, shells, feathers, butterfly wings, as well as other elements prefabricated for other purposes, such as bits of metal, mirror fragments, burlap and cord, scrap paper, and synthetic products. As in some categories of primitive and folk art, the modern interest often lies in the immediate effect, rather than in the durability of the object created, so that perishability of the materials is of no importance. Certain primitive and folk products (ceremonial objects, festival apparatus, and the like) are intended to be destroyed or discarded after serving their purpose. No doubt, similar ephemeral objects existed also in antiquity, but they have rarely survived. On the other hand, in the preceding sophisticated arts and in the survivals from antiquity it is clear that there was a search for the materials ensuring the greatest degree of permanence for important works of art intended as enduring records or precious possessions. By the frequent choice of perishable materials, without intrinsic value and flexible enough in connotations to be manipulated for the expression of original turns of thought, the modern artists declare the topical and experimental character of their work, the about-face on ideas of beauty, value, and meaning in art.

It cannot be said, therefore, that works fashioned of multiple elements in the past or in other cultures are direct antecedents of the modern composite media. Nevertheless, methods, as well as materials, were occasionally borrowed from primitive and folk art, particularly in the simple and unpretentious manner of joining parts — unconcealed knots, simple lashing, coarse stitching, and unfinished joints. Such indications of poverty of means, either material or technical, were preferred to the studied and polished craftsmanship of the previous sophisticated arts.

Here, however, similarity ends, as a few examples will show. In primitive art a combination of materials usually has (or had originally) a cosmic, magical, or supernatural power that contributed to the function of a particular object (see MAGIC). A ritual mask, for example, might include elements of bone, horn, teeth, feathers, hide, shell, hair, or a human skull (e.g., PLS. 395, 441–443; II, PLS. 109, 115; XIII, PL. 4), each of which, in conjunction with the others, has a special virtue for invoking the power or presence of a supernatural being who can bring rain, cure sickness, ensure fertility, and so on. Nails or mirrors are attached to wooden fetish figures (e.g., II, PL. 103) as elements having a particular physical efficacy, just as do the many attachments of a shaman's costume (XIII, PL. 2). In such art, originality or departure from cultural tradition regarding material, form, or technique would result in the failure of the object to perform its function. That such traditions are still operative, even after long acculturation, is proved by the fact that in 1964 the conservation services of the U. S. Government fulfilled an urgent request from the Pueblo Indians for eagle feathers to be used in ceremonial equipment; laws protecting wild life had deprived the tribes of an indispensable material.

This importance ascribed to specific materials for religious and ritual objects is also characteristic of more advanced societies (see LITURGICAL AND RITUAL OBJECTS). The rarest and most precious materials obtainable have generally been lavished on objects intended for the glorification of a deity, for the embellishment of sacred premises, or for containing sacred offerings or relics (e.g., PLS. 160, 395; IV, PLS. 405, 409; VI, PLS. 260, 261, 263). Similarly, the association of costly and rare materials is symbolic of royalty, political power, social rank, and wealth, so that objects intended as signs of exalted position (see EMBLEMS AND INSIGNIA) or as personal adornment and accessories of royalty are generally elaborate accumulations of precious metals, stones, and products of the jeweler's art (e.g., I, PL. 286; IV, PLS. 361, 391; VI, PLS. 241, 242, 247).

In all these periods and cultures a combination of materials may also have a purely representational value, offering greater verisimilitude in color values, textures, forms, and light effects than any single medium provides. The mimetic factor is present alongside the magical factor in the primitive use of shell eyes, human hair, and so on, when the intent is to create or re-create a being. In ancient statues and late Renaissance and baroque copies of such works, the flesh is rendered in white or black marble, with varicolored stone for clothing, and eyes inset in color. In the application of color to stone, wood, or clay sculpture, a mixture of media has been in use for representational fidelity since ancient times, for example, in Egypt (IV, PLS. 337, 338, 352, 382), in Greece (I, PLS. 337, 351, 361), in China (III, PL. 257), as well as in primitive and folk art.

The mimetic motive is strong in the combination of materials in folk art. The selection of media may be limited by availability, and traditional factors involving remote and forgotten magical concepts may also enter in, but in general the folk artist chooses his means for their representational effectiveness. In paper collage and appliqué, for example, a folk form that long antedates the cubist and Dadaist experiments with this medium, cutouts from a variety of solid-color paper are mounted to form traditional landscapes or naturalistic decorative compositions (e.g., the *Alpfahrt* collages of Switzerland, the elaborate cut-paper certificates of the Rhineland, and the Polish paper work in openwork, silhouette, or appliqué; V, PL. 349). Details are occasionally enhanced by painting, and at times preprinted papers are included. Other composite creations include the Nativity scenes — the *crèches*, *krippen*, and *presepi* — of folk art, for which all manner of materials are adopted to give realism to the figures, costumes, and settings. These scenes are sometimes boxed or framed as permanent units. Similar arrangements, with religious, secular, or even still-life groups are the *kästchen*, the little shadow-box scenes in which flowers,

beads, ribbons, buttons, and other decorative objects are combined. Materials used in traditional folk festival masks and costumes are frequently rough natural substances such as straw or pea vines, attached to wood, coarse cloth, or other foundations for the impersonation of specific characters (see MASKS).

Perhaps the most extreme efforts at mimetic effect are exemplified by the combination of media in baroque architectural settings to achieve a trompe l'oeil transition between painted or sculptured works and the architectural elements adjoining them (e.g., II, PLS. 166, 172) and in landscape architecture (q.v.). The latter in certain periods has involved construction of elements in shells, stone, pebbles, and innumerable other materials for the purpose of reducing to the compass of a single garden the many picturesque aspects of natural geographical features in the form of artificial grottoes (PL. 395), fountains, mountains, and so forth.

The artists of the early 20th century were ideologically far removed from all such concerns, either as reasons for creating a work of art or for selecting a congenial medium in which to execute it. Experimenting freely in many directions (see EUROPEAN MODERN MOVEMENTS), they were concerned with new optical, spatial, and psychological concepts and required new means for expressing them. Within the technique of painting, the experiments with composite media in the works of Picasso and Braque (qq.v.) played an integral part in the evolution of cubism (see CUBISM AND FUTURISM). Early in 1912 Picasso incorporated a piece of oil cloth printed with simulated chair caning into his *Still Life with Chair Caning* (Picasso Coll.) and surrounded the picture with rope instead of a frame, creating his first "collage." Later the same year Braque, by pasting three pieces of wood-grained wall paper in the *Compotier et verre* (London, D. Cooper Coll.), executed his first *papier collé* (pasted paper). Within a short time both artists, along with Gris (q.v.; IV, PL. 80), Marcoussis, and other cubist painters, were including certain extraneous materials as integral parts of many of their paintings; postage stamps, playbills, newspapers, strips of cloth, mirrors, playing or calling cards, and metal foil are all to be found in the cubist compositions of 1912–14.

Such materials fulfilled various functions within the cubist paintings. They served to define certain stable planes within compositions which, as a result of the fragmentation of the objects depicted, have foregrounds almost completely filled with many facets held precariously in balance between recession beyond the now-limited depth of the picture and projection forward from its surface. Newspapers and similar printed materials were ready substitutes for the stenciled typographical letters and numbers which had earlier been introduced in cubist paintings for this same purpose. In addition, the subjects, which frequently became unrecognizable, could be made identifiable by the substitution or incorporation of a representational fragment of these objects; for instance, a newspaper on a table is rendered by a piece of newspaper pasted on a strip of wood-grained paper, or a real label is pasted on a painted bottle (PL. 393). The inclusion of a piece of reality within a painting projects it into the world of objects, narrowing the distance between the painting and the spectator. This occurrence is in accord with the cubists' concept of their works as self-contained, constructed objects with weight, solidity, and texture. "It is not enough to make the painted object visible," wrote Braque, "it must also be made tangible."

The adoption of composite media was, however, also a repudiation of the classical tradition of painting, with its emphasis on technical ability and especially on slickness of brushwork. In using nontraditional materials, the artist asserted his freedom to use any technique or medium in his work, opening the way both to the rediscovery of the artistic interest of commonplace objects and to the wide-ranging technical experimentation of the 20th century. Guillaume Apollinaire gave literary weight to the new concept of art by stating, "You may paint with whatever material you please, with pipes, postage stamps, postcards or playing cards, candelabra, pieces of oil cloth, collars, painted paper, newspapers" (*The Cubist Painters*, 1913).

At about the same time as the cubists were experimenting with collage in paintings, the futurists (see CUBISM AND FUTURISM) were producing the first three-dimensional objects made from agglomerations of heterogeneous materials. Similarly opposed to traditional technical criteria, Umberto Boccioni (q.v.), in his *Technical Manifesto of Futurist Sculpture* (1912), declared that futurism should "deny the exclusiveness of one material for the entire construction of a sculptural ensemble. Affirm that even twenty different materials can compete in a single work to effect plastic emotion . . . glass, wood, cardboard, iron, cement, horsehair, leather, cloth, mirrors, electric lights, etc., etc." Having become interested in sculpture as it relates to the problems of the continuity of particular forms in space, Boccioni produced, as one of a series of "plastic complexes," the *Fusion of a Head and a Window* (ca. 1912; destroyed), in which he combined a sculptured plastic head, a wooden window frame, metal hardware, and glass panes. Although futurist experimentation along this line was short-lived, Boccioni and other futurist painters such as Severini, Balla (qq.v.), Sironi, and Carrà, influenced by cubism, continued to explore the possibilities of composite media (especially the combination of printed materials) in their collages. Often, however, they were less concerned with the spatial and textural qualities of the materials than with their verbal content, which was chosen for social or propagandistic purposes (Carrà, *Patriotic Celebration*, 1914; Milan, Coll. G. Mattioli) or for topical reasons — the newspaper in Boccioni's *Cavalry Charge* (1914; Milan, Coll. R. Jucker) identifies the battle depicted.

The idea of rebellion against the technique and the illusionism of traditional art inherent in these early uses of composite media was advanced by the Dada movement in its anarchic denial of all accepted standards of producing and judging art. As early as 1913, Marcel Duchamp (see DUCHAMP BROTHERS) had exhibited unaltered industrial objects ("ready-mades") and natural materials (*objects trouvés*, or "found objects") as works of art. Combinations of such objects, as well as scraps and refuse, formed the basis of many collages and constructions displayed at the Dada exhibitions of the years 1917–22, by Arp (q.v.), Duchamp, Man Ray, Picabia, and others.

In the following years, the surrealists Max Ernst, Joan Miró (qq.v.), André Masson, George Grosz, and others exploited the verbal and symbolic content of the materials of collage and related techniques as a direct means of giving form to the fantasies of the subconscious (products of dreams, hallucination, chance, insanity), a primary goal of surrealism (q.v.). The use of these forms liberated surrealist art from traditional technical restrictions and from the vagaries of style, taste, and personal ability. (Even the untutored could externalize the products of their subconscious.) Max Ernst, who had earlier been a Dada artist, was a most prolific creator of collages — even collage novels, such as *Une Semaine de Bonté* ("One Week of Kindness") — incorporating altered technical illustrations, photographs, photoengravings, and anatomical charts. His definition of collage as an exploration of "the fortuitous encounter upon a nonsuitable plane of two mutually distant realities" shows that the material in itself need not have any predetermining influence on the use to which the artist puts it in a collage, and that the only valid relationship between different materials is their juxtaposition within the work itself. Kurt Schwitters, who participated in a highly individualistic way in both the Dada and surrealist movements, conceived of an art form embracing not only many materials but also all the arts — a form called "Merz," after the fragment of a word in one of his collages. As part of this idea, he produced many small "drawings" (primarily pasted papers), larger collage compositions, and three large architectural constructions (*Merzbau*), all composed of imaginative combinations of varied rubbish. These works are primarily juxtapositions of shapes, colors, objects, textures, and substances — with contrasts of wire on wood, metal against paper and canvas (PL. 397), fabrics over printed materials, and so on — resulting in abstract objects of great variety of design and organization.

Works assembled from various ready-made materials are now generally grouped under the name "assemblages," first suggested by the painter Jean Dubuffet. A more comprehensive term than either collage or *papier collé*, it includes these tech-

niques, as well as those of gathering and juxtaposing, constructing and mutilating, pasting and unpasting (*décollage*), photomontage, etc. This broad usage underlines the fact that assemblage has become a new medium with its own techniques, conforming neither to painting nor sculptural categories but falling somewhere between the two. The creative activity in assemblage consists in the gathering and arrangement of the separate objects, and the measure of value and content of the work is based on that creativity rather than on conventional technical proficiency.

The arrangement of the parts of an assemblage can be comprehended on a series of different levels. An artist may dispose his objects with purely formal intentions, a primary concern being the relationship of their sizes, shapes, textures, colors, etc., and the qualities derived from the method of producing them — cutting, tearing, burning (PL. 398), sewing (X, PL. 343), sawing, compressing, nailing, welding. The materials are often devoid of any aspect which would identify them with their previous functions. This approach has become basic to the production of much nonobjective art. Robert Motherwell, working primarily with pasted papers, explained his use of composite media. "One cuts and chooses and shifts and pastes, and sometimes tears off and begins again. In any case, shaping and arranging such a relational structure obliterates the need, and often the awareness, of representation. Without reference to likenesses, it possesses feeling because all the decisions in regard to it are ultimately made on the grounds of feeling." Jean Dubuffet has used a technique of arranging previously painted, cut pieces of paper or canvas; similarly, Corrado Marca-Relli creates, in effect, a second painting from cut-up pieces of an earlier one. John Chamberlain uses automobile parts as painted metal raw material for his abstract reliefs (*Essex*, 1960; New York, L. Castelli Coll.).

An object in assemblage may also be used as a representational device, either representing itself or suggesting the whole of which it is only a part. In Dubuffet's *Landscape with Three Trees* (PL. 398), leaves themselves become the trees, while in photomontages parts of photographs, individually descriptive, become entirely new representations by their unorthodox combinations. In addition to grouping for formal effects, objects may also be combined for symbolic reasons to convey an idea or determine a mood (PL. 394).

Aside from those assemblages which are simply abstract formal arrangements, constructions of recognizable objects, or completely representational compositions, great attention has been aroused in the 1960s by those in which the objects, drawn from the manufactured ephemera and the vast junk heaps of contemporary civilization, retain much of their original shape but little or none of their original function. Often called "factual" or "pop" art, or the "new realism," the works of this type have an ironic humor resulting from a surprise confrontation with diverse fragments of reality. Robert Rauschenberg, whose "combines" have been influential for many "pop" artists, approaches his work as "a matter of just accepting whatever happens, accepting all those elements from the outside and then trying to work with them in a sort of free collaboration." Frequently such assemblages appear to be random combinations, haphazardly packaged — for example, as boxes containing numerous unaltered similar objects [Arman (Fernandez), *Little Hands* (*Ainsi font, font. . .*), 1960; Great Neck, N.Y., Robert C. Scull Coll.]; as groups of a few isolated objects in boxes, which are then stacked together and painted a uniform color (e.g., works by Louise Nevelson); as a single compartmented box, in which individual or grouped similar objects are doubled by reflection in a mirror [Martial Raysse, *Super Market* (*Hygiène de la vision*), 1961]; or as a single, mirror-compartmented box in which diverse objects are similarly displayed in similar bottles (Joseph Cornell, *Apothecary*, 1950; Houston, Texas, J. de Menil Coll.). In other assemblages the materials may be arranged on or as an adjunct to a canvas. Robert Rauschenberg's *Canyon* (1959 New York, M. Sonnabend Coll.) consists of pasted papers, wood, and oil paint on canvas, a stuffed eagle projecting from it, and a pillow hanging below on a cord tied to it. Raymond Hains's *Affiches Lacérées* are pictures made of torn and weathered posters, removed from walls, and repasted on canvas. On a larger scale, works in this category may be groupings of the junk remains of heavy industry, among them César's creations of welded or compressed automobile parts and Jean Tinguely's machines, verging on automata (q.v.), of which the spectacular *Homage to New York: A Self-constructing and Self-destroying Work of Art* (1960; made of an upright piano, machine fragments, a weather balloon, bicycle parts, etc.) was a series of continually changing, chance juxtapositions of materials with movement and sound.

The effort to overcome the limitations of traditional materials and techniques has often led to the addition of unfamiliar substances to conventional media in the work of 20th-century painters and sculptors. Along with their collages and *papiers collés*, Picasso and Braque began experiments with mixing foreign materials (ashes, wood shavings, sand, metal filings, soot, and tobacco) with their paints to vary textural quality and to convey color (by then almost absent from cubist compositions) through texture. Similarly, other painters have explored a great variety of effects produced by combinations of paint with other substances: for example, Paul Klee (q.v.) with gesso, gouache, and exposed canvas (PL. 397); André Masson, with oil, sand, and pencil (XIII, PL. 320); Sonia Delaunay-Terk, with oil and wax (*Portuguese Market*, 1915; New York, Mus. Mod. Art); Willi Baumeister, with sand and sometimes pieces of colored substances with paint (X, PL. 499); Jackson Pollock, with oil, aluminum paint, and Duco (X, PL. 342); and Antoni Tàpies, with oil and sand (*Great Painting*, 1958; New York, Solomon R. Guggenheim Mus.). Sculptors too have employed a wide variety of new materials, joined together directly and chosen for their specific properties. The works of Vladimir Tatlin (as early as 1913), Calder, Gabo (I, PL. 132), Pevsner, and Giacometti (XII, PL. 522) have displayed combinations of glass, wire, sheet metal, plastics, paints, and wood, replacing marble or cast bronze as the principal materials of sculpture and fulfilling the goals and prophecy of the futurist manifestos of the early 20th century.

MEDITERRANEAN, ANCIENT WESTERN. The ancient civilizations of the western Mediterranean islands and of the Iberian Peninsula never reached a development comparable to those of Greece and Italy. Apart from the Greek colonization in the area, which began in the 7th century B.C., the only attempt at unification before the Roman conquest, in the 2d century B.C., was undertaken by Carthage (see PHOENICIAN-PUNIC ART). But what the Carthaginians created, more than anything else, was a politico-economic system of little consequence for the general cultural development of the area, and still less for the arts. Cultural development in the regions of the western

Mediterranean between the end of the Bronze Age and the Roman conquest was therefore heterogeneous and unrelated, the product of individual peoples at different levels of development. To a great extent it was determined by the protohistoric heritage, influenced, with varying degrees of intensity in different localities and in different periods, by the civilizations of the Aegean, of Greece, of the Semitic East, of Italy, and of Rome (see MEDITERRANEAN PROTOHISTORY). Of these, Greek influence was the strongest and most widespread, so much so that the western Mediterranean may be regarded as marginal to the main sphere of Greek art. In any case, the individual areas of greatest interest are nuraghic Sardinia, the Balearic Islands, western Spain, and southern France. In the present article these areas will be considered in succession under separate headings rather than combined within a single unitary treatment. Of the areas under discussion, only Spain achieved a relatively mature and original artistic tradition (see below, *Iberian civilization*).

SUMMARY. The insular civilizations: Sardinia, Corsica, the Balearic Islands (col. 601): *The nuraghic civilization of Sardinia; The megalithic culture of Corsica; The Balearic Islands and the talayotic civilization.* The Iberian civilization (col. 614): *Origins and development of Iberian art; Cultural areas; Principal phases; Architecture and architectural decoration; Sculpture; Painting and ceramics; Minor arts.* The indigenous art of pre-Roman southern Gaul (col. 627): *Provincial Greek architecture and sculpture; Indigenous sanctuaries and sculpture; Minor arts.*

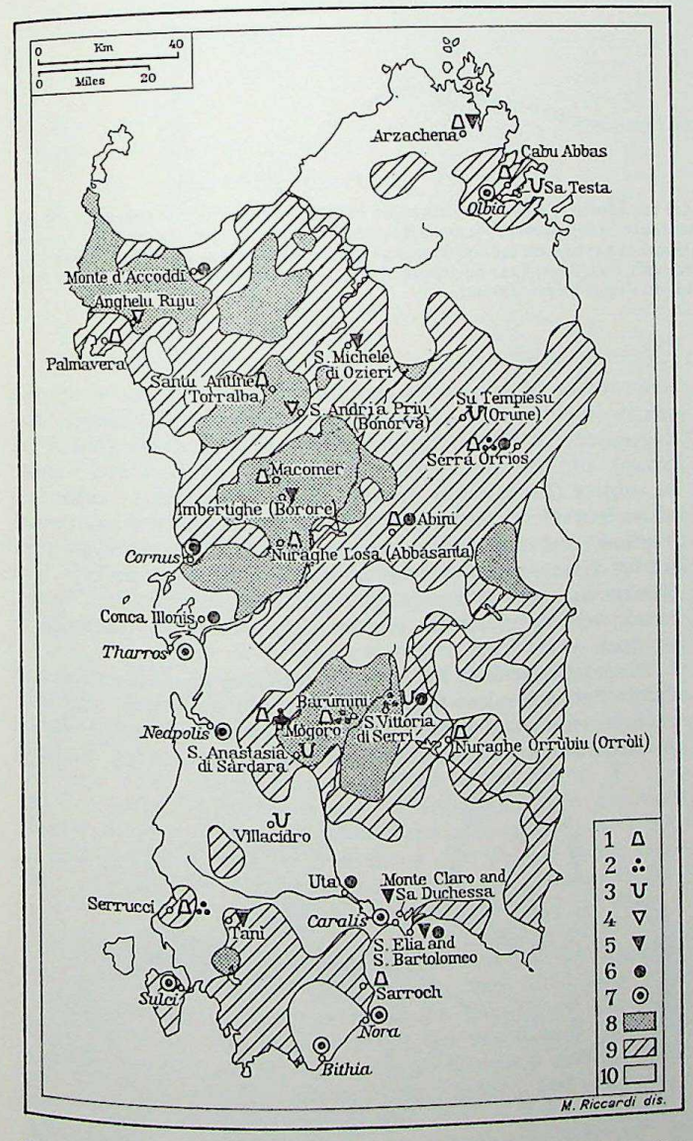
THE INSULAR CIVILIZATIONS: SARDINIA, CORSICA, THE BALEARIC ISLANDS. Sardinia, Corsica, and the Balearic Islands constitute an area of the western Mediterranean in which it is possible to discern, if not an ancient unified and original ethnic substratum, a complex of cultural relations and affinities that make it a distinct provincial strain, with definite characteristics and its own individual products.

There are two principal reasons for these cultural similarities, these common results: on the one hand, the insular nature of the area and, on the other, the ethnic bond between the peoples who from earliest times inhabited it. The former, determining both their mode of life and the forms of their art, tended to produce a sort of spontaneous generation, a creative originality of expression; however, this insularity also limited their contacts and eventually either impoverished their creative impulses and forms of expression or reduced their pristine freedom of expression to the banal and the routine. In Sardinia, Corsica, and the Balearic Islands certain artistic forms are of first quality and full of significance, while other artistic products are "recessive," giving evidence of artistic atrophy or outright disappearance, from lack of cultural give-and-take. In the case of these western Mediterranean islands their insularity has been the common factor determining their cultural recessiveness and compartmentalization; and basically a product of this recessiveness is the phenomenon of megalithic art — a remarkable archaic relic that continued there well into the historical period. This isolation favored the survival of very ancient ethnic elements, relatively free from later admixtures, in which can be glimpsed affinities with the Libyan world and with the peoples of the substratum of the Iberian and Ligurian regions. It is possible that the common ethnic background of the western islands and, even more, the reciprocal contacts in various prehistoric periods may have fostered analogous artistic and monumental forms of expression, of which the megalithic is one of the more obvious manifestations.

The megalithic architecture of Sardinia, Corsica, and the Balearic Islands has substantial ties with that of Malta (q.v.; see MEDITERRANEAN PROTOHISTORY), of Africa, and even of continental Europe (see EUROPEAN PROTOHISTORY), but the relation is not always apparent because of cultural and chronological divergencies. The links that connect the European and the Mediterranean megalithic are the dolmen type of monument and its special funerary function, the dolmenic form, in itself the architectural essence of the trilithon, and the orthostatic form, which gives structure to the symbolic principle of the menhir and which appears everywhere. At the same time, Sardinian-Corsican-Balearic megalithic art is distinct in that it is characterized by the development of tower structures, by the hypaethral nature of the surfaces (exquisitely Mediterranean in feeling and flavor), and by an architectural function essentially connected with the practical necessities of the living, rather than the religious and funerary character of the continental European megalithic. A further differentiation is found in the structural use of blocks and a greater curvilinear articulation of the surface planes, of the supporting elements, and of the roofing. This does not preclude the possibility of the presence in the islands of megalithic structures of the mainland type, persisting as a fairly pure strain alongside the variant insular megalithic architecture as it developed. Indeed, it is clear that onto the main trunk of dolmenic megalithic architecture (of Western origin and function) was grafted a branch of Eastern derivation and style, the prime expression of which is the tholos. This brought with it and developed the elements of curvilinear architecture, which became characteristic of the ancient Sardinian, Corsican, and Balearic peoples and, to a certain extent, of their modern descendants.

Eastern influences are also seen in the figural arts (small Sardinian bronzes, larger Balearic bronzes), in the crafts (ceramics and glass paste, etc., in Sardinia, Corsica, Mallorca, and Minorca), and in certain religious elements (the cult of the Mother Goddess and of the ox in Sardinia and the Balearic Islands). However, apart from certain elements originally imported in very ancient times from the east (Aegean-Anatolian) and certain others of Cretan-Peloponnesian and possibly even Cypriote origin, the basis of the eastern component represents the residue (simplified and bastardized, through the effect of recessiveness) of original acquisitions of the 2d millennium B.C., surviving late into historical times in a peripheral region, unaffected by cultural perspectives that had lost their original meaning and importance.

These western islands, themselves scattered like megaliths, are a striking example of cultures typical of the Bronze Age. They are repositories, outside of time, of civilizations in which the use of bronze continued even when the technique of iron-working was flourishing elsewhere. They are prehistoric manifestations that flourished with a certain rude vitality in the era of the great historic colonization of the West by the Greeks and the peoples who were their rivals. The island civilizations were only in part affected by these colonizing movements: the Greek was effective in a limited way in eastern Sardinia (which accounts for the name and tradition of the town of Olbia), and the Phoenician and Carthaginian in Sardinia and on the island of Ibiza. While present and operative in the western islands, the Phoenician-Carthaginian and Greek cultural influences were much less decisive there than they were in the same period on the coasts of Italy and on the Iberian Peninsula (see below).



The nuraghic civilization of Sardinia. The first genuine civilization in Sardinia, which can be connected with peoples whose names are recorded in historical sources (the Iolei and the Bàlari), and which can thus be called historical even though it left no written records, is the nuraghic, so termed from the nuraghe, the most conspicuous and remarkable monumental expression of proto-Sardinian architecture, as well as the most lasting concrete achievement of the social and politico-economic system of those ancient times. The formative elements of the nuraghic civilization undoubtedly are to be found in the preceding neo-aëneolithic culture of the island (see MEDITERRANEAN PROTOHISTORY). Present knowledge based on modern research suggests that there was no clear-cut division between the two periods; instead, there was a gradual transition, a progressive enrichment, an orderly regeneration. Thus, the nuraghic civilization gives the idea not of spontaneous generation or of importation as a whole, but rather of development from earlier historical and sociological conditions under particularly favorable environmental circumstances. This development was also marked by the influence of foreign elements and motifs on the earlier cultural substratum. The nuraghic civilization (or culture of the Sardinian Bronze–Iron Age) was rooted in a society of shepherds and warriors: the dynamism, the territorial ambitions, and the warlike temper of the pastoral

Principal cities and archaeological sites of western Mediterranean cultures (Sardinia, Corsica, Balearic Islands, Iberian Peninsula, southern France).

communities gave this culture its original impetus, determined its structure, and provided continuous incentive and sustenance for a development extending over many centuries. From the territorial fragmentation, the strong tribal antagonisms, prompted by nature — the upland plains cut by deep valleys forming the natural frontiers of small states — the nuraghic civilization derived both its character and its historical limitations, which accounts for the fact that the island people, although always resistant to foreign pressures, have been in almost every period subjected to foreign domination.

The nuraghe (PL. 401), the most tangible and striking product of this civilization, was a form of military architecture, the development of which paralleled the cultural evolution of ancient Sardinia. There are approximately 7,000 such fortresses, large and small, scattered more or less densely throughout the island (FIG. 605). The nuraghe, with its studied and elaborate development of line and volume, is the most complex and evolved protohistoric architectural formula found in the islands — possibly in the whole western Mediterranean area. Gradually, the single isolated tower was surrounded by a complex of smaller towers and concentric circular curtain walls, disposed in a system of terraces on a central plan, as seen in polylobed examples

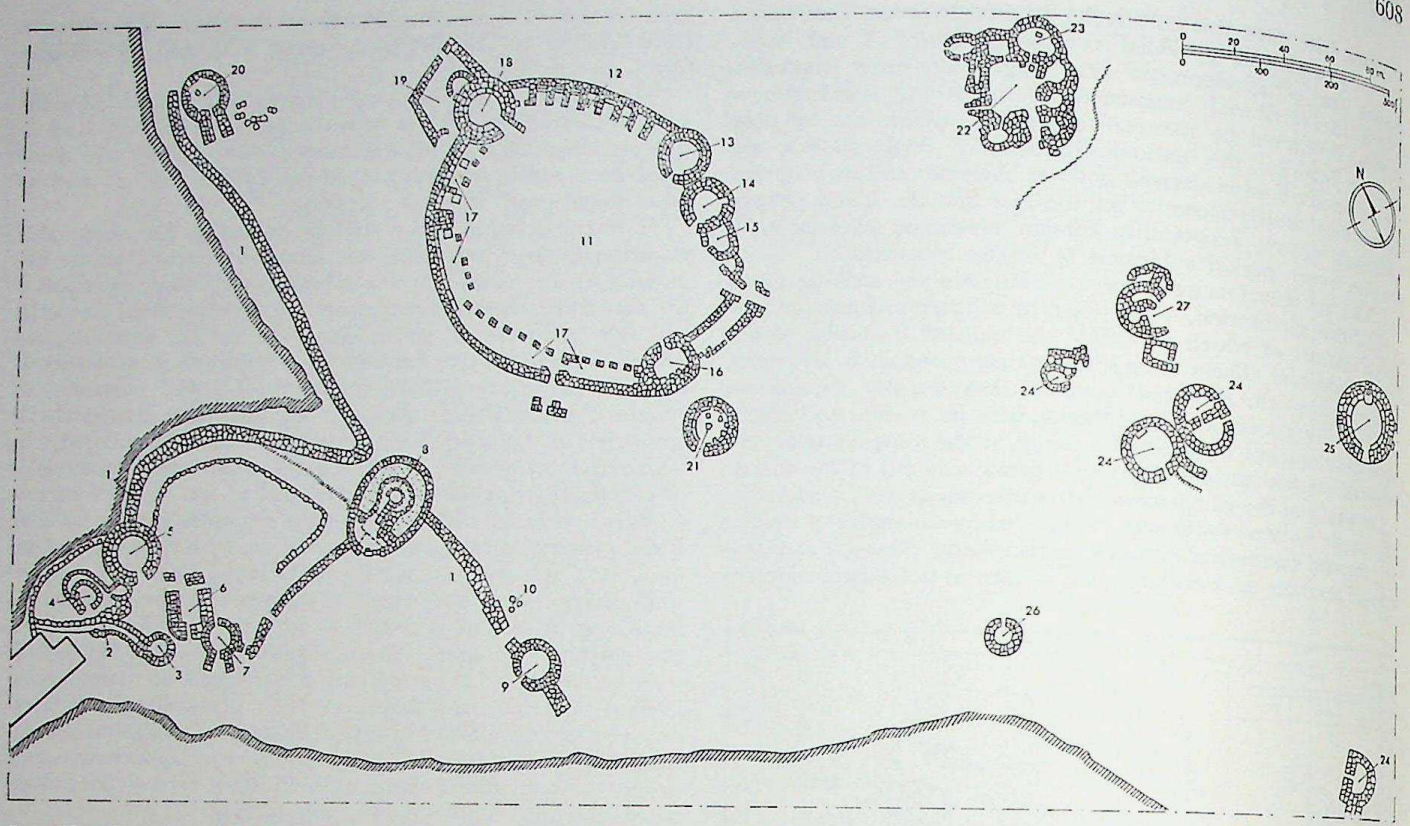
such as the nuraghe Su Nuraxi at Barúmini, the nuraghe Santu Antine at Torralba (PL. 401; FIG. 611), and the nuraghe Orròli at Orrùbiu.



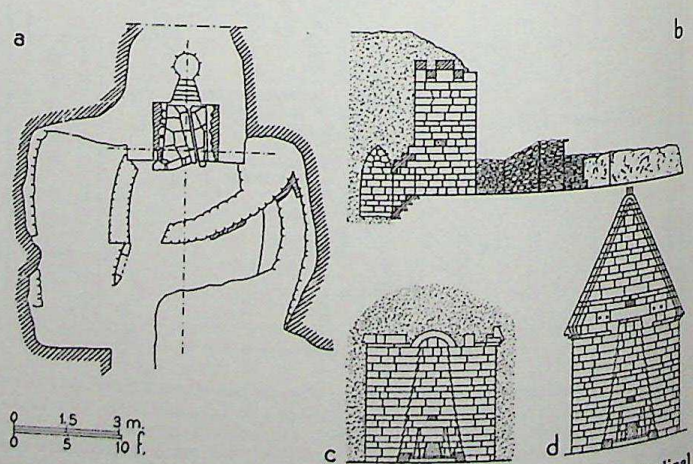
Despite the variety and complexity of structural solutions and additions (FIG. 611), certain constants are to be found in this monumental type of architecture — the tholos, the truncated-cone form, and the continuous curved line, as well as other details and practical accessories.

Two components of the nuraghe belong to the prenuraghic tradition drawn from megalithic island architecture of the beginning of the metal age: the dolmen, or trilithon, exemplified by that form especially widespread in north-central Sardinia; and the technique of laying stones in circular tiers, stepped inward from bottom to the top, as exemplified in monumental form in the great platform (probably of sacred character) of Monte d'Accoddi, near Sassari. The dolmenic component is embodied in the type of nuraghe classified as "corridored," in which the interior of a circular (or more often rectangular or elliptical) structural mass is reduced to one or more narrow corridors with flat walls and ceilings; examples are the nuraghe Fronte (Fonte) e Mola at Thiesi, the nuraghe Séneghe at Suni (FIG. 611), and the nuraghe Peppe Gallu at Uri. The inclined wall composed of courses of superimposed stone blocks diminishing in section is found in both the corridored and the tholos type of nuraghe. The possibility exists that the outside walls meeting at an acute angle, as found in certain corridored nuraghi, are a continuation of prenuraghic rectilinear architecture (the altar of Monte d'Accoddi; hypogeum dwelling-tombs in the Sassari district; etc.). The two components cited denote a historicultural stratum of Western type — the indigenous contribution to nuraghic architecture.

The most outstanding imported component of nuraghic architecture is the tholos. Whether the models for this came from Asia Minor, Cyprus, the Aegean, or the Peloponnesos, the tholos introduced into the Western architectural substratum the curvilinear spatial concept that started nuraghic architecture on the development of its juxtaposed and superimposed spatial forms. On this Eastern component are based the thousands of domed nuraghi, representing almost 99 per cent of the total number on the island. The remaining 1 per cent, of the corridored type, survive mainly in "recessive" areas, subordinate and peripheral to those of intensive cultural development.

Related to nuraghic architecture in technique, details of form and structure, and fundamental style are other funerary and religious structures; among the former are the "giants' graves," and among the latter the domed wells with underground stairs (well-temples) and the megaron temples. The "giants' graves" (PL. 401) are large apsed structures, in which an arched extrados is preceded by an exedra, containing a long and narrow mortuary chamber, in some cases surmounted by a high arched stele with a small postern at the base (Goronna, near Paulilátino). The dolmenic structure of the corridor and the rectilinear profile of the external walls are vestiges of the prenuraghic component, while the projecting outer structures and the curvilinear outline of the apse, of the exedra, and of the stele derive from the nuraghic style. The development of these monumental structures parallels that of the nuraghi: from the simple dolmen to the megalithic tomb without frontal hemicycle (Ena e Muros, Ossi) and finally to the complete form with exedra and stele, certain of them echoing decorative elements found in the Greek or Grecized Punic orbit (e.g., the dentilated cornices in the tombs at Oragiana and Cùglieri and at Nela and Sindìa).

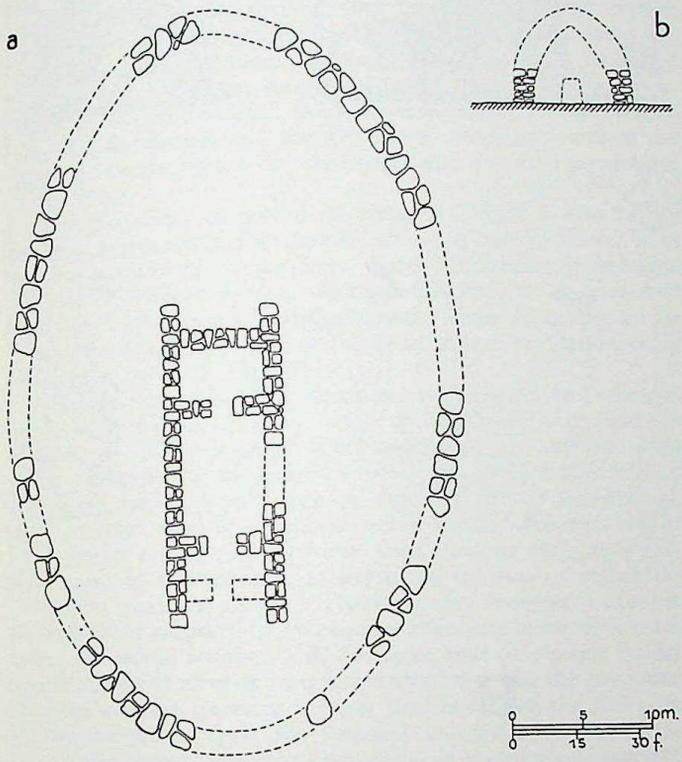
How the type of sacred well, or well-temple, developed from the curvilinear nuraghic form with projecting element is quite apparent (FIGS. 607, 608). The "vaulted" chamber of the nuraghe becomes a tholos cella containing the water springing from the well; in some instances (e.g., S. Anastasia in Sàrdara) the walls of the cella are arranged in the articulated projecting courses of undressed masonry of the nuraghic tholoi, clearly showing the source from which they were derived. In the majority of cases, however, the outer facing of the rim of the well (preceded by a vestibule), the stairway, and the wellhead are of isodomic masonry. In section the domes show a continuous incline, and



Santa Vittoria di Serri, Sardinia, sanctuary on the acropolis, plan: (1) Walls; (2) corridor; (3) crenelated nuraghic tower; (4) trench; (5) enclosure; (6) rectangular temple; (7) dwelling hut of priest (?); (8) well-temple; (9) hut at entrance; (10) baetuli; (11) enclosure for markets and feasts; (12) banquet area(?); (13) "enclosure of the double-headed ax"; (14) enclosure with seats; (15) house of the hearth; (16) cookhouse; (17) portico with pilasters; (18) foundry(?); (19) sheeppen; (20) large dwelling hut; (21) hut with small altar; (22) square with dwellings; (23) enclosure with double baetulus; (24) huts; (25) large circular edifice, possibly for meetings; (26) hut of caretaker(?); (27) group of dwellings (*from Zervos*).

the ceilings of the stairs are corbeled, with smooth and symmetrical lines. On the front are added architectonic-decorative elements with bichrome effects (e.g., those at Santa Vittoria di Serri) — animal sculptures (bulls), and symbolic ornaments (bosses, geometric signs). An example is the triangular pediment-shaped element, with a cluster of bronze swords as acroterium, of the recently discovered and excavated small temple of Su Tempiesu (FIG. 608) in the district of Orune (province of Nuoro). These monuments would seem to indicate a certain amount of contact between barbarian and Greek, or Grecizing, cultures.

The influence of Hellenic models, possibly transmitted by way of Phoenician-Punic culture, is also seen in a number of small temples *in antis* (Santa Vittoria di Serri, FIG. 607; Dorgali), especially in the mountain monument of Domu de Orgìa in Esterzili (FIG. 609). In view of the archaic techniques — megalithic rather than isodomic — the possibility cannot be dismissed that these monuments represent a late echo of the plan of the Anatolian-Peloponnesian megaron. Similarly, a certain type of circular dwelling with central atrium appears to go back to a remote Aegean prototype; this type, which was present in the declining phase of the nuraghic civilization, is seen in Barúmini (province of Cagliari), the village around Su Nuraxi (PL. 401), a form strangely similar to the example of the dwelling at Khamaizi, in eastern Crete (district of Sitia; IV, FIG. 81). The chronological interval is enormous (ca. 1800 B.C. in Crete, 5th cent. B.C. in Barúmini), but it would seem as if the kingdom of Minos had found a last refuge in Sardinia.



Another typical art form of the protohistorical civilization here is the bronze sculpture, some examples of which reach a high artistic level. This noteworthy production was entirely small-scale; large sculpture of human subjects, was unknown among the ancient Sardinians, as was painting. More than 400 such figurines (PLS. 403, 404) have come to light; the majority of them represent warriors, but there are also statuettes of kings, priests, women, peasant folk, and animals, as well as some works of magico-religious significance. These sculptures can be divided into two stylistic groups: the geometric, distinguished by volumetric and decorative elements (Uta-Abini group), and the Mediterraneanizing, freer in form and popular in subject (Barbaricino group). Both groups show reflections of ancient Near Eastern sculptural forms (Anatolian, Syrian, Aegean), and there appear basic motifs from the Geometric art, of Greco-Italic derivation, of the historical period. The bronzes as a group can be dated 8th–6th century B.C., but in certain remote mountain regions these statuettes continued to be made even later.

Geometric style of the linear, nonfigural phase is exemplified also in fine examples of pottery (recovered from the nuraghi, the mountain huts, and above all from the temples, e.g., S. Anastasia in Sàrdara) and in utilitarian and decorative bronzes. Some of

the ceramics, as well as certain of the bronze pieces, exhibit interesting parallels to art forms of the Villanovan and early Latian cultures of continental Italy, with significant similarities even in ornamental details (see ETRUSCO-ITALIC ART). There are other ceramic objects, more ancient, of an archaic facies of the nuraghic civilization, the Monte Claro; this pottery is characterized by shapes probably derived from metal prototypes, by a red color, by grooved decoration, and by the persistence of a

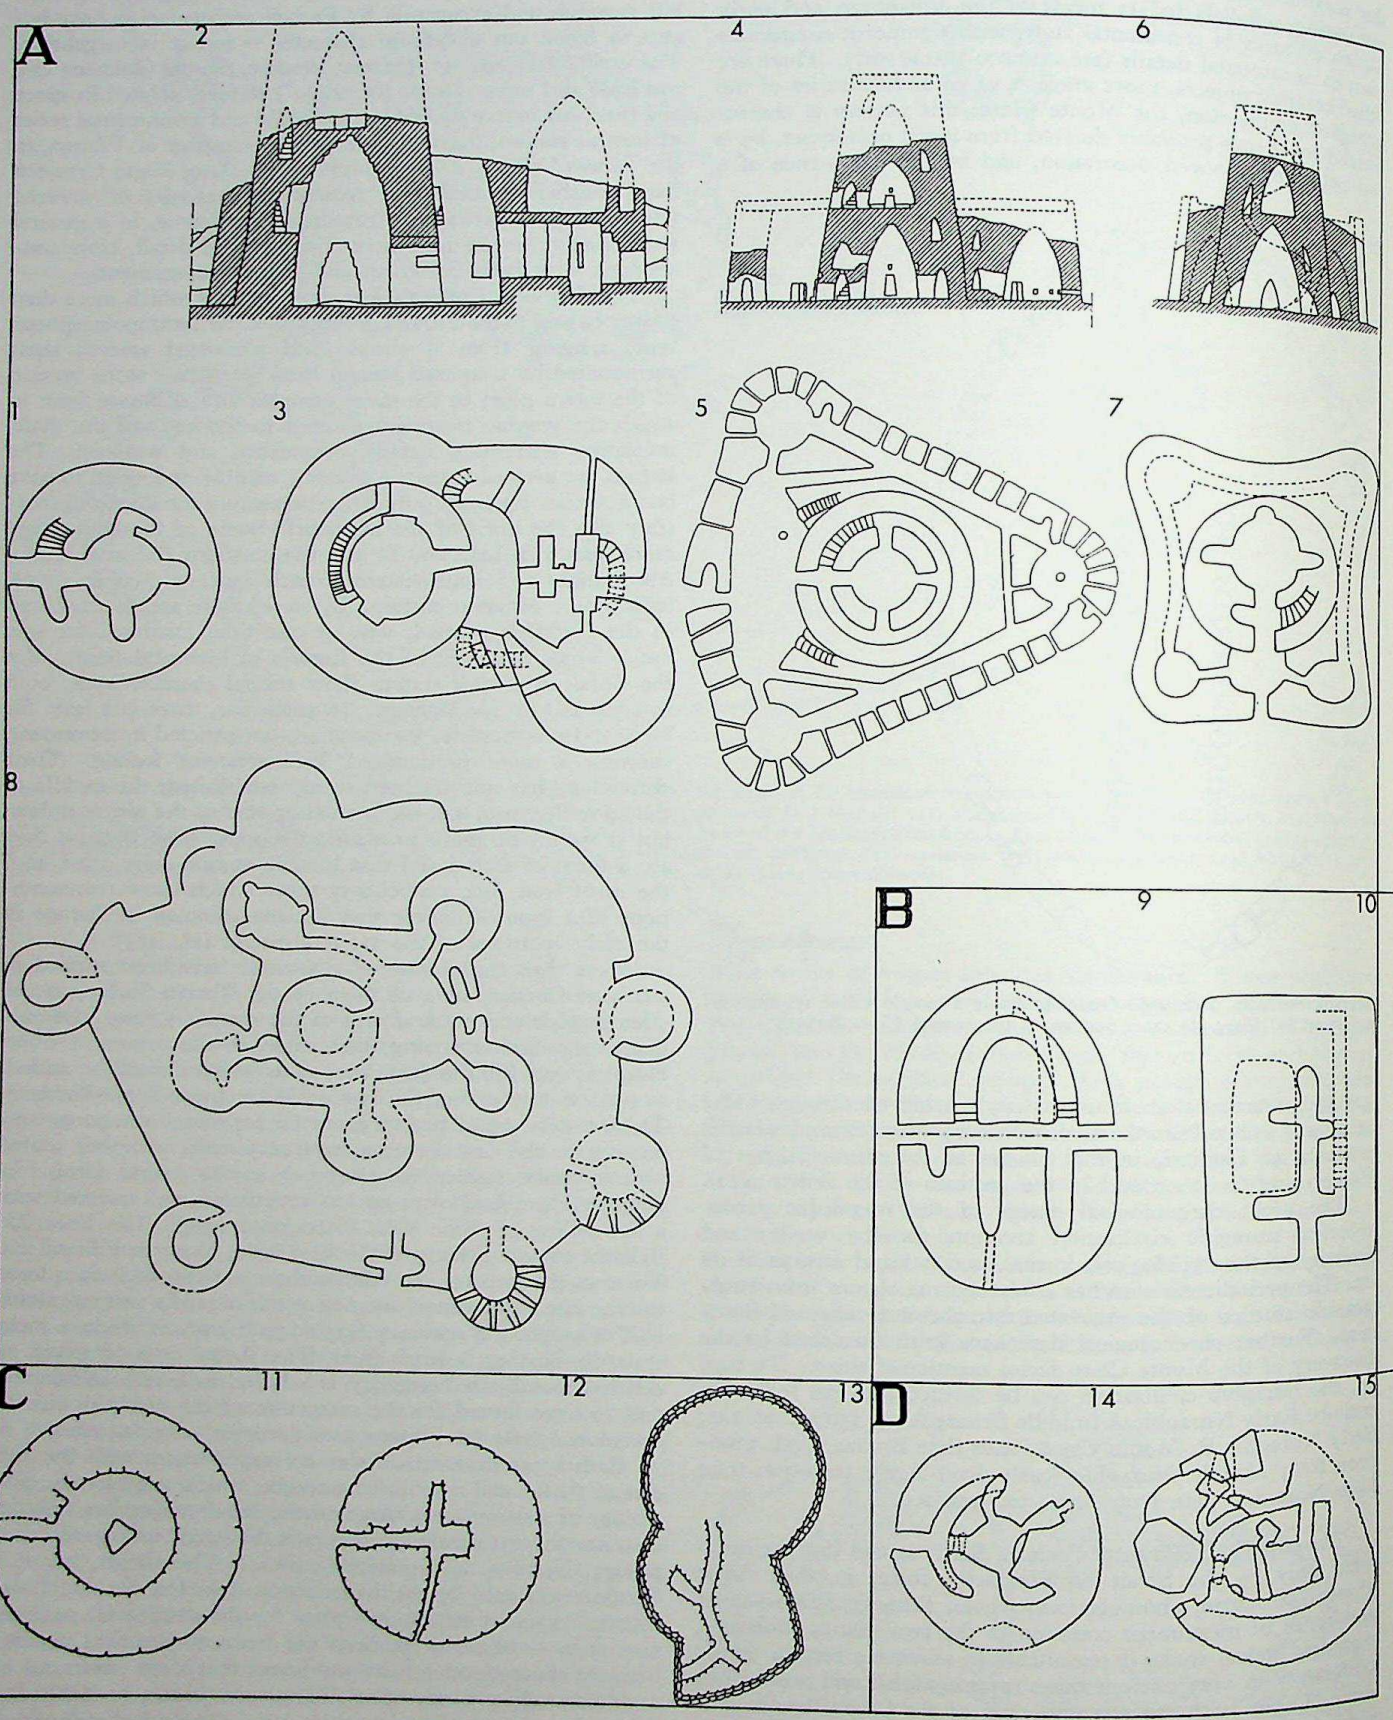
free and unarticulated decorative style achieved through older techniques drawn from the chalcolithic tradition (examples found in tombs at Cagliari, in the villages of the municipalities of Mógoro and Oristano and in the grottoes of the Súlcis area).

The great chronological extent of the megalithic protohistorical nuraghic civilization accounts for the variety and diversity of the typological, formal, and cultural aspects of its art. The periodic division has lately become clearer from stratigraphic studies of the excavated nuraghe and village of Barúmini. Further chronological data have been furnished by the discovery of the Monte Claro facies mentioned above. To sum up, the nuraghic civilization can be divided into the following periods: Early Nuraghic A (middle Bronze Age), 1500–1200 B.C.; Early Nuraghic B, Monte Claro facies (late Bronze Age), 1200–1000 B.C.; Middle Nuraghic (early Iron Age), 1000–500 B.C.; Late Nuraghic (late Iron Age), 500–200 B.C.



The megalithic culture of Corsica. Sardinia and Corsica, separated only by the Strait of Bonifacio, form, in their basic physical structure, a homogeneous whole. Ethnographic evidence and types of monument common to the two islands (dolmens, menhirs, steles) make it reasonable to assume a certain ethnic uniformity in very ancient times (premegalithic and pre-Bronze Age). Later, with the strengthening of the Libyo-Iberian cultural basis in Sardinia and of the Ligurian in Corsica, this unity gradually dissolved, and the original homogeneous, or almost homogeneous, cultures took separate if not divergent paths. To this separation the differing geographical situations of the two islands contributed, in that Corsica faces toward Europe, while Sardinia extends into the Mediterranean at the crossroads of the routes between East and West.

Until a few years ago, Corsica was an archaeological unknown, but research and excavation by French archaeologists have begun to block out a definite character — and it is megalithic. The earlier catalogue of *stazzone, stantare, filarate* (dolmens and menhirs) and some menhir (or "stele") statues, isolated in space and time, has been enriched by a splendid and monumental series of menhir statues, the truly exceptional complex of Filitosa, in the Taravo Valley (PL. 405; XII, PL. 562). Also, Roger Grosjean has published a number of remarkable examples of towered (FIG. 611) and corridored structures which show, in a general way, Mediterranean influences and, more in detail, close connections with both Sardinian and Balearic monuments.

The fifty-odd Corsican menhir statues, of which more than twenty belong to the Filitosa group, are of the anthropomorphous type, ranging from a simple and elemental smooth shaft surmounted by a stylized human head (perhaps a stone version of the totem pole) to the more complex and elaborate form in which the graphic treatment extends to the body of the shaft, indicating anatomical details, ornaments, and weapons. The statues are derived from the aniconic menhir and seem to have had a similar funerary purpose, representing the deceased (possibly also the spirit of the ancestor). Some of the statues are more than 6 ft. high and fit into the northern Italian (Liguria, Alto Adige) and southwestern French type of menhir statue, indicating a common custom. By some, these are all attributed to the Ligurian peoples, who at one time inhabited an area much larger than that of the Liguria of historical times. But the Corsican menhir statues show special characteristics, both in style and in development. In particular, there is a taste for loose and unarticulated composition, unrestricted in movement, showing a more pronounced Mediterranean feeling. Their chronology has not yet been firmly established; the middle of the 2d millennium B.C. has been suggested as the terminal date, but it would be more prudent to suppose (also because they are a form of sacred art) that menhir statues were used until the early Iron Age, particularly those which show representations of a type of dagger that became common in Europe in the early centuries of the 1st millennium (PL. 405).

More than thirty towered structures have been studied in southern Corsica, nine of them in the Taravo Valley, in the ethnographic and cultural area of the menhir statues. Of particular significance among these nine are the towers of Foce, Balestra, and Filitosa (FIG. 611) — to which should be added, as no less interesting, the one at Torre (near Porto-Vecchio). These towers are of two types, or forms: round structures containing, in the first form, a covered circular chamber roofed over in tholos fashion (tholos type); in the second form, rectangular chambers, more or less articulated, and covered with a flat ceiling of stone slabs (corridored type). The Foce and Balestra towers belong to the first type, those at Filitosa and Torre to the second. At Filitosa there are two such corridored towers, one at the center and one at the edge of a vast megalithic wall of polyhedral masonry (425 × 130 ft.) which blocks a rocky spur dominating a large area. The tholos type of tower, of relatively small-sized masonry, is believed to have been funerary and to have served for the cremation of the dead, as did the corridored type (at Filitosa also used for religious rites).

Both types have remarkable correspondences with the Sardinian tholos and corridored nuraghe, which suggests the possibility of a common heritage whose development has followed a course in part parallel and in part divergent as regards chronology, customs, and material culture. The tholos, which in Sardinia was used by the living, retained in Corsica its characteristic Eastern function as a place for the dead — its rudimentary state — while in Sardinia the force of practical necessity brought about development into forms that were enormous and architecturally superior. Sociological conditions, probably similar in the two islands, determined the form of the corridored tower: it was an instrument of hidden warfare, a tower-hideout, inasmuch as it was suitable for the guerilla fighters, who, the ancient writers tell us, continued to live and fight in the wild and inaccessible mountains of the two islands until the Roman republican period. The archaeological material (pottery and bronze) that has come to light in the corridored towers indicates

customs and events common to the two islands that belong to a relatively late historical period, at any rate to the 1st millennium B.C.

The Balearic Islands and the talayotic civilization. The major Balearic islands, Mallorca and Minorca (anc. Nure), fostered the third, and westernmost, insular megalithic civilization of the western Mediterranean. It is not possible to document a prehistoric Ibero-Levantine ethnic base from which the Balearic megalithic civilization derived, but the infiltration of certain forms, as well as geography itself, makes this a legitimate assumption. Later, in historical times, this substratum acquired the designation Baleari, comparable with that of the Sardinian Bàlari, to whom historical tradition ascribes an Iberian origin. Like the Sardinians and the Corsicans, the inhabitants of the Balearic Islands were a warlike people and formidable wielders of the sling.

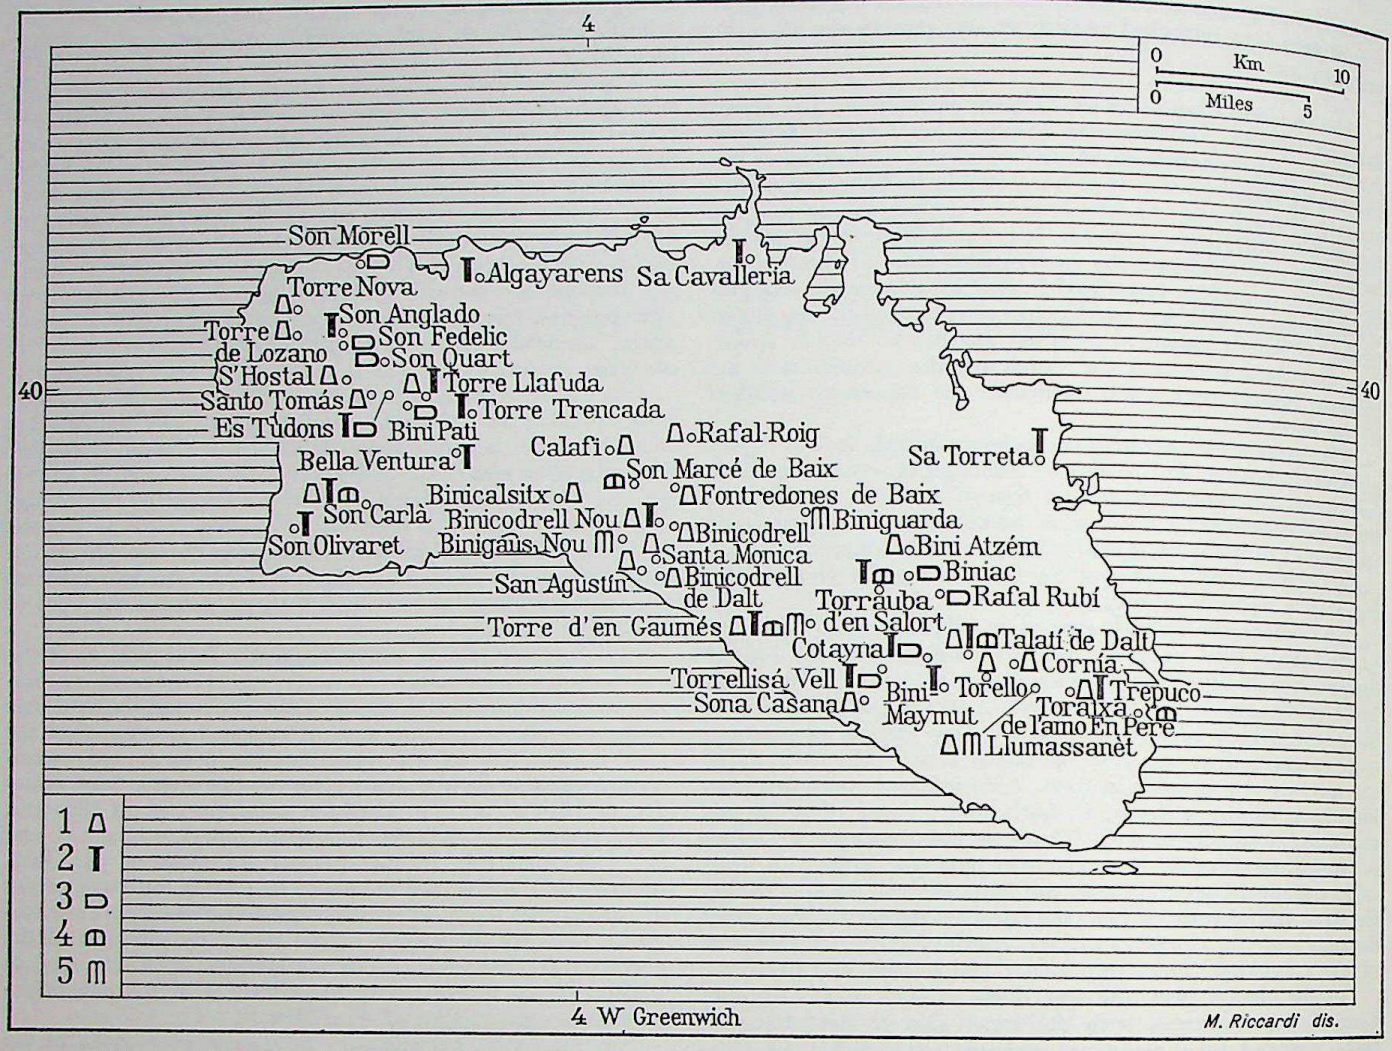
The megalithic culture of the Balearic Islands is also highly evolved, imposing, and grandiose, although on a different scale and to a different degree from that of Sardinia. It presents its own individual accent, with modulations more numerous and varied in Minorca, perhaps because of the proximity to the "quasi-continental" island of Sardinia, whence it undoubtedly received a cultural stimulus.

The Balearic megalithic structures, which came to be known as the talayot (FIG. 611), the *naveta* (or *naus*), the taula, and the *antigor*, are of dry masonry with cyclopean elements (PL. 406). Most numerous is the talayot (over 1,000 in Mallorca, 267 in Minorca), which served both as dwelling and as fortification, and, in more than one case, as burial vault. The majority of the talayoti are circular in form, with inclined walls that rise, like those of the nuraghi, in horizontal courses of stones diminishing gradually in size. There are also, however, a number of talayoti of elliptical or rectangular plan (the latter with truncated pyramidal section) with the same kind of exterior facing. On the basis of interior plan the talayoti are, like the Sardinian nuraghi and the Corsican towers, classified as of the tholos or of the corridored type, the former being more numerous.

In the tholos type, the true dome is seen as an exception (Son Carlá, Minorca), with the upper part of the projecting walls replaced by a ceiling of wooden beams and stone slabs supported by a central pillar made up of many stones (Sa Canova, in Artá, Mallorca; FIG. 611). Perhaps in ancient times the complete tholos occurred in many talayoti, since examples are still found in a secondary cycle derived from the ancient megalithic forms, in certain rural constructions, particularly in Minorca (*pont de bestiar*, *barracas*). The central pillar, built of dry masonry of stone blocks that are progressively larger from bottom to top, is a characteristic of the talayot and of other Balearic structures (*navetas*, dwelling houses, hypostyle rooms for funerary or religious use). It suggests an influence stemming from the early megalithic culture, of a stamp that is dolmenic, Mediterranean (Maltese), but, above all, Ibero-Atlantic, in which the flat ceilings of the small dolmens and of the large corridor tombs are supported on orthostats, sometimes consisting of a number of stones. This element of orthostatic and trilithic architecture (of aëneolithic origin), which gives an archaic cast to the Balearic megalithic, obstructed the new fashion of the Eastern dome, hindering, if not its adoption and application, its growth and spread, and furthered the establishment of the corridored talayot as the chief architectural form. The corridored type of talayot is seen in both the circular and the rectangular form, just as in Sardinia. The corridors, which sometimes have an entrance at ground level (Fontredones de Baix, Mercadal, Minorca), are either contained within the interior of the tower, built in the form of a solid mass (Minorca: Santa Monica, FIG. 611; San Cristóbal), or traverse it diametrically like a tunnel (Mallorca: Ses Païsses, Artá).

Both types of tower are sometimes diversified by steep and narrow spiral stairs built within the thickness of the walls, leading to rooms on an upper story or to terraces (Torre Vell d'en Lozano, Ciudadela, Minorca); in other cases they are surrounded by the remains of circular walls which supported external ramps (Ses Païsses), so that they take on the appearance of stepped towers, as in the modern *pont de bestiar* and the Apulian trullo (V, PL. 337), derived from Bronze and Iron Age *specchie*).

Typological and formal connections with Sardinia are met with again in the *naus*, a large structure in the form of an upturned ship, with an apse at the far end, which, apart from having no exedra in front, is related in plan and exterior appearance to the Sardinian "giants' graves." However they differ as to interior space, which is sometimes divided into aisles by a row of pillars of the type described above — even, in exceptional cases, being on two levels, as in the "Naveta dels Tudons" at Ciudadela in Minorca (PL. 406). In the *naus* the dolmenic orthostatic element is much more pronounced than in the "giant's grave," in which the projecting component, derived from the nuraghe, predominates. The function of the *naus* was funerary.



On the other hand, the taulas, vast monuments in trilithic style, peculiar to Minorca, seem to have been temples; the horseshoe form is faintly reminiscent of the Maltese "temples" (as is the great size of the orthostatic structures) and, in a more general way, of the famous megalithic complex of Stonehenge (V, PLS. 164, 165). The term "taula" derives from the gigantic horizonal stone slabs laid horizontally atop the monolithic upright piers in the center of the vast enclosure, the two elements (pier and slab) together forming a T shape, perhaps the aniconic symbol of a deity.

Talayoti and taulas not infrequently form part of settlements on the order of the fortified village, surrounded by massive walls, with gates and towers on the perimeter; the dwellings inside are also megalithic and orthostatic (in some cases the plan is like that of the *naus*, basically a large and monumental dwelling for the dead). Noteworthy among these *poblados*, or villages, are Son Carlá, in Minorca, and, in Mallorca, Els Antigors (Ses Salines), Capocorp Vell (Lluchmayor), and Ses Païsses (Artá). In the unusual necropolis of Son Real, Alcudia, in Mallorca, are to be seen structures, built one against the other, that repeat in miniature and in perfectly regular isodomic masonry the design of the round talayoti and of the *navetas*: this is the refined touch of a less remote locality, freer in outlook, which invested with the Greek spirit the megalithic-cyclopean cultural base of these islands.

On the basis of findings in the recent excavations of the talayot complex of Ses Païsses, the talayotic culture can be subdivided into three distinct phases: (1) Archaic Talayotic period (ca. 1200–1000 B.C.?), which produced the corridored talayoti and corresponds to the oldest phase of Balearic megalithic culture, characterized by the influence, both architectonic and nonarchitectonic, of the civilization of the Iberian Peninsula, admixed with Mediterranean elements, such as artificial rock-cut grottoes; (2) Middle Talayotic period (ca. 1000–500 B.C.), the time of the greatest monumental and cultural expressions of the Balearic peoples, marked by connections with the *floruit* of Sardinian nuraghic architecture and by commercial relations with the southern part of the Iberian Peninsula, and, more remotely and perhaps indirectly, with the Atlanto-European area (as shown by the Huelva and northern bronze artifacts), as well as by Phoenician-Punic influences from the Phoenician colony established at Ibiza (see PHOENICIAN-PUNIC ART); (3) Late Talayotic period (ca. 500 B.C. to the Roman conquest), in which there was a survival of declining older traditions alongside new imported cultural elements — Punic, Hellenistic, Greek, Iberian, and other — eventuating in a notable local production of figural crafts including bronze statuettes and such works as the Costitx bulls' heads (Madrid, Mus. Arqueológico Nacional).

Giovanni LILLIU

THE IBERIAN CIVILIZATION. The topography of the Iberian Peninsula has well-defined features: in the center is a plateau (the Meseta), whose altitude above sea level averages 2,000 ft., flanked by two roughly triangular depressions, the valley of the Ebro on the northeast and the valley of the Guadalquivir on the south; the rest consists of coastal strips. The actual area that was the seat of the Iberian civilization includes only the Mediterranean coastal strip and the two above-mentioned de-

Minorca, principal megalithic monuments. *Key*: (1) Talayoti; (2) taulas; (3) *navetas*; (4) megalithic grottoes; (5) hypostyle halls.

pressions, for the central Meseta and the western portions remained outside the sphere of Mediterranean civilization; not until they were conquered by the Romans in the 2d century B.C. did they become part of the Latin cultural world.

The early Greek geographers and historians called the people who inhabited the Mediterranean side of the peninsula "Iberians"; the inhabitants of the southern part of the peninsula were designated as "Tartessians." Thus was indicated the existence of a shade of difference in the ethnic substratum, a difference that slowly disappeared as cultural development brought about the unification of the area. Consequently, as the region became better known the term "Iberian" was extended to cover an ever-increasing geographical area, and in Greek historiography the term came to designate the whole peninsula, although the difference between the peoples of the eastern and southern parts and those of the interior — the Iberian Celts, or Celtiberians, as they are termed — remained very real.

Two elements enter into this differentiation: a clear racial divergence, and a differing capacity to react to the Mediterranean stimulus. This indicates that the ancient historians recognized the existence of an "Iberian civilization," which was capable of taking its place alongside the other Mediterranean civilizations, in contrast with the uncivilized inhabitants of the interior, who were included in the Greek category of "barbarians." However, there persist in the Iberian region traditions going back to prehistoric times that point to differences, derived from the earlier development of distinct cultural phases, that seem to define two areas; one in the east and the other in the south.

In the south the population was descended from a very ancient people who, already settled in this region in the Neolithic period, gained vigor from the arrival of an ethnic group from the eastern Mediterranean, numerically inconsiderable but of a superior culture and with new religious ideas. This fusion produced, in the course of the 2d millennium B.C., a distinct culture, the Andalusian megalithic civilization, which, although its impulses were Orientalizing, was original in its development and prospered from the great metallic wealth (copper) of the region. A new wave of Mediterranean immigration, probably of Anatolian origin, introduced into the southeast the working of silver, giving rise in the middle Bronze Age to the El Argar culture, which, while it did not follow the religious practices of the older megalithic civilization but deviated in its rites and funerary practices, did not, from the ethnic point of view, differ from its predecessor to any appreciable extent. Being a region poor in metals, eastern Spain did not receive a similar stimulus and, throughout the 2d millennium, continued unchanged in its neolithic traditions, modified by the influence of the Central European neolithic culture, more intensely felt in the territory north of the Ebro. Only the eastern Pyrenees region and the adjacent regions felt the influence of the Mediterranean megalithic civilization, which did not essentially modify the racial character of the population. Thus the Iberian contribution can be considered to have been the indigenous population (see MEDITERRANEAN PROTOHISTORY).

The cultural division between the south and the east became more marked at the end of the 2d millennium B.C. From the Mediterranean coast of southern France the first wave of the Urn-field people arrived in the peninsula, with a largely continental cultural heritage and a new religious concept, which introduced in Iberia for the first time the rite of cremation of the dead. Absorbed by the more numerous indigenous population, this group, concentrated north of the Ebro, succeeded

617

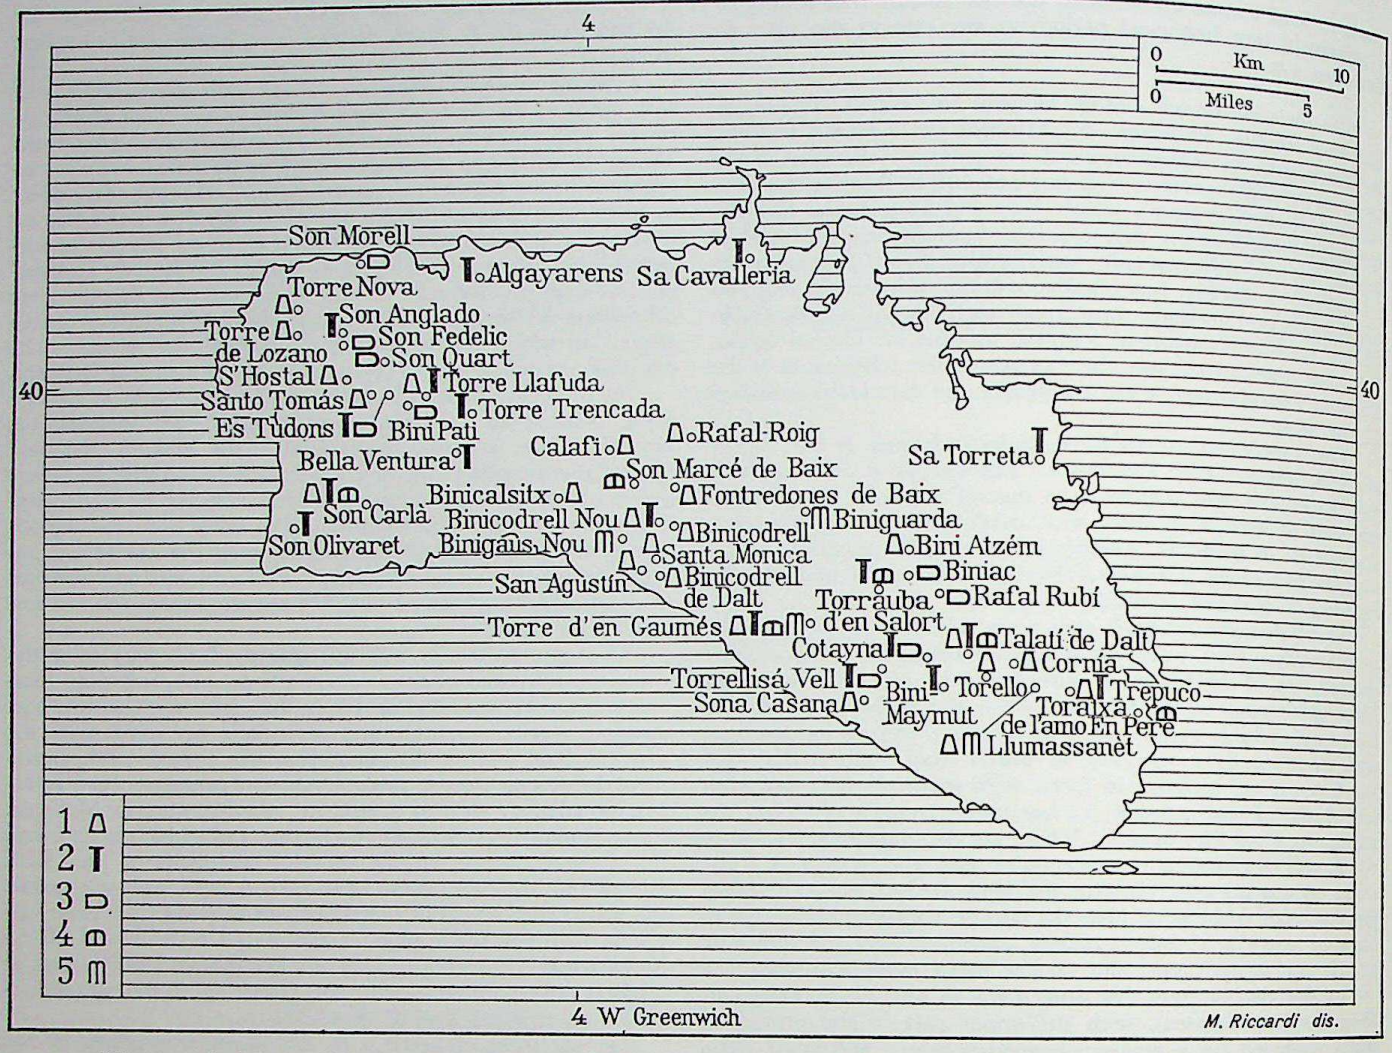
in exercising a certain influence even in the south. Here, immediately preceding the Phoenician colonization, a new and vigorous Mediterranean cultural impulse that must have been a large-scale colonization, from outside, of the lowlands of the Guadalquivir and the Guadiana is already distinguishable under the historical name of Tartessos. While silver had been the great stimulus of the middle Bronze Age culture, it was now western tin that was to determine the success of the westward expansion of Mediterranean civilization. The actual beginnings of the Tartessian component are difficult to establish accurately; data obtained through recent researches point to the Aegean-Cypriote region at the time when the eastern Mediterranean was attempting to regain its economic balance after the crisis familiar to historians as the migrations of the Peoples of the Sea. The Tartessian element in the south and the Urn-field element in the east contributed to the maintenance of the traditional duality already noted between the two regions; southeastern Spain, the point of contact, constituted the most advanced and vital center of Iberian culture.

The Mediterranean colonizations of the Iberian Peninsula and their varied fortunes represent the decisive factor in the formation of the Iberian civilization. The first event was the Phoenician colonization, which, concerned exclusively with commercial activity, affected only the south coast, where even before 1000 B.C. the city of Gadir (mod. Cádiz) had flourished, monopolizing Tartessian metal production and exerting a great influence in the transmission of eastern techniques (chiefly in gold- and silverwork) and religious concepts (lunar cults, worship of Astarte, Kronos, Melkarth, etc.). When, beginning in the 6th century B.C., Carthage achieved political supremacy over the western Semitic world, the influence on southern Spain continued to be more Phoenician than Punic, so that Carthage's attempt to found a territorial empire in Spain in the 3d century B.C. came at a time when Iberian culture had already reached its classic phase (see PHOENICIAN-PUNIC ART).

Geographically far more extensive was the influence of the Greeks. The mineral wealth of Tartessos, monopolized by the Phoenicians, enticed the Greeks to colonize the southern coast in the 7th century B.C. Greek literary tradition recalls the discovery of Tartessos by Kolaios of Samos and of his attempt to settle in that region. Numerous traditions survive regarding contacts with the Iberian coast, but the first genuine colonization is attributed to the Phokaians, who founded Mainake, in an as yet undetermined location on the Málaga coast, Hemeroskopeion (mod. Denia) on the Alicante coast, and Emporion (mod. Ampurias) on the Gulf of Rosas, near the eastern Pyrenees. The ultimate goal of the Greeks was the Tartessian market; but Mainake, surrounded by Phoenician settlements, managed only to establish relations with the interior areas by overland routes. Hemeroskopeion, whose early history is unknown, exerted a powerful influence on the formation of Iberian culture. Emporion was influential in a later period; it must have been founded at the beginning of the 6th century B.C. as a mere port of call on the route to Tartessos (a six-day voyage away). At the end of the 6th century B.C., when the power of Massilia (mod. Marseilles) declined, the center of Tartessian power shifted toward Gadir, and Mainake was abandoned. Emporion then began to make its influence felt in the area north of the Ebro and maintained maritime contacts with Hemeroskopeion, with the southeastern region, and with the Punic world (e.g., via Ibiza). Through its relations with the Greek cities of Magna Graecia, Emporion contributed greatly to the evolution of Iberian culture north of the Ebro (see GREEK ART, WESTERN).

Less important — because later — but no less interesting is the Italic influence on late Iberian culture. From the mid-4th century B.C., Italic imports, probably brought in through Greek trade in immense quantity, completely supplanted Attic products: Campanian ware was extensively and habitually used for the table in the Iberian world until well into the 1st century and was widely imitated by local potters.

A further influence on the Iberian world was exercised by the Celtic inhabitants of the interior of the peninsula. With the discovery of iron in Moncayo and in the Soria area, the Indo-European population of the interior developed a highly original culture, without, however, reaching what could be termed an urban level. Drawn by the superior cultural centers of the Iberian region, the Celtic population of the interior eventually gravitated to them, and eventually it contributed certain aspects of its own artistic heritage — particularly certain decorative motifs — which in turn were absorbed and taken over by the Iberian populace (see CELTIC ART).



Apart from these, so to speak, passive influences affecting the Iberian world, there was another influence, of an active sort, arising from the direct contact of large numbers of Iberian mercenaries serving in the Carthaginian armies during the wars in Sicily. Iberian troops took part in the battle of Himera (480 B.C.) and for two centuries were participants in the Punic expeditions, thus passing through the principal Greek cities of Sicily in peace and war. This experience revealed to the Iberians the Greek civilization in all its splendor, and they returned home filled with new ideas which were to be realized in Iberian art forms.

Origins and development of Iberian art. Built on so heterogeneous a substratum, subjected to such a variety of influences, the formative process of the civilization of the Iberian world was not uniform, in either time or space, and never reached the same level in all regions. Actually, there arose gradually in various areas a development toward a process of cultural unification which in the south and southeast appears to have been complete as early as the 5th century B.C., while in the rest of the eastern region and in Catalonia it was not effected until the 4th century B.C. The first center was that which the ancient writers called "Tartessian": this extended from the region of the Strait of Gibraltar to the extreme western end of the peninsula, thus including the lower basins of the Guadalquivir and the Guadiana. Since in this area the Cypro-Phoenician cultural stimulus had been felt since very ancient times, an urban culture had been achieved as early as the 9th century B.C. But the period of the greatest flowering of the Tartessian culture was the 8th–6th century B.C. After that the entire valley of the Guadalquivir saw the development of an "Iberian" culture constituting a separate area, yet but partially known, in which are encountered the ceramics showing Cypriote influence that were the prototypes of the ware which came to be known as Ibero-Andalusian.

Another center of activity, in the southeast, includes the modern provinces of Alicante, Murcia, Albacete, Jaén, and, in part, Almería and Granada. Its cultural stimulus clearly appears to have been that stemming from the Alicante coast with the beginning of the 6th century B.C. The existence of rich mineral deposits in the provinces of Jaén and Córdoba and the difficulties experienced by the Greeks in their attempts to reach this region by the maritime route, because of Phoenician-Punic control over the zone of the Strait of Gibraltar, impelled the Greeks to seek an overland route from the Alicante coast to the interior. Through this route they exerted so strong an influence over the entire territory that during a certain period the Ionian alphabet was adopted even in the writing of the Iberian texts found in the cities and sanctuaries.

The intensity of Greek influence in the southeast caused this area, richer and culturally and artistically more highly developed, to assume predominance as the Iberian region from which cultural influences spread along the coastal lands as far as the Ebro; there, however, the earth was poor in metals, and development toward an urban culture was much slower.

A third productive center comprised the eastern Pyrenees zone, near the Greek colony of Emporion. Although the city of Emporion was in existence in the 6th century B.C., the cultural development of this area was late, for the indigenous Catalan population, both to the north and to the south of the Pyrenees, powerfully influenced by the Indo-European migration from the Urn-field region, was less open to the Mediterranean stimulus of the Greeks, and their incorporation into the Iberian cultural sphere proper was therefore slower and was effected later than in other areas. Nor did this area ever reach a cultural level comparable to that of the peoples of the southeast; indeed, some of the principal art forms are not found —

Minorca, principal megalithic monuments. *Key*: (1) Talayoti; (2) taulas; (3) *navetas*; (4) megalithic grottoes; (5) hypostyle halls.

pressions, for the central Meseta and the western portions remained outside the sphere of Mediterranean civilization; not until they were conquered by the Romans in the 2d century B.C. did they become part of the Latin cultural world.

The early Greek geographers and historians called the people who inhabited the Mediterranean side of the peninsula "Iberians"; the inhabitants of the southern part of the peninsula were designated as "Tartessians." Thus was indicated the existence of a shade of difference in the ethnic substratum, a difference that slowly disappeared as cultural development brought about the unification of the area. Consequently, as the region became better known the term "Iberian" was extended to cover an ever-increasing geographical area, and in Greek historiography the term came to designate the whole peninsula, although the difference between the peoples of the eastern and southern parts and those of the interior — the Iberian Celts, or Celtiberians, as they are termed — remained very real.

Two elements enter into this differentiation: a clear racial divergence, and a differing capacity to react to the Mediterranean stimulus. This indicates that the ancient historians recognized the existence of an "Iberian civilization," which was capable of taking its place alongside the other Mediterranean civilizations, in contrast with the uncivilized inhabitants of the interior, who were included in the Greek category of "barbarians." However, there persist in the Iberian region traditions going back to prehistoric times that point to differences, derived from the earlier development of distinct cultural phases, that seem to define two areas; one in the east and the other in the south.

In the south the population was descended from a very ancient people who, already settled in this region in the Neolithic period, gained vigor from the arrival of an ethnic group from the eastern Mediterranean, numerically inconsiderable but of a superior culture and with new religious ideas. This fusion produced, in the course of the 2d millennium B.C., a distinct culture, the Andalusian megalithic civilization, which, although its impulses were Orientalizing, was original in its development and prospered from the great metallic wealth (copper) of the region. A new wave of Mediterranean immigration, probably of Anatolian origin, introduced into the southeast the working of silver, giving rise in the middle Bronze Age to the El Argar culture, which, while it did not follow the religious practices of the older megalithic civilization but deviated in its rites and funerary practices, did not, from the ethnic point of view, differ from its predecessor to any appreciable extent. Being a region poor in metals, eastern Spain did not receive a similar stimulus and, throughout the 2d millennium, continued unchanged in its neolithic traditions, modified by the influence of the Central European neolithic culture, more intensely felt in the territory north of the Ebro. Only the eastern Pyrenees region and the adjacent regions felt the influence of the Mediterranean megalithic civilization, which did not essentially modify the racial character of the population. Thus the Iberian contribution can be considered to have been the indigenous population (see MEDITERRANEAN PROTOHISTORY).

The cultural division between the south and the east became more marked at the end of the 2d millennium B.C. From the Mediterranean coast of southern France the first wave of the Urn-field people arrived in the peninsula, with a largely continental cultural heritage and a new religious concept, which introduced in Iberia for the first time the rite of cremation of the dead. Absorbed by the more numerous indigenous population, this group, concentrated north of the Ebro, succeeded

in exercising a certain influence even in the south. Here, immediately preceding the Phoenician colonization, a new and vigorous Mediterranean cultural impulse that must have been a large-scale colonization, from outside, of the lowlands of the Guadalquivir and the Guadiana is already distinguishable under the historical name of Tartessos. While silver had been the great stimulus of the middle Bronze Age culture, it was now western tin that was to determine the success of the westward expansion of Mediterranean civilization. The actual beginnings of the Tartessian component are difficult to establish accurately; data obtained through recent researches point to the Aegean-Cypriote region at the time when the eastern Mediterranean was attempting to regain its economic balance after the crisis familiar to historians as the migrations of the Peoples of the Sea. The Tartessian element in the south and the Urn-field element in the east contributed to the maintenance of the traditional duality already noted between the two regions; southeastern Spain, the point of contact, constituted the most advanced and vital center of Iberian culture.

The Mediterranean colonizations of the Iberian Peninsula and their varied fortunes represent the decisive factor in the formation of the Iberian civilization. The first event was the Phoenician colonization, which, concerned exclusively with commercial activity, affected only the south coast, where even before 1000 B.C. the city of Gadir (mod. Cádiz) had flourished, monopolizing Tartessian metal production and exerting a great influence in the transmission of eastern techniques (chiefly in gold- and silverwork) and religious concepts (lunar cults, worship of Astarte, Kronos, Melkarth, etc.). When, beginning in the 6th century B.C., Carthage achieved political supremacy over the western Semitic world, the influence on southern Spain continued to be more Phoenician than Punic, so that Carthage's attempt to found a territorial empire in Spain in the 3d century B.C. came at a time when Iberian culture had already reached its classic phase (see PHOENICIAN-PUNIC ART).

Geographically far more extensive was the influence of the Greeks. The mineral wealth of Tartessos, monopolized by the Phoenicians, enticed the Greeks to colonize the southern coast in the 7th century B.C. Greek literary tradition recalls the discovery of Tartessos by Kolaios of Samos and of his attempt to settle in that region. Numerous traditions survive regarding contacts with the Iberian coast, but the first genuine colonization is attributed to the Phokaians, who founded Mainake, in an as yet undetermined location on the Málaga coast, Hemeroskopeion (mod. The existence of rich mineral deposits in the provinces of Jaén and Córdoba and the difficulties experienced by the Greeks in their attempts to reach this region by the maritime route, because of Phoenician-Punic control over the zone of the Strait of Gibraltar, impelled the Greeks to seek an overland route from the Alicante coast to the interior. Through this route they exerted so strong an influence over the entire territory that during a certain period the Ionian alphabet was adopted even in the writing of the Iberian texts found in the cities and sanctuaries.

The intensity of Greek influence in the southeast caused this area, richer and culturally and artistically more highly developed, to assume predominance as the Iberian region from which cultural influences spread along the coastal lands as far as the Ebro; there, however, the earth was poor in metals, and development toward an urban culture was much slower.

A third productive center comprised the eastern Pyrenees zone, near the Greek colony of Emporion. Although the city of Emporion was in existence in the 6th century B.C., the cultural development of this area was late, for the indigenous Catalan population, both to the north and to the south of the Pyrenees, powerfully influenced by the Indo-European migration from the Urn-field region, was less open to the Mediterranean stimulus of the Greeks, and their incorporation into the Iberian cultural sphere proper was therefore slower and was effected later than in other areas. Nor did this area ever reach a cultural level comparable to that of the peoples of the southeast; indeed, some of the principal art forms are not found —

sculpture, for example, never having progressed in Catalonia beyond the stage of simple decorative reliefs for architectural use (Ampurias; Ullastret).

The Iberian cultural evolution was a varied and complex process, tending toward unification and crystallization. The cultural unification of the Iberian world began to develop in the middle of the 5th century B.C., stimulated by the political expansion of certain peoples whose existence can be presumed because of archaeological finds but of whom written sources offer no information. At the end of the 5th century B.C. Iberian culture penetrated toward the interior of the peninsula across the basin of the Ebro, gaining a foothold among a population in which, though its ethnic origins were diverse, the Indo-European element already predominated. In the Ebro Valley this gave rise to a mixed culture, which on the technical level coincides with that of the Iberian world but which artistically appears to be more closely tied to the peninsula's Celtic stratum.

Cultural areas. Because of this complicated formative process, the Iberian world, in spite of its geographical unity, remained divided into separate cultural areas, each with its own individual character. The most important are: (1) the Andalusian region, comprising Lower Andalusia (the lower basins of the Guadalquivir and the Guadiana), which coincides with the ancient Tartessian area; (2) the southeast, which extends to the upper valley of the Guadalquivir, the adjacent Mediterranean provinces of Alicante, Murcia, and Almería, the inland provinces of Albacete, Jaén, and in part Granada, with individual settlements as far as the province of Córdoba; (3) the east, comprising the provinces of Valencia, Castellón de la Plana, and Tarragona and reaching inland toward Lérida, Saragossa, and Teruel; (4) the Catalan region, which includes both the southern and northern slopes of the eastern Pyrenees (approximately from the Hérault River, in France, to the Tordera), centering in the provinces of Gerona and Roussillon.

Outside these areas, the Iberian civilization amounted only to a light cultural admixture, arising from the play of economic forces, which did not affect the individual character of the people or its structure. This applies particularly to the district of Numancia (anc. Numantia), in which the Celtiberian culture (see above) developed in a relatively later period. This culture, in certain technical aspects such as vase painting, was in part indebted to Iberian influences that had penetrated via the Ebro basin.

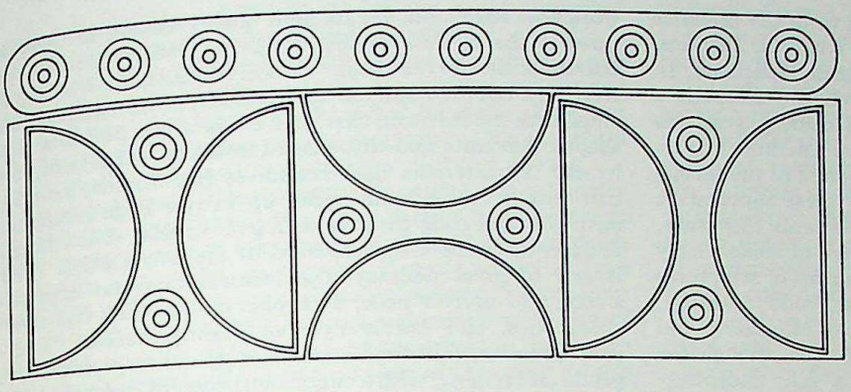
Leaving aside the different gradations in the different areas, one sees in the Iberian world not only a highly original cultural unity but also an ethnic, religious, and linguistic unity. From the *oppidum* of Ensérune to the middle Guadalquivir basin (Cástulo, or Castulon) indigenous inscriptions show the use of a common language and the same onomatology; while a highly original semisyllabic system of writing was developed in the same area, it is interesting that from the middle of the 2d century B.C. this system was also adopted by the Celtic peoples of the interior for writing in another language, which was related to those of the Gaulish (Celtiberian) group. In the lower Guadalquivir basin and in southern Portugal (the region corresponding to the oldest Tartessian boundaries) a different language seems to have been spoken, but its character has not been determined.

Principal phases. The development of Iberian art can be divided into three distinct phases: A "formative" phase, extending from mid-6th to mid-5th century B.C., is characterized by strong archaizing and Orientalizing Greek influence, particularly evident in the development of sculpture; this phase is found only in the southeast, archaeologically the best-known area; it is absent in the others. A second phase, which will be termed "classic," extended from mid-5th to mid-3d century B.C., two centuries that are most important in the development of an Iberian community with a political life of its own, upon which Carthaginian pressures did not yet impinge. The policy of annexation established by the Carthaginian military leaders, Hamilcar Barca and his successors, interrupted the autonomous development of the indigenous community and imposed new political systems and foreign religious beliefs, but Carthage also prevented the formation of centralized Iberian powers capable of providing a stimulus to the already established cultural base and promoting its wider development. Iberian culture thus grew arid and repetitive, and when the territory was occupied by the Romans, it languished, although maintaining a certain originality in many aspects of decorative art, particularly in ceramics. This last phase of Iberian art, which can be termed one of "survival," lasted until the middle of the 1st century B.C.

Architecture and architectural decoration. Iberian civilization, essentially urban in character, supported a threefold development of architecture — civil, military, and funerary — but in many areas it is little known today, because of the insufficiency of excavations of the richer strata, and because of the very fact that in many Iberian cities life continued uninterruptedly throughout the Roman period.

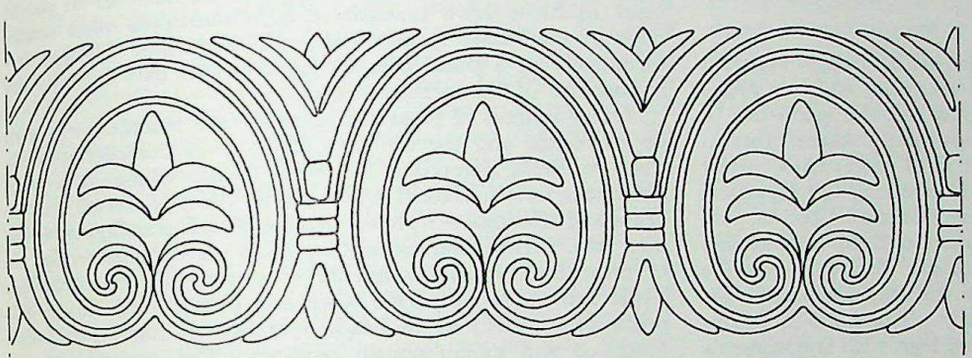
Construction materials used were stone, clay, and wood. The use of clay is typical, in the shape either of the tapia (wall formed in a mold, *tapial*, made of boards) or of adobe (sun-dried brick). Genuine bricks were little used before the Roman conquest. To avoid dampness from the soil the walls were raised on a stone foundation on the order of a socle. Wooden posts and architraves were built into the walls, following the Mediterranean tradition. The clay roofs were supported on lathing resting on wooden frames.

Very little is known about the structure of private dwellings, but the clear demarcation of social classes in the southeast and the south would lead us to suppose that there must have been a great variety. In general, houses were formed of adjoining square or rectangular rooms, in accordance with the particular topography of the location. In the Catalan area, in the east, and in the Ebro basin, the Iberian house was simply a development and elaboration of the type of dwelling peculiar to the region in the early Iron Age — when the houses, built on an elongated rectangular plan, had the hearth in the center and various interior subdivisions, reproducing the general plan of the megaron — with few differences between one and another, for the social structure does not appear to have been so stratified here as it was in the south.



The make-up of the large cities of the south is practically unknown to us. Literary sources tell us that they contained an agora and were encircled by walls. In the east, in Catalonia, and in southern France the urban unit was the *oppidum*, or village, situated on the summit of a hill, surrounded by walls. The houses were built on streets laid out on a grid plan following the topographical conformation.

The greatest architectonic efforts of the Iberians are apparent in military architecture. The cities were surrounded by walls ranging in thickness from 6 to 18 ft. and standing more than 24 ft. high, partly built of cyclopean stone masonry, without mortar: a double range of dressed stone blocks, the intermediate space being filled with earth and stones. This cyclopean technique, while not used in all walls, is typical of the east (Catalan) and southeast; notable examples are at Tarragona and Gerona. There were also smaller walls, of very careful construction, such as those of Ullastret, which show the direct influence of West Greek (Sicilian) models. The walls were punctuated by towers, generally square in plan (a few were circular), and the gates were fortified by very thick bastions. Preoccupation with the military was characteristic of the warlike Iberians.



The very interesting development of funerary architecture can be studied only in a limited part of the southeast, in the provinces of Granada (necropolis of Galera) and Jaén (necropolises of Peal de Becerro, La Guardia, and Los Castellones de Ceal; the last in part unpublished). In these cemeteries, alongside simple pit graves, are true hypogeum structures in which, under a tumulus of earth, are rectangular chambers preceded by a dromos. In some cases the vaults are supported by columns or piers, surmounted by a kind of capital decorated with interlace patterns in relief; the interior walls are painted and stuccoed. Unfortunately the known tombs are in a very bad state of repair and the details of the paintings have been lost, but they appear to have been geometric and floral in design (interlacing and palmettes). The colors were chiefly white and

Principal Iberian decorative motifs. (*A*) Architectura /sculptures: (1) Capital from the Cortijo del Ahorcado in Baeza; (2) capital from Elche; (3) architectural element from Osuna. (*B*) Ceramics: (4 and 5) Border designs from Archena; (6) decoration on urn from Azaila (cf. PL. 400).

red. The date of the tombs can be deduced from the presence of Attic craters of the 5th and 4th centuries B.C. The Iberians, like all Mediterranean peoples, were profoundly religious. In every important city or village there rose on the acropolis a sanctuary or a temple to which the faithful made pilgrimages on given days, bringing to the divinity votive offerings of various kinds, in accordance with the specific nature of the shrine. Very little is known of the architecture of these sanctuaries: probably they consisted of a rectangular cella with clay walls, and the architrave and lintels of the doors were of stone, richly carved with floral and geometric designs. Remains of sculptures from such sanctuaries (FIG. 621) have been found at Elche, Cástulo (Castulon; PL. 408), Baeza (Cortijo del Ahorcado), and Osuna. Their artistic inspiration was east Ionian, though the palmettes have been transformed and have a fully independent character. At Osuna there are a number of orthostats and sculptured blocks, which would indicate the existence of religious constructions of importance.

Sculpture. The originality of Iberian art is strongly apparent in the sculpture (stone, bronze, and terra cotta) which is found in the two southern regions, Andalusia and the southeast; in other parts of Spain sculpture is almost totally absent. Iberian sculpture appeared abruptly, without local antecedents, under the direct influence of the archaic Greek world, felt especially in the southeast (provinces of Alicante, Murcia, Albacete, and Jaén). The formative phase is characterized by zoomorphic sculptures, representing fantastic animals, derived from the Orientalizing iconography with which the Iberians became familiar through the Greek art of Sicily. There are sphinxes, either recumbent or sitting on their hind legs, with fine women's heads. These were found chiefly in Agost (Alicante), Llano de la Consolación (Murcia), El Salobral (Jaén), and Haches (Albacete). Then there are griffins, such as the one found at Redován (Murcia), and human-headed bulls, such as the "Bicha de Balazote" (PL. 408). Also from this first phase are a few human figures, such as the seated statue found as reused material in the necropolis of Verdolay (Murcia). The phase of Iberian sculpture to which all these pieces belong began in the second half of the 6th century and extended to the middle of the 5th (in which the greater part of them were doubtless executed). They are of fine workmanship and show a perfected technique that denotes a direct knowledge of Greek sculpture; but they were all found away from their original locations, and their true nature and purpose are not known.

A second phase saw the development of a clear tendency toward regional originality. Art freed itself from Greek influence and became essentially Iberian, gaining in originality what it lost in technique. This is realistic sculpture: the artist depicts the clothed figure with the more significant details minutely rendered. The garb of the priestesses, the overladen ornamentation of necklaces and earrings, the clothing and arms of the warriors, and the trappings of the horsemen are all represented with great virtuosity. This phase, the most fruitful in the whole development of Iberian art, began in the middle of the 5th century B.C. and lasted until the middle of the 3d, when the Carthaginians, in their wars of conquest, destroyed the greater number of the cities of the southeast. These cities were later rebuilt in large part, but with the lessening of political liberty the originality of Iberian sculpture soon faded.

The works of these two centuries represent a number of distinct schools and greatly varying degrees of artistic excellence, but beyond these, a conceptual unity that stamps the works with a certain baroque aspect is continually present, regardless of the greater or lesser abilities of their authors. A common feature is the exclusively "human" character of this sculpture: it does not depict deities or heroes but men and women from its daily life — priestesses, ladies (perhaps princesses), warriors, and so on. These figures were dedicated to particular deities in sanctuaries and temples.

One of the great artistic centers emerged at Elche (anc. Ilici), undoubtedly in the shade of a famous temple, in which were dedicated a great number of sculptures of male and female figures, gradually being brought to light by excavation. The work that stands out for its high quality among all these sculptures is the famous "Lady of Elche," the masterpiece of all Iberian sculpture (PL. 409). This is the bust of a woman, shown wearing a mantle rendered schematically with flattened pleats to emphasize the intricate character of the triple necklace of heart-shaped pendants and urn-shaped amulets. The head, covered by the characteristic high headdress (the Iberian *peineta*), has hair that is braided and rolled up in two large metal circlets, next to which hang cordons with gold tassels. Everything tends to accentuate the sumptuousness of the lady's attire. The face is one of great delicacy, the features fine and expressive — a long and narrow nose, a regular mouth with fine lips, high cheekbones, and cheeks ever so slightly sunken. The eyes, with prominent brows, contribute to an expression at once gentle and remote, with a slight suggestion of melancholy. Every detail denotes the hand of a great artist. The "Lady of Elche" is not an isolated work, as excavations carried out in recent years in Elche have brought to light numerous other sculptures of superlative quality and great originality. Though unfortunately in a poor state of preservation, they confirm the importance of this artistic center.

Other sources of great sculpture are the sanctuary of Cerro de los Santos and the one near Llano de la Consolación, both close to Yecla (Murcia). From the former come more than 300 pieces, now in Madrid (Mus. Arqueológico Nacional), mainly bearers of offerings — male and female figures, standing or sitting (PL. 408). These hieratic and in many cases crude works are of great interest as documents of classic Iberian sculpture. Their artistic merit varies: alongside pieces of quality — appreciable especially in the heads — are second-rate types, mass-produced and monotonously repeated. The greater part are the products of uninspired workshops, but are perhaps for that very reason highly realistic. Since these sanctuaries continued to be frequented during the centuries of Roman rule, there also appear among the votive offerings toga-clad figures showing the new influence (see HISPANO-ROMAN ART).

The most remarkable of this group in Madrid is the "Lady of Cerro" ("Dama del Cerro"), also known as the "Great Lady" ("Gran Dama"), a standing figure wearing a mantle that hangs from the shoulders, reaching to the ankles, arranged in front in regular graduated folds (PL. 408). Under the mantle she wears a double tunic with pleated border, which reaches to the shod feet appearing beneath its edge. On her head, instead of the characteristic *peineta*, she wears a diadem in Orientalizing style, with a fringe on the forehead and two lateral rosettes, from which hang five jeweled braids. Like the "Lady of Elche," the "Lady of Cerro" is adorned with a triple necklace recalling the Iberian silver torques. In her two hands she holds, at waist height, a ritual urn. Many other figures, both male and female, are depicted in the same attitude; an occasional group comprises two figures. A few wear the tall pointed headdress; all are fairly large, though smaller than life size.

Animal sculpture followed a parallel development in this classic period. Fantastic animals disappeared and their place was taken by representations of bulls, deer, rams, and lions, the last interpreted most freely and imaginatively, and with no great concern for realism. These animal sculptures appear with equal frequency in Andalusia and the southeast, and some seem to have been funerary, placed on tombs as steles.

The Celtic inhabitants of the Meseta later imitated this form of sculpture and developed a somewhat cruder animal art in which bulls, boars, and pigs — the fauna that constituted the economic basis of this pastoral people — are recurrent themes.

In the lower Guadalquivir Valley, a center rich in sculptural activity grew up around Osuna (anc. Urso); among its productions was an important complex of carved stone blocks and orthostats decorated with high reliefs. These pieces, reused later as construction material for the ancient walls, originally belonged to Iberian religious edifices. On the whole these reliefs are of great originality and far superior to the votive statues of Cerro de los Santos. Represented are a flute player, an acrobat, female offering bearers holding urns, warriors, and horsemen. Not all the pieces belong to the same period; some, especially one showing warriors armed with *caetrae* (short Spanish shields),

625

obviously belong to the late Roman period and appear to reflect the military atmosphere of the Lusitanian wars.

In the sanctuary of Cigarralejo (Murcia) the small sandstone votive statues are all of horses, some with magnificently worked trappings. Some of them are in flat relief on stone slabs, but there are many that are freestanding figurines. This sanctuary was undoubtedly dedicated to a tutelary deity of horses.

So far as is known, large sculpture in bronze did not enter into Iberian art, but thousands of cast-bronze figurines were dedicated as votive gifts to sanctuaries in all parts of the Iberian territories (PL. 410). The greater part of these statuettes have come to light as the result of continued plundering by treasure-seekers, over many centuries, of the subterranean vaults of these temples; however, there have been assembled in the Museo Arqueológico Nacional of Madrid a number of important groups of these pieces obtained through more legitimate excavations. Some of these figurines were cast by the lost-wax process; others were cast in sandstone molds. Artistically, they are of uneven quality; their chief interest is iconographic. The male figures depict warriors, either nude or wearing a sagum, holding a curved sword or a lance, and with a shield (*caetra*) slung over the shoulder; other examples represent horsemen with javelin and shield, wearing either headgear or true helmets. The female figures present a great variety of types: nude (the smallest number) or clad in mantles and with the typical mantilla on the head. They are shown in numerous attitudes — offering bearers with a small bird held in the left hand; others with the right arm extended and the palm of the hand open, in the act of salutation, or with arms open and hands extended in supplication.

From an artistic point of view the quality, as has been said, is as varied as the attitudes. Some are well modeled and realistic, comparable to similar pieces found in Greek temples and distinguishable from the latter only by details of garment or headdress. Others are highly schematized and without originality. Their chronology is uncertain. It may be that their qualitative variation is economic rather than chronological in origin, that is, that the small schematized types which constitute the greater part were produced cheaply for the poorer classes, while the realistic statuettes, all of which are of larger proportions, were destined for the well-to-do. However, the sanctuaries were frequented over many centuries, during which art must naturally have undergone some evolution. Unfortunately the course of this evolution is completely unknown, since the provenance of the majority of the figurines has not been recorded. Together with the human figurines has been found a great number of animal representations, also in bronze, but in general more naturalistic in treatment. All these bronze figurines are small, the majority from 3 to 4½ in. high, the largest between 7 and 8 in. The pieces of larger size are rare exceptions.

Terra-cotta sculpture, too, was produced by the Iberians. This medium was used, as by the Greeks, in architectural decoration (antefixes) and also in the sanctuaries for votive artifacts and for funeral objects such as have been found in the necropolises. In the sanctuary of La Serreta, near Alcoy (Alicante), all the votive gifts were of terra cotta — female figures of very crude workmanship, hollow inside, represented with children in their arms and often accompanied by flute players. There are among these ex-votos more complex groups of several characters, but because of their fragility these have sustained much damage. The workmanship, crude and popular, is comparable to that of the bronze votive offerings.

Painting and ceramics. What remains of the painting is very little, limited as it is to the decorations in burial chambers (see above) and on rectangular cinerary urns such as the one from Galera (Madrid, Mus. Arqueológico Nacional). However, the high artistic level reached in figural ceramic painting warrants the assumption that great mural paintings existed in the temples and sanctuaries.

As for ceramics, these constitute one of the most important elements in the study of Iberian art. From the 6th century B.C. onward, the potter's wheel, which made possible the production of pottery on an industrial scale, was known and used. This production began in the colonial settlements, in imitation of imported Phoenician and Greek pottery in the south, and of Greek pottery throughout the east and in Catalonia. Local production, which imitated Ionian pottery decorated with opaque red bands, began early. From copying, the potters progressed to the creation of new and original forms, which they came to decorate likewise with simple red or purple bands, together with such motifs as circles and semicircles. The quality of the clay and their good firing technique enabled the Iberians even to surpass the imported pottery. Indeed, production soon reached a high degree of development and homogeneity in all the areas of Iberian civilization, the predominant type in the classic period being a ware decorated with a simple geometric pattern of bands. The great innovation of Iberian pottery was the appearance of vases with rich floral decoration and figural representations, at a time when the Mediterranean peoples had for the most part already passed the figural stage and were pursuing beauty in the ceramic art through monochrome glazes. In the southeast, in the neighborhood of Elche and Archena, workshops produced an ornate pottery, with decoration of a baroque type based on plant forms, in which the stems proliferate into sprays, tendrils, and spirals covering the whole surface of the vase. These motifs present a variety peculiar to Iberian art (PL. 399; FIG. 621; III, PL. 137; VI, PL. 106). In this group of ceramics, zoomorphic and human figures make their first appearance: on one vase wild animals of wolflike aspect pursue a strange bird with outspread wings; in a mythological or religious scene appears a goddess with wings in place of arms, or with one wing and one arm, holding a dove — a figure that has been identified, on no very convincing evidence, as a depiction of the goddess Tanith.

Farther north, in the eastern area proper, vase painting, which at Archena had for the first time represented scenes of warriors, underwent marked development in Liria (anc. Lauro), where a very interesting type of pottery was produced, with a variety of scenes from daily life: hunting, fishing, wrestling, religious pilgrimages, bands of musicians. The painters of Oliva attempted even more ambitious subjects, such as the siege of a fortress. The scenes, painted in a purplish red, reveal the varying artistic abilities of the painters. This pottery is not only of artistic interest, for inscriptions in Iberian accompany many scenes. However, these do not as yet contribute to their interpretation, since the language has still to be deciphered.

Similar painted pottery has recently been discovered in Castelillo de Alloza, a village in the province of Teruel; the designs are more schematized and seem to anticipate the abstract representations of Numantine painting. Pottery workshops also developed in the lower Ebro Valley, at Azaila. Here the painting was more severe but of excellent quality (PL. 400); it derived from the work of the centers of production in Lower Urgel and of Sidamunt in the Catalan region. The production of Iberian pottery continued until the 1st century B.C.

There has been much discussion of the chronology of Iberian figural painted pottery. Some experts regard it as simply an imitation of archaic Greek pottery; others, on the basis of certain figural elements, ascribe it to the first centuries of the Roman period. Recent studies of the material with which this pottery is associated stratigraphically warrant the tentative statements that the beginnings of the Elche-Archena ceramic group date from the 3d century B.C., that the Liria group is a little later, and that production continued through much of the 2d century B.C. This would mean that production began at the end of what has been called the "classic" period of Iberian art and, because of the lively market for this ware, persisted for a long time.

Minor arts. The character of Iberian art can be studied in many other manifestations which clearly demonstrate the special decorative spirit that consistently expresses itself through the same elements as are found in sculpture and ceramics. Although the Iberians had less skill in the techniques of working metal than did the Celtiberi of the interior, they were able to master certain technical secrets, such as applying niello work to copper and inlaying gold and silver in bronze and iron. In the making of arms and in their ways of decorating them, they were able to give free play to their exuberant imagination. The typical

Iberian curved swords, pointed, with a single cutting edge, have hilts in the form of birds or equine protomas and are ornamented with niello inlay of plant forms based on spirals, which is similar to the painted decoration of the pottery. Belt buckles, in the form of rectangular bronze plaques, were overlaid with silver foil in a repoussé decoration of motifs inspired by the eastern Mediterranean palmetto.

Gold and silver jewelry constitute another of the art forms of the Iberian world; these have survived in hiding places, or treasures, traces of which were once lost in the wars. In the gold jewelry a strong Greek influence is seen — always with an Orientalizing tinge. A typical piece is the Jávea diadem (Madrid, Mus. Arqueológico Nacional), which shows the interlace and spiral designs found in other art forms. The Iberian, with his taste for display and ornamentation, adorned himself, as is seen in the sculpture, with an abundance of fibulas, necklaces, and earrings which ancient authors described as very rich. The most famous treasures (Mogón, Fuensanta, Perotitos, Marrubial and Los Almadenes) are located in the mineral-rich southeast. Nearly all of them contained silverware, some of which (e.g., the series of plates from Abenjibre) is truly remarkable. An important collection of vases and paterae in gold-plated silver, showing a strong Greek influence, was found at Tivisa (Tarragona). One of the most famous paterae (PL. 407) has an engraved decoration depicting a scene from a now unknown Iberian myth, the elements of which are derived from the Mediterranean orbit, a confirmation of the Mediterranean filiation of all Iberian art.

Finally, another form characteristic of Iberian art is its coinage, which began as an imitation of the drachmas of Emporion, in a style altogether Greek but showed its originality through the introduction of indigenous symbols such as the wolf in the coins of Iltirda (Lérida) and in the inscriptions written in Iberian characters. When, under the Romans, Iberia adopted the Roman denary system, the Iberian denarii remained within the classic Hellenizing current. Particularly noteworthy are the obverses depicting a male head, the closest parallels of which are found in the sculptures of Cerro de los Santos, and the reverses depicting an Iberian horseman, the special symbol of all Iberian civilization (PL. 410).

Juan MALUQUER de MOTES

THE INDIGENOUS ART OF PRE-ROMAN SOUTHERN GAUL. The coast of southern Gaul, from the Alps to the Pyrenees, inhabited by a Ligurian people which from the 5th century onward was subject to Celtic and Iberian infiltration, maintained trade relations, over land routes, with the interior of Gaul from the beginning of the metal age. At the end of the 7th century B.C., and more especially in the 6th century, maritime relations were in effect with Asia Minor, Greece, and Etruria, which established trading stations on the coast in order to acquire the products that they lacked: precious metals, salt, salted fish, and medicinal herbs. The Phokaians founded the colony of Massilia (ca. 600 B.C.) in order to intercept, by way of the Rhone Valley, the traffic in tin coming from Cornwall, which had hitherto been monopolized by the Phoenicians.

Among the goods imported from the eastern Mediterranean the most important were wine amphoras and earthenware accessories for the consumption of wine; the place of origin of this class of pottery, none of it earlier than the end of the 7th century B.C., enables us to trace out the map of the trade relations of Massilia and the other trading stations on the coast, from Nicaea (mod. Nice) to Ruscino (mod. Roussillon), with the Phoenician coast (undoubtedly Tyre, represented exclusively by amphoras), Etruria (amphoras and black bucchero ware), Rhodes, Chios, Phokaia, Miletos, Corinth, Attica, Chalkis, and Laconia.

While — in contrast to the situation in the eastern part of the Iberian Peninsula — the Phoenician connection left no mark on the indigenous art of southern Gaul, its Celto-Ligurian inhabitants came under the twofold influence of eastern Greece and northern Italy. But these influences operated differently in different localities: thus only the Greek colony of Massilia seems to have had, from the 6th century B.C., Greek architectural and sculptural models; not before the 3d century B.C. did the indigenous inhabitants of the coast and of the Rhone Valley draw from Greco-Italian art forms the means of expressing their religious beliefs through architecture and sculpture. Moreover, the intensity of Greek penetration varied from the east to the west bank of the Rhone, and in fact in the sphere of sculpture and pottery the Mediterranean influence made itself felt more strongly in Provence and the lower valley of the Rhone.

Provincial Greek architecture and sculpture. Greek temple architecture is exemplified only by a capital of the Ionic order, carved in the local limestone of Cap Couronne, on the coast between Marseilles and the Étang de Berre, site of a quarry used by the Greeks from the 6th century B.C. The capital, of unusual dimensions (l. 5 ft., 11 in.; ht. at axis, 1ft., 10 in.), belongs to the archaic period (ca. 520 B.C.), as is shown by the proportions of the volutes and of the fluting, and is comparable to the capitals of Phokaia and Ephesos. The provincial imprint is seen in the acanthus that replaces the traditional palmette at the base of the volutes, a peculiarity also found in the Ionic capitals of the pronaos of the Doric temple of Athena (Ceres?) in Paestum. Imitation of the volutes of the Ionic order is found in the barbarian capitals of the columns of certain indigenous dwellings at Constantine, north of the Étang de Berre, and at Ensérune (late republican period). This taste for the Ionic takes on even greater interest from the fact that the Doric order was used for the capitals of the peristyle houses of Glanum (Saint-Rémy-de-Provence) and Ernaginum (Saint-Gabriel), in the Alpilles — these also dating from the late republican period.

The classical profile of the echinus of the Glanum capitals, of stone and Carrara marble, with an Ionic base and a horizontally faceted striated torus of the type found in the Temple of Artemis in Ephesos, shows the same taste for Greek archaism that prevailed in this "Little Greece of the West," as the area delimited by the Étang de Berre, the Rhone, and the Durance was called.

The statues that adorned these temples have not survived; all that has been recovered is a deposit of votive offerings (6th cent. B.C.) from a temple of Artemis, which included a number of steles of local limestone representing the goddess seated in a hieratic pose within a pedimented aedicula, sometimes holding a lion cub on her lap. These steles, which are similar to examples from the Ionian coast (Kyme, Klazomenai) and from Thasos, Rhodes, and Velia (Elea; a Phokaian colony on the Lucanian coast of Italy), are the sole evidence of the Greek art in this region; leaving no echo in indigenous sculpture, nor yet pointing the way for the development of a Massiliote art in the Greek tradition, they nevertheless undoubtedly awakened the sensibility of the Celts to a plastic art that was to express their beliefs in the indigenous pre-Roman sanctuaries.

Indigenous sanctuaries and sculpture. The oldest sanctuary in which human and animal figures are depicted is at Mouriès, on the Caisses plateau; it dates from the end of the Hallstatt period. Menhirs, steles, and some architectural fragments, later reused in the construction of a bastion (4th cent. B.C.), are covered with incised schematic representations of horses, in some cases mounted by horsemen wielding javelins. This stylized art has more affinity with Hallstatt art, and with certain incised carvings found in the Valcamonica (northern Italy), than with Greek art, and it is older than the art in the sanctuaries of the Saluvii — the tribe whose capital was Entremont — in which, under new influences, sculpture in the round unexpectedly makes its appearance.

If the art of these peripheral western provinces could be dated by comparison with Greek and Etruscan art, one would have to attribute to the archaic period a "xoanizing" statue in soft stone found in the sanctuary of the *oppidum* of Courtine at Ollioules. Wrapped in her garment, with arms hieratically pressed to her sides, this figure is related to the Hera of Samos in the Louvre, the votive statue dedicated to the goddess by Cheramyes (I, PL. 356), and even more closely to the Etruscan funerary statues from Chiusi, which comprise a human bust surmounting a figure enclosed in a cylindrical garment. The xoanon of Ollioules, which represents the oldest sculpture of a human figure in the round, was associated with other statues of a more fully evolved style, similar to those found

in the sanctuaries of Roquepertuse and Entremont (PL. 411; III, PL. 111).

In the architectural and religious evolution of the Roquepertuse sanctuary, which rises in a rocky semicircle in the valley of the Arc, northeast of the Étang de Berre, is clearly shown the transition from a megalithic culture (represented by rude menhirs and small aniconic steles with chiseled corners, sometimes with cupule-shaped decorations) to an anthropomorphic one. The first sanctuary, an Iron Age structure, was remodeled in the 3d century B.C., the menhirs being reused for the construction of a terrace that supported a portico. It does not seem as if the architectural type of these propylaea was Greek-influenced, since apparently the Mouriès sanctuary already had had a portico, with piers and architraves.

The piers of Roquepertuse were erected with care and decorated with paintings (dentils, stars, horse protomas, birds). They support an architrave above which rises a large bird, sculptured in the round, on the point of taking flight (PL. 412). Another architrave is decorated with incised horse protomas, painted red. These are symbolic portrayals that undoubtedly refer to the ultimate journey (PL. 411).

Lined up in this sanctuary were statues of crouching human figures, on socles in the form of acroteria; though unfortunately they have come down to us headless and without arms, their attitudes can be reconstructed from the statues of Entremont. The question is, are these gods or heroized dead? The sanctuary with menhirs and the one with statues represent the same religious concept: the heroization of the deceased and his survival in the beyond. But these beliefs are expressed with a realism that indicates the persistence of the indigenous religion at the very gates of Massilia. The piers and architraves have niches molded in the shape of a human head, in which were inserted human skulls (doubtless mummified), in accordance with a Gallic custom reported by Posidonius in the 2d century B.C. This custom was prevalent among the Saluvii, as is seen at Entremont. Pillars and architraves with niches have also been found at Saint-Blaise, Saint-Rémy, and Cadenet (on the north bank of the Durance).

The preservation of the skull has the same significance as its sculptured representation: on one of the pillars at Entremont is a group of 12 *têtes coupées* without mouths; on the architrave in Nages (on the west bank of the Rhone) *têtes coupées* alternate with galloping horses; in the sanctuary of Saint-Chaptes (valley of the Gardon) and that of Substantion at Castelnau-le-Lez, near Montpellier, the dead are represented by busts, with the head either covered by a great leather casque or veiled, the eyes closed. Among the Saluvii this macabre realism reached a degree of expression unknown in Greek or Etruscan art and, for the present, unique in sculptural representation. Typical of the statues of Entremont, as well as of those of Roquepertuse, Ollioules, and Glanum, is the *tête coupée* with closed eyes, drawn features, and mouth closed in the last sleep. The hero at Entremont, dressed in leather armor, and the one at Roquepertuse, clad in a scapular decorated with geometric design, both hold in their right hands, poised on the knee, an iron object — either a scepter or the thunderbolt of Taranis, with which the dead man is identified — and each rests the left hand on a human *tête coupée*, a macabre representation of death. Whatever interpretation is given to this cult of the skull, it seems clear that the native peoples meant to preserve, by mummification or by figural representation, the spirit of the deceased residing in the head, from which they hoped to derive benefits in the future life, through the mediation of an ancestral relic or the sacrifice of a prisoner.

These statues show a considerable variety of techniques and styles. Since these cannot be regarded as the evolution of a school of sculpture, we must assume that the sculptors derived their ideas from Greek art of the 4th century B.C. and from Etruscan art. What seems certain is that in carving religious images the artists of the sanctuaries of the Saluvii did not follow a Celtic tradition.

The hair of the Entremont heads is sometimes striated like that of the kouroi, sometimes curled, or rolled into small snail-shaped clusters. Certain of the heads from Mont Garou, in the Bay of Sanary, and from Entremont, with their tightly closed lips and strong chins, recall the archaic heads from Chiusi rather than the idealized heads of Greek art. In the Roquepertuse herm the mouth is represented by a broad slit, in the heads of the heroes from Entremont (PL. 411) it is rendered in a more classical and naturalistic manner, and in a fine female head from Entremont with an oval profile and regular features (Switzerland, private coll.) the mouth is slightly open.

The Romanization of the coast in the republican period, with the consequent destruction of the sanctuaries, caused an abrupt interruption in the production of these statues, and by the time of the foundation of Aix and Narbonne (122–118 B.C.) it had ceased altogether. But the sculptured representation of the crouching hero seems to have survived in the Gallo-Roman art of the Celtic people: it is the prototype of limestone statues of a seated goddess with a ram of Quinssaines (Allier), of the crouching nude hero of the Hechtsheim sanctuary near Mainz (early 3d century of our era), and of the statuettes, in bronze and in terra cotta, representing a seated god, from Bouray (Seine et-Oise; III, PL. 113), from Quilly (Loire Atlantique), and from Vesoul (in the form of Hermes Kriophoros) — all magico-protective funerary images.

Minor arts. The pottery imported into the coastal trading stations and Massilia does not antedate the 7th century B.C. With the exception of a few Phoenician amphoras found with Etruscan amphoras and black bucchero ware, it falls into two groups: fine luxury ware from Rhodes, Chios, Samos, and continental Greece (Corinth, Attica, Chalkis, Laconia) and "colonial ware," decorated with painted bands or made of gray monochrome clay, from Phokaia and the Ionian coast. The only pottery imitated in Massilia and the native settlements of the lower Rhone Valley and of the coast was the colonial ware with late sub-Geometric, chiefly linear, decoration, also met with in Larisa in Aeolis. The thickness of the poorly fired clay, the inferior quality of the glaze and of the decoration, the muddy color, and the lack of slip make it easy to distinguish originals from imitations. The "Little Greece of the West" made no attempt to reproduce either the Attic or the Samos black-glazed ware. Massilia distinguished itself, however, in the creation of a type of wine amphora made of a micaceous clay, without slip; originally potbellied, the form later became ovoid, with a short neck ending in a ringed lip. This amphora was not derived from the Phoenician or Etruscan type with twisted handles attached to the upper part of the belly; rather it was modeled on the Rhodian-Ionian amphoras, shards of which are found in great quantity everywhere on the coast. This indicates that the Greeks had disseminated the art of vine growing and wine making and had provided the Massiliotes, from the 6th century B.C. on, with a new medium of exchange for their commerce with the interior. Viticulture soon spread to the regions of Ensérune and Narbonne, which in the 4th or 3d century B.C. began in turn to export their own wines.

The pattern of diffusion of the imported pottery and of the Massiliote imitations makes it possible, for the first time, to chart the trade routes between the coast and the interior of Gaul. The itineraries followed the valleys of the Rhone and its tributaries as far as Mont Lassois (Vix), Château-Salins, Heuneburg on the upper Danube, the upper Loire Valley (Le Puy Jœuvres), and the valleys of the Hérault, the Orbe, and the Aude. During the whole of the 6th century B.C. the fine bronzes from Rhodes, Samos, and continental Greece were probably transported by the Rhone Valley route: the oinochoai from Vilsingen and Kappel-am-Rhein, the caldron with griffin protomas from the tumulus of La Garenne-Colombes, and the crater from the nearby tumulus of Vix, which, on account of its situation at the confluence of the Saône and the Seine, certainly marks one of the tin routes from Cornwall to Massilia. These trade relations with the interior created, in the second half of the 6th century B.C., what might be described as an Ionian "atmosphere" — civilization is perhaps too strong a term — in a region limited to the coast and to the middle Rhone Valley.

Recent discoveries have revealed a certain number of native settlements where the handmade Hallstatt pottery of dark clay

was replaced by a wheel-turned ware, finer in quality, of light-colored clay, with painted decoration derived from the late sub-Geometric pottery made in Larisa and in the Greek cities of the coast of Asia Minor — dentils, rows of dots and flecks (sometimes curvilinear), festoons, wavy lines of zigzag, and cables in relief. These settlements are situated along the Rhone: at Baumes-de-Venisse (Durban), Mourre-de-Séve, Le Pègue, on the east bank; at Nîmes, Roquemaure, and Soyons, on the west bank. There were undoubtedly among the native population Ionian elements who engaged in the transport of goods, and these may have supplied the ceramic craftsmen.

The same Ionian influence is perceptible in Languedoc, in a type of pottery called by turns "pseudo-Iberian" and "pseudo-Ionian." This type was turned on the wheel in reddish clay and has geometric decoration showing the effect of the Iberian influence (Ensérune, Cayla-de-Mailhac, Saint-Thibéry, Ruscino, etc.). This region corresponds roughly to the Roman province of Narbonensis, established under Augustus, differing in many aspects from the Three Gauls, whose capital was to be Lyons (anc. Lugdunum). It was already fully Romanized, over a Greek substratum, at the time of the Gallic wars.

Possibly this limitation of the zone of Ionian influence implies the complete exclusion of Celtic influence. We have seen that the Massiliote trade had carried Ionian pottery as far as the valleys of the Seine, the Doubs, and the Upper Danube. It is certain that the painted sub-Geometric decoration of the pottery found in Vix and in the upper valley of the Seine, dating from the 6th century B.C., is partly derived from Greek influence emanating from the "Little Greece of the West." Handmade or wheel-turned, this pottery was decorated with painted versions of the incised patterns of the Hallstatt ware, plus a series of geometric motifs: zigzags, rows of dots, hourglasses, squaring, and checkerboards, all of which are met with again in the painted pottery of the coast. The association of this pottery with Greek contributions — bronze vessels, Ionian pottery, and Massiliote amphoras — indicates that this region was at the junction of two great currents of civilization: the Hallstatt, issuing from the Alpine hills, and the Mediterranean, from the valley of the Rhone.

MEDITERRANEAN PROTOHISTORY. The origins of Mediterranean civilization and art, the fundament of the entire structure of the classical and the Western world, coincide with the development of the cultures of the Neolithic period and of the metal age in those regions of the Near East that gravitate, to a greater or lesser extent, toward the Mediterranean Sea and in the lands washed by its waters, especially the peninsulas and islands of southern Europe. The character of these cultures differs sharply from the character of the cultures within these areas in the more remote prehistoric period (see PREHISTORY): the progress of human society toward a systematic production of the means of subsistence through agriculture and stock raising gave rise to a sedentary way of life and to the concentration of population in urban centers and hence to the formation of stable traditions in architecture and in the figural arts as well. Since all these innovations had their most ancient focal centers within the Mediterranean area, it is particularly in connection with the Mediterranean world that we can apply the concept of a "prelude to history" — or protohistory — taking in the continental areas that, both to the east and to the north, border on the Mediterranean basin, of which they can be considered from a cultural point of view to be extensions, each with its own individual aspects and phenomena (see ASIATIC PROTOHISTORY; EUROPEAN PROTOHISTORY).

Priority is held by the eastern area, cradle of neolithic civilization, where the development of protohistoric cultures between the 7th and the 3d millennium B.C. reached, in the great historical civilizations of ancient western Asia (see ASIA, WEST: ANCIENT ART) and Egypt (q.v.), a culminating point in advance of all other areas. The Aegean and the Balkans were early exposed to the influences of this development, remaining at this cultural level far into the Bronze Age, when the first historical Greek

civilization began to be formed (see CRETAN-MYCENAEAN ART). Cultural development in the countries of the western Mediterranean — the Italian area and Spain — was slower. Here the protohistoric era lasted until the beginning of the Iron Age (see ETRUSCO-ITALIC ART; MEDITERRANEAN, ANCIENT WESTERN). Nevertheless, a basic unity of artistic expression and cultural trends, spanning considerable intervals of time and space, links the various Mediterranean lands; this accounts for a certain well-defined imprint discernible in their artistic concepts, architectural forms, and figural sculpture — a unity that lasted until it was interrupted by the spread of Greek art and civilization in the course of the 1st millennium B.C., that is, until the beginning of the classical world.

SUMMARY. Geographical, chronological, and ethnic background of the early Mediterranean world (col. 633). The Near East, the Aegean, and the Balkans (col. 636). *The Neolithic origins of the Mediterranean cultures and their art forms. Individual neolithic cultural areas: a. Western Asia (Neolithic and Chalcolithic); b. Continental Greece (Sesklo); c. Crete; d. Southeastern Europe. Final phases of the Neolithic: a. Influence of Southeast European* Bandkeramik *culture in the Aegean area; b. Transition to the age of metals. Aegean-Anatolian cultural unity in the early Bronze Age: a. Anatolia; b. Crete (prepalatial period); c. The Cyclades; d. Continental Greece (Early Helladic); e. Influences in Europe. The middle Bronze Age: a. Anatolia; b. Crete and the Cyclades; c. Continental Greece (Middle Helladic and the beginnings of Greek civilization); d. Late cultural developments in the peripheral areas of the Aegean and in the Balkans. Characteristic elements of protohistoric Mediterranean art and architecture: a. The megaron; b. The tholos; c. Plastic art as represented by statuettes of the fertility goddess; d. Spiral and meander decoration; e. Conclusions.* The central and western Mediterranean (col. 664). *The neolithic cultures: a. Early neolithic; b. Sicily and southern Italy; c. Northern Italy and western Europe. The early age of metals: a. Early phases in Sicily and southern Italy; b. The megalithic civilization of Malta; c. Sardinia; d. Subsequent phases of the early age of metals in Sicily and Malta; e. The aëneolithic cultures and the beginnings of the Bronze Age in Italy; f. Southern France; g. Spain (the Alméria and Bell-beaker cultures). The late Bronze Age and the transition to the Iron Age: a. Sicily; b. The Apennine culture; c. End of the Bronze Age and beginning of the Iron Age in Italy; d. The western Mediterranean.*

GEOGRAPHICAL, CHRONOLOGICAL, AND ETHNIC BACKGROUND OF THE EARLY MEDITERRANEAN WORLD. The current division of the periods of the prehistoric and protohistoric era into Paleolithic, Mesolithic, Neolithic, Bronze Age, and Iron Age is valid only in the most general way in the Mediterranean world. Aside from the fact that these periods have no chronological limits that are universally accepted or universally applicable, there are numerous special applications and subnomenclatures, particularly with regard to the Bronze Age. In Mesopotamia the terms "Bronze Age" and "Iron Age" are not generally used, because in this region the periods represented fall within the scope of recorded history; it seems preferable in the historical context to refer to the "Sumerian period" and the "Semitic period." (A parallel situation obtains in Egypt.) In the other regions of western Asia, as well as in the Aegean and Balkan regions, the Bronze Age is subdivided into early, middle, and late. In Crete, the Bronze Age has been broken down by Evans into Early, Middle, and Late Minoan; for continental Greece, Wace and Blegen named the parallel divisions Early, Middle, and Late Helladic. Early, Middle, and Late Cycladic are used for the islands, and for Macedonia, Early, Middle, and Late Macedonian. The majority of these classifications have proved themselves appropriate and useful. The classification for Asia Minor, on the other hand, remains controversial. Here, instead of the early Bronze Age or the Chalcolithic, the early Copper Age is spoken of (rather than Aëneolithic, which is preferred for the central and western Mediterranean areas); although not inappropriate, the term "Copper Age" is not really useful, since in all early Bronze Age cultures copper was only gradually replaced by bronze. For the Bronze Age in Asia Minor, M. J. Mellink favors the designations Early, Middle, and Late Anatolian. It should be borne in mind that the term "Middle Anatolian" is applied to the Cappadocian pottery and Kültepe cultures, as well as the earliest Hittite culture, while Late Anatolian is the period of the Hittite Empire. Moreover, the Minoan palaces belong to Middle and Late Minoan, and, finally, the Late Helladic is the Mycenaean culture and the period is therefore also designated as Mycenaean.

For the western Mediterranean areas (Italy and Spain) the classification and terminology are less clear-cut and are virtually still in a formative stage. Instead of the traditional division into Neolithic, Aëneolithic (for the final phase of Neolithic), Bronze Age, and Iron Age, the tendency (at least as regards Italy) is to use a division into early, middle, and late Neolithic, an early metal age (including the early Bronze Age), late Bronze Age, and an age of transition to the Iron Age.

The interrelations of the main divisions of protohistory as it unfolded in the Mediterranean world are graphically summarized in the table below.

The chronology of protohistory presents complex problems. In the modern method of dating by radiocarbon (C 14) a rather wide margin of error (up to plus or minus 250 or more years) has to be allowed for. The approximateness of the results is also contributed to by the variety of ways in which the specific materials used for examination are selected and preserved by researchers and by differences in the techniques used in the various laboratories. Thus, at least for the more recent period, the historical method, based on the dates of the rulers of Egypt and of Mesopotamia, remains the surest. The Egyptian sequence places the beginning of the 1st dynasty at about 2850 B.C. For Mesopotamia the list of kings can be traced back as far as 2500 B.C., plus or minus 45 years. Everything belonging to earlier periods (including Egypt and Mesopotamia) must be dated on the basis of criteria derived from the correlation of various stylistic elements or by the radiocarbon method. In Egypt, for the period beginning in 2850, it is possible, on the basis of imports and exports of goods, to establish temporal links with Crete, and from that island with other Aegean locatities; in Mesopotamia such links exist with Asia Minor and the Aegean area. It has thus been possible to establish a series of dates around the Mediterranean basin that enable us to check, from two points of reference, the chronology of the Aegean world.

According to present calculations, and also on the basis of radiocarbon tests, the Neolithic age began, in western Asia and in Egypt, at least as early as the 6th millennium B.C. and possibly even as early as the 7th. At the beginning of the Neolithic age pottery was as yet unknown. The Chalcolithic age in western Asia substantially spans the 4th millennium B.C. The early Bronze Age began in Anatolia perhaps about 2700 B.C., in Crete, toward 2600 B.C., while on the Greek mainland its beginnings are not earlier than 2500. This is because in Asia Minor (especially in the eastern part) metalworking techniques were more advanced than in the other western regions. The middle Bronze Age also began earlier in Asia Minor — about 2200 B.C. — than in the other areas. The Middle Minoan (ca. 2100) similarly anticipated the Middle Helladic (ca. 1950). The late Bronze Age began everywhere about 1600 B.C.; the Iron Age about 1200. For the West there exist only dates synchronous with the eastern Mediterranean chronology (apart from radiocarbon dating). The beginning of the age of metals can be established toward the end of the 3d millennium B.C., the late Bronze Age about 1400 B.C., and the final phase of the Bronze Age and the transition to the Iron Age can be placed at about 1250 B.C.

The oldest ethnic ties within the Mediterranean world can be recognized in the relation between the Basque and Caucasian languages and in the concordance, from Spain to Asia Minor, of a number of place names and nominal suffixes. It is unlikely that these relations were established by later migrations of peoples; they were probably, at least in part, already established in Paleolithic or Mesolithic times. The cultures that rose in the eastern Mediterranean during the Neolithic and the early Bronze Age owe their creation to the initiative of the indigenous populations of eastern Anatolia, Syria, northern Mesopotamia, Palestine, and Egypt. From these regions, beginning in the 5th millennium B.C., cultures spread west and northwest, reaching as far as southern and southeastern and even central Europe. In the 4th millennium B.C. a further stimulus was given to this expansion by the Semitic culture, whose diffusion, however, remained limited to the East. In the 3d millennium B.C. certain elements of the ribbon-decorated-pottery (*Bandkeramik*) culture (see below) were found even in the Aegean area and in certain areas of the Italian peninsula.

From the end of the 3d millennium B.C, the expanding Indo-European peoples gained the upper hand everywhere, and this led, among other developments, to the formation of the Hittite people in Asia Minor, to the earliest Greek beginnings (ca. 1950 B.C.) in Hellas, and to the emergence of the Italic peoples, in the course of the 2d millennium B.C.

Fritz SCHACHERMEYR (with additions)

THE NEAR EAST, THE AEGEAN, AND THE BALKANS. *The Neolithic origins of the Mediterranean cultures and their art forms.* For the early prehistoric periods, Paleolithic and Mesolithic, archaeological evidence in these regions remains scarce, except in Egypt (see PREHISTORY). In Greece the available material is limited to the finds from the banks of the river Peneios and from a cave in Boeotia. Richer material has come to light in Palestine. The researches of R. J. Braidwood have made available abundant material from Kurdistan (some of which has not yet been published).

In the 7th and 6th millenniums B.C. a change of historic portent took place in the Near East: man progressed from the economic stage of food gathering to the stage of systematic production of food by means of agriculture and stock raising. In this new phase of cultural evolution, human groups entered upon a sedentary existence. As food producers, men built permanent dwellings and founded villages, some of which even grew into cities. At the same time, the number of their domestic tools — of stone, bone, and wood — greatly increased. In the social organization the possession of soil and lands assumed importance. From the fact that in the early part of this phase pottery was as yet unknown, whereas the manufacture of stone vessels had reached a very high level, it is sometimes given the designation "stone vessel culture." The most significant documentation of this culture, also termed "prepottery," has been found at Jericho (PL. 413), where it has been possible to establish the existence of solid city walls and towers built with great technical skill. Similar settlements have come to light at Abu Ghosh in Israel, at Ras Shamra (anc. Ugarit) in Syria, and at Jarmo in Iraq (Kurdistan). Even in this very remote epoch we find a few early samples of figural sculpture, chief among them the unbaked clay figurines representing the great fertility goddess (e.g., at Jarmo). In Jericho human skulls, detached from the rest of the skeleton, were worked, in an effort to reproduce the individual features of the deceased, with fine clay to replace the flesh and with bitumen and pieces of shell for eyes (PL. 414). It is interesting to note that in this very early stage of human culture there evolved a type of plastic portraiture and a degree of realism to which much later cultures would return, using, of course, different means.

A parallel transition from the food-gathering to the food-producing level took place (perhaps under West Asian influence) in Egypt and in northern Africa in general. In these regions, however, the development was not so rapid as in western Asia (see EGYPT).

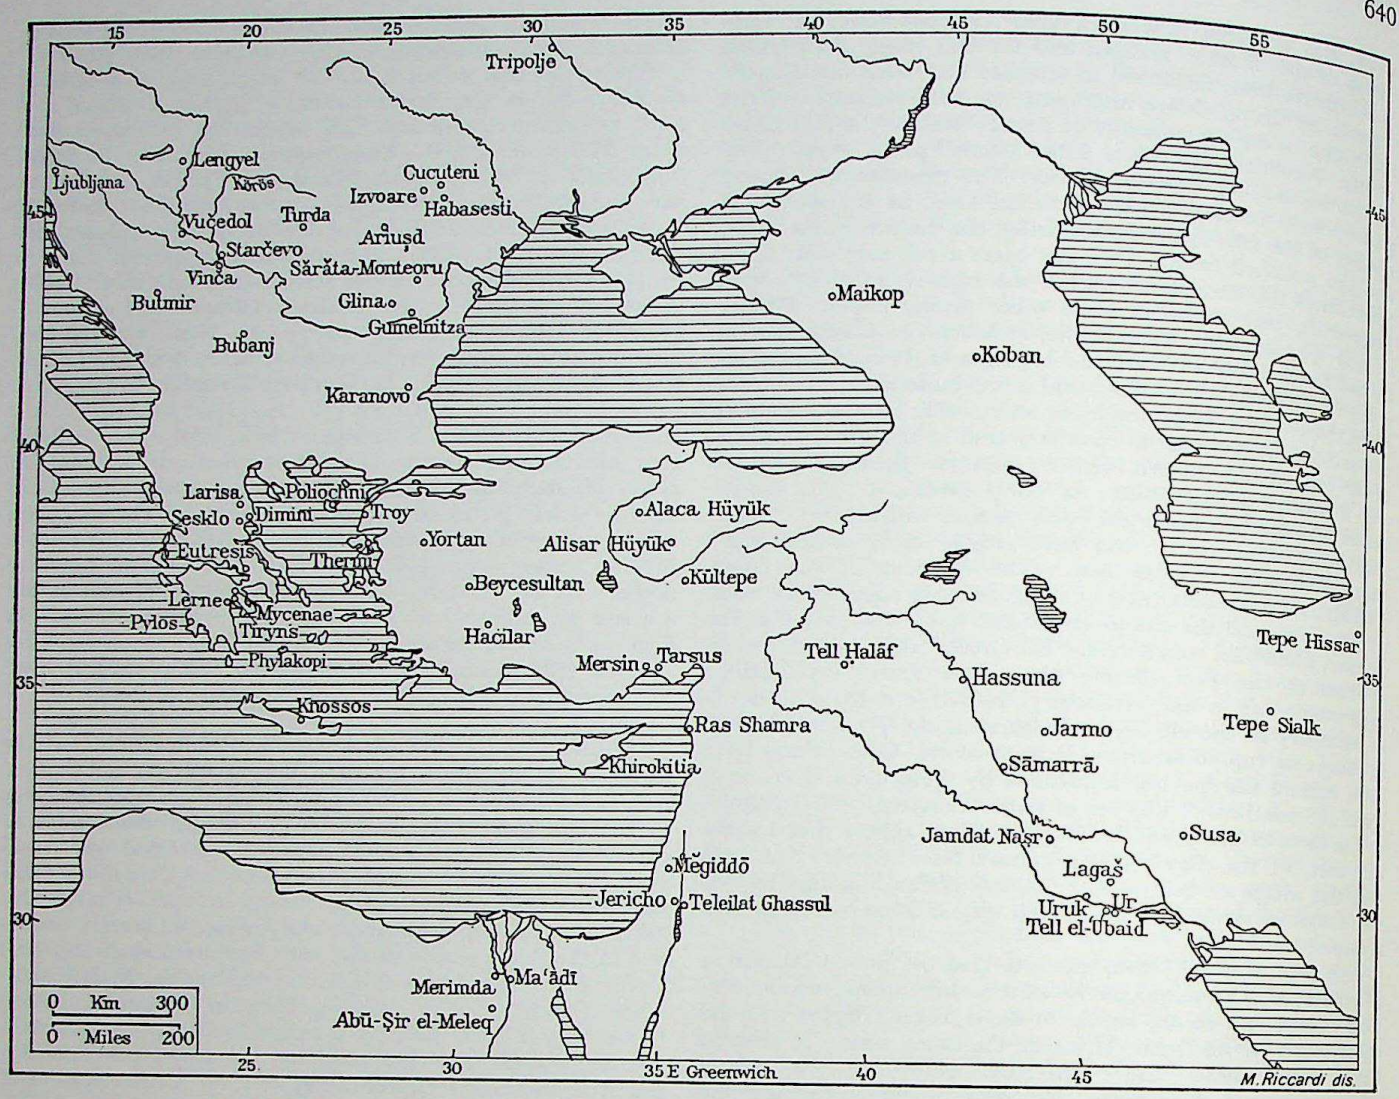
The primacy of the Near East in the transition to agriculture and the raising of animals can be explained in part by the fact that certain types of cereals, and sheep and goats as well, originally came from this region. Crop rotation for the renewal of the soil being as yet unknown, the early agriculturists were obliged continually to seek out virgin soil to clear and bring under cultivation. The agriculture of western Asia was, therefore, of an expanding nature. As it spread, it must have found plentiful sustenance in the rich alluvial soils of western Anatolia, the Balkan Peninsula, and perhaps along the banks of the lower and middle Danube — though the only traces of prepottery agricultural cultures that have so far come to light in these areas are on the Aegean island of Skyros and in Thessaly (Argissa, near mod. Argura; Soufli-Magoula). This diffusion marks the beginnings of that Anatolian cultural movement which, in the 5th and 4th millenniums B.C., brought an ever-increasing number of migrating people — and soon also traders with wares to barter (along with cultural influences) — from western Asia to the Aegean areas and southern Europe. But western Asia was always in the cultural vanguard, while the lands to the west and northwest were at first cultural importers, not cultural exporters. It can be assumed that the appearance in the Aegean area and in southeastern Europe of the agricultural religion of the East, with its Great Mother deity — the Earth Mother, or fertility goddess — and the development, in those regions, of a systematic type of agriculture, with varieties of suitable staple cereals, were connected with these agricultural migrations.

The invention of pottery (see CERAMICS), a great step for-

ward, also occurred in western Asia. Concomitantly, the statuettes of the mother goddess and the clay stamp seals which had hitherto been fashioned in unbaked clay were made more durable by firing. More important was the application of the technique to the manufacture of pottery vessels: the first phase of the Neolithic age — the lithic (stone) phase — gave way to the second, or pottery, phase. The manufacture of clay pottery soon reached a high technical level, as is seen in the quality of the fabric, the skilled firing, the thinness of the walls, and the polished finish. In a few cases a red paint was used. Sometimes the surface decoration was incised, apparently with fingernails, tiny sticks, or some other similar means. Pottery of this type appears, for example, at Mersin in Cilicia; it soon spread from the east toward the Aegean area, being found especially in Thessaly. It is also found in the hinterland of Dalmatia — in the Balkans, along the lower and middle Danube — and at the same time it seems to have appeared in the coastal regions of the central and western Mediterranean (see below, *The central and western Mediterranean: a. Early neolithic*). The typical vessel was the hemispherical bowl, with or without feet. There was also a spherical or oval base with a flaring conical neck, sometimes with circular foot. The figurines of the Great Mother, the representations of the goddess in relief on the sides of clay pots, and the use of clay stamp seals now spread as far as the Danubian territories. In Greece this cultural stage appears as the Proto-Sesklo phase (the term "Pre-Sesklo," in common use, is less satisfactory), in Serbia as the Starčevo I, in Hungary as the Körös, in Bulgaria as the Kremikovci, and in Romania (up to southern Russia) as the Cris. Much later even central Europe was influenced by these cultural currents from the southeast. The art of pottery entered central Europe in the form of the bowls, hemispherical and spherical and without feet, of the *Bandkeramik* culture (see below). Not only was the image of the mother goddess diffused in this region; the religious symbol of the double ax, of Eastern origin, also appears.

Another cultural wave, characterized by incised decoration of pottery and by particular vase forms with spread necks, vertical necks, and so on, seems to have reached Egypt and the other parts of northern Africa at the same time. It affected Crete (see below) and, especially, influenced the central and western Mediterranean, including Sardinia, Corsica, the Balearic Islands, and Spain, and beyond to other areas of western and central Europe.

Individual neolithic cultural areas: *a. Western Asia* (*Neolithic and Chalcolithic*). The development of the neolithic cultures of western Asia was a very concentrated and progressive one. It was here that man early learned to use the metal found in great quantities in Asia Minor, Armenia, and Iran; as early as the 4th millennium B.C. gold, silver, and copper appeared, in the shape of wire and jewelry and in other forms. It is the use of metal in western Asia in this period that accounts for the use here of the term "Chalcolithic." Other arts and crafts, such as weaving, basketry, and the decoration of clay pottery with a design of interlaced motifs painted in rich colors emerged contemporaneously. This development began with the Hassuna style — named after the archaeological site in Assyria (mod. Iraq) — and reached its apex in the styles of Samarra on the Tigris (Iraq), and of Tell Halaf on the Khabur (Syria; PL. 416). In the Tell Halaf style, the fertility goddess appears in excellently fashioned statuettes and in reliefs on clay vessels; the finest representations are, however, the polychrome painted decorations on pottery, which constitute a high point in decorative art of all time. There are also some important examples of architecture. In the subsequent al-'Ubaid phase (PL. 415) the potter's craft turned toward more utilitarian and practical designs and mass production, but architecture continued to flourish. Temples that were erected indicate that the builders knew the principles of vaulting. Technical knowledge of fortification was noteworthy. A further stage of evolution was reached early in the 3d millennium B.C. in the Uruk (Warka) phase. By this time the invention of the potter's wheel had caused a decline in the originality of the ceramics, which also suffered from the competition of the newly developed metalworking techniques (see also MESOPOTAMIA).



The styles and cultures of Tell Halaf and of al-'Ubaid spread as far as the Mediterranean; important evidence has come to light at Ugarit and Tell esh-Shaykh (Syria), as well as at Mersin in Cilicia. Even eastern Anatolia — to judge from finds at Malatya (anc. Milid) and Fraktin — seems to have been within this cultural area, as was Armenia (Tilkitepe).

In southwestern Anatolia we find the Hacılar culture, the earliest product of which was a monochrome pottery. Later a painted pottery similar to that of Mersin was produced (PL. 416), and there appears a peculiar tendency toward freely organized grotesque designs, unique in this period. Here, too, the clay figurines of the great fertility goddess reached a high artistic level. At Çatal Hüyük, in southern Anatolia, lively mural paintings representing dances (XI, PL. 297), hunting scenes, and other activities, in a schematic style have come to light; they can be attributed to a neolithic phase earlier than the classic Hacılar phase. Alabaster statuettes and seals (pintaderas) of this earlier phase have also been found. The paintings are the earliest examples of this art form yet found in the eastern Mediterranean region (Mellaart, 1962). A separate province is the Cypriote Neolithic (see CYPRIOTE ART, ANCIENT): in the 4th and 3d millenniums B.C. an original culture developed in Cyprus, with circular dwellings built of stone, surmounted by a tholos (Khirokitia; PL. 413), as well as fine pottery of both the impressed and the painted type (Erimi).

b. Continental Greece (*Sesklo*). The Sesklo culture, which emerged on the Greek mainland during the 4th millennium B.C., is a continuation of the Proto-Sesklo, the distinction lying in the fact that in the latter, under Eastern influence (as at Mersin and Hacılar), a painted pottery (mainly red) was developed. The most important sites where Sesklo culture finds have been made are in Thessaly, chiefly at Sesklo, Tsangli, Otzaki-Magoula, Arappi-Magoula, and Argissa. In central Greece and in the Peloponnesos similar finds have been made at Halai, Orchomenos, Chaironeia (III, PL. 122), Eutresis, Makri, Marathon (grotto of Pan), Gonia, Corinth, Prosymna, Lerne (PL. 416), and Asea. Because of certain local stylistic differences the term "Sesklo style" is applied in a narrow sense to Thessaly, the style in central Greece being termed "Chaironeian" and in the Peloponnesos "Lerne (Lerna)."

Textiles, pottery, and sculpture figure in the art forms of the Sesklo culture. No original examples of textiles have been preserved, but their decorative motifs, such as interlace, banded, and dentate patterns, appear on the painted pottery. A large, spaced zigzag design, encircling the vessel horizontally is the decoration found on most examples; on others the painting gives the impression of imitating net or lace. As in the Hacılar pottery, the decoration is sometimes divided into vertical panels, suggesting metopes. Curvilinear motifs are virtually unknown; the spiral and the meander do not appear at all. Compared with the vivid ceramic painting found at Hacılar, the decoration of the Sesklo pottery is sober and refined. The same refinement characterizes the very forms of the vessels. The earliest examples were spherical, semispherical, and oval — forms also found in the Proto-Sesklo — but originally of Eastern derivation. The conical or cylindrical neck and foot now assumed an important role in the structure of the base, and splendid wide ribbon handles of fine design appear. While the Tell Halaf style is distinguished by its wealth of ideas and the Hacılar by its imagination, the Sesklo style stands out for its clarity, which can be regarded as classic.

An even more important product of the Sesklo culture is the small-scale sculpture. The majority of the figurines are idols of the great fertility goddess (PL. 423), in which the sex is emphasized and the arms are folded over or just below the breasts. Together with these have been found a number of idols representing a young ithyphallic god, as well as some animal figurines (mostly oxen, a few bulls), probably votive offerings. The Sesklo statuettes present certain peculiar qualities in their elaboration of the female figure. While farther east such statuettes continued to be mass-produced, in Sesklo

Eastern Mediterranean basin and western Asia, principal archaeological sites and protohistoric art centers.

it would appear that the best pieces were created individually with particular care, no piece being exactly like another. They show an ingenuous naturalism; the artist observes the subject without abstraction but recognizes the existence of a common ideal of female beauty, as is seen particularly in the modeling of the buttocks and the contours of the abdomen. Together with this sculpture in the round, on a high artistic level, are found representations of the mother goddess executed in relief on the sides of clay pots, probably vessels used for religious rites. The majority of these have survived only in fragments. It is possible that the image of the goddess with upraised arms which later became so usual in the Aegean cultural area (especially on vessel walls) had its origins in this period.

In architecture, construction with stone or unbaked brick, depending on the availability of the materials, predominates. The commonest type of building is a large square house, with walls buttressed probably for protection against earthquake as well as for subdivision of the interior space. At Otzaki the prototype of the megaron is found.

Metal is very rare in the Sesklo culture, and is found only in small fragments. For this reason the Sesklo culture is considered neolithic, although it is contemporaneous with the Chalcolithic cultures of Hacılar, Mersin, Tell Halaf, and al-'Ubaid. The bearers of the Sesklo cultures were originally inhabitants of Anatolia; their emigration from eastern Asia Minor is placed partly in the Proto-Sesklo period and partly in the Sesklo period proper. Possibly they intermixed with the local paleolithic population. From an art-historical point of view the exceptional importance of the Sesklo culture lies in the fact that its artifacts are the earliest forerunners of the Hellenic art of later times, which was rooted much more deeply in the Mediterranean than in the Indo-European component of the Greek people.

Metal vessels made their first appearance toward the end of the Sesklo period. If not produced locally, these were probably imported from Asia Minor. They affected ceramic styles: a new type of black monochrome pottery showing the influence of metalware was produced (see below). Together with this has been found another type: a ware painted in a brown color over a brown ground, with predominantly vertical decoration. The most beautiful examples of this type come from the grotto of Pan in Marathon.

c. Crete. Crete does not belong to the Sesklo cultural area. Lying between western Asia, Egypt, and Sesklo, it constitutes an autonomous cultural province, not only on account of its geographical position but also on account of its cultural components. A great number of emigrants from eastern Anatolia must have reached the island; in fact, Cretan place names (Tylissos, Knossos, Pyranthos, Rhethymna) share the "Aegean" character of those of Anatolia and continental Greece. Several Cretan ceramic forms show the influence of the Anatolian cultural spread. On the other hand, Crete did not accept painted pottery; the Cretans preferred to imitate the Egyptian type of incised ware with white incrustation. Egyptian influence is also evident in the shapes of the vases; it played a particular part in the formation of a taste for stone vessels; imported at first, these were subsequently imitated locally on the island.

In sculpture there are the same figurines of the Great Mother as appear in western Asia and continental Greece, but they do not equal the artistic maturity of the best Sesklo pieces. The animal statuettes (doves, dogs, cattle), undoubtedly votive, are excellent; they reveal exceptional powers of observation and a definite preference for types rather than emphasis upon the individual. A direct connection exists between this work and the genre type and realistic animal scenes of the Minoan era. In architecture Crete does not seem to have been influenced by western Asia, Sesklo, or Egypt. The layout and plan of the multiple-roomed dwellings that already appear in neolithic Crete show the same internal structural concepts later found in the Minoan palaces. It is in architecture that the earliest purely Cretan artistic expression is revealed. Nevertheless, when viewed as a whole the Cretan neolithic appears to be a less closed culture than the contemporaneous Sesklo. Being more exposed, Crete was affected by numerous influences, and its culture therefore, with the exception of the architecture, had more possibilities for future development. The Egyptian influences on Cretan art can be understood only in the light of that second great cultural movement (mentioned above) which spread from Egypt and the whole of northern Africa along the shores of the Mediterranean.

d. Southeastern Europe. So far as is known, the Sesklo culture spread as far as the mountainous area of southern Macedonia (Servia). A similar culture probably flourished in Macedonia proper (only a few scattered shards have been found), and still farther north — in what is now Bulgaria, Serbia, Hungary, Romania, and southern Russia — flourished the above-mentioned Kremikovci, Starčevo, Körös, and Cris cultures. This is the period of the *Bandkeramik* culture in central Europe. Through the influence of the Hacılar and Sesklo cultures, painted pottery found its way into the Kremikovci, Starčevo, and Cris cultures. It was decorated in black or white, always on a red ground. Farther northwest, painted pottery appeared late and was rare. The Sesklo pottery forms, with their stereotyped division into neck, belly, and foot, appear in all these cultures, at least in the early stages, except the *Bandkeramik*, in which the foot is never, and the neck rarely, seen. Clay stamp seals are found throughout the Aegean world, up to the Körös area. Vases with relief decoration depicting the fertility goddess with upraised arms, as well as female figurines, are found as far north and west as the Austrian and Czechoslovakian zones of the *Bandkeramik* area.

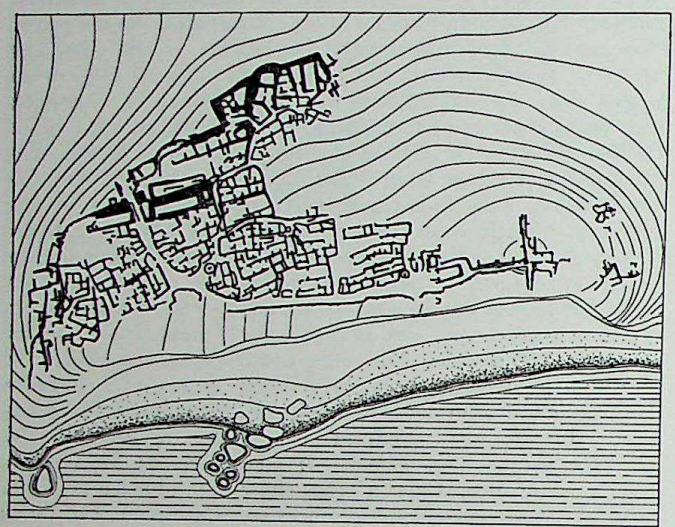
In these more northerly cultural provinces there were certain innovations which appear not to have originated in the southeast but to have been autochthonous. Thus in Romania and Bulgaria a chip-carving technique, originally devised for wooden vessels, is found in pottery, and gradually the products of the new Boian and Vadastra (or corded-ware) cultures supplanted the Cris and Kremikovci types. Throughout the Starčevo, Körös, Cris, and *Bandkeramik* cultural areas is found a vessel characteristic of the region — a typical peasant's receptacle designed to be carried on the back. The spiral and the meander motif appear repeatedly everywhere in this region. They are found in the incised decorations of the *Bandkeramik*, and later also in the pottery of Boian. In the Cris pottery they are painted, in white or black. At Starčevo and Kremikovci the spiral is used less frequently than the meander. The appearance of these two motifs is accompanied by a new feeling for their complementary relations. Designs in which the spiral and the meander replace the zigzag, like those found in the cultures from Tell Halaf to Sesklo, derive from basketry patterns.

This is the first appearance in neolithic art of a mode of decoration which goes back as far as the Paleolithic age (see PREHISTORY) and the development of which was to extend into Minoan, Mycenaean, and ultimately, Greek art.

The diffusion of the latest type of *Bandkeramik*, with large dots suggesting the heads of musical notes (*Notenkopfkeramik*), in the widespread area of the Cris culture and the increased exchange of the spiral and meander styles of southeast Europe created a koine of "Southeast European *Bandkeramik*," which can be subdivided into the following local styles (at least in part coextensive): Bükk in Slovakia (V, PL. 153), Lengyel in Moravia and western Hungary (V, PL. 154), Tisza in eastern Hungary, "West Transylvanian pottery culture," Ariuşd (Erösd) in eastern Transylvania, Gumelnitza in Walachia and Bulgaria, Cucuteni in Moldavia (PL. 416; X, PL. 433), and Tripolje in southern Russia (III, PL. 122; V, PL. 167; see also ASIATIC PROTOHISTORY and EUROPEAN PROTOHISTORY). Within this Southeast European *Bandkeramik* zone must be included both the Dalmatian and the Bosnian areas. On the other hand, the Vinča area (in mod. Serbia) shows a fairly autochthonous character: the meander and (at a later date) the spiral appear, but the dominating feature is a polished monochrome pottery imitating metalware.

Final phases of the Neolithic. a. Influence of Southeast European Bandkeramik *culture in the Aegean area.* In the period 2800–2400 B.C., approximately, the bearers of the Southeast European *Bandkeramik* culture began to migrate toward the Aegean Sea. In general this was not so much a large-scale invasion as a series of movements of small groups who joined together either while in transit or on their arrival at their new settlements. Groups from Bükk, the Tisza region, Transylvania, Boian, and Vadastra seem to have taken part in this migration. Their most important goal was Thessaly, where they established a large number of settlements. From Dimini — the best-known of these settlements and one of the most important archaeological sites in Thessaly — the cultural aspect of this migration has taken its name. At Dimini, on the summit of a hill, is a chieftain's megaron, entered from a central court surrounded by several fortified walls (FIG. 655). Between these walls are a number of dwellings for members of the retinue. The pottery produced by the Dimini peoples (III, PL. 122) is not homogeneous in character, for their ethnic origins are diverse. Certain types show the influence of Tisza, or West Transylvanian, ware; others recall the pottery of Boian and Vadastra. The forms of the vessels ("fruit stands" and cups of corded ware and reentrant borders) are of the types found in the Danubian territory, despite the fact that during this period all other pottery forms produced in southeastern Europe as well as in the Aegean area (already partly influenced by metal techniques) were based on Anatolian models. Dimini ware is scarce in central Greece; more of it has been found in the northwestern part of the Peloponnesos (e.g., at Corinth, Prosymna, and Gonia). The other parts of the Greek peninsula were probably never penetrated by the Dimini migrants.

Shortly after the Dimini migrations, other groups reached the Aegean from Gumelnitza. Their culture, in addition to the Boian, embraced chiefly Walachia and Bulgaria. The Gumelnitza peoples migrated to the Thracian and Macedonian coasts of the Aegean. Characteristic of the culture are, among other features, graphite painting and the spiral motif. Another group of migrations seems to have started at the same time from the Lengyel area and from the Dinaric coastal area. It moved, partly overland and partly by sea (perhaps across the Adriatic), toward the Cyclades, where these migrants gave impetus to the Syros culture, with art characterized by recurring and interlaced horizontal spirals. Lengyel influences are also evident in the Rachmani culture in Thessaly, but here they seem to have merged with those from Gumelnitza.



In Anatolia only one isolated instance of *Bandkeramik* influence has so far come to light: in the southeastern part of the peninsula we find the sole evidence of a *Bandkeramik* migration (possibly of Gumelnitza origin) to this area.

In general, we can be sure that the spiral and meander reached the Mediterranean with the migrations from the Danube area. As will be seen, these two decorative elements were to have a particularly rich development in the Mediterranean area.

b. Transition to the age of metals. In Greece and the Balkans, during what is called the Chalcolithic period in western Asia, the cultures were still almost entirely in a neolithic stage. In western Asia the term "metal age" is not properly applied even to the Chalcolithic period, assuming, as this writer does, that

the age of metals is entered upon only when metalworking techniques have been developed to the point where the manufacture of utilitarian objects of metal is an activity of the first importance and where metal vessels are fashioned by forging and hammering rather than by the older method of casting. As for types of objects, the age of metals properly begins with the production of pitchers with beaked spouts (*Schnabelkannen*) and other pouring vessels.

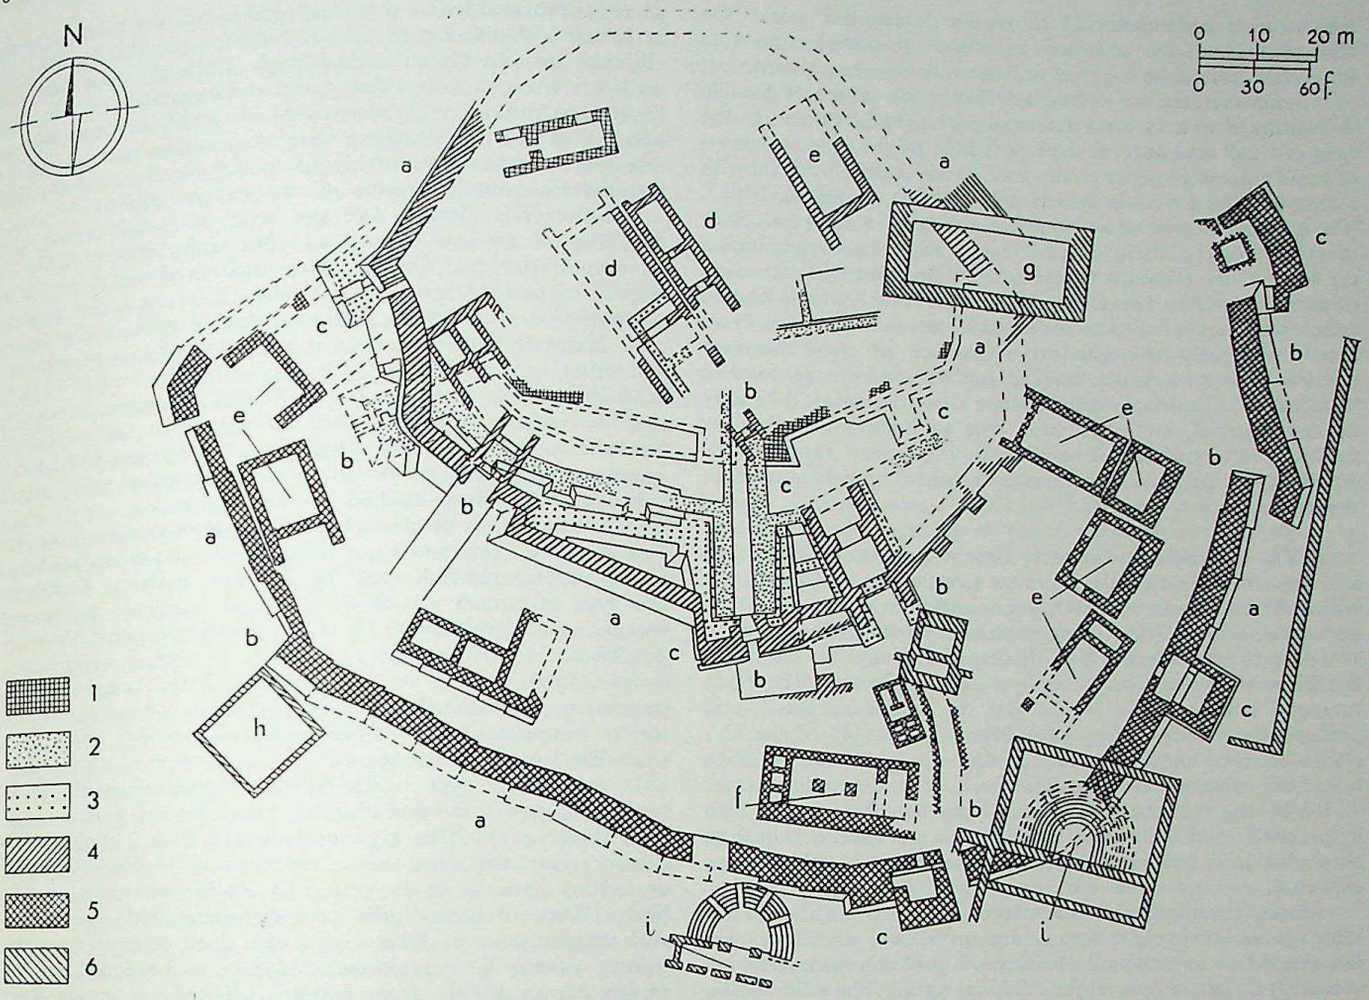
Before such a stage was fully reached, in Asia Minor and in the Aegean area, a preliminary phase occurred, lasting approximately from 2900 to 2500 B.C. In Anatolia metal vessels were already being produced, for the most part by casting. They were exported even as far as Greece (Euboea). These vessels, of gold, silver, and copper, exerted an ever-increasing

Poliochni (Lemnos), plan (*from BArte, XLII, 1957, p. 194*).

influence on ceramics, stimulating potters to produce a ware in imitation of metal vessels, with rigidly angular forms and a monochrome polished surface. This contributed to the decline of the taste for lively painted decoration; polished black ware was the favorite type of pottery during Phase XII of Mersin, in the late Chalcolithic phase at Alişar (Alishar) in eastern Anatolia, Beycesultan on the Maeander (mod. Menderes), Besiktepe, and Kumtepe in the Troad, as well as in the late Neolithic period in Crete and the Cyclades. In those sectors of continental Greece, Macedonia, and Thrace not reached by the *Bandkeramik* culture (which favored painted spiral and meander decoration) the polished black ware held first place. Ultimately even the *Bandkeramik* immigrants from the north, who merged with the indigenous population, accepted the new type of ware.

The polished black ware spread with the Vinča culture from Macedonia as far as the Danube. In the course of time, however, it was obliged to assimilate *Bandkeramik* influences (spiral and meander decoration applied by incision). The polished Komotini ware (unpublished finds) was produced in Thrace at this time. As in the Vinča culture, the Komotini potters accepted incised decoration and competed with the makers of the Gumelnitza ware, produced in and imported from the north.

Although this polished black ware was basically an imitation of metal with its light-reflecting surfaces, the potters were unable to resist the temptation to apply decoration, especially since between the polished surfaces of the pots sections were left unpolished. On these, bars, crosshatched panels, triangles, and bands of fine white lines (often in the form of a garland), or grooves and button designs were applied. In the Balkans and on the Greek mainland, where *Bandkeramik* influences were stronger, painted decoration was sometimes applied to the polished surfaces after firing.



This polished black ware can be regarded as a universal ceramic form in competition with metalwork. On the important question of whether the diffusion of this type of ware was accompanied by any ethnic movements it is not yet possible to arrive at any definite conclusion. In this connection it should be noted, however, that in the archaeological strata of the dwellings of this period (in Thessaly and at Beycesultan) we find a more primitive type of building than in the preceding period.

Aegean-Anatolian cultural unity in the early Bronze Age. In Anatolia and in the Aegean area the early Bronze Age coincides with the first appearance of the beaked pitcher. This probably occurred in Anatolia between 2800 and 2700 B.C., in Crete about 2600 B.C., and on the Greek mainland about 2500 B.C. In Crete the production of polished black ware overlaps that of early Bronze Age beaked jugs, 2600–2500 B.C.

We can now discern the formation of a unified cultural area comprising Anatolia and the Aegean region. It progressively detached itself from Mesopotamia and Syria but encompassed Cilicia and Cyprus. To the north it gradually included the Macedonian and Thracian coasts but no longer included the interior of the Balkan peninsula. The elements uniting this Aegean-Anatolian community are two: the working of metals, which came from Asia Minor, and the migrations of additional population groups from Asia Minor to the Cyclades, Crete, and the Greek mainland. These peoples also brought with them a more evolved form of urban life, similar to that which had meanwhile developed in Asia Minor. It is possible to distinguish within this Aegean-Anatolian culture five well-defined sectors: Anatolia, the Cyclades, Crete, the Greek mainland, and Macedonia.

a. Anatolia. In the early Bronze Age, Anatolia underwent a series of cultural developments, all of which had artistic consequences. The social structure became more urbanized in comparison with earlier periods, and the number of fixed settlements increased with the foundation of city-states protected by strong walls. City walls also appear in the islands near the Anatolian coast: in Lesbos, at Thermi, and in Lemnos, at Poliochni (FIG. 643). The outstanding example of a royal city is Troy (PL. 418, FIG. 645), founded in the beginning of the early Bronze Age. Levels I–V date from this period. The traits of the period are seen in the massive walls and city gates (Troy I and II), which were constantly restored or rebuilt. Within Troy II there was a central court surrounded by walls. Access was through a large portal; within were megaron-like edifices for princes. It is here that the plan of the megaron, an earlier example of which is found in Dimini, was developed to mature and classic proportions. As for the plastic art forms, minor sculpture was generally in decline; an exception is a sculptured stele (PL. 419) found in Troy I, which is a remarkable work of art. It appears to be a totally isolated example of this form within the Aegean area. Practically nothing is known of the textiles of the period, since their patterns were not reproduced in ceramics, the pottery consisting entirely of monochrome ware. Among the ceramics, which are on the whole of no intrinsic artistic merit, the only noteworthy forms are the urns (often called "face urns") on which the face and the breasts of the fertility goddess are represented, following an ancient tradition; probably such portrayals had a religious purpose.

Metalworking was, however, of the first importance, and metal prototypes provided the inspiration for all kinds of vessels, pottery included. The earliest examples of metal vessels are of gold, silver, electrum, or forged copper or bronze. The forms include beaked pitchers, "sauceboats" (PL. 424), goblets, and teapot vases (PL. 422). Our knowledge of the metal artifacts of this period is not derived entirely from the excavations at Troy and Poliochni; it comes also from the royal tombs at Alaca Hüyük and Horoztepe. These tombs, situated in northeastern Anatolia, show more than one link with the Caucasus and southern Russia, though their metal artifacts are of somewhat coarser workmanship and their style is more original. The usual types of metal vessels are found here; most important are the so-called "standards" (I, PL. 517)

Troy, plan of the citadel. *Key*: (1) Level I; (2) Level IIa; (3) Level IIb; (4) Level IIc and IIg; (5) Level VI; (6) Level IX. (*a*) Fortification walls; (*b*) gates; (*c*) towers; (*d*) megara; (*e*) houses; (*f*) Pillar House; (*g*) Temple of Athena; (*h*) sanctuary; (*i*) theaters (*from Blegen, Caskey, Rawson, and Sperling*).

— among them statuettes of sacred animals (especially stags) and religious emblems such as sun symbols — and the necklaces and pins. Particularly characteristic of the region are the bronze statuettes representing human beings and gods. It cannot be claimed that these artifacts represent any very high artistic level; they are, however, enlivened by a spontaneous realism, which is expressed with particular vigor in the bronze statuette found at Horoztepe representing a mother goddess nursing her child (PL. 417). It should be noted that the techniques of metalworking of northeastern Anatolia show very slight ties with the contemporaneous techniques of the Sumerians in Mesopotamia; the artifacts from the royal tombs of Ur (I, PL. 509) are without doubt far more advanced from every point of view. And yet the metal artifacts of the treasure of Troy II (PL. 419) are outstanding for their great delicacy and artistic craftsmanship; in many aspects they are superior to the finds from the royal tombs of Ur. Only in Troy was the production of filigree and granular work, particularly in the exquisite pins, of so high a quality as to tempt one to suggest an attribution to the middle or late Bronze Age.

As the result of the numerous excavations made since Schliemann and Dorpfeld — at Troy by the Americans C. W. Blegen and J. L. Caskey, at Beycesultan and Polatli by English archaeologists, at Alaca Hüyük and many other sites by Turkish expeditions, and at Tarsus by an American expedition under H. Goldman — it becomes evident that in early Bronze Age Anatolia the evolution of the various art forms was neither parallel nor homogeneous. While some forms progressed, others regressed. Clay sculpture and pottery gradually lost in importance and interest because of the advances made in metalworking techniques. In pottery there is another factor of equal weight: with the appearance of the potter's wheel (which existed in Mesopotamia as early as the Uruk phase, ca. 3000 B.C.), for the first time in the course of the history of art the products of the machine compete with handmade work. The result of this first encounter between two methods of manufacture was the decline in the single, handmade artifact in favor of the mass-produced and more anonymous one.

Of course the new machine, the potter's wheel, had not yet, at this time, replaced human hands in the making of pottery; nor had pottery completely lost its old character. But the use of the wheel in a number of workshops in the Uruk period in Mesopotamia was the beginning of a process in which the manufacture of pottery became progressively easier and less demanding of artistic ability, and thus tended to become a handicraft rather than an art. Concurrently with this decline in the ceramic arts there was a corresponding advance not only in metalworking but also in architecture, which achieved a degree of excellence hitherto unknown. About the lithic sculpture of this time, apart from the stele mentioned above, little is yet known.

b. Crete (*prepalatial period*). In early Bronze Age (prepalatial) Crete we find neither the great innovations nor the unequal levels of productivity found in Anatolia. Metalworking had not yet assumed a leading role, although all the pottery forms were influenced by the forms of metal vessels. Cretan potters attempted to imitate in clay the variegated effect of copper vessels in the so-called "mottled ware." Since Crete has no mineral deposits of consequence, metal had to be obtained from overseas by commercial exchange. The gold ornaments found in the princely tombs of Mochlos show a refined

artistic taste reminiscent of Sumerian goldsmiths' work. On the other hand, the technical aspects of this work appear to be rather primitive; filigree and granulation are absent.

Cretan architecture — best studied in the palace of Vasiliki — continued to have a particular importance of its own. In the field of small sculpture, first place is held by the representations of small animals in genre scenes such as the steatite pyxis lid with a sleeping dog found in Mochlos (Heraklion, Archaeol. Mus.). The greatest degree of artistry was achieved in the production of stone vessels; these surpass every other contemporaneous art form. The stimulus came from Egypt, where the creation of stone vessels had reached a very high level, but the Cretan artists were not satisfied to make stone vessels of the same type; they ambitiously attempted to reproduce in stone the new metal vessels such as the beaked pitchers and the teapot and "sauceboat" shapes. Since the stone they used was a delicately flecked material, and they were able to make the walls very thin and fashion graceful handles, their products represent an artistic peak perhaps never again reached anywhere else in the world.

c. The Cyclades. In the early Bronze Age, the Cyclades had a distinct culture, and the Cycladic people was the first in the entire Aegean basin to practice navigation and overseas trade on a large scale. Their ships, with many banks of oars, sailed not only to the Adriatic Sea, Malta, and Sicily, but as far as the Balearic Islands and possibly southern France. The trade in metal between Asia Minor and the Greek mainland, and perhaps Crete, appears to have been a monopoly of the Cycladic seamen. And this enterprising race does not seem to have been content merely with the yield of their maritime trade. Aided by the fact that the islands (especially Paros) were rich in precious marbles, minerals, and clays of excellent quality, they also modeled vases and figurines, some of which were exported.

Among the most typical Cycladic art forms are the marble idols, generally upright female figures which, since they are not shaped so as to stand alone, were probably supported on a base (PL. 421, upper right; VII, PL. 352). The scale varies, ranging up to two-thirds of life size. The anatomy is so highly schematic as to imply a rather superficial workmanship and commercial mass production. Whether these idols represent the great fertility goddess is doubtful; the figure is nude, but the arms are folded and the hands do not touch the breasts. It has not been established that the purpose of the neolithic idols of the Sesklo culture was funerary. That the early Bronze Age Cycladic marble idols likewise had another, perhaps more worldly significance is suggested by the fact that in Cycladic graves statuettes representing musicians are also found. These too, though not so numerous as the female figures, were apparently produced in quantity. To date, two types of musicians have been found, one seated and playing a harp (PL. 420), the other standing and playing the double aulos. These instruments reappear later in the Cretan funerary cult, as represented on the painted sarcophagus from Hagia Triada (IV, PL. 62). Nude male figures are rare.

There are also among the Cycladic artifacts several marble vessels, worked in forms that are also found in pottery versions and were probably executed in metal as well. They are distinguished by their graceful lines, especially of the feet. In the tomb finds marble cosmetic tablets are also fairly frequent. Together with this work, mass-produced yet of high quality, another, cruder type of idol is found, which basically seems to depict a seated or squatting goddess. No anatomical details or limbs appear; curving in at the waist, in the shape of a violin (PL. 421, upper left) or a spade, the idol of this type is a schematic outline of the human torso, neck, and head.

So much for the works in marble. Two types of objects were made of softer stones, especially steatite: pyxides in the shape of a house, and seals. The seals generally show a spiral motif. The pyxides are of great archaeological as well as artistic interest. An example found at Melos reproduces a house with a courtyard: a portal with a cornice leads to the inner courtyard, surrounded by seven round towers. The exterior of the entire piece is decorated with a graceful spiral motif (the infinite curve) in intaglio. Another pyxis, from Naxos, is in the form of an elliptical house with an arched roof. Both the roof and the walls are covered with a fine spiral ornamentation. It is very likely that pyxides were also made of wood, covered with a network of gold spirals; these wooden examples were probably rectilinear. It was presumably the nature of the medium that dictated the rounded forms of the steatite pyxides.

In the early Bronze Age the craft of metalworking was doubtless of no less importance, but unfortunately little of its output survives. Only a silver diadem from Amorgos is worthy of note (Athens, Nat. Mus.). There are also various types of pins, some with a bird or a double spiral at the upper end. Naturally there are also a number of daggers, spearheads, and other similar objects in bronze. All these metal objects seem from their types to be of Anatolian origin, however; they show no elements that entitle them to be classed as original Cycladic works. The only original works coming from these islands would seem to be the wooden pyxides with spiral network of metal mentioned above.

Cycladic pottery of the early Bronze Age is extremely varied. One class, the Pelos pottery, as it is known, shows late neolithic forms and an old-fashioned herringbone pattern. Generally this type of pottery was destined for use as grave goods and was therefore fashioned from clay of inferior quality. Another variety, the Syros pottery, so termed, is distinguished by its spiral decoration based on *Bandkeramik* motifs (Lengyel). The decoration is scratched and incrusted with white; sometimes this is complemented by incised decoration. The vases have pyxis-like forms, sometimes with a graceful foot. A particularly noteworthy type is the so-called "pan-shaped" vessel (or "frying-pan"), flat and circular, with low rim and a single handle (PL. 421). This type undoubtedly had a religious significance, but that such vessels represented the Great Mother, or fertility goddess, as suggested by Zschietzschmann, is unlikely. Some of these "pans" are decorated with spirals and with intaglio designs. The origins of a third ceramic type, the painted pottery (PL. 421), are probably to be found in the woven fabrics which, from eastern Asia Minor, made their way across the trans-Anatolian trade route and finally reached the Cyclades.

What is known about Cycladic architecture is, unhappily, little. Walled cities undoubtedly existed. On the internal layout of the houses, limited data from Melos and Naxos are available, but from the diffusion of the megaron type in the surrounding regions — in Lemnos (Poliochni) and Samos and on the Greek mainland — we can deduce that it was also known in the Cyclades.

Because of their far-flung maritime activity and their commercial expansion, the Cyclades, during the early Bronze Age, exerted considerable influence in the neighboring areas of the Mediterranean world. Cycladic exports are found particularly in Crete (where the spiral eventually gained a place among the principal decorative motifs of Minoan art). Cycladic imports are also found on the Greek mainland and in the Dalmatian islands. The Stentinello culture in Sicily (PL. 428) and the contemporaneous culture of Malta (q.v.) show Cycladic influences. The most distant market for Cycladic exports was probably the Balearic Islands, where a Cycladic pitcher has come to light. On the whole, Cycladic culture was interregional in character, and the radius of its diffusion was very great (later the same could be said of the Phoenicians). The handicrafts were also important in this period, but the products tended to be mass-produced; nor did they have any longer the profundity that had been characteristic of the neolithic cultures.

d. Continental Greece (Early Helladic). The culture that flourished on the Greek mainland between 2500 and 1950 B.C. is known to us chiefly through excavations by the American archaeologists H. Goldman (Eutresis), J. L. Caskey (Lerne), and C. W. Blegen (Korakou and Zygouries); the Swedish archaeologists O. Frödin and A. Persson (Asine), E. Holmberg (Asea), and M. N. Valmin (Malthi); and the Greek archaeolo-

gists G. E. Mylonas (Aghios Kosmas) and D. R. Theocharis (east coast of Attica). With the descendants of the neolithic inhabitants had mingled the peoples of the Dimini migrations, and then in the course of the early Bronze Age a number of groups seem to have migrated to the mainland from Asia Minor, reinforcing the older Anatolian influences. Since the Early Helladic is essentially a culture of small cities, architecture held a preeminent place among the arts. In some locations — for example, in Lerne, in Attica, and on Aegina — city walls have been found. The gates and the entry ramps indicate remarkable skill in fortification. This establishes the fact that the science of fortification had reached a high level not only in the Trojan area (including the nearby islands; e.g., sites such as Poliochni in Lemnos and Thermi in Lesbos) and in the Cyclades, but also on the Greek mainland. The cities generally consist of an agglomeration of houses built one next to another and reached through very narrow streets. An occasional structure is built on the megaron plan. Some cities seem also to have served as the seat of a prince or chieftain. A very interesting princely dwelling was discovered at Lerne. The layout does not follow the usual megaron plan; a number of corridors run along the outer walls, and there are two large inner rooms. There may have been an upper story reached from the corridors by means of wooden staircases.

At Tiryns a large and monumental circular construction, some 90 ft. in diameter, has been discovered under the Mycenaean palace. This is believed to have been a large royal residential complex, similar in type to the Sardinian nuraghe; it may, on the other hand, have been a monumental tomb. (The small circular buildings discovered at Orchomenos, in Boeotia, were probably granaries rather than dwellings.)

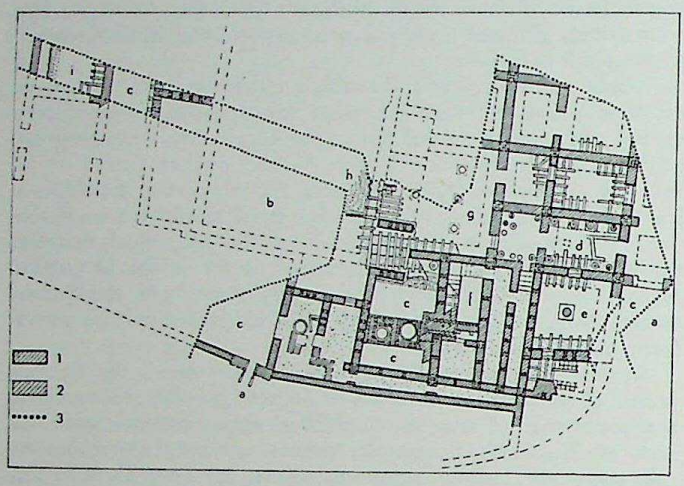
The suggestion that this large circular structure served as a royal residence seems to this writer of dubious merit. The fact that on the island of Leukas there exist tumulus tombs with circular stone bases of the same period, coupled with the fact that the circular structure of Tiryns stands on the highest point of the hill, leads the writer to suggest instead that this structure is the monumental tumulus tomb of a ruler of that town. Some confirmation of this proposition may be found in the fact that on the summit of the hill in Lerne, when the royal palace which existed on this site was destroyed, a large tumulus with approximately the same diameter as that of the circular structure in Tiryns was covered over by the rubble. The corresponding palace building of Tiryns to which this royal tomb might have belonged is yet to be found.

In the examination of other details of Early Helladic architecture, we find ditches or cisterns (*bothroi*) either within or adjoining the house in almost every case. These probably served for the preservation or fermentation of certain kinds of foods rather than for religious purposes. Another feature is the use of terra-cotta tiles and slate slabs for roofing and street paving. Grooved stones were used for door hinges. The plan of the palace at Lerne, in every detail the work of an experienced architect, shows the high standard that the Early Helladic builders were capable of reaching. The metalworking skills were likewise in evidence in the Early Helladic culture. Mineral ore was brought to the eastern Attic ports, where (as at Raphina) there were metalworking shops that manufactured tools, utensils, weapons, and other objects, both in copper and in bronze. The weapons and utensils show no substantial divergence from the types produced in Asia Minor and the Cyclades, but the hammered metal vessels are different. Two smooth gold "sauceboats" have survived (PL. 424). The form, one that is frequently seen in pottery, is typical of continental Greek art; undoubtedly these are of local manufacture. All the other pottery types may likewise have been patterned after metal models, a possibility that would seem to be confirmed by the facsimile nails found on the handles of a number of clay pots. Symmetrically constructed vessels (jugs, stemmed cups, and bowls with a ring base) as well as asymmetric vessels (askoi, beaked pitchers, "sauceboats") were manufactured. In order to obtain a glossy metallic surface, potters gave the early vessels a high polish; in a later phase vessels were entirely covered with a dark glaze. Only toward the end of the Early Helladic period did the potters return to the colored ornamentation obtained by covering only part of the surface with glaze and decorating the vases with white or dark paint in bands of broken lines and braids. These designs were probably inspired by East Anatolian textiles, which at this time were being exported as far as Greece.

e. Influences in Europe. The early Bronze Age Aegean-Anatolian cultural movement did not penetrate the interior of the Balkan peninsula. Here, as well as in the middle and lower Danubian territory, the *Bandkeramik* cultures were engaged in a mortal struggle with the Indo-European Battle-ax people, by whom they were everywhere defeated. The fusion of the victorious and the vanquished peoples brought forth new populations with a relatively high cultural level. Of these, the most widely diffused were the producers of the *Schnurkeramik* (corded ware).

While the Balkan and Danubian territories were the scene of these upheavals (the effects of which, though lasting for several centuries, were not felt in the Aegean area), the progress achieved in metalworking in the Aegean centers passed on to the rest of Europe. Little by little the European populations learned to obtain and work metals. It is possible to trace the successive stages of the diffusion of the individual metallic forms (e.g., the askos) which reached as far as the Danubian region. The beaked pitcher gradually spread to the whole world. Even the fine ribbon handles of the Baden culture derive from metal originals.

If the influences indicated above have been, up to this point, of a cultural character, it is now possible to establish the occurrence of a series of political counterattacks from the area of the Battle-ax people, events certainly ascribable to migration and violent conquests. Thus, in Troy II, splendid stone double axes, of a type which had long vanished from Anatolia, suddenly appeared. At the same site we also find amphoras of a definitely "tectonic" form, which were found with particular frequency among the *Schnurkeramik* people. Stone double axes and *Schnurkeramik* pottery forms appeared in early Bronze Age Macedonia, and the "tectonic" amphora gradually penetrated to central Greece and the Peloponnesos. Mass migrations of Indo-European populations into Asia Minor did not occur until the end of the period. In approximately 1950 B.C. they also appeared in Greece.



The middle Bronze Age. As has been shown, strong Aegean-Anatolian cultural ties existed during the early Bronze Age. In the middle Bronze Age the various areas of Anatolia, Crete, and the Greek mainland went their separate ways. This came about as a result of the Indo-European invasions of Asia Minor and the Greek mainland.

a. Anatolia. In eastern Anatolia the most important documentation has come from the excavations at Kültepe and Alişar. The middle Bronze Age began somewhat earlier in Anatolia than elsewhere in western Asia; it is marked by the appearance of the painted pottery known as "Cappadocian" (beginning ca. 2200 B.C.). The designs of the painted decoration (partly in the continuous-band and partly in the panel style) were undoubtedly derived from textiles; *Bandkeramik* pottery may have contributed also. Monochrome ware continued to be produced; in contrast to the painted ware, which was handmade, it was made on the wheel. This monochrome ware, as the Kültepe excavations show, gradually evolved into the earliest Hittite pottery, a type distinguished for its sharp edges and daring profiles and curves, which sometimes resulted in singular and even bizarre forms (VII, PL. 290).

Glyptic work reached a high level in the Kültepe culture. Finds include stamp seals with handles (one example is decorated with a continuous spiral design) and also cylinder seals, which clearly were influenced by Mesopotamia. The sculpture too was noteworthy. In stone and clay, statuettes of animals, particularly lions, depicted with a naturalism not lacking in ingenuousness, were favored. Zoomorphic vases (rhytons), which undoubtedly had a religious significance,

also appeared. The cast-bronze statuettes, of which the molds have also occasionally come to light, are mainly small figures, draped or nude, of deities; among these is a group of a god and goddess with their child. Eastern Anatolia between 2000 and 1700 B.C. had close ties with the countries to the southeast, with Syria, and especially with Mesopotamia; trade with the last-mentioned was in the hands of the Assyrian commercial colonies that existed on the outskirts of the various Anatolian cities. One colony, which yielded thousands of tablets with cuneiform writing, has been found at Kültepe; another colony has come to light at Bogazköy.

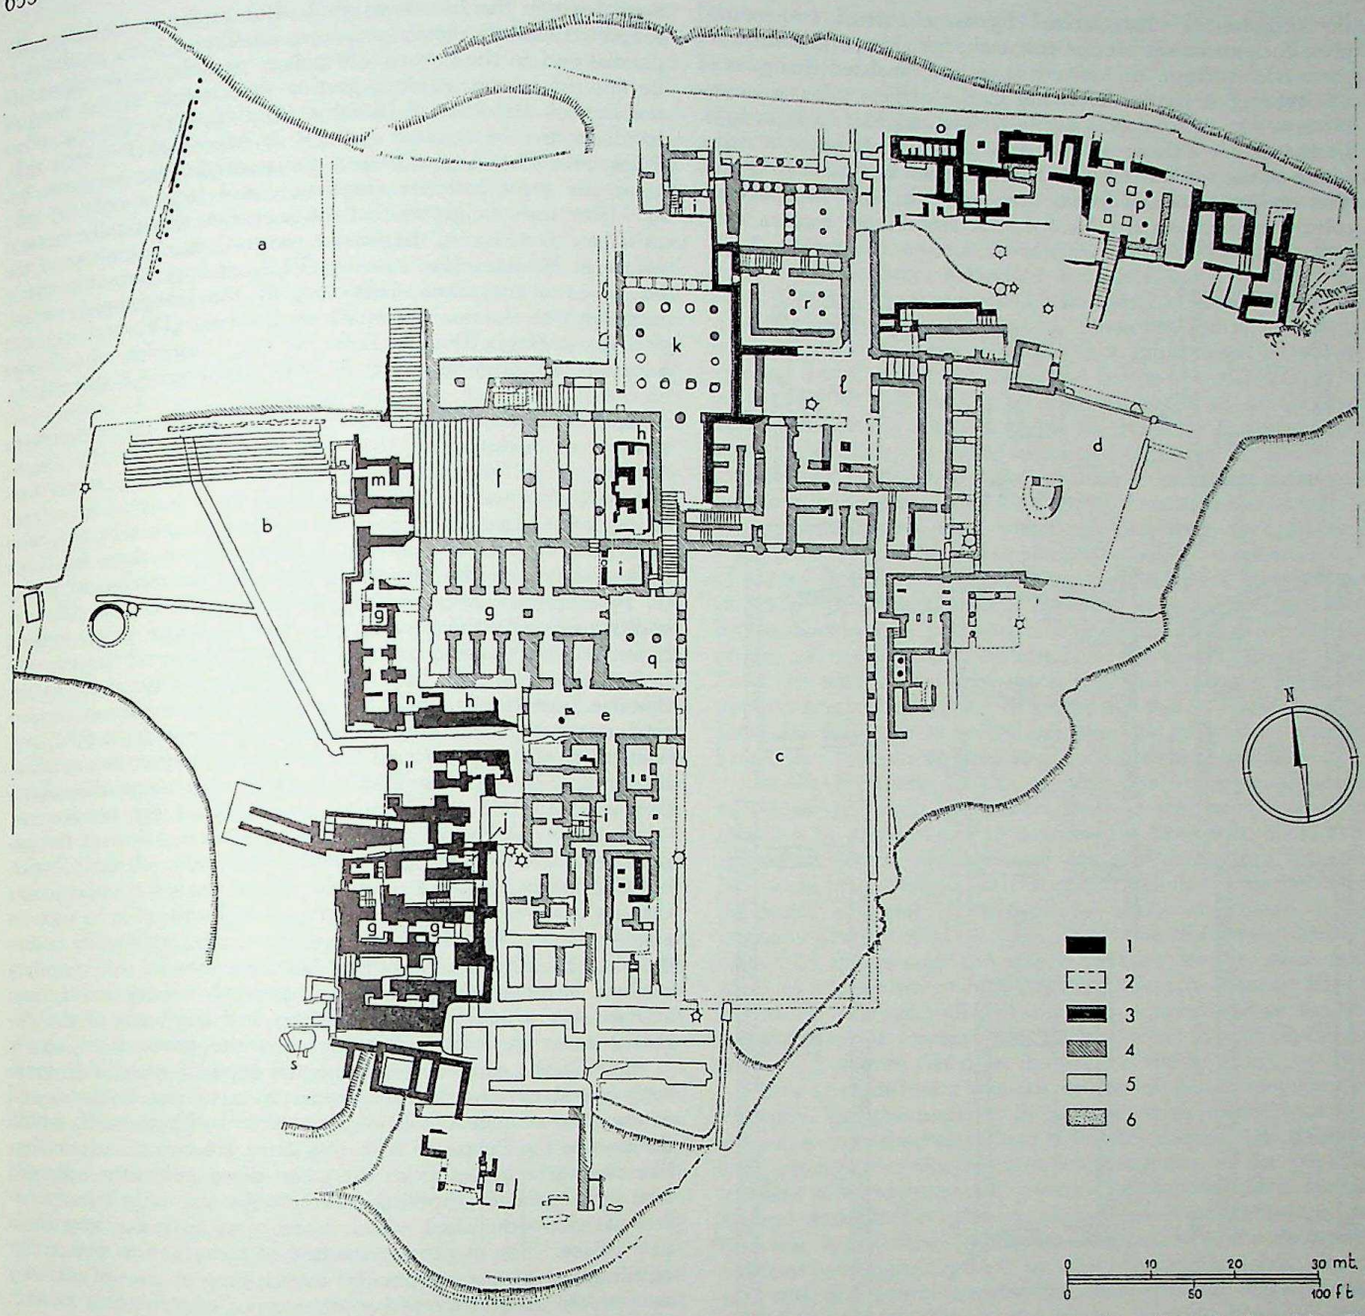
Probably from the middle Bronze Age is the palace at Beycesultan, on the upper Maeander, in western Anatolia

Beycesultan, palace, plan (partly reconstructed). *Key*: (1) Brick walls; (2) ruined foundations; (3) excavated zone: (*a*) entrances; (*b*) central court; (*c*) open areas; (*d*) lustral room; (*e*) "Painted Loggia"; (*f*) stair hall; (*g*) "Painted Hall"; (*h*) level of rushes; (*i*) rush floor (*from Anatolian Studies, 1956, p. 108*).

(FIG. 651). The layout of its interior shows a certain resemblance to the palaces in Knossos (IV, FIG. 85) and Phaistos (FIG. 653), but inasmuch as the excavations at Beycesultan have not yet made clear whether the palace was built around an inner courtyard (as were the Minoan palaces), an assessment of the relations existing between Beycesultan and Knossos would be unwarranted. There is no Cretan equivalent of the use of massive wooden beams found in the palace of Beycesultan, nor is there any visible architectural link between it and the later public edifices of the Hittites (see HITTITE ART) in eastern Anatolia.

The city of Troy V belongs to the transition period between the early and the middle Bronze Age. Troy VI (PL. 418; FIG. 645) was built, probably after a hiatus, in the 19th century B.C. by new colonizers, undoubtedly of Indo-European origin, who in the course of time entered the Aegean cultural sphere and had no further connections with eastern Anatolia. Nevertheless, in the massive fortifications they built around the city (which they had greatly enlarged), the builders of Troy VI remained essentially faithful to the traditions of fortification in Troy II. Only the oldest parts of Troy VI belong to the middle Bronze Age; the later portions were built in the late Bronze Age.

b. Crete and the Cyclades. In Crete, the middle Bronze Age, 2000–1700 B.C., was the floruit of the first palaces (see CRETAN-MYCENAEAN ART), whereas in the Cyclades the middle Bronze Age (Middle Cycladic) was a period of decline. Further, with the development of the Cretan palace culture the Minoan merchant fleet achieved preeminence at the expense of the Cycladic fleet. Minoan influences, as well as Middle Helladic trends from the Greek mainland, made increasingly greater headway in the islands. The production of statuettes and of spiral-decorated pyxides gradually declined, as did the Pelos and Syros pottery. On the other hand, painted pottery maintained its place, along with a monochrome ware, much of it with incised decoration of triangles and the like.



c. Continental Greece (Middle Helladic and the beginnings of Greek civilization). About 1950 B.C. a momentous upheaval took place on the Greek mainland with the arrival of the first groups of Greek-speaking Indo-European peoples to penetrate the peninsula. Violent struggles must have occurred, for the majority of the Early Helladic settlements were destroyed. Some of the cities were completely abandoned, but the majority were rebuilt, at first on a smaller scale and in a simpler architectural style. The indigenous population merged with the newly arrived Indo-European elements, and thus the earliest Greeks came into being.

From the point of view of art history, the arrival of the new people at first caused a serious regression. This not only affected plastic art, which promptly declined, but metalworking as well. Pottery, however, maintained its former level. Two types can be distinguished, the Minyan and the matt-painted wares (*Mattmalerei*). The former (named after the Minyae, since it was found in their city, Orchomenos) was often wheel-made; the monochrome surface varied in color, so that there are gray, black, red, yellow, and other varieties of Minyan ware. In some cases the interior of the vase is of the same color as the outside (presumably owing to consummate skill in firing). Of the various forms, the goblets with graceful stems with horizontal fluting and the wide-mouthed examples (some decorated with the same fluting) are particularly worthy of note. These vase forms seem to have been derived from the silver vessels of eastern Anatolia, although sometimes, in their particularly well-balanced and beautiful form, they surpass their models. The matt-painted ware is also derived from eastern Anatolian models, which undoubtedly reached the Aegean world by the overland route across Anatolia. Both their forms and their decorative motifs are reminiscent of the Kültepe products; the decoration may also have been strongly influenced by the designs of imported textiles.

In architecture a definite regression from the proto-Helladic is perceptible. Some of the buildings have less solid walls, and in general considerably less skill in architecture is in evidence. The most widely diffused type of building is the megaron (often ending in a kind of apse), which is also found in princely dwellings (e.g., Asine and Malthi). Apparently in many cases the cities were surrounded by walls; this can be assumed to have been so in the case, for example, of Malthi, Mycenae (PL. 425), and Tiryns.

In its earlier phases, Middle Helladic culture shows a strong dependence on imports from eastern Asia Minor, and even the production of Minyan pottery appears to parallel the course of the cultures of Chalkis and Troy VI. With the passage of time, cultural exchanges with the Cyclades probably increased, and by the 17th century B.C. Minoan influence seems to have become dominant.

About 1600 B.C., the Middle Helladic culture gave way to the Late Helladic (or Mycenaean) culture, although no ethnic changes seem to have taken place at this time. The Greek ethnic mixture that had been formed in the early phase of the Middle Helladic — which might be termed the "proto–Middle Helladic" — by the merging of Mediterranean and Indo-European peoples continued through the phase of Minoan dominance. The Mycenaean culture came about through the introduction of a great number of Minoan cultural elements from Crete, together with the war chariot from the east. Apparently the Mycenaean princes took advantage of the great earthquake that destroyed Knossos about 1600 B.C. to invade Crete and then continued as far as Egypt. Here, as allies of the Egyptian 18th-dynasty regime, they took part in the expulsion of the Hyksos, and it is here that they may have learned the use of the war chariot. After the earthquake disaster, the Cretans were able to rise again, and a period of peaceful coexistence between Knossos and Mycenae followed. With the beginning of the Mycenaean period the Greek mainland entered the late Bronze Age (see CRETAN-MYCENAEAN ART).

Pernier and L. Banti, Il Palazzo minoico di Festos, 1935–51, brought up to date*).

d. Late cultural developments in the peripheral areas of the Aegean and in the Balkans. As noted above, east Anatolian and, later, Minoan influences played a rather significant part in the development of Middle Helladic culture. But these advanced cultural influences did not penetrate the mountainous regions to the north and northwest. Until the late Bronze Age, the proto–Middle Helladic culture may be said to have survived in these regions; it is in evidence in Aetolia (Thermon), in Epirus, and in the northernmost part of Thessaly (Argissa). It is possible that these territories were inhabited by the ancestors of the later Dorian and northwestern Greek peoples, who did not fully participate in either the Middle Helladic or the Late Helladic (Mycenaean) culture, having been able to penetrate into Greece only after the destruction of the Mycenaean culture, about the 11th century B.C.

Macedonia also showed a certain retardation in the middle and the late Bronze Age. Actually in the middle Bronze Age the influence of and ties with Anatolia were particularly evident in the Minyan pottery; but matt-painted pottery was absent, and there were no Minoan influences. Incised recurrent spirals were favored in both the panel and the continuous-band styles. In the late Bronze Age, Mycenaean pottery was imported from about 1400 B.C., and there was an increase in the number of imported Mycenaean weapons and other objects. However, incised and painted pottery, with meander, spiral, checkerboard, and zigzag designs, persisted within the orbit of the middle Bronze Age traditions. The same retardative phenomena were operative in the Iron Age from about 1200 B.C.; at this time they seem to have been closely connected with strong Balkan-Illyrian influences ("spectacle" fibulas, etc.), also perceptible, for example, at Trebenište.

Characteristic elements of protohistoric Mediterranean art and architecture: a. The megaron. As an architectural form,

the megaron is characterized by an elongated two-roomed plan; the entrance is on one of the shorter sides, and sometimes there is an atrium. In western Asia, only isolated examples of this type of structure are found in the earliest stage of protohistory — at Jericho (PL. 413), Byblos, and Mersin (FIG. 655). In the Sesklo culture a kind of widened megaron, consisting of two rooms but having no atrium, appears at Otzaki-Magoula. The megaron occurs more frequently in the *Bandkeramik* culture of southeastern Europe, but since these megara were

Types of megaron in the eastern Mediterranean: (*a*) Jericho; (*b*) Mersin; (*c*) Erösd; (*d*) Dimini; (*e*) Sesklo; (*f*) Dimini; (*g*) Troy I; (*h*) Eutresis; (*i*) Troy II (*from Schachermeyr, RE, XXII, 1954, cols. 1377–78*).

built of perishable material, the plan is discernible only from the holes dug for the pilasters. In Thessaly, the Dimini people built very beautiful megara, which sometimes served as dwellings for their princes. The megaron appears in Troy I in various structural phases, sometimes with an apse; in Troy II splendid princely megara are found in the inner enclosure reserved for the royal family (FIG. 655). Megara are also found in other early Bronze Age settlements in Anatolia and nearby islands: in Beycesultan they were used for religious purposes; at Poliochni (Lemnos) and Thermi (Lesbos) they served as private dwellings. On the Greek mainland, various types of megara were built during the same period, but from study of the Lerne site it is evident that the megaron was not the dominant architectural form. In the Middle Helladic the megaron assumed considerably more importance: in some cases the end wall is rectilinear, in others the building ends in an apse. Even the royal residences were apparently built on the megaron plan (*e.g.*, at Asine, Malthi). In this period various types of megara

were built in the islands as well. But so far as we know, the megaron was completely unknown in Crete, both in the prepalatial and in the subsequent palace periods; the term cannot be applied to the majestic portico that stands at the head of the famous stairway at Phaistos (IV, PL. 53). On the other hand, in the Mycenaean palaces at Mycenae (IV, FIG. 108), Pylos, and Phylakopi (Melos), for example, the megaron became the great hall par excellence, and it was only by way of Mycenaean emigrants that the megaron was finally brought to Crete. But, again, the throne room of the last phase of the palace at Knossos (IV, FIG. 85; VIII, PL. 92) cannot properly be called a megaron. However, in the postpalatial period, megaron-type houses appeared at Gournia (IV, FIG. 91) and perhaps at Hagia Triada. Later, in their temples, the Greeks adopted the megaron plan for the dwellings of their gods.

b. The tholos. The domed tomb, or tholos, belongs to a type of architecture that had its origins in the North African megalithic culture. There are many indications that originally they were simply circular tombs. Only on structures of moderate size was it possible to erect a dome of overhung concentric courses of masonry. Unfortunately, there has been little research on the North African circular tombs, of which O. Bates (1914) discovered a number in Cirenaica. Circular and domed megalithic structures of north African type appeared in various European areas, assuming the form of the nuraghe in Sardinia (PLS. 401, 402) and of the *naveta* (or *naus*) in the Balearic Islands (FIG. 677). In Spain the megalithic monuments retained their true character of domed tombs (FIG. 677), and from there this type of structure made its way as far north as Britain and Ireland. In Malta (q.v.) circular megalithic chambers are found in the form of underground sanctuaries.

In Crete circular megalithic tombs appeared first at the beginning of the Bronze Age. Particularly in the Mesara district, but in other parts of the island as well, there are circular tombs that are too great in diameter and have walls too thin to support a stone dome. However, small circular tombs with stone domes do occur in scattered locations. All the tombs of this type had a lateral entrance (dromos); an exception is a very small tomb at Krasi, in which the door is blind and the body of the deceased must have been lowered into the grave from above.

During the early Bronze Age the type of megalithic tomb with lateral entrance spread from Crete to the Cyclades and to the coast of Attica (Hagios Kosmas). In Crete itself, within the area of the Palace of Knossos, there are two circular cellar-like chambers hewed from the rock; these evidently belonged to a large princely dwelling built on the site only shortly before it was demolished, about 2000 B.C., to make way for a new palace. The megalithic method of construction with either rectilinear or concentric circular overlapping courses of masonry was widely used in Crete for other types of structures as well. The rectilinear system was used for bridges; an example of the use of the system of concentric rows is the domed spring-house at Arkhanes. The tholos tomb discovered by R. W. Hutchinson (1962) near Knossos undoubtedly belongs to the period 1700–1600 B.C.

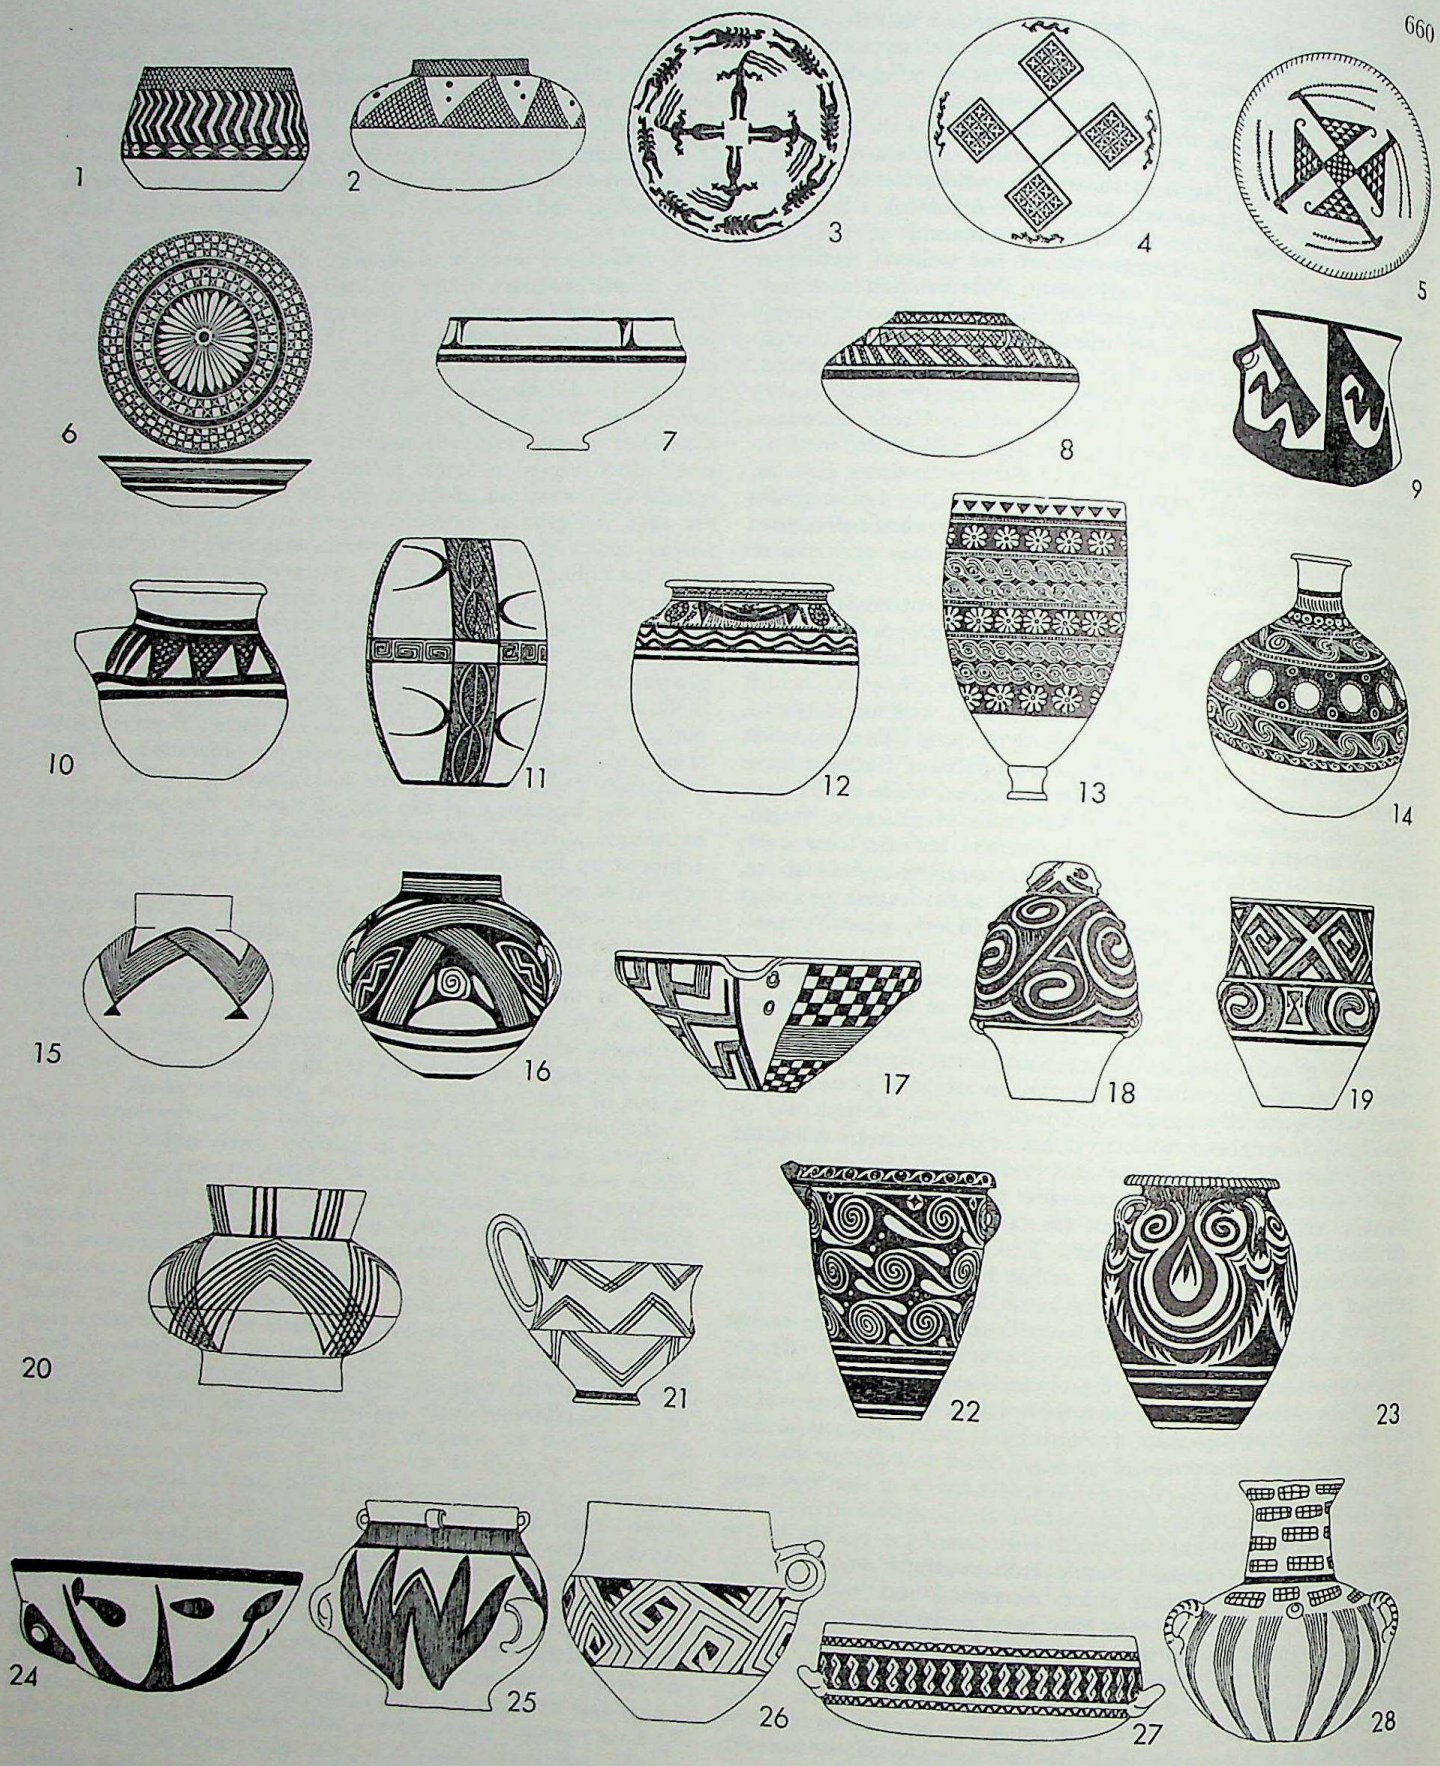
The domed tomb at Osman Agha on the Greek mainland is, according to Blegen, of the Middle Helladic period and thus antedates the Mycenaean. It can be assumed that during the Middle Helladic two parallel traditions existed; one spread to Crete and the other to the Greek mainland. At this time, however, the domed tomb did not become the fashion. At the beginning of the Mycenaean period the shaft grave was by far preferred for the burial of kings. The domed tomb came into favor only about 1500 B.C. Later generations of kings (known as Wanaktes) were buried in the splendid tholos tombs of Mycenae, in the no less splendid one at Orchomenos, in the Vaphio tomb, and in the tholos tombs in the vicinity of Pylos, of Tiryns, and of Iolkos. There were also many other smaller tombs, where vassals were sometimes buried. It should be noted that all these edifices had lateral entrances; these dromoi were probably covered with earth and then uncovered for each subsequent burial. Some of these edifices — the so-called "Treasury of Atreus" (IV, PL. 68, FIG. 105), for instance — had

portals decorated so sumptuously as to suggest that they must have been left uncovered for the admiration of devout pilgrims. In some cases the lower part of the mounds covering the tholoi was protected by a ring of masonry (*krepidoma*).

It appears probable that in Crete the scattered tholos tombs existed from the time of the very earliest settlements. But, as the excavations at Knossos show, the grander tombs were of the temple type (e.g., the one south of the palace), which was altogether different from the tholos tomb, and of the type of the princely tomb at Isopata, which has walls of rectilinear isodomic rows of masonry and bears some relation in layout to the domestic graves of Ugarit. On the whole it would appear that both the rectilinear and the concentric-circle type were part of the koine of the entire eastern Mediterranean world.

At the time of the great migrations, about the 12th century B.C., the tholos tomb fell into disuse on the Greek mainland. Only in Crete were edifices of this type still built, small in size and with the space beneath the dome sometimes circular, sometimes square. In the Bodrum Peninsula, in Caria, tholos tombs of this period are found under a tumulus surrounded by a *krepidoma*; it is probable that such tombs also existed in other parts of the Aegean area.

In Asia Minor, tumulus tombs without internal masonry structures or lateral entrances made a fleeting appearance. To this category belong the Phrygian tombs at Gordion and the so-called "Tomb of Tantalus," near İzmir (Smyrna), which have an internal well-closed wooden cell, without entrance, and are enclosed by a solid outer facing of stone. To the Lydian period belongs the great tumulus necropolis of Bintepe; some of the tombs there have no means of access, while others have both an entrance and an internal structure of masonry. Beginning in the 4th century B.C., tholos tombs became commoner; in fact they became a veritable fashion, especially in Asia Minor, the Balkans, and southern Russia. One of the largest and most remarkable of these tombs is that of Belevi, near Ephesos.



c. Plastic art as represented by statuettes of the fertility goddess. The small statuettes of the great fertility goddess made of unbaked clay in the prepottery phase of the Neolithic age have already been mentioned as having come to light at Jarmo, among other sites. After the invention of pottery these statuettes, generally squatting female figures, were made in fired clay throughout western Asia. From western Asia, the form penetrated Asia Minor and thence the Aegean area. In the Sesklo culture a variant — the standing figure with the hands raised toward the breast (PL. 423), following a common Oriental form — was preferred. The best of the Sesklo statuettes have real artistic merit; as has been indicated, the early Cretan pieces are not on the same level.

The type was transmitted from Sesklo as far as the region of the middle Danube, but there the arms were generally not worked out in detail, being merely indicated. During the Neolithic age there also appeared, in southeastern Europe and in Greece, the kourotrophos, divine mother and child, a type that, to judge from the material at hand, does not appear in Asia Minor until the early Bronze Age. As early as the beginning of the Neolithic, the representation on pottery (either in relief or painted) of the face and sometimes the breasts of the fertility goddess reached Sesklo from western Asia (Hassuna and Tell Halaf). Similar reliefs on pots found in the middle Danube area would seem to have been derived from the Sesklo type. A type with upraised arms is also found in the middle Danube area. The face of the goddess is represented on the lids of many late neolithic vases from the Vinča culture, in this region. In the early Bronze Age such representations appeared in Troy. But during the early Bronze Age clay sculpture underwent a distinct regression in the Aegean orbit. Only in the Cyclades did stone sculpture maintain its level: here marble statuettes of female figures (it is doubtful whether these represent goddesses) were made for tombs — some executed realistically in great detail, others highly stylized. In Asia Minor, in the early and the middle Bronze Age, cast-bronze statuettes of divinities were of first importance. During the Minoan palace period in Crete (and during the Hittite Empire), there were a great many depictions of the goddess of fertility — in sculpture, in reliefs, in gem carving, and in painting. Toward the end of this period, most particularly in the late Mycenaean age, the ancient types of idols reappeared, both as cult statuettes (particularly the type with upraised arms), and as grave goods. At the beginning of the Iron Age, sculpture was limited in the Aegean world to the production of primitive idols: only in western Asia and Egypt did it maintain a high artistic level.

d. Spiral and meander decoration. Simply coiling a strand or a thread produces a kind of snail-shell spiral pattern; this decorative motif is found, on a stamp seal, as early as the prepottery Neolithic period in Jarmo. However, this is an isolated example, which did not give rise to a spiral-based decorative system. In the Egyptian Neolithic it was for a brief period fashionable to decorate pottery with a number of unconnected snail-shell spirals scattered over the surface. But since not even these offered a spiral pattern capable of development, spirals soon went out of favor, and for a long time they were not used in Egyptian decoration in any form. In the Sumerian period coiled waves were sometimes engraved on cylindrical seals; the rolling of the seal in soft clay produced a spiral pattern of sorts. But since this motif was not adopted in other art forms, no ornamental system based on it was ever developed by the Sumerians. The same is true in the case of one of the phases of the Iranian Neolithic, in the pottery from Tepe Sialk, on which a kind of spiral tree often appeared, and in pottery from Hacılar, on which spiral forms, together with arms and hands, were sometimes used for decoration, without ever really being integrated into a decorative system.

In the beginning of the age of metals, the spiral began to assume a certain importance because the form was easily achieved by the twisting of a wire. In Azerbaijan there now appear on pottery ornaments of one sort or another achieved by means of twisting a cord in plastic relief; the same motifs are found in jewelry from the royal tombs of Ur and in the treasures from Troy II (PL. 419). But these still remain isolated cases. In this period the spiral had not won a permanent place in the ornamental tradition of western Asia or Egypt, nor had it acquired sufficient importance to become an autonomous decorative element. As for the meander, in the early periods of western Asian art it does not appear at all.

Altogether different was the course of the development of the spiral and the meander in Europe. Both appear occasionally as early as the Paleolithic; at Mezen, in northern Ukraine, excellent meander designs have come to light. In the 5th millennium B.C., when pottery reached southeastern and central Europe through the diffusion of western Asian influence, the first vase forms were Aegean-Anatolian, as were the decorative elements — designs incised by the fingernails, short linear segments, and points (impressions made with the serrated edge of the Cardium shell). In the course of time, however, local decorative motifs were applied to ceramics. Thus in the orbit of the *Bandkeramik* culture, textile-derived designs, including the spiral and the meander, were assimilated and were incised on vases. The spiral was generally used in horizontal zones; sometimes it appears in a diagonal design and is then interrupted horizontally or vertically, at need. Zones of meanders used in the same way were popular in Cris (incised) and Boian (painted) pottery in Romania. In Boian and Vadastra the meander is sometimes found along with the spiral. In Starčevo we see only spirals (no meanders), and again in Kremikovci the spiral is dominant. All this variation shows that there were no over-all influences at work; each area drew from its own individual heritage of weaving motifs and adapted to pottery designs derived from fabrics and basketry. Throughout the middle and lower Danube regions spiral and meander designs are found, often entwined and enclosed in panels. But whereas the tendency is to organize the meander in a repeat pattern, the spiral frequently appears in the form of a snail shell or of the letter S. Generally the decoration is applied in bands marked off, for example, by dark or light borders. In southern Russia the spiral was common everywhere; starting from here and spreading through Romania and Bulgaria to the shores of the

Neolithic and aëneolithic painted ware. (1, 2) Hassuna (Mesopotamia), early 4th millennium; (3, 4, 5) Samarra (Mesopotamia), early 4th millennium; (6) Tell Halaf (Mesopotamia), early 4th millennium; (7, 8) al-'Ubaid (Mesopotamia), 4th millennium; (9) Hacılar (Anatolia), 4th millennium; (10) Jamdat Naṣr (Mesopotamia), early 3d millennium; (11) Erimi (Cyprus), early 3d millennium; (12) Tepe Giyan (Iran), late 3d millennium–early 2d millennium; (13, 14) Tell Atchana (Mesopotamia), mid-2d millennium; (15) Sesklo (Thessaly), 4th millennium; (16, 17) Dimini (Thessaly), first half of 3d millennium; (18, 19) Cucuteni culture (Romania), 3d millennium; (20) Lerne (Greece), second half of 3d millennium; (21) Lerne (Greece), early 2d millennium; (22, 23) Kamares style (Crete), early 2d millennium; (24) Stentinello culture (Sicily), mid-4th millennium; (25) Capri style (Italy), early 3d millennium; (26, 27) Serra d'Alto style (southern Italy), 3d millennium; (28) Serraferlicchio style (Sicily), end of 3d millennium.

Aegean, a particular spiral style was developed which can be described as the flowing spiral or spiral cluster (*Stromlinien-Spiralen*) style.

The migrations referred to earlier carried both the spiral and the meander to the Aegean lands: with the Gumelnitza migration came the flowing spiral and with the Dimini migration the patterns of twisted meander repeats, the meander with spiral hooks, the scattered single spiral (III, PL. 122), and spiral repeats. The Cyclades, on the other hand, were reached only by the horizontal running spiral (sometimes replaced by a horizontal crown of tangential circles), the spiral repeat, and a design of triple and quadruple spirals. So far as is known, the meander did not reach any of the islands, with the exception of Samos.

The spiral and the meander do not seem to have reached western Asia Minor during the transitional period preceding the early Bronze Age, to judge from the finds at Beycesultan, Besiktepe, and Kumtepe. The isolated appearance of the spiral in eastern Asia Minor (prepottery Neolithic, Jarmo) has been mentioned above. In the early Bronze Age in Asia Minor, the spiral appears in the form of wire twisted into ornamentation for jewelry, particularly in Troy; in Mesopotamia, similarly, it is represented in the material from the royal tombs of Ur. On the Greek mainland, spiral ornament was used only on the large pithoi and on ceramic bowls, these designs having been impressed by rollers. In the Cyclades spiral decoration continued to flourish in the local pottery as well as on pyxides covered with a network of gold spirals and on seals.

Toward the end of the early Bronze Age the spiral made its way from the Cyclades to Crete and also to Egypt. In Crete it inspired a veritable revolution, for there it was, from this time on, the principal decorative motif (IV, PL. 53). A strictly stylized recurrent spiral is found thriving contemporaneously with a vegetal spiral in a completely different style; alongside these are spiral vortex designs and entire complexes branching out in multiple spirals, surrounded by a series of vortex designs. The Kamares pottery of the period of the first palaces and the splendid finds at Phaistos furnish the best examples of Cretan spiral-decorated pottery (PL. 422; IV, PLS. 56, 57; X, PL. 432). In the later palace period the vegetal spiral became rare and the stylized spiral came to the fore. In the Minoan palace period the spiral also appeared in glyptic forms. The types most frequently seen are the S spiral and the triple and quadruple spiral group. Contrariwise, the meander never had a prominent place in Cretan art. From the beginning of the period of the first palaces there remain a vase with meander decoration and a few seals with meander repeat pattern.

The diffusion of the spiral in Egypt and the Levant toward the end of the early Bronze Age constitutes an important landmark in the history of art. In Egypt it was adopted for the scarab with enthusiasm; moreover, the spiral was skillfully assimilated into the systems of endless repeats. The Syrian Levant favored the horizontal running spiral and complex spirals, both of which undoubtedly reached the eastern ports with the Minoan silver vases and Kamares pottery. Thence they followed the trade route along the Euphrates. The horizontal running spiral traveled as far as Mari, where it appears in the frescoes of the palace.

In Asia Minor the spiral had a mixed reception. It appears in isolated cases at Kültepe but is more frequent in the glyptics of Kara Hüyük (unpublished), where it either arrived with Cycladic influences or was transported across the Anatolian mainland. In this region, however, the spiral did not, even at this time, become a usual ornamental motif; the interwoven band pattern continued to be preferred.

In the Cyclades the spiral continued in use during the middle Bronze Age, although it was no longer predominant. The first Greek-speaking peoples to migrate to the Greek mainland at the beginning of the middle Bronze Age did not at first appreciate the motif. But later, under the influence of Crete and the Cyclades, they adopted it in certain forms, for example, the S spiral and the recurrent spiral. Of the meander there is no trace.

The Mycenaean pottery of the late Bronze Age assimilated the spiral on the one hand from Crete and on the other from the Cyclades, as well as from the cumulative ornamental heritage of the middle Bronze Age in continental Greece. Thus the spiral, especially in its recurrent form, assumed great importance in ceramics. Spiral repeats also appear frequently, for example, on metal objects. In the later Bronze Age the meander seems to have disappeared almost completely from the Aegean scene. In Macedonia incised and painted spirals appear frequently, the meander only occasionally.

No comprehensive change in decorative style came about until after the great migrations of the 12th century B.C. Curvilinear decoration, and consequently the spiral, gradually lost ground. In its place, a rigorously geometric decoration gained increasing esteem and interest (see GEOMETRIC STYLE). Greek proto-Geometric pottery still made use of concentric circles and semicircles (VI, PL. 93), but these were now traced with the compass. The meander increasingly replaced the spiral, not only in the Greek Geometric style but also in the Phrygian pottery of Asia Minor. Style of ornamentation in both Greece and Asia Minor was more and more determined by architecture, and the meander (VI, PL. 89) was far better adapted to the Phrygian cliff façades (I, PL. 532), for example, and the Greek architectural terra cottas. The spiral had become a purely accessory element in ceramic decoration, being mostly used in scroll-like designs.

e. Conclusions. Summing up, it is clear that the peoples of the eastern Mediterranean had, by the Neolithic and Chalcolithic ages (i.e., in the 4th millennium B.C.), reached a remarkably high artistic level. A further advance, in the Bronze Age, was registered only where the populations were able to remain relatively undisturbed and free of strong influences or migrations from abroad. Such was the case in Egypt from the beginning of the 3d millennium B.C., among the Sumerians in the first half of the 3d millennium, and in Crete in the first half of the 2d millennium. In regions where vast migrations, especially of Indo-European peoples, occurred, an artistic regression is evident at first. Even Hittite and Mycenaean art were not able to check this regression, much less to halt it. It was not until the 1st millennium B.C. that Indo-European peoples — the Persians, the Greeks above all, and finally the Romans — created great new works of art which, in many aspects, surpassed all that had been produced hitherto.

Still, a great many characteristic elements of later Hellenic art in the Aegean area can be traced to the very earliest times. From the Neolithic age on, the population of the Greek mainland showed a remarkable aptitude for sculpture especially in the depiction of the human body. The noble sense of balance that was later to become the most outstanding feature of Greek art is already apparent in the pottery of the neolithic culture of Sesklo, as is the Greek sense of color. On the other hand, Cretan influence is seen in the extraordinary capacity of Greek artists to observe and reproduce genre scenes. The rigorous structural quality that marked the artifacts of the Greek Geometric period was apparent in the "tectonic" amphoras of the Middle European Battle-ax culture, later in the early Bronze Age Aegean culture, and still later in the Minyan ware of the Middle Helladic period. The architectural prototype of the Greek temple may be traced back through the megaron to the Mediterranean Neolithic as well as to the *Bandkeramik* culture. The meander, which was to become such an important motif in Greek decoration, had its roots in the European Paleolithic and was originally introduced into the Aegean area through the Dimini.

Fritz SCHACHERMEYR

THE CENTRAL AND WESTERN MEDITERRANEAN. The neolithic and Bronze Age civilizations of the western Mediterranean do not, on the whole, present outstanding artistic phenomena comparable with those that the preceding paleolithic civilization had produced in the same area (see PREHISTORY), or those that the contemporaneous peoples of the eastern Mediterranean and of the Near East produced (see above).

Western Mediterranean basin, principal archaeological sites and protohistoric art centers.

Only Malta (q.v.) and, on a far lesser scale, Sardinia reached an artistic level at the beginning of the age of metals comparable with that of the civilization of the eastern Mediterranean, by which they were undoubtedly influenced. Malta developed not only a very refined type of sculpture, which compares very favorably with Cycladic sculpture, but also an imposing megalithic architecture, which probably formed the basis of all the related architectural forms of the Italian peninsula, of the large Mediterranean islands, of southern France, and of Spain. The hypogeum tombs of Arles, the dolmens in the Málaga region, the megalithic structures of Sardinia and of the Balearic Islands (see MEDITERRANEAN, ANCIENT WESTERN) are artistic expressions having close ties to the Maltese megalithic architecture. But, except for the Arles tombs and the Málaga dolmens, they were achieved at a relatively late period, during the mature or final phases of the Bronze Age or even as late as the Iron Age. To these same late periods belong also the Alpine petroglyphs of Mont-Bégo and of Valcamonica (XI, PL. 294). For the rest, it can be stated that the single field in which the artistic sensitivity of the central and western Mediterranean peoples is revealed to us is their pottery, together with a minor production of clay idols and animal figurines. The great bulk of what constituted the artistic and ethnographic legacy (in many cases undoubtedly extremely rich and varied) of these prehistoric populations has not come down to us because of the perishable nature of its materials (textiles, embroidery, basketry, wood, leather, etc.). Pottery attained a notable degree of grace and stylistic coherence, both in the forms of the vessels and in the decorative style. Thus it is, of all the elements, the one that characterizes and distinguishes the various cultural facies which succeeded each other in space and time, allowing us to observe the concordances, the influences, the expansive and regressive movements, without losing sight of the possibility that the phenomena so observed may also correspond to alignments of an ethnic or political nature.

The succession of the single cultural facies, or — more precisely — of the various styles of ceramic decoration to which they correspond, is shown in a striking and unequivocal manner by certain sites, inhabited over long periods, in which each age has deposited its own testimony overlying those of preceding ages. Among such sites are the grottoes of Arene Candide at Finale Ligure, with deposits that demonstrate the succession of the early, middle, and late Neolithic in northern Italy. The data they furnish are confirmed by other sites, among them the palafitte settlement of the Isolino of Lake Varese, which demonstrates the middle-to-late Neolithic progression; the Agnano cave near Pisa, which shows the succession of late-to-subneolithic cultural phases; and a number of caves in southern France which document the progression from early to late Neolithic (in this region, as we shall see, the middle Neolithic is missing) and the successive subneolithic and early-metal-age facies. The diverse strata of a number of sites in Dalmatia and Herzegovina (Smilčić, Zelena Pećina, Črvena Stijena, etc.) are of great interest because they complement one another and reveal the succession of neolithic and early-metal-age cultures of the Adriatic region. Of particular importance, however, is the stratigraphic sequence offered by the Castello of Lipari in the Lipari (Aeolian) Islands, supple-

mented by the no less rich but chronologically more limited site in the Diana plain directly below the Castello site. The Aeolian stratigraphic series, even though it lacks an early neolithic facies, is probably the most complete in the entire Mediterranean region because it presents, clearly superposed and hence in a relative chronological sequence that is absolutely reliable, all the successive cultural facies from the beginning of the middle Neolithic up to the dawn of the Iron Age, that is, up to the historical era. Moreover, it permits us to observe the internal evolution of the individual facies. Thus the Aeolian stratigraphy provides us with a means of establishing the chronological position (at least relatively) of the neolithic and the Bronze Age cultures of Sicily and peninsular Italy, whose succession heretofore either had been uncertain or, in some cases, had been erroneously reconstructed. The cultures of the Lipari Islands, with their manifest relations (at least in certain phases) to the Aegean cultures — in some instances attested by the presence of objects undoubtedly imported from the Aegean — likewise enable us to synchronize, step by step, the sequence of cultures in the Italian peninsula and Sicily with that in the eastern Mediterranean and to establish, at least from the 17th century B.C. onward, the first fixed dates of Western prehistory.

The neolithic cultures: a. Early neolithic. The early neolithic is characterized by pottery with decorations impressed on the raw clay — or, at any rate, decoration done with the clay soft, before firing — by diverse objects, often the serrated or smooth edges of shells (usually of the edible Cardium, whence the term "cardial ware"). This type of decoration is found at the beginning of the Neolithic age along the entire extent of the Mediterranean coast — from northern Syria, Cilicia (Mersin), and southern Anatolia to continental Greece (Proto-Sesklo, or Pre-Sesklo, culture of Thessaly), the valley of the Danube and its tributaries (Starčevo and Körös cultures), the Dalmatian coast, the Italian peninsula, and the Mediterranean coasts of France, Spain, and North Africa. This widespread distribution of an almost identical type of pottery in areas where rather diverse mesolithic cultures had previously flourished demonstrates that the advent of neolithic culture was not the outgrowth of an evolution occurring *in loco* but the contribution of new peoples, probably migrating from the Near East; its distribution in coastal areas and its presence even on very small islands show that the diffusion of this neolithic culture must have followed maritime routes.

One of the regions of Italy in which impressed pottery is most widely diffused is Apulia. At first its culture must have produced only impressed pottery, based on a very limited heritage, but at a certain point a type of pottery painted in two colors, whose origins must be sought in the Sesklo culture of continental Greece, began to arrive in the Apulian villages. Locally produced, this painted pottery gradually become more and more diffused, while the impressed type gradually fell into disuse. At the same time there came into circulation a type of pottery scratched with a hard-pointed tool after firing; this is known as "Materan ware" but might more aptly be named "Ostuni ware," since the greatest number of examples, and the finest, have been recovered in the grotto of Sant'Angelo at Ostuni (PL. 434). This technique is also of Eastern provenance; remote prototypes are found in the Neolithic of northern Syria. Thus imperceptibly, by a gradual evolution, the transition is made from the earliest Neolithic, with its impressed pottery, to the middle Neolithic with painted and scratched pottery. It is not, perhaps, an accident that villages of the early Neolithic and of the transitional phases to the middle Neolithic are more numerous in Apulia than in other Italian regions. Apulia, because of its proximity to Greece and the Levant, is the region of Italy which received, before any other, the first wave of neolithic civilization, the bearer of impressed pottery, and then a second wave, bearing painted pottery.

The presence of the earliest neolithic impressed pottery in San Domino, one of the Tremiti Islands, and the discovery of many worked flints in the Palagruža Islands (Split, Yugoslavia, Archaeol. Mus.) may indicate the route by which the early Neolithic reached Italy: the islands of Korčula, Lastovo, Palagruža, Pianosa, and Tremiti form a bridge that lessened the risks of crossing the Adriatic. The characteristics of the impressed-pottery neolithic cultures in Dalmatia and Herzegovina are identical with those of the Italian peninsula and are extremely different from the early impressed-pottery neolithic cultures of the Danube Valley (Starčevo).

From Apulia and the promontory of Mount Gargano this culture spread northward along the Italian Adriatic coast as far as the Marches. Southward it must have spread over the plains bordering the Gulf of Taranto, and evidence of it has come to light at Favella, near Sibari. The mountainous terrain of Calabria may have presented an obstacle to its expansion, but there is reason to think that before long it had reached the Tyrrhenian coast. Unknown in Latium and Tuscany, it presents typical fragments on the island of Elba and in Corsica. We find it again in Liguria, at Finale Ligure, in the lowest neolithic level of the cave of Arene Candide and in the cave of Arma dell'Aquila, and north of the Apennines at Alba in Piedmont.

The same culture was widely diffused in southern France along a coastal strip varying from 30 to 60 miles, approximately, in width. The characteristic cardial pottery of this area shows a decoration chiefly of horizontal bands with impressed borders, which if not unknown is at least rare at Arene Candide, whereas in Catalonia it predominates. At Fontbrégua, Bord de l'Eau, Châteauneuf-les-Martigues, Unang, La Baume-Latrone, and Roucadour the early neolithic stratum lies directly below the late neolithic stratum (Chassey culture); there is no trace of the middle neolithic. This would lead us to suppose that in the west the early neolithic was able to survive for a long time, coetaneously with at least the early stages of Italian middle neolithic.

Similar conclusions can be drawn for the cardial facies of the Neolithic in Catalonia — the Montserrat culture, which takes its name from the principal complex of deposits in the grottoes of Montserrat near Barcelona. At Esquerdade los Roques del Pany, near Torelles de Foix, the Montserrat stratum lies below the stratum characterized by bell-beaker pottery. There are many deposits in Catalonia, in which the pottery, like that of the Levant, is decorated with impressions of the umbo as well as the outer rim of the Cardium shell. Of the deposits in eastern Spain the most important is Cueva de la Sarsa at Bocairente (Valencia). The backwardness of this cultural facies seems evident here and may have lasted beyond the limits of the middle Neolithic of the Italian peninsula. Cardial ware does not seem to have been diffused southward much beyond the provinces of Valencia, Alicante, and Murcia. Scattered examples have come to light in the region of Almería (Velez Rubio, La Gerundia) and of Granada (Alhama de Granada); farther south it is as yet unknown.

b. Sicily and southern Italy. In Sicily the impressed-pottery neolithic culture had a remarkable development, but with characteristics different from those of the peninsular Italian neolithic, being perhaps more evolved and later: this is the Stentinello culture, so named after a village near Syracuse. Like other similar and neighboring sites (Matrensa, Megara Hyblaea, Ognina), Stentinello was fortified, being surrounded by a trench (at Matrensa the trench is discontinuous) some 6 to 12 ft. wide, cut in the soft limestone and reinforced by a rampart of dry stone masonry. Only a few traces of the huts remain on the rock that lies barely below the topsoil. The Stentinello culture flourished in almost every part of Sicily and also in Malta, at Ghar Dalam and Li Skorba. Two classes of Stentinello pottery can be distinguished: a coarse ware, frequently with cardial decoration, which is identical with the impressed pottery found in peninsular Italy, and a much finer ware, richly decorated either by impression or in intaglio, the decoration not infrequently enlivened by a white incrustation not found elsewhere. Two techniques are sometimes associated on the same vessel (Naxos; PL. 428). Among the designs found on the finer ware is the motif of stylized eyes, which undoubtedly had an apotropaic significance. In a few

of the Stentinello-culture villages (Megara Hyblaea, Trefontane, etc.) scant fragments of painted pottery have been found, some with two colors (red on a light background; PL. 428) and some (identical with the earliest middle neolithic pottery of Apulia) with three colors (red bordered with black on a light background). Furthermore, nearly all the characteristics observed, beginning with the fortified villages, seem to belong to the middle rather than to the early Neolithic. A few specimens of small idols and clay animal figures appear at Stentinello. In the Stentinello villages obsidian is abundant; it was undoubtedly umported from Lipari. The Stentinello culture, although it grew out of the main stem of the early Neolithic, must actually have developed during the middle Neolithic. So far, no more archaic neolithic stage has come to light in Sicily.

The stratigraphy of Lipari is fundamental to the establishment of the evolutionary sequence of the middle and late Neolithic, since it allows us to recognize four clearly defined successive phases. We have seen that in Apulia there was a gradual evolution from the impressed-pottery early Neolithic to a middle Neolithic characterized by painted pottery in two colors, with red bands or flames on a light ground, with which, for a time, the impressed type continued to coexist. The most typical sites are those around Matera, that is to say, the fortified villages of Murgecchia, Tirlecchia, Murgia Timone, and Serra d'Alto, whose culture is identical with that of the Sicilian Stentinello villages, and two caves, the Grotta Funeraria and the Grotta dei Pipistrelli. The two types of pottery, impressed and painted in two colors, are found in almost equal quantities; only toward the end of this period does a third color appear (the red bands are bordered in black). Relatively common, too, is scratched (graffito) ware, often very graceful. The same elements are found in many caves in Apulia and the Abruzzi.

To this period also belongs the earliest neolithic site in the Lipari Islands, Castellaro Vecchio, on the uplands of the island of Lipari. Here the painted pottery in two colors (a few fragments in three) is associated with the more plentiful brown ware of the Stentinello type. The extraordinary prosperity of Lipari during the Neolithic age was based on the working and export of obsidian. This cultural phase was followed by the first settlement at the Castello of Lipari, with different characteristics. Impressed decoration had now practically disappeared; painted pottery predominated, always in three colors, with red bands or flames, bordered in black on a light ground, often alternating with broken or intersecting clusters of black lines. It is associated with an elegant brown ware, perfectly smooth and polished, often with a sober scratched decoration applied after firing and encrusted with white, or, more rarely, painted with red ocher on a blackish ground. But sometimes the decoration was incised before firing or engraved in intaglio or even carried out in relief; this decoration marks the first appearance of the spiral and meander motifs (not infrequently these cover the entire surface of the vase) that were to become dominant in the following phase.

In southern Italy also appear other classes of pottery painted in three colors (but without spiral and meander designs), which certainly belong to the middle Neolithic; among these is the ware that takes its name from Ripoli, a village in the Abruzzi, which presents a distinctive decorative repertory of bands with large dots and triangles of parallel lines within metope-like panels. The commerce in this type of pottery must have been very extensive, for fragments have come to light in many deposits in southern Italy and also in regions where the painted-pottery neolithic is unknown, such as Emilia, Tuscany, and Liguria; a stray fragment has even been found in southern Spain. In the Grotta delle Felci, on the island of Capri, various vessels of this type have been found, together with others of a style similar to the Lipari pottery (with black-bordered bands and flames) but of a somewhat different quality of clay and a darker brown color. Neither in Capri nor at Ripoli does impressed pottery appear; this type evidently fell into disuse not only in Lipari but also in the Italian peninsula. A third class of three-color painted pottery, different from the other two, shows simple spiral and meander motifs in the technique of black-bordered red bands. It is as yet little known, but excellent examples have come to light (at Scaloria, in the Caverna dell'Erba at Avetrana, in the Ostuni cave, etc.), and it seems to represent a transitional stage leading to the next cultural phase.

A cultural facies with closely similar characteristics also appears at this time on the Dalmatian coast. At Danilo, near Šibenik, and at Smilčić, near Zadar (and also in central Bosnia, at Kakanj) is found a type of three-color painted pottery, without spiral and meander motifs, that is stylistically very near to the Ripoli ware. Associated with it is a brown clay ware — with decoration of spiral and meander motifs, incised or in intaglio, completely covering the surface of the vase — that is identical with the allover decoration at Lipari and has very singular shapes. These are strange objects, probably lamps, with bulging bases shaped like human legs, large oval mouths, and arched handles on the top; they appear also in the Neolithic of Greece, at Drachmani and Corinth. Obviously these similarities are not accidental. A single culture, closely related to continental Greek culture, although with marked provincial differences, was diffused over southern Italy, along the Italian Adriatic shore extending northward beyond Ancona, and on the coast of Dalmatia, opposite.

In Lipari the third phase is characterized by spiral-meander decoration appearing also on the painted pottery, by then a ware of great elegance and delicacy. Qualitatively this is among the noblest products the whole of Italian protohistory has to show. The forms of the vessels are elaborate and sophisticated, frequently heart-shaped; the walls are very thin. The decoration, almost always in miniature, is predominantly formed by complicated derivatives of the spiral and the meander, but checkerboards, lozenges, and, especially, bands of bordered zigzags appear as well. The handles are distinctive: they appear to be made by complicated twistings and turnings of a strip of clay. In Sicily the finds of this ware have been only sporadic. On the other hand, it is typically represented in southern Italy, in the deposit from which it derives its name, situated near the fortified village of Serra d'Alto, near Matera; here it is found in the foundations of the huts, which, it should be noted, are considerably later than the settlement itself. Serra d'Alto ware (PL. 429) is also found in other sites of the Matera district, such as Setteponti, and in Apulia, near Taranto. The same trend also appears farther north, on the Apennine watershed, at Starza di Ariano Irpino; this ware has also come to light on the Tyrrhenian shore at Paestum. Thus it seems to have had a remarkable diffusion.

The fourth phase in Lipari is characterized by the abandonment of painted ceramic decoration. The pottery is now monochrome, of a fine coral-red color, with a glossy finish. The handles also become simpler, being cylindrical or spool shaped. This is the period when the Lipari settlement moved from the Castello to the plain below, the Diana district, an extremely rich site whose name is applied to this ware. In the early stage the shapes of the vessels are still reminiscent of those of the Serra d'Alto styles, with the high rims, flaring lips, and heart-shaped profile. But subsequently the rims become smaller, until they disappear entirely, the profiles gradually become more rigid, until they are carinate, and the handles are reduced to mere symbols. The fine red color of the earlier stages gradually changes to a purplish brown. A fact of great interest is the presence in this phase of the Castello of Lipari of slag from copper smelting, indicating that metalworking techniques were now known and used; it is this that may have determined the change in the color of the pottery, by fostering the taste for a metallic sheen. Numerous deposits and several tombs of this period are known in eastern Sicily. Pottery of the Diana style is also found in Malta, where the painted-pottery middle Neolithic is lacking; it is diffused all over southern Italy and in the central part of the peninsula as well.

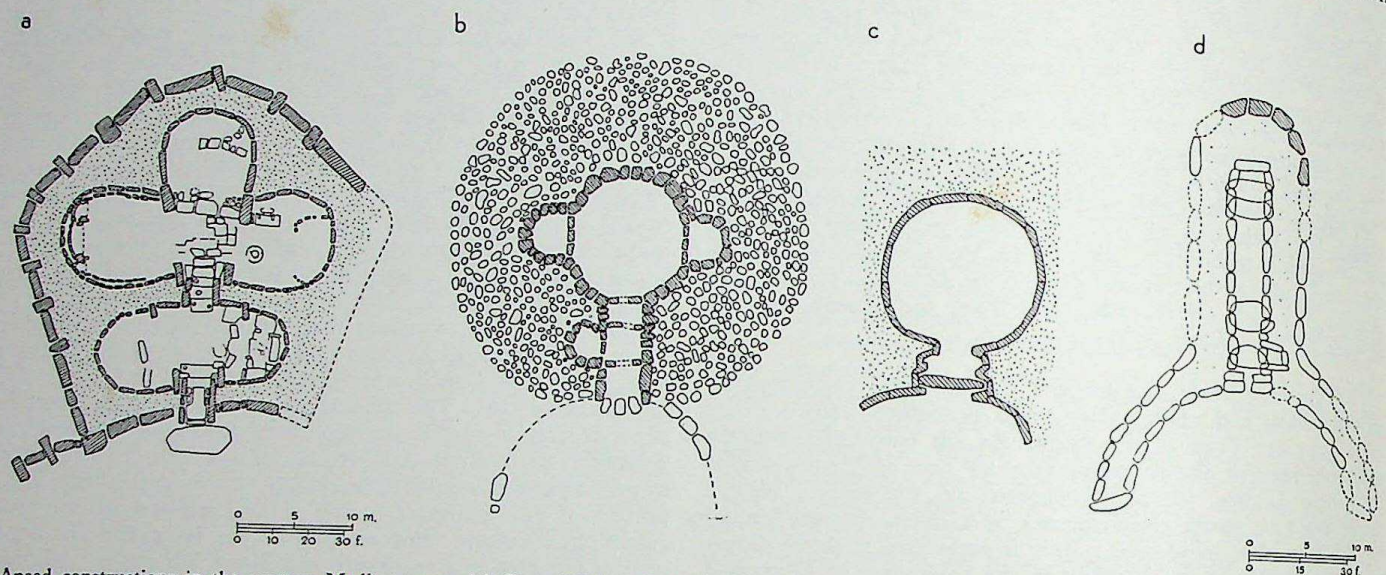
On the Dalmatian coast the Danilo-Smilčić culture was replaced by a new facies, of which the richest deposits are those of the Grapčeva, Markova, and Pokrivenik caves on the island of Hvar (Lesina), but which has been reported on other islands, among them Korčula and Lastovo, and at Smilčić (Zadar).

669

It is characterized by pottery of a brown glazed fabric, the shapes recalling those of the Diana style but incised and painted in red ocher with festoon, half-moon, and spiral motifs; this ware is also found in the valley of the Neretva (anc. Naro), Lisičići, and in the upper strata of Zelena Pećina. On the other hand, this is the time of the culture of Butmir (Sarajevo) in Bosnia, which is also present, but with marked differences, in the Nebo (Travnik) site; its pottery, with an exuberant spiral-meander decoration, either incised or in relief, seems to have stronger connections with the preceding Danilo-Kakanj culture.

There is no question that the neolithic civilization of southern Italy and Sicily shows an uninterrupted continuity of development, whose phases can easily be linked to those of the neolithic in Greece and in the general area of the southern Balkans. Three-color painting and spiral-meander decoration are characteristic of the Greece of the Dimini period, of which the three-color pottery of Lipari, Capri, and Ripoli appears to be a very early derivation, while the Serra d'Alto style represents a later reelaboration with many pronounced local characteristics. The shapes of the Diana ware and its decorative elements (especially the rows of tiny lozenges) seem to correspond rather to the late neolithic ware of such sites as Orchomenos, Eutresis, Larisa, and Corinth, that is, to a period in which the Greek neolithic civilization was undergoing a radical transformation under the influence of other cultures with more advanced metalworking techniques, which were pressing against its borders and making their appearance on the Anatolian shore of the Aegean Sea (see above, *The Near East, the Aegean, and the Balkans; Final phases of the Neolithic*).

c. Northern Italy and western Europe. The characteristics of the middle and late neolithic strata in northern Italy are very different from those in the south. As has been indicated, the sequence rests on the stratigraphy of the cave of Arene Candide at Finale Ligure, where, superposed on the early neolithic, there are rich strata characterized by a brown pottery similar to the type that in southern Italy is associated with the three-color painted pottery. Typical in the beginning of the period are vases with quadrilobed mouth, with square mouth in the fully developed phases; the latter type in particular often shows decoration scratched after firing. From these more evolved phases *pintaderas* of both stamp and cylinder types and small clay idols, generally seated, are among the finds. A few ceramic fragments show spiral-meander decoration and zigzag bands, either incised or carved in intaglio. In the Ligurian caves have been found a few scattered fragments of painted pottery imported from the south, which show that the first phase of the middle Neolithic at Arene Candide corresponds to the period of the three-color painted pottery at Lipari, Capri, Ripoli, and Danilo and that the more evolved phase corresponds to the period of the spiral-meander painted pottery of the Serra d'Alto style.



These two phases appear even more clearly in Emilia, where the pottery has markedly individual shapes; four-handled cups and carinate closed vessels, decorated with small impressions suggesting grains of wheat and with incised festoons, appear. In the second phase, represented chiefly by the Chiozza di Scandiano (Reggio Emilia) site, there are square-mouthed vases with decoration — scratched, incised, or in intaglio — consisting of spiral-meander motifs like those at Arene Candide. But the typically Ligurian tendency, with the square-mouthed pots, is also apparent in some of the oldest palafitte settlements in Lake Varese and in the Veneto, at Quinzano (Verona), as well as in a few lake dwellings of the Val di Marca (Lake Fimon) and of the Val Liona, in the Berici hills, south of Vicenza. To the west, on the other hand, this stylistic tendency does not cross the barrier of the Alps. Nor is there any evidence of it in southern France. A few isolated elements are found in the levels still characterized by impressed pottery (examples at Châteauneuf-les-Martigues) and in the levels similar to those of the Italian Lagozza culture (square-mouthed pots in the *sepulcros de fosa*, or trench graves, of Sabadell, in Catalonia). The middle Neolithic of Tuscany and Latium is less well known, the only important discovery being the tomb in the Patrizi cave at Sasso di Furbara.

At Arene Candide the upper (late) neolithic, or Lagozza, culture overlies the middle neolithic strata. The pottery, undecorated, is generally thin-walled, perfectly smooth, and highly polished; it is black or dark brown in color (in a few cases bright red). The shapes are few and often repeated. Characteristic is the absence of true handles; their place is taken by small perforated lugs. Scratched and incrusted decoration is occasionally found on the bowls. Even before the excavation of the site that gave its name to this culture — Lagozza di Besnate, near Gallarate (approximately 25 miles northeast of Milan) — it was clear that the culture extended to the west and was linked to the coeval cultures of Chassey (France) and of Cortaillod (on the Lake of Neuchâtel in Switzerland). The culture of this horizon is probably also related to the trench-grave culture in Catalonia. Thus it is possible to discern in this period, despite certain regional aspects, a cultural unity of the whole coastal arc of the Mediterranean from the mouth of the Arno to the estuary of the Ebro, including the hinterland — a cultural complex often referred to as the "western neolithic." The type of dwelling and marked differences in the pottery forms and in the stone industry distinguish the Ligurian facies from the Lombard, which is characterized by palafitte lake dwellings, such as those of Lake Varese (Isolino, etc.), Lagozza di Besnate, and Torbiera di Bosisio. The Lagozza culture also appears in peninsular Italy; it is sometimes found (as in Umbria) in association with red pottery of the Diana style, sometimes (as in Tuscany) in association with types of pottery that seem to reflect the influence of the bell-beaker forms. At Pescale di Modena (Emilia), pottery of the Lagozza type is associated with a ware having incised and often also intaglio decoration. This ware, in some of its features and certain of its decorative motifs, can also be related to the late neolithic pottery of the Dalmatian Hvar-Lisičići type, but other features, in particular the intaglio technique, are closer to the "Slavonic" pottery of Vučedol (PL. 416) and of the Ljubljana swamp, representing a culture that succeeded the Hvar and extended over a far greater area toward the Danubian region. All this shows the persistence of this horizon of culture, which lasted beyond the Neolithic age and into the first phases of the age of metals.

As has been noted, the Lagozza facies of the Ligurian caves is found along the entire Mediterranean littoral of France, from the Alps to the Pyrenees, in identical form with the sole exception that a greater quantity of scratched decoration is found in certain deposits. This is the culture which in France took its name from Chassey. The deposits in which the Chassey strata directly overlie those of the impressed-pottery early neolithic are relatively numerous, but there are no traces of the existence of an intermediate facies corresponding to the Italian middle neolithic. It therefore seems likely that beyond the Alps the early neolithic continued to flourish for a long time, concurrently with the Italian middle neolithic; a precocious appearance of the late neolithic in France seems less likely. The Cortaillod culture in Switzerland — the "early lacustrine neolithic" of P. Vouga (1934) — is more closely related to the Lagozza facies of Lombardy, if only for the similarity in the types of palafitte dwellings.

Doubtless also a part of the great late neolithic cultural complex — the "western neolithic" mentioned above — is the Catalan trench-grave culture known too by the name of its most important site, Sabadell; it does not seem to have extended south beyond the mouth of the Ebro. The undecorated pottery of the Sabadell culture is related to the types, generically termed "Western," of Lagozza, Chassey, and Cortaillod, but the presence of ring-shaped handles and of a number of square-mouthed vases seems to recall the Ligurian middle neolithic. Some of the later tombs seem, however, to indicate that the evolution of this culture continued until the dawn of the age of metals. What lay south of the Ebro is, at present, difficult to say, but it seems probable that here the impressed-pottery cultures of very early protoneolithic origin lasted for a very long time; the finds of Cueva de la Sarsa suggest that

these cultures, too, continued to flourish until the beginning of the metal age. In fact at Sarsa, in an apparently homogeneous pottery complex, characterized by a cardial decoration far richer, more elaborate, and more exuberant than that found in any other western deposit, there appear isolated elements (vases with beak handles, perforated maceheads, etc.) that reveal their derivation from Aegean-Anatolian prototypes of the same period as those widely diffused in Malta, Sicily, peninsular Italy, and elsewhere. Still farther south, in the region including the provinces of Granada, Málaga, Córdoba, and Seville, there is a noticeably different facies, known chiefly from the discoveries made in a considerable number of caves. In the pottery, which has decoration incised in the raw clay or bears various impressed designs (none cardial), the typical forms are spheroidal cups and, above all, flasks, whose forms, symmetrical triple handles, and raised cord decoration closely recall the middle neolithic pottery of Arene Candide — of which we are also reminded by certain other artifacts, such as the large-band marble bracelets decorated with horizontal grooves and the stone rings. But in some of the caves the beak-handled vases appear; especially in the cave of Los Murciélagos de Albuñol, which also yielded a very rich hammered-gold diadem; these finds attest the influence of the Aegean-Anatolian cultural stream, bearer to the west of the metal-age civilization.

Apsed constructions in the western Mediterranean. (*a*) Gozo (Malta), Ggantija (*from Evans, 1960*); (*b*) Los Millares (Spain), domed tomb (*from V. Gordon Childe, The Dawn of European Civilization, London, 1950*); (*c*) Castelluccio (Sicily), rock-cut tomb (*ibid.*); (*d*) Bultei (Sardinia), "giant's tomb" of Sas Prigionas (*from Zervos, 1954*).

The early age of metals: a. Early phases in Sicily and southern Italy. A sharp break seems to have occurred at the end of the Diana-style phase in the Aeolian cultural series. The type and forms of pottery that characterize the succeeding Piano Conte culture are entirely new and have no similarity to earlier ones. The ware is rather coarse, glossy, and dark brown to black in color; deep bowls, globular or pear-shaped jars, large closed jars with a type of lugs known as "tunnel handles," and crude cooking pots predominate. A few large basins with rectangular rims also appear. There is only one manner of decoration — bands of shallow parallel grooves, generally horizontal but becoming radial on the borders of the deep bowls — a motif that can be traced in its diffusion from the central part of Anatolia to the shores of the Aegean; this is the decoration found in sheet gold applied to metal vessels, of which excellent examples have been preserved in the tombs of Alaca Hüyük. The Piano Conte culture was diffused all through southern Italy; fragments typical of this culture are found in the Zinzulusa cave at Otranto, in the Ostuni cave, and at La Starza, Ariano Irpino. This period presents a totally different and much more complex situation in Sicily, where there was a radical transformation between the end of the Neolithic age and the beginning of the age of metals. This was in reality the beginning of the metal age, though metal was probably still a very rare material. A number of new cultural elements made their appearance, among them the horn cult and the collective rock-cut, oven-shaped tombs opening from a small shaft. Following the neolithic Diana style there was a first phase in which a number of different pottery styles seem to have coexisted: the San Cono–Piano Notaro style, the Conzo style, and a polished buccheroid ware. The San Cono–Piano Notaro style, of brown clay decorated with pairs of incised lines often flanked by impressed dots, generally outlining four large panels on each face of the vase, is found in eastern Sicily, on the south coast in the Gela district (at Piano Notaro), and also in the oldest group of oven-shaft tombs in the Conca d'Oro (the area around Palermo). The Conzo style, with similar motifs painted in red and black on a yellowish ground, is, up to now, known only in the caves of the Syracuse district. A third type is a polished gray buccheroid ware, often decorated with fine striations made with the spatula over the whole surface. In a second phase appears a type of pottery painted with a great variety of motifs in opaque black on a purplish-red ground. The style of this ware is known as Serraferlicchio, after a site near Agrigento. This decorative technique also appears over a wide area of Greece (e.g., Eutresis, Thespiai) at the very end of the Neolithic age, although its origins are much older.

Another complete typological change occurred during the next period in the pottery of the Lipari Islands. This new period takes its name from the Piano Quartara site on the island of Panarea. It appears to have been a period of decline, probably caused by progress in metalworking techniques and the consequent decline in the Aeolian obsidian trade. In Sicily the pottery of this period differs from the Piano Quartara style in that it often has a glossy red surface. The forms, however, are similar and, in some cases, identical; they often recall eastern Aegean prototypes [particularly Troy I, the Green and Red levels of Poliochni, Thermi (Mytilene), together with contemporaneous material from Chios, Samos, and Kalymnos in the Cyclades] approximately synchronous with Early Helladic II, even though, because of the time lag in the spread of cultural currents from east to west, the chronology of this Sicilian culture may have been, to a certain extent, parallel to Early Helladic III. It is relatively easy to follow the evolution of this culture from the Chiusazza–Malpasso–Ticchiara phase, with its almost exclusively red pottery, to the phase in which painted brown decoration on a yellowish or buff ground prevailed. The characteristic shapes of this ware are small single-handled, yellow-toned jugs; small flasks, sometimes with pointed bases and high cylindrical

necks cut obliquely to form a mouth; and many other forms which reveal their continuous derivation from Aegean-Anatolian prototypes. The decoration on the belly of the pot consists of separate bands of three lines, each descending vertically; on the neck it consists of a few lines, bands of horizontal segments, or a row of large dots.

b. The megalithic civilization of Malta. The early age of metals in Malta and Sardinia was a period of extraordinary prosperity. Aegean sailors in new types of ships (of which images have been preserved on the Cycladic paterae and the graffiti of the Hal Tarxien temple in Malta) were easily able to reach not only Sardinia but also the Iberian and southern French coasts. Vast new lands now came under the civilizing influence of the Near East. Their natural resources were tapped and exploited; new, flourishing civilizations sprang up and developed along their coasts and spread rapidly throughout the regions of the interior. A thriving commercial traffic passed through the Sicilian channel (between Sicily and Africa), and Malta became an obligatory port of call along this route; hence its extraordinary prosperity.

During the Neolithic period Malta formed part of the Sicilian Stentinello cultural area. Up to now, however, no traces of neolithic painted pottery have come to light, although at Li Skorba there is evidence of late neolithic culture in the form of Diana-style pottery, first brown and later red in color. It was the next period that witnessed the beginnings of the extraordinary megalithic architecture and the construction of the gigantic "temples" which are among the grandest and most imposing creations of Mediterranean prehistoric architecture.

In the field of pottery the sequence of styles was: the Li Skorba (still linked with the Diana style), the Zebbug, Mgarr, Ggantija ("Giant's Tower"), and Hal Tarxien styles. The last two, especially the Hal Tarxien style, represent the apogee of the Maltese megalithic culture, of which the others more or less constitute preparatory phases. However, in spite of the variety of its styles, it can clearly be seen that Maltese pottery is derived from Aegean Cycladic prototypes, as well as from the contemporaneous cultures of Samos, Mytilene, and Lemnos. There are also close ties with the Cretan Early Minoan. Only in the last Maltese phase, that of Hal Tarxien, are there clearly evident relations with the Middle Minoan in Crete and with the Kamares pottery style (see CRETAN-MYCENAEAN ART).

It was John D. Evans who recognized that the Maltese "temples" have their typological origins in the collective rock-cut tombs, sometimes multilobed, which had been built since the beginning of the age of metals under the influence of eastern prototypes, in Malta as well as in Sicily and peninsular Italy. The earliest "temples," built above ground level (e.g., at Mgarr), and the slightly later ones of the simpler type (Kordin III) are, in fact, on a trefoil plan. Each of the three great horseshoe-shaped apses is usually separated from the central rectangular chamber by means of pillars or by masonry forming a gate or balustrade. Sometimes the central chamber is reached through a large trilithic door. Almost all the temples belonging to the more evolved phase (Mnaidra, PL. 426; Hagar Qim; Ggantija, FIG. 671; Hal Tarxien, FIG. 418), already of imposing dimensions, have five apses. In one case (the middle temple at Hal Tarxien) there are seven apses. The central, axial apse, however, generally assumes smaller proportions. The middle gallery is narrow at the point of division between the first and second pairs of apses and is often flanked by a pair of altars. In the older temples the pillars, the thresholds, the posts, and the lintels of the large doorways, and in a few cases also the base blocks of the façade, are great monolithic stone slabs; the rest of the structure, the apses and exterior walls, was of irregular dry masonry. In the later temples there is a carefully constructed plinth of large stone orthostats, often very regular, on which is built the structure of rough-hewn (in some cases perfectly dressed) ashlar in isodomic courses of great technical perfection. In these later phases the interiors of the temples were decorated with magnificent sculptures. The surfaces of the pillars, piers, and lintels are ornamented with a pattern of hammered holes; balustrades and altars are covered with elegant decorations, generally spiral motifs or running spirals in a vine pattern (PL. 427), prototypes of which may be found in the Cycladic steatite pyxides. At Hal Tarxien there are animal friezes depicting sacrificial victims (rams, goats, swine, and oxen; PL. 427). In addition to the temples built aboveground with megalithic techniques, there is a magnificent underground temple at Hal Saflieni, where much the same temple plans and architectural elements are carved in the living rock. It must have served as a place of worship and also for burial.

In addition to temple sculpture, during this period the Maltese also developed a very refined type of small sculpture, generally representing female figures, standing, crouching, seated, or recumbent on a bed. They are sometimes clothed, but more often they are nude, accentuatedly, sometimes even exaggeratedly steatopygous, and almost always vividly realistic (PL. 427). Even though there are some local variations in the ritual position of the arms, these figurines seem closely related to the Cycladic marble idols. The rigid stylization of the latter contrasts, however, with the much looser naturalism of the Maltese statuettes, which are more like the much earlier statuettes that have been discovered in the neolithic strata at Hacılar (Anatolia), at Lerne (Argolis), and at Knossos (Crete). The rigid stylization of Cycladic derivation, on the other hand, is evident in an anthropomorphic stele, found in one of the tombs at Zebbug, which has a remarkable resemblance to a stele from Troy I. This Maltese stele would seem to be one of the links in a chain that joins the distant Anatolian prototypes with the similar, but later, manifestations in Corsica, southern France, and Liguria.

When the megalithic culture of Malta had reached its apogee, it appears to have come to a sudden and violent end. There are no known phases of decadence. Over the ruins of the temples of Hal Tarxien, possibly destroyed by fire, there is a cremation necropolis, belonging to a separate and successive cultural facies. (See below, *Subsequent phases of the early age of metals in Sicily and Malta.*)

c. Sardinia. Sardinia presents a cultural phenomenon similar to that of Malta. There is practically no trace of a Sardinian neolithic culture; at the beginning of the age of metals there developed a flourishing culture which in all its manifestations shows its derivation from the Aegean cultures. The individual phases of its development have not as yet been clearly identified, and it seems probable that the splendors of its terminal phase have obscured those leading up to it. This Sardinian culture is known to us mainly through its tombs, some of which are rich in materials. The predominant type of tomb is cut into the rock in the form of an artificial grotto (known as *domus de gianas*), often grander and more complex than the Sicilian tombs. Some of them (at Anghelu Ruju, Cuguttu, Riu Mulinu, and elsewhere) consist of a number of chambers and sometimes have sculptured decorations of bulls' heads (Anghelu Ruju). Near them are found dolmens, built aboveground of great stone slabs and covered with barrows. While the form of some dolmens (Birori) recalls the rock-cut tombs, others (Su Coveccu, near Bultei; Perdalunga, near Austis; Doli Fichina; S' Enna sa Vacca) show a gradual transition to the *allée couverte* (gallery grave), which developed into the "giants' graves" of the succeeding nuraghic period. The necropolis of Li Muri, near Arzachena (La Gallura), on the other hand, consists of grave circles enclosing cist tombs and smaller cists, perhaps intended to contain cremated remains. Small idols are also found in Sardinia (PL. 433). They are even closer to the Cycladic idols than are the Maltese, but artistically they are greatly inferior to the latter. Many other Sardinian artifacts, such as pierced maceheads (from Li Muri and Macomer), ax-adzes and stone double axes, stone vases (a splendid steatite cup was found at Li Muri), clay tripod vessels (PL. 432) and certain ceramic techniques and decorative motifs, are also of obvious eastern origin. But Sardinia was more open to contacts with the Iberian Peninsula than any other region of Italy, and it is probable that dolmenic architecture was transmitted to Spain from Sardinia. From the Iberian Peninsula, Sardinia (probably in the final phases of this cultural period, which must have lasted for a considerably long time) received the bell beaker and all the other elements generally associated with it, such as buttons with a V-shaped perforation.

d. Subsequent phases of the early age of metals in Sicily and Malta. In a period after those described above, there followed a series of distinct local cultures in Sicily, the Lipari Islands, and Malta. Not only did they differ considerably from one another, but they actually seem to have exerted very little mutual influence. Some of them at least, such as the Castelluccio culture in eastern and southern Sicily, the Capo Graziano culture in the Lipari Islands, and the Hal Tarxien necropolis culture in Malta, have their genesis in, and very close typological connections with, the Middle Helladic cultures in Greece (see above). There seems to have been a colonization of the west by various Middle Helladic peoples, each marked by its own particular character. However, the numerous imports of Early Mycenaean pottery (Late Helladic I and II, ca. 1600–1425 B.C.) in the sites of the Capo Graziano culture show that at least this culture (and probably the other parallel ones also) must have continued to develop at a time when, in the Aegean, the Middle Helladic had given way to the Late Helladic (better known as Mycenaean). These imports provide the earliest definite dates of western Mediterranean prehistory and help to fix the earliest limits of these cultures.

The Castelluccio culture is characterized by pottery painted in a brown or blackish color on a yellowish or reddish ground (PL. 435). It is closely linked, in techniques, decorative motifs, and vase forms, to the matt-painted ware of the Middle Helladic. The Castelluccio people lived in small villages consisting of a few huts, generally situated on high ground at the edges of the richest agricultural zones. The only one of these villages that has been systematically excavated to date is that of Manfria, near Gela, where nine roughly ellipsoid huts (some with lateral niches) have been uncovered. The floors, which are much lower than the level of the ground, are made of beaten clay with a chalk whitewash. The structure is sustained by a central pole and four or more others at the sides. One hut is divided into two sections by five axial pillars and has numerous others around the edge. The interiors are surrounded by small, rough walls. Other important villages include the one at Monte Sallia, near Comiso, and that at Castelluccio, near Noto, which has given its name to this culture. In the adjacent small necropolis of Cava della Signora, the tombs were sometimes closed with sculptured stone portal slabs (PL. 435), which constitute the only examples of prehistoric sculpture in Sicily. The spiral motifs of these sculptures represent the human figure in an extremely schematized form. These same tombs have yielded a number of small bone idols of a singular type, also highly schematized, consisting of a number of globules (PL. 435) with incised decoration. Their greatest interest lies in the fact that they are very similar to idols found in Troy II, in the Peloponnesos (in the first Middle Helladic stratum at Lerne), in southern Italy (Altamura), and in Malta (Hal Tarxien necropolis). No imported Aegean pottery has come to light in the villages of the Castelluccio culture, in contrast to the great quantity found in the coeval strata on the Lipari Islands.

The Castelluccio culture assumes particular and individual characteristics in the various zones of the vast territory it covers. The best-known facies is that of the small villages in the Syracuse area and on the edges of the plains of Vittoria and Gela. In the Agrigento area the pottery from the necropolises of Montedoro, Monte Sara, and Monteaperto, among others, has a much more delicate decoration. The forms that characterize the eastern and southeastern facies, such as hourglass-shaped mugs with one or two handles, do not appear in the Agrigento facies; on the other hand a biconal mug, with or without a foot, is a type unknown in the east and southeast. In the Etna zone the hardness of the lava did not permit the hewing of rock-cut tombs and necessitated a change in the funerary rites. The numerous natural caves and hollows formed by the flowing lava served as burial places. The pottery of the Etna zone often has carinated forms, remarkably similar to the Peloponnesian matt-painted ware. Another facies of the Castelluccio culture has been distinguished in northeastern Sicily (Naxos, Rodì, Tindari) and is characterized by pottery with elongated handles, either in the shape of an ax or bifurcate, with prolongations shaped like equine ears. These types, associated with painted pottery of the Castelluccio type, appear in a tomb at Vallelunga in the central Sicilian province of Caltanissetta. 676

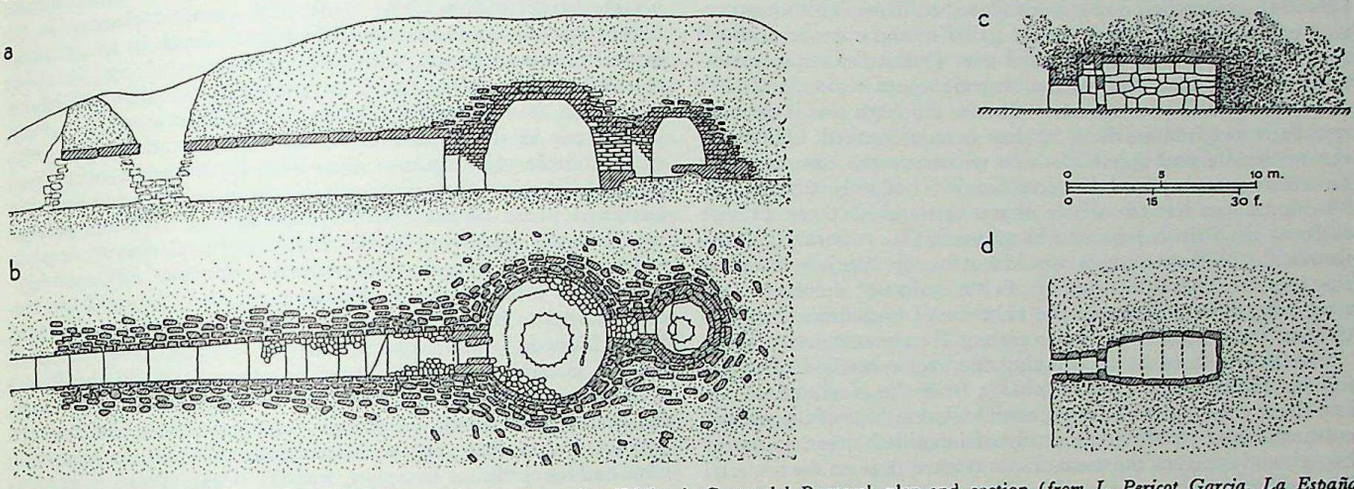
The Capo Graziano culture takes its name from a promontory of the island of Filicudi, where villages of oval huts have been found. It is documented also by remains on the Castello of Lipari, and evidence is also found in others of the islands (Salina, Panarea, and Stromboli). The huts are not sustained by poles but are surrounded by stout stone walls. During this period the Lipari Islands must have been a prosperous outpost of the Mycenaean maritime commerce with the west. The pottery is of brown clay decorated with incised, frequently wavy, lines and with rows of dots. There is a singular similarity with the richer and more varied Maltese pottery found in the cremation necropolis that extends over the ruins of the Hal Tarxien temples. This necropolis also contains a considerable number of small dolmens.

Northwest Sicily seems during this period to have been oriented toward the west, and it offers evidence of closer relations with the Iberian Peninsula. At La Moarda, Segesta, Villafrati, Isnello, and Torrebigini (near Selinunte) there has been found a particular style of pottery with incised bands, apparently a local derivation of the bell beaker. The center of production and diffusion of this form is believed to have been the Iberian Peninsula; during this period the pottery was widely exported not only throughout the Mediterranean (Sicily, Sardinia, northern Italy, southern France) but also to the Atlantic coast of France, the British Isles, and the Rhine and Danube valleys.

e. The aëneolithic cultures and the beginnings of the Bronze Age in Italy. In peninsular Italy there is evidence of a facies corresponding to the Piano Conte type of deposits. The beginning of the age of metals is, however, best documented by the discovery of the Gaudo necropolis near Paestum. Here the tombs are of the rock-hewn artificial-grotto type, similar to those found in Sicily. The pottery is of monochrome clay and generally undecorated. The most common shapes are flattened spherical flasks with either a cylindrical or truncated-cone neck, askoi of similar shape, but with an eccentric neck, single-handled jugs, twin vessels, and bell-shaped lids. The influence here is evidently Early Helladic. Diverse other objects were found with this pottery, including several large flint daggers, pedunculate arrows, and a small copper dagger. A similar necropolis, discovered on one of the Apennine passes in the district of Santa Maria delle Grazie, near Mirabella Eclano, forms a link between the Tyrrhenian Gaudo facies and the contemporaneous Apulian facies, documented by the collective tombs of Andria, Gioia del Colle, Selva di Matera, and Cellino San Marco, near Brindisi. Here the prevailing types are pear-shaped pots decorated with minute impressions, with rows of small cones in relief, and also with incised patterns, generally arranged in horizontal bands (PL. 434).

Also related to the Gaudo culture is the Rinaldone culture, extending over Latium and Tuscany. It is characterized by rock-hewn artificial grotto tombs at Sgurgola, near Anagni; Alatri; Mandela (formerly Cantalupo); Camerata, near Tagliacozzo; Rinaldone, in the Viterbo district; Bardano, near Orvieto; Ponte San Pietro; and other sites near Lake Trasimeno and on the island of Pianosa. (Farther north, pit graves and stone cist tombs are the prevailing types.) The Rinaldone pottery is like the Gaudo pottery, especially in the forms of the flasks, either plain or decorated with a few slightly raised ribs. The handles differ, however, from the Gaudo type; they are not of the ribbon type, but generally tubular or subcutaneous. Stone battle axes appear, and metalwork is represented by flat adzes, knives studded with small nails, and other objects.

In the lower Po Valley there flourished at this time the Remedello culture, named for a burial ground near Brescia which contains over a hundred tombs. The Remedello people observed the ancient burial rites; bodies were buried singly in a crouching position in a simple pit, nearly always with a rich collection of grave goods. The same facies is found in Emilia. Ornamental objects are numerous and various, including a marble cross and star, small steatite disks, and shell plaques and buttons. The most interesting feature of Remedello pottery is the appearance



677

of the bell beaker. The incised and grooved decoration of some vases includes bands of panels in an alternating arrangement of horizontal and vertical segments. This decoration reappears in other areas where the bell beaker is frequent, such as the Fontbouisse culture in southern France. Less is known about the villages of the Remedello culture. The one to which the Remedello necropolis probably belonged seems to have consisted of huts and was surrounded by a ditch and perhaps also by an inner rampart, like the neolithic villages in southern Italy. Other noteworthy sites are La Sassina, near Verona, where fragments of bell-beaker pottery have come to light, and Colombare di Negrar, where rectangular huts were built againt rock cliffs.

It is impossible to separate the Remedello tombs from the villages of the Polada culture, best known for the material recovered from the sites (nearly always lake dwellings and occasionally palafittes) in the natural amphitheater formed by the terminal moraine that bounds Lake Garda on the south, at Polada, Cataragna, Barche di Solferino, Bande di Cavriana, and elsewhere. It has been discovered that the villages of Barche di Solferino and Bande di Cavriana are not built on platforms supported by piles but rather on land reclaimed by covering the sites with tree trunks laid horizontally in crisscross fashion and reinforced by a few small piles on which the huts were probably erected. The pottery is coarse, consisting of cups and jugs; what little decoration there is generally consists of a few horizontal cordons, level with the joints of the handles, or of groups of short vertical ribs. In a finer ware, consisting of blackish vessels with a better and smoother finish, a rather frequent decoration comprises rows of impressed dots and incised geometric motifs; this repertory may have been influenced by prototypes of "Slavonic" pottery. The forms, the types of handles, the techniques, and the decorative motifs closely link the Polada pottery with that of the contemporaneous or earlier cultural facies of peninsular Italy (Ortucchio, Andria, Cellino San Marco) and Sicily (Piano Quartara–Chiusazza and the contemporaneous facies of the Conca d'Oro); this fact demonstrates the peninsular and Mediterranean origins of this cultural complex. The Polada culture undoubtedly had a wide territorial diffusion. In certain areas it lasted even through the subsequent Bronze Age; in a few others it probably lasted until the dawn of the Iron Age.

f. Southern France. The cultural movement that spread from the shores of Anatolia over the whole of the western Mediterranean, bringing with it metal-age civilization, also reached the southern coast of France. It appears likely that it followed a maritime route, passing through Malta and Sardinia. It may also have touched Corsica, an island region hitherto almost entirely unknown from the point of view of prehistory (see MEDITERRAEAN, ANCIENT WESTERN). In southern France, while men continued to dwell in caves, a great number of hut villages sprang up. The best-known of these is Fontbouisse (Salinelles, Gard). The essential funerary symbol of this culture is the anthropomorphic stele, or stele statue, with which must also be associated the aniconic baetuli, possibly originally painted. Caves were used as ossuaries to contain partially cremated skeletons. The cremation rite became common, with the ashes preserved in small cists often associated with sculptured or aniconic steles. In some cases the ashes were placed in natural cracks in rocks and sealed with slabs, but the rock-hewn artificial grotto tomb is also present. The most widely diffused type of tomb, which continued to develop through the successive phases of the Bronze Age, is the megalithic surface monument, built in the form of a simple dolmen, and the *allée couverte*, a number of different groups of which can be identified in southern and western France.

Perhaps one of the oldest, as well as one of the richest, of these groups comprises the magnificent *allées couvertes* of Castellet, near Arles. These are wide galleries carved in the living rock, covered with enormous slabs, and sometimes flanked by

Western Mediterranean megalithic tombs. (*a, b*) Antequera region (Málaga), Cueva del Romeral, plan and section (*from L. Pericot Garcia, La España primitiva, 1950*); (*c, d*) Minorca, Rafal Rubí *naveta* (*from J. Hernandez Mora, Menorca prehistorica*).

funerary cells and surmounted by a barrow with a dolmen. The greatest diffusion of this type of monument is, however, found in the uplands of the Gard and Hérault departments and on the Grands Causses in the departments of Aveyron and Lozère and in the northern part of Hérault. The material found in the tombs does not differ from that found in the villages and caves of the same region. Metal artifacts include adzes, small daggers, olive-shaped or biconical beads, small spirals, and, later, large pins with heads twisted or hammered into disks, trefoils, and other shapes. In the Arles dolmens even gold is found. Pottery shows a great variety of decorative techniques. During the earliest phase there appears to have been a survival of Chassey traditions, including scratched decoration, as well as the initiation of new techniques. These include clusters of grooves or incised lines. The motifs are arranged in simple horizontal bands of lines or in angular groups (chevrons) and in metope panels with alternating clusters of vertical and horizontal segments. Of particular interest is a design of concentric semicircles hanging like festoons, perhaps having a sacred meaning. There are also rows of cones of about the size of a lentil, obtained by boring the wall of the vessel from the inside. Precedents for this technique are found at Orchomenos, at Cellino San Marco (near Brindisi), in Malta, in Sardinia, and elsewhere. The bell beaker, of Iberian origin, is relatively little diffused. A noticeable difference occurs in the large *allées couvertes* of the Audes, which sometimes are as much as 45 ft. long and furnished with very rich grave goods, including gold objects. Here bell-beaker pottery predominates, accompanied by all the artifacts usually found with it. The Aude tombs appear to be an extension of the Iberian cultures. The small dolmens of Roussillon, perhaps much later and less rich, actually form part of the Pyrenean megalithic orbit. Another well-defined group is in the southwest and consists of the *allées couvertes* of La Halliade, Taillan, and other sites,

containing deep double-cone cups with three, four, or even more small feet (polypedal vases). It is not difficult to follow the route of their diffusion from the eastern Mediterranean via Sardinia. The pottery with eye decoration, from the Peu Richard site in the Charente-Maritime, has clear links to Sardinian and Maltese prototypes.

Luigi BERNABÒ BREA

g. Spain (the Almería and Bell-beaker cultures). The early metal age cultures that spread across the western Mediterranean exhibit some of the same essential characteristics found in the older Aegean-Anatolian Bronze Age cultures in Malta, Sardinia, Sicily, and southern Italy. The chief features are the diffusion of collective rock-hewn or surface graves, more refined stoneworking techniques, and the appearance of copper tools and utensils, as well as the schematic idols. In Spain these developments, undoubtedly of Mediterranean origin, seem to have assumed a preeminence particularly evident in the megalithic technique of building with great stone blocks or slabs placed in juxtaposed and superimposed courses. This construction is found especially in burial galleries and chambers. Such megalithic structures are diffused over almost the entire peninsula, with the exception of the central-eastern region, and have their epicenter in southwestern Iberia, although this is perhaps not their original nucleus, as has been suggested. However, the technique and spirit of these structures are common to a far vaster geographical area, embracing not only the western Mediterranean but the whole of western and northern Europe as far as the British Isles and Scandinavia (see EUROPEAN PROTOHISTORY). Nevertheless, it would not be appropriate to define the Iberian aëneolithic cultures as "megalithic" cultures; it is, moreover, difficult to apply the criterion of megalithic construction as a distinguishing factor among certain cultures.

In Spain there is, at present, no precise method of defining the sequence of cultural phases from the Neolithic to the late Bronze Age or the environmental relationships of the various cultures. The stratigraphic study of inhabited sites has barely begun, and much of the most circumstantial data on the material is provided by the tombs. The Almería zone in the southeast, with its vast, fortified settlements and its grandiose necropolises rich in funerary monuments (particularly Los Millares and Almizaraque), manifests an intensive and relatively well-defined concentration of cultures spanning a long period of development. The earliest innovations that penetrated this region from the east by a maritime route were superimposed on the local neolithic cultures, dominated by the cardial ware mentioned above, and were partly characterized by elements in common with the North African shores of the Mediterranean (whence the term "Hispano-Mauretanian cycle," applied by some authorities to this substratum). The appearance of metalworking, of schematized idols (PL. 432), of incised-bone and terra-cotta plaque-idols, of smooth pottery with predominantly spheroidal shapes, and of pit or cist graves with stone circles characterize the first phase of the Almería culture, represented at El Garcel, at La Gerundia, and in the burial areas of Loma del Jos, La Pernera, and Cerro de las Canteras. This was followed by the first phase of Los Millares, in which funerary architecture was developed into the form of megalithic gallery graves ending in a round cella covered with a false dome (FIG. 671). This type of tomb was undoubtedly inspired by the tholoi of the eastern Mediterranean [see above, *Individual neolithic cultural areas: a. Western Asia (Neolithic and Chalcolithic)*]. Grave furnishings became extraordinarily rich, especially in ornamental objects. A new type of incised pottery appeared, decorated with bands of straight or wavy lines, circles edged by radiating lines, eyes, and schematized figures. There are also protuberances and other elements executed in relief. The high point of the Los Millares phase is characterized by the great increase in size and complexity of the plan of the sepulchers. To this period also belong the monumental pillared gallery tombs found in the Málaga zone and in Andalusia, such as the Cueva de Menga (PL. 431), the expanded form of which anticipates the subterranean and surface *naveta* (or *naus*) tombs of the Balearics. The bell beaker also appears in the Almerian cultural complexes.

The Almería culture extends along the eastern coast of Spain as far as Catalonia, but without the megalithic architecture that is found in the interior and in the western part of the Iberian Peninsula. There it is accompanied by some of the elements found in the Almería zone, especially plaque-idols incised in the unmistakable Geometric style of the Spanish Aëneolithic, together with the eye motif. Another coeval megalithic province exists in the north, in the Pyrenean region, but its characteristics are more archaic and simple than those of the east and south.

At the same time, over the greater part of the peninsula, another very important cultural phenomenon was taking place: the diffusion of the bell beaker, accompanied by certain other elements such as small plaques (probably erroneously believed to have been intended to protect the wrists of archers) and buttons with V-shaped perforations. Bell-beaker pottery is characterized by a rounded base and a flaring mouth. This form is found not only in the beaker (PL. 432) but also in broad, low vessels (*cazuelas*). Simple hemispherical bowls also appear. None of these vessels have handles. The most characteristic element is the decoration of minute impressed or incised lines in straight horizontal or zigzag bands, with dots or cross-hatching, somewhat resembling fine basketry. The prototype of this bell-beaker decoration is undoubtedly to be found in impressed pottery, particularly in the most evolved cardial decoration of the Iberian neolithic substratum, rather than in Almerian incised pottery. Bell-beaker pottery became predominant during the most advanced phase of the Spanish Aëneolithic. In some areas it is associated with megalithic architecture; elsewhere (e.g., in much of the eastern part of the peninsula) it appears independently; but it is diffused over a very wide area even beyond the borders of Spain. In one direction it extends to the Mediterranean, to the Balearic Islands, Sardinia (in the Anghelu Ruju culture), western Sicily, central Italy, and northern Italy (in the Remedello culture). In another direction it spreads north to France, the British Isles, central Europe, and Scandinavia. It has been suggested that this very wide cultural diffusion, presumed to have had its epicenter in Spain, was the result of vast migrations and conquests on the part of the bell-beaker bearers; this hypothesis is as yet unproven (see EUROPEAN PROTOHISTORY). The culminating Bell-beaker phase occurred at the beginning of the 2d millennium B.C.

* *

The late Bronze Age and the transition to the Iron Age: a. Sicily. In the Lipari Islands, the Capo Graziano culture was succeeded about 1400 B.C. by a culture known as Milazzese (from the promontory on Panarea), characterized by villages consisting of oval huts, sometimes with an adjacent rectangular enclosure. The builders of these villages chose locations that were difficult of access but easily defensible (Panarea, PL. 437; Portella on Salina), or they continued to inhabit locations where villages had been built during the preceding era (Castello di Lipari, Capo Graziano on Filicudi), provided these locations seemed strong enough to withstand an enemy attack. Milazzo, on the north coast of Sicily, also belongs to this facies. There a necropolis has been discovered in which the dead were buried in a crouching position within great pithoi, probably covered by stone barrows. This manner of burial had been very widely diffused since the beginning of the Bronze Age in Anatolia and in the Aegean, where the necropolis of Nidri on the island of Leukas provides the closest comparison to the Milazzo necropolis. Finds of Mycenaean pottery (Late Mycenaean III*a* 2, 1400–1300 B.C., and, more rarely, III*b*, 1300–ca. 1230 B.C.), including a small idol, and a necklace of vitreous paste beads (undoubtedly imported) found on Salina provide the proof of continued and active trade relations with the Aegean area. A particularly interesting fact is the presence on local pottery of potters' stamps and marks that sometimes reproduce the symbols of Minoan-Mycenaean linear script. At this time there were also numerous importations of typical Apennine pottery from the Italian peninsula (see below, *The Apennine culture*).

Flourishing in Sicily during this period was a culture known as Thapsos, which succeeded the Castelluccio culture. It is

best known from its necropolises of rock-cut oven tombs, identical with those of the preceding phase. The majority of them are found in the country around Syracuse, but the Thapsos culture area also extends to the Etna region (e.g., Naxos and Paternò) and to the Agrigento district (Caldare). In western Sicily only a few traces of the Thapsos culture have been found (Mangiapane cave, near Custonaci). The inventory of the grave goods (e.g., swords, bracelets) shows a much larger diffusion of bronze than in the previous facies. Numerous imported Mycenaean vases are present, and an ivory comb and necklaces of faïence beads have also come to light. These objects belong to the Mycenaean III*a* 2; only a very few pieces may be attributed to Mycenaean III*b*. There are no traces of contacts between Sicily and continental Italy. On the other hand, the necropolises of the Syracuse district contain a great deal of pottery identical with the ware of the Borg in-Nadur culture of Malta. The forms are generally vessels in a truncated-cone shape on a high truncated-cone foot (having, therefore, the form of an hour-glass), single-handled jugs with spherical bellies and strong truncated-cone necks. The clay is reddish in color, and the decoration is rather monotonous, consisting of bands of fine lines incised parallel to the rim or forming large chevron patterns on the walls.

In the course of the 13th century B.C. a radical change occurred in the cultural evolution of Sicily and of the Lipari Islands. The very foundations of the social and economic organization seem to have changed. The relations that had linked these regions with distant Mediterranean countries were apparently broken off. The villages of the Milazzese period were evidently destroyed and never rebuilt. It is probable that these changes were brought about by the arrival of new peoples from the Italian peninsula: the Ausones mentioned by Diodorus Siculus. At the Castello of Lipari there appeared a culture entirely different from its predecessor but similar to the Sub-Apennine culture of continental Italy. The pottery is distinguished by the quantity and variety of terminals or projections (in the form of small upright cylinders, double cylinders, horns, axes, and volutes) on the handles of the carinated bowls. Also very common are situlae decorated with a cordon and four small tongue handles around the rim. This first facies of the Ausonian culture (Ausonian I) seems to have lasted only a short time, probably not longer than a century. The presence of a few rare shards attributable to Mycenaean III*b* establishes the date of the beginning of the facies as not earlier than 1250 B.C. One may suppose that it lasted at least until 1150 or 1100 B.C. The second phase (Ausonian II) presents a far richer and more complex cultural heritage. In the pottery, frequently of a shiny reddish as well as of a blackish color, the projections on the handles disappear almost entirely; only the horned type remains, assuming the form of an animal protoma. New types appear, for example, a cup with an inturned rim and a single arched handle, typically Villanovan features. There is also a type of decoration consisting of grooves, often associated with raised pellets surrounded by semicircular grooves. Two classes of painted pottery appear; one has simple geometric motifs in brown on a yellowish ground; the other has a decoration which may be termed "plumed." The Ausonian period is known from its necropolises as well as from its dwellings. The Lipari necropolis has cremation burials, in which the ashes are preserved in large situlae, always without grave goods, along with inhumation burials consisting of large jars, sometimes enclosing a rich inventory of grave goods: necklaces made of amber, vitreous paste, and rock crystal; gold wire bracelets; and leaf fibulas with either a stilted or a simple bow. A continental type of fibula with a looped bow is related to the fibulas found in the Terramare cultures of the Po Valley, in the Peschiera del Garda palafitte dwellings, and in the proto-Villanovan deposits. In Milazzo, which undoubtedly lay within the Ausonian cultural orbit, a cremation necropolis has also been discovered. It is probably of a more evolved type; the urns, which are covered with pebbles, are of a definitely proto-Villanovan type.

In Sicily, too, after the Thapsos period, the populations abandoned the coastal regions and took refuge in the less accessible hill country. New settlements sprang up at Pantalica (from which the new eastern Sicilian culture took its name), Cassibile, Caltagirone, Monte Dessueri, and elsewhere. Sicilian culture of this period was still based on Mediterranean traditions, and tombs were still of the rock-cut grotto type. At Pantalica, Cassibile, Monte Dessueri, and elsewhere they are gathered in vast necropolises like huge honeycombs cut from the precipitous faces of the cliffs that surrounded the settlements. Household objects such as pottery and bronzes are of types altogether different from the contemporaneous objects of peninsular Italy. In some cases they show close similarities to those of Mycenaean III*c* (ca. 1230–1100 B.C.). The evolution of the Pantalica culture can be traced through several centuries. The first phase (Pantalica Nord, or Pantalica I, ca. 1230–1000) is documented in the north and northwest necropolises of Pantalica, the Caltagirone necropolis, and a number of tombs at Monte Dessueri, by a fine glossy red pottery in which very high tubular feet are common (PL. 437). Some of the forms are of evident Mycenaean derivation; the bronze pieces, too (mirrors, knives, daggers, fibulas with "violin" bows or simple bows), are often of Mycenaean types. In the second phase, which began perhaps about 1000 B.C. (necropolises of Cassibile and Calcarella di Calascibetta, and some of the Monte Dessueri tombs), the red pottery gives way to a painted ware with characteristic "plume" motif. The typical bronze forms include the fibula with a stilted elbow bow and the small knife with a loop handle. Some identical forms are found in the Iberian Peninsula, and some have even come to light on the Atlantic coast of France and in the British Isles. This is the period in which Phoenician commerce dominated the western Mediterranean and extended even beyond the Pillars of Hercules. The third phase (Pantalica Sud, or Pantalica III; Cavetta, and Filiporto necropolises) shows evident influences of the Greek Geometric style. The typical fibula has a small looped bow, which in time is made smaller, while the pin is longer and curved. This phase probably embraced the end of the 9th and the first half of the 8th century B.C. The majority of the tombs in the Finocchito necropolis and all those at Tremenzano and Noto Antica belong to a fourth phase, the Finocchito period, which is contemporary with the foundation of the Greek colonies on the coasts of Sicily. A good many Greek objects (or objects of Greek type), such as small proto-Corinthian vases, now appear. A type of painted pottery developed locally, in imitation of sub-Geometric Greek types. An incised ware was also developed with a Geometric repertory. The fibulas have a long catchplate. Ornamental bronze objects abound, including rings, chains, pendants, and beads for necklaces. And here, for the first time, iron objects appear.

During the Iron Age there developed very profound differences between the cultures of eastern and western Sicily. The southeastern facies of Cassibile, Pantalica Sud, and Finocchito corresponds to a facies in central and western Sicily known as the Sant'Angelo Muxaro culture, named after its largest center, in the province of Agrigento. The town of Sant'Angelo Muxaro may possibly have been the legendary Kamikos, mentioned by Herodotus as the citadel of King Kokalos, where Daidalos found refuge after his flight from Crete and where King Minos, who had pursued him there, met his death. Of the two great ethnic groups, Siculi and Sicani, whom the Greeks found in divided possession of the island in the second half of the 8th century B.C., the Siculi may be recognized as the bearers of the Cassibile, Pantalica Sud, and Finocchito cultures and the Sicani as the bearers of the Sant'Angelo Muxaro culture.

b. The Apennine culture. The term "Apennine" is used to indicate the culture that extended over the entire Italian peninsula, from Apulia to Emilia, probably developing over a long period between the 15th century B.C. and the beginning of the 1st millennium B.C. In its earliest phase, designated as Apennine proper, it is characterized by a type of pottery decorated by incision or intaglio, with bands of dots forming spirals, meanders, lozenges, and crosses. The intaglio is often filled with a colored substance (PL. 438). This type of pottery appears in the Milazzese culture of the Lipari Islands in association with Mycenaean III*a* and *b* pottery and can, therefore, be dated between 1400 and about 1230 B.C. The next phase is represented predominantly by pottery that is undecorated but

has a broad variety of modeled handles. It appears in the Ausonian I period in Lipari and is generally designated as Sub-Apennine. The transition from the decorated Apennine to the undecorated Sub-Apennine, which is seen very clearly in the Lipari Islands, is much less sharply marked in many sites in peninsular Italy, where the settlement continued to flourish without interruption through both phases and through a subsequent transition from the Sub-Apennine to the Iron Age, corresponding to the Ausonian II in Lipari and the first proto-Villanovan urn fields.

A pure decorated Apennine style is found not only in the Milazzese culture of the Lipari Islands but also in the vicinity of Castiglione, on the island of Ischia (where Mycenaean pottery fragments have also been found), and in the Latronico cave (province of Potenza). On the other hand, the late Apennine and the Sub-Apennine are represented in the Nicolucci cave, near Sorrento, and in the Zachito cave (Salerno). The deposits in the Pertosa cave (province of Salerno), at La Starza (Ariano Irpino), and in the Grotta delle Felci on the island of Capri contain material of all these phases as well as post-Apennine. In Apulia the deposit richest in early Apennine material is Coppa Nevigata near Manfredonia. Deposits of the succeeding phase are far more numerous, as at Porto Perone near Leporano (province of Taranto), where Mycenaean III*c* pottery has also been found. Other Apulian deposits include those in the village of Torre Castelluccia, near Pulsano, in the upper layer of the Caverna dell'Erba at Avetrana, in the open-air sites at Bari and Terlizzi, in the Pulo cave at Molfetta, and in the lower levels of Stratum III and in the innermost sections of the Manaccora cave on Monte Gargano. The tombs of this last site have yielded a large number of bronzes. Numerous burials of the Apennine culture have also been discovered in Apulia and in the Matera district. In some cases these are rock-cut tombs, but they are mostly characterized by dolmens. The dolmen appears only in two clearly defined zones on the Adriatic side of the Apennines, and the character of each of these zones is noticeably different. The first group, in the Terra di Bari, comprises a few rather large monuments of the gallery-tomb type, as at Bisceglie (IV, PL. 456), Albarosa, Frisari, Corato, and Cisternino, to which must also be added two dolmens near Taranto, at Leucaspide and Accettulla di Statte. Only the Albarosa dolmen still retains the greater part of the tumulus (specchia) which once covered it. These dolmens have been found to contain Sub-Apennine material. The second group of dolmens is in the Salentine Peninsula; they are generally smaller. Also associated with the megalithic architecture of the Salentine area are the menhirs (*pietrefitte*), although it has been suggested that their origin and use was medieval.

The Apennine culture is found also in the Abruzzi (e.g., in the Valle della Vibrata, in the caves of Sant'Angelo and Salomone, and at Penne). In the Marches the material is very rich, with peculiar forms and decorations. The richest deposit, at Santa Paolina di Filottrano, has yielded some very beautiful decorated ware with the extraordinary and highly complex handles of the older phase, together with Sub-Apennine and post-Apennine material. Pottery of the decorated phase is found at Spineto, at Pievetorina, and especially at Sassoferrato (III, PL. 124). A purely Sub-Apennine deposit is located at Conelle di Arcevia and in the level of the dwellings at Pianello di Genga below the proto-Villanovan necropolis. Later phases are represented in the sites of the Sentino gorges.

On the Tyrrhenian side to the north of Campania, the Apennine and Sub-Apennine cultures have left traces in Latium, in the territories of the Falisci (west of the Tiber) and of the Sabines (east of the Tiber), in Umbria, and in Tuscany. Decorated pottery of the first phase appears in the mountain zone of Tolfa (Pian Sultano) and in the coastal region near Civitavecchia. On the other hand, the Grotta Misa deposit in the Fiora Valley is one of the typical sites of the Sub-Apennine phase. The most important discoveries of the Apennine culture have come to light in the village of Belverde on Monte Cetona, near Chiusi (PL. 438), where it overlies traces of a preceding phase corresponding to the Rinaldone culture, and probably is divided into a series of layers. The stratigraphy, however, is not clear. A considerable amount of pottery appears in various shapes (including large situlae with cordons in relief, large carinated bowls, jars in biconical forms). The decoration is either incised or intaglio and embraces the entire Apennine decorative repertory. Sub-Apennine pottery, with its high handles, is also widely represented. This site was inhabited continuously until the Iron Age (see below).

Farther north the Apennine culture spread up the Adriatic side of the peninsula and extended over Romagna and into the part of Emilia west of the Panaro River. In northern Italy, however, the dominant aspects are those of the Sub-Apennine, which lasted for a very long time and merged with the particular late Bronze Age Terramare and palafitte cultures of these regions.

c. End of the Bronze Age and beginning of the Iron Age in Italy. The situation at Lipari (where the levels of Ausonian I, corresponding to the Sub-Apennine phase on the mainland, lie directly below the completely different culture of Ausonian II) is generally true of the whole of Italy. It was during this period that the rite of cremation became generally diffused. In the cremation burials at Torre Castelluccia, near Taranto, the ashes were preserved in situlae or in biconic jars covered with carinated bowl-shaped lids, also containing bronze objects similar to those found in the necropolis of Lipari. A short distance inland is the necropolis of Timmari (province of Matera), an urn field identical to the one at Milazzo in Sicily and therefore perhaps only very little later than the Torre Castelluccia necropolis. The necropolis of Timmari belongs to the type known as proto-Villanovan, which is diffused over the whole of Italy as far as the Po Valley. This proto-Villanovan type can be recognized in the oldest group of tombs in the Tolfa region (Sasso di Furbara, Tolfa, Allumiere), in the Fiora Valley (Ponte San Pietro), in the Grosseto district (Sticciano Scalo), at Pianello di Genga in the Marches, at Bismantova (province of Reggio Emilia), and at Fontanella di Casalromano (province of Mantua). Information on this culture, especially with regard to bronze household objects, is broadened by the very rich deposit of Coste del Marano in the Tolfa region, including hammered bronze cups with handles in the form of a bull's head and splendid fibulas with leaf bows (PL. 438). The cinerary urns, deposited in small wells and often protected by stone slabs or revetments, are decorated with grooves and cupules; the lids are shaped like a cup with a reentrant rim — a type that was to be widely diffused during the Iron Age. Among the bronze grave goods are fibulas with simple bows and rectangular razors with a double cutting edge.

There is no doubt that the proto-Villanovan culture represents the advent of new elements that were foreign to the preceding Apennine cultures and of European rather than Mediterranean origin. Possibly the arrival of this new culture was connected with contemporary political events, but there is no evidence to suggest that all the elements appeared suddenly or in a single period, or that a clean-cut break occurred between the new culture and the old, nor can it be proved that the proto-Villanovan marks the arrival of a large mass of new people. Nevertheless, the cultural development corresponding to the diffusion of cremation necropolises is reflected in the types of settlements, particularly in the Marches and in Apulia (where production of a type of painted pottery in the Mycenaean tradition and, later, reflecting the Geometric style, continued). At Casa Carletti in the Monte Cetona district, the Sub-Apennine culture also appears to have undergone a transformation. During this period the high raised handles on various types of pots gradually went out of use and handles assumed the shapes of horns or crescents. There was also an increase in the number of figural elements of modeling.

As outlined above, the Sub-Apennine cultural current spread in northern Italy as far as Emilia. Its influence was diffused also across the Po. The palafittes at Peschiera and on the eastern shore of Lake Garda are of particular interest because of the great quantity of bronze objects they contained. These include violin-bow fibulas (one of which is plated with gold), razors, adzes, and many small knives. There is also a wide variety of large pins and hairpins. There is a close connection between these bronze objects and those found, for example, at Scoglio

del Tonno near Taranto (of uncertain date because of the lack of stratigraphical data). A comparison with bronzes from Pantalica Nord and from the tombs of Torre Castelluccia and Lipari justifies attribution of the Garda material generically to the Sub-Apennine phase. Nevertheless, the pottery associated with the Garda bronzes, with its grooved decoration, would seem rather to suggest a period at the very end of the Sub-Apennine and close to the time of the diffusion of the proto-Villanovan necropolises.

On the other hand, the identity of types of these bronzes shows that the Peschiera palafittes were contemporaneous with the larger complex of the Terramare, the prehistoric settlements in western Emilia and immediately adjacent territories, where a specialized and more complex structural system, differing from the rest of Italy, existed — or was formerly believed to have existed. These settlements presumably consisted of palafitte dwellings surrounded by a rampart and a moat, laid out on a remarkably regular plan with a fixed orientation. (This was probably the case only in the Castellazzo di Fontanellato site.) A complex pseudohistoric theory, with no sound basis of fact, was evolved about the Terramare, whereby the settlements and their inhabitants were regarded as the forerunners of Italic and Roman civilization. In actual fact the prehistoric sites of the Terramare region (in the provinces of Modena, Reggio Emilia, Parma, Piacenza, and adjacent areas) present a ceramic facies noticeably different from that of the Sub-Apennine sites of eastern Emilia. The handles are more uniformly elevated, the decoration consists of grooves and protuberances, and the technique is generally coarse. This would indicate that the majority of the Terramare material belongs to a chronologically later phase than the Sub-Apennine phase. One cannot, however, exclude the possibility of an earlier development of the Terramare sites, as suggested by the presence in some of them of bronzes that are of earlier types than those of the Peschiera phase (e.g., at Castione dei Marchesi) and especially of pottery of a strictly Sub-Apennine type. Similar occurrences can be noted in Lombardy, where a phase corresponding to the Emilian Terramare overlies the Bronze Age Polada culture. Here, as in the Lake Garda region, palafittes are found.

In the Po Valley, too, one of the most salient characteristics of the late Bronze Age is the diffusion of the new rite of cremation. The oldest group of cremation burials seems to be the one represented by the necropolis of Canegrate near Legnano. The biconical urns, with wide necks generally sharply distinguished from the shoulders and with broad rims, are always decorated with grooves. The decoration is, however, rigidly limited to the shoulder; the motifs of vertical broken lines or of horizontal bands of grooves, sometimes interrupted by small circles or large cupules, clearly differ from the decoration that characterizes the later Terramare and proto-Villanovan production. There is no doubt that this finer and more elegant pottery represents an entirely new element in northern Italy; it gives the impression of an intrusive element from beyond the Alps. In the eastern part of the Po Valley, the earliest burial ground is perhaps the necropolis of Povegliano Veronese, where the dead are inhumed with daggers or long swords at their sides. There are also some cremation tombs. This necropolis is followed, in order of time, by the neighboring necropolis of Bovolone, where cremation prevails with globular groove-decorated urns. Of a similar type are the necropolises of Monte Lonato at Cavriana (province of Mantua) and of Castellazzo di Fontanellato. The adjoining settlements belong to the same period. The necropolises of Ascona (in the Ticino canton, Switzerland) and of Fontanella and Bismantova (mentioned above) are unmistakably proto-Villanovan.

The cultures of the Iron Age in continental Italy show clearly defined regional differences corresponding to the groupings of historic peoples (see ETRUSCO-ITALIC ART). These cultures developed, presumably from the 9th century B.C. onward, on this complex, and not yet entirely clarified, basis of events and currents. In the south the Sub-Apennine tradition, with a few intrusions from the outside, seems to evolve without any noticeable upheavals into the cultural facies of the Iron Age in Apulia, Calabria, and Campania, where inhumation was prevalent. Central and northern Italy underwent a proto-Villanovan type of evolution, relatively uniform throughout its extent, within the increasingly divergent structures of the Villanovan Latian, Umbrian, Atestine, and Golaseccan cremators. This more or less confirms an interpretation of the proto-Villanovan as a phase or as a cultural mode, rather than as an ethnic unity. The counterblows represented by the Greek colonization of southern Italy and Sicily and the rise of a new urban civilization mark the progressive transition from the protohistoric to the historic era.

Luigi BERNABÒ BREA

d. The western Mediterranean. The distribution, sequence, and characteristics of the Bronze Age cultures in the western Mediterranean are, as yet, far from clear. Nevertheless, these phases, with the exception of their final manifestations in Sardinia and in the Balearic Islands, do not seem to present any very significant developments, any remarkable originality, or any particularly creative effervescence in either civilization or art, in comparison with the preceding phases of the beginning of the age of metals. In many places traditions of the earlier period — such as megalithic construction, certain aspects of pottery, the ways of life, and the religious beliefs — seem to have continued long into the second millennium B.C. On the other hand, the influences of Aegean shipping and trade, which, particularly in the late Mycenaean period, acted so strongly on the coast of southern Italy, Sicily, and the Lipari Islands, reached the countries of the western Mediterranean only rarely or indirectly and in some regions not at all. The increasing development of metalworking in the production of weapons and tools was a distinguishing mark of the Bronze Age. This particularly affected the West in two ways. One was the gradual establishment of relations with the Atlantic regions, along the trade route for tin from the British Isles; the other was the presence in Sardinia and in Spain of large deposits of metals, destined to be exploited to an increasing extent, especially during the late Bronze Age and in the historical era.

An initial cultural phase of the Bronze Age, following the Aëneolithic, is only barely noticeable in Sardinia in the middle centuries of the 2d millennium B.C. (Bonnanaro culture). Knowledge of its relationship with the nuraghic culture is still very uncertain. In Corsica, southern France, and Pyrenean Spain, megalithic traditions continued through the early phases of the Bronze Age. In southeastern Spain developed the El Argar culture (PL. 436), the reflections of which are diffused in the Iberian Peninsula and also appear in the Balearic Islands. This culture is characterized by the development of metalworking; fine knives and halberds are the most typical forms. Pottery is glossy black, in imitation of metal; it appears in the shape of rounded ollae, generally without handles, or with very small ones, and footed bowls. Decorated pottery is very rare. Parallels with Italian cultures of the early metal age and Bronze Age are tenuous. It is possible that the El Argar culture represents one of the farthest western offshoots of the early Bronze Age Aegean-Anatolian cultural complex (see above, *The Near East; Aegean-Anatolian cultural unity in the early Bronze Age*).

In the late and final phases of the Bronze Age, in the late 2d and early 1st millennium B.C., there appeared the spectacular development of the insular cultures of Sardinia and the Balearic Islands, particularly in architectural forms. In Sardinia, there was also an advanced production in metalwork with figural works of art (PLS. 403, 404). Undoubtedly there was a link between the two zones, manifest not only in the contemporary and parallel development but more specifically in the similarity of certain monumental types, especially the Sardinian nuraghi and the Balearic talayoti, which represent the most typical elements of the respective architectures. The diffusion of these types of architecture also reached southern Corsica. Nevertheless, a true cultural unity did not exist. The Sardinians elaborated their own structural themes very intensively, notably the false vault and the false dome (PL. 402). In the Balearic archipelago appear peculiar architectural forms (*navetas*, taulas, and hypostyle halls) that are not found elsewhere (PL. 406). It is possible to find prototypes of many of these architectural motifs in both Mediterranean cultural traditions and in western megalithic

phases. The essential imprint of both the Sardinian nuraghic and the Balearic talayotic cultures is found in the forms created in the cultures of the Bronze Age. Iron Age features, such as geometric decoration, fibulas, and cremation, are all but unknown in the islands. Chronologically the high point of these cultures must be placed within a period corresponding to the Iron Age and the beginning of historical times, in the Phoenician-Punic and Greek colonizations, between the 9th and 7th centuries B.C. They survived until the periods of Punic domination and the Roman conquest (see MEDITERRANEAN, ANCIENT WESTERN).

The introduction of objects of northern European origin into Spain (during the period of the Atlantic Bronze Age culture, 1100–800 B.C.) and the Balearic Islands in the late Bronze Age can be traced to the commerce, particularly in metals, between the Mediterranean countries and western and northern Europe by continental routes and along the Atlantic coast. The most important development in continental Europe during this period is the diffusion of the urn fields along the French and Spanish Mediterranean coastal regions. This occasioned profound changes, not only in the traditions and rites of the burial of the dead, but also in the types and forms of artifacts, especially pottery and its decoration. The earliest cremation necropolises in these territories are related to the central European phase known as Hallstatt B, dating from the 8th century B.C. Their appearance here is chronologically much later than that of the parallel occurrences in Italy. This may be explained by the greater distance of the southern French and the Iberian regions from the epicenter of the diffusion of the Urn-field culture, the Danubian region of central Europe (see EUROPEAN PROTOHISTORY). In Spain, these new cultural elements, and possibly also new ethnic groups, were introduced through Catalonia, where the oldest cremation burial grounds (Tarrasa type) are found. The eastern and southern coastal regions were, however, soon subjected to other external influences due to Phoenician colonization (apparently particularly early in the south) and Greek colonization (at least from the 7th cent. B.C.), superimposed on the older local cultural traditions. The melding of all these elements marks the beginning of the Iron Age culture in Mediterranean Spain and prepares for the development of the civilization known as Iberian (see MEDITERRANEAN, ANCIENT WESTERN). The continental European elements, represented by the penetration of the Celts, found a particularly favorable and receptive soil for subsequent cultural development in the interior and the western part of the Iberian Peninsula. Here the native and the imported elements combined to constitute one of the most characteristic provinces of Celtic civilization (see CELTIC ART).

MEIDIAS PAINTER. The name of the potter Meidias (Μειδίας), who signed the famous Attic hydria in London with the double-tiered representation of Herakles in the Garden of the Hesperides and Castor and Pollux carrying off the daughters of Leukippos (PL. 439), is also used to designate the anonymous painter of this vase. To the same artist, the most important Greek "mannerist" vase painter, active at the very end of the 5th century B.C., have been definitely attributed fourteen other vases: four hydrias, one pelike, one oinochoe, four lekythoi, two lekanai, and two pyxides. The name of the Meidias Painter is associated with a decorative and linear taste, a refined and somewhat affected style that was taken up by followers more or less direct in their imitation. Not only did this manner of painting lead to the development of an important school of painters around the Meidias Painter, but in effect it also set a decisive pattern for the ensuing Greek vase painting of the 4th century B.C.

At least a hundred vases have been attributed to artists in this red-figure style. Among these, the forms most used are hydria, lebes gamikos (nuptial basin), oinochoe, lekythos, lekane, and pyxis; the calyx-crater (PL. 440) and volute crater are rare. On the whole, the artists of this manner preferred the more complicated and refined shapes, on which the painter could arrange — using a wealth of figures and delineating graceful gestures and poses — those scenes favored by the general taste of the period. The same qualities of delicacy and grace, as well as a love of minute detail, are found on vases not securely attributable to the Meidias Painter himself but clearly very similar to those of the master. Examples of such include a hydria in Karlsruhe (Landesmus.) and an amphora in Arezzo (Mus. Archeol.) representing the story of Pelops and Hippodameia; in these, however, the draftsmanship is less precise.

On those vases attributed with greater certainty to the Meidias Painter, the subjects are predominantly mythological and derive from the realm of Aphrodite, Eros, and Dionysos that had become so popular in late-5th-century Attica, reflecting the decided change in spiritual and cultural values which had taken place there. The London hydria reveals varied mythological inspiration: the rape of the daughters of Leukippos, Herakles in the Garden of the Hesperides, and an array of Athenian heroes that includes Akamas, Philoktetes, and Demophon. But the artist uses these themes chiefly as a point of departure for presenting a diverse group of nymphs and heroes, whose identities have no real significance other than as pretexts for a composition full of charm and serenity. This relaxed tone extends even to the scene of the rape of the daughters of Leukippos, where the sense of drama is lost in a sinuous arabesque. The

two hydrias in Florence attributed to the Meidias Painter, with the myths of Phaon (III, PL. 375) and Adonis, illustrate his later tendency toward a more complex decorative scheme. The number of characters is increased, and the figures are placed on different levels, following a system to be linked with the Polygnotan tradition. Lekythoi in the Louvre, Ruvo (Jatta Coll.), and London (Br. Mus.) and a pelike in New York (Met. Mus.) present multiple scenes with Aphrodite and Eros or Adonis according to this same system of superimposed levels. Heads gracefully inclined and arms languidly extended affirm the essential mannerism of pose. As in the wedding scenes on loutrophoroi decorated by artists of the school of the Meidias Painter, the stress is upon elegant detail, a quality of graceful linearity appropriate to the amorous themes to which it is applied. It is a draftsmanship that dwells lovingly on particulars, carefully conveying the most minute details, modeling and emphasizing drapery and anatomy, and often adding arbitrary embellishments.

This mannerist current had already found passing expression in the more modest efforts of the Eretria Painter, a predecessor of the Meidias Painter. The original inspiration came from the drapery style of Phidias's figures on the east pediment of the Parthenon, but in succeeding adaptations the harmonious balance of fluid drapery clothing a firm underlying structure in the Parthenon sculpture was gradually weakened. Between the careers of Phidias and the Meidias Painter falls the art of Parrhasios (q.v.), a highly sophisticated painter from Ephesos, who also lent great elegance of gesture and pose to his figures and gave them a psychological intent previously unknown to Greek painting. The work of the Meidias Painter is clearly more frivolous, on occasion even superficial; nor does this artist have the deep interest in mythology of Parrhasios, who dwelt upon the traditional heroic themes. The Meidias Painter did, however, conserve the same fluidity of contour line and the frequent use of foreshortening.

The mannerism of the Meidias Painter and his school represents one of the more refined manifestations of Greek taste after Phidias. Sculpture after Phidias continued to be well served by such original and substantial artists as Kallimachos and the coin engravers Eukleidas and Kimon, whose work is known from Syracusan coinage. The vase painters instead favored less imposing shapes for the vessels themselves and emphasized the "pathetic" emotional quality of the scenes depicted. These changed aspirations were symptomatic of the spiritual crisis that arose in Athens after the Peloponnesian war. In a sense, the scenes illustrated by the Meidias Painter may be said to have taken inspiration from that cultured, highly refined literary tradition which also constituted the basis for the Platonic dialogues on love.

MELANESIA. Melanesia includes all the archipelagoes and islands lying between Indonesia to the west, Micronesia to the north, Polynesia to the east, and Australia to the south. Discovered as early as the 16th century but explored only in the 18th, particularly during Cook's great voyages, this region was called Melanesia from the Greek μέλας (black) and νῆσος (island) because of the dark skin of its inhabitants, reminiscent of that of the African Negroes. It includes, from north to south and west to east: New Guinea (q.v.), Paramicronesia, the Bismarck Archipelago, the Solomon Islands, the Santa Cruz Islands, the Banks Islands, the New Hebrides Islands, New Caledonia with the Loyalty Islands, and the Fiji Islands; geographically, anthropologically, and culturally, the last group represents an area of transition between Melanesia and Polynesia. In a number of these island groups the traditional art production, which flourished almost to the end of the 19th century, still survives in part, especially in the field of wood sculpture (see MELANESIAN CULTURES). The finest Melanesian art is preserved in the ethnographic museums of Europe, America, and Australia. In the modern period, no metropolitan centers or Occidentalizing art trends worthy of mention have developed.

SUMMARY. Paramicronesia (col. 692). Bismarck Archipelago (col. 692): *New Britain and adjacent islands; New Ireland; Admiralty Islands; Saint Matthias and Tench.* Solomon Islands (col. 694). Santa Cruz Islands (col. 695). New Hebrides and adjacent groups (col. 695). New Caledonia and the Loyalty Islands (col. 695). Fiji Islands (col. 696).

PARAMICRONESIA. Stretching westward from the Admiralty Islands is an archipelago of small low-lying coral islands, called by ethnologists Paramicronesia, to indicate that its light-skinned inhabitants, though belonging to Melanesia, are akin to those of Micronesia and Indonesia, if not to those of Polynesia. In its cultures, also, Micronesian and Indonesian elements are clearly discernible. This archipelago forms part of the Trust Territory of New Guinea, under Australian administration. The principal islands are Wuvulu (Matty) and Aua (Dourour), ethnically homogeneous; the small group of Ninigo; the Luf, or Hermit, Islands; and the Kaniet, or Anchorite, Islands. Evidences of the past are lacking, and contemporary art is rather scant; wood sculpture in the round is rare, being found only on Kaniet and Luf. Many utilitarian objects are outstanding for their nobility of form and attractive pyrographic decoration. In the ornamental carving on Kaniet and Luf appears the spiral motif — sometimes even double — which is very rare in Oceania. Outstanding on Luf in the past were the war canoes with incised (spiral) and painted decoration.

BISMARCK ARCHIPELAGO. The Bismarck Archipelago, consisting of over 200 islands and islets, was explored by Dampier at the beginning of the 18th century. It is under Australian trusteeship.

New Britain and adjacent islands. This group includes, in addition to New Britain (formerly Neu-Pommern), the island of Umboi (Rooke) and the Siassi Islands, which form the chief link between the cultures of New Britain and New Guinea because of their situation in Dampier Strait, as well as the French Islands. New Britain is inhabited mainly by sedentary cultivators of Melanesian stock, who in the coastal areas engage in fishing and navigation; the island is very little known, with the exception of the Gazelle Peninsula, which was settled by two interesting pre-Austronesian tribes, the Sulka and the Baining, widely known for their rich art production.

Archaeological discoveries are quite numerous: rock carvings have been found on Umboi, together with three large monoliths (*biak*), to which pig's blood is offered in the course of certain ceremonies; also found in the area were stone pestles and club heads. On the island of Watom, off the New Britain coast, square-heeled axes have been found, together with potsherds, qualitatively akin to those from Kunie (Ile des Pins), near New Caledonia. From different parts of New Britain come prehistoric stone artifacts: pestles, pierced stones, a type of pick, and bowls, found chiefly along the western coastal strip; discoveries from the northwest coast, particularly those from the Baining territory, show Polynesian affinities.

The material culture of the Baining, except for those elements borrowed from the coastal Melanesians, belongs entirely to the pre-Austronesian phase and includes, among others, the crude gable-roofed hut, the stone-headed club, the adz with cylindrical stone blade fitted in a special hole in the shaft, the knapsack of knotted cord, and the simple xylophone. As in nearly all New Britain, here, too, pottery is absent. The high point of Baining art is reached in the masks used in the dance and religious ceremonies (PL. 442). The type of mask varies widely in style, technique, and material and differs from all other Melanesian masks (see MASKS). The masks of the Sulka (PL. 449), on the other hand, seem to resemble closely those of the Duk-duk secret society of the coastal population: they are largely conical and made of plant materials. Also noteworthy are the carved and painted shields of the Sulka, of the Mengen, of the tribes of the South Cape, and of the inhabitants of the nearby French Islands.

Sculpture is comparatively rare in New Britain and is limited

to the human and zoomorphic figures placed on the Sulka masks and to statuettes of a soft tufflike stone, which on the Gazelle Peninsula serve as cult objects of the Ingiet secret society. The decoration reveals influences from New Guinea; the strongest bonds with this island are discernible on Umboi and in the Siassi Islands, where the art of sculpture and woodcarving extends not only to masks and utensils but also to sculpture incorporated in the structure of the cult houses, on the posts of which are depicted combined human and animal figures, in the style characteristic of the island of Tami (PL. 354; see NEW GUINEA). Outstanding among the minor arts are the dance sticks, a number of which reveal the existence of past ties with the Solomon Islands (Buka), as well as the modeled skulls of the Gazelle Peninsula.

New Ireland. Forming part of this area, in addition to New Ireland (formerly Neu-Mecklenburg), are the island of New Hanover or Lavongai, and the smaller islands to the north and east; Tabar Lihir, Tanga, and Feni. After New Guinea, this is the area of Melanesia where the most outstanding art has been produced.

Evidence of the art of the past is fairly plentiful. In a number of places in New Ireland stone bowls and pestles have been discovered. Figures of sharks, in limestone or volcanic stone, come from the southwest coast and the center of the island and seem to have been used in magic rites connected with fishing. A number of petroglyphs with geometric figures (concentric circles) have been observed at Majom, near Kavieng, in the northern half of the island, while a highly stylized bird motif may have come from southern New Ireland. Bowls and pestles from a very early epoch have also been found on Tabar and Lihir and in several areas on New Hanover. On the last island there are many petroglyphs which, according to the natives, are the work of spirits; the carvings include, besides geometric motifs and prints of human hands and feet, human figures and faces, highly stylized and in the form of masks, showing a strong resemblance to present-day local masks.

The most prized contemporary art in New Ireland is the wood sculpture, both figural and decorative, which reaches its peak in the northern part of the island; the production in the southern part is rather modest. Wood sculptures are known as *malanggan* (PLS. 447, 448; see MELANESIAN CULTURES) and include the anthropomorphic statues called *uli* (PL. 448; see ESCHATOLOGY); various kinds of masks, outstanding among them those called *tatanua*, topped by a high crest of coconut fiber; boards carved in openwork and painted; and a number of zoomorphic figures. In addition, there are dance ornaments and objects intended for ritual or eschatological use, such as the *totok* posts, carved in human form but with a face like the snout of a crocodile. Sometimes carved, at least in part, in an openwork technique that gives them an extraordinary lightness, all these sculptures are further embellished with brilliant colors.

Produced in the southern part of the island are chalk figures, called *kulap*, which are carved in honor of ancestors. In the north, decorative styles predominate, with an abundance of utilitarian objects, ornaments, ornamental house posts, ceremonial planks, and other forms; the principal decorative motifs are the saw tooth, the chevron, and the herringbone, as well as quatrefoil motifs, possibly derived from plants. Deserving special mention are the splendid pectoral ornaments, called *kapkap*, carved from Tridacna (giant clam) and tortoise shells.

Admiralty Islands. This group includes a series of smaller islands lying south and east of a main island called Manus, which is also the name of the light-skinned people who live in houses built on piles along the coast and on the reefs. In the interior of the main island are the Usiai, who live in houses on the ground level; the Matankor represent an intermediate stage between the two groups.

Archaeological material is limited to a modest rock art (hand- and footprints, crocodiles, turtles, sun, and moon) near Tingou, in the interior of Manus, from which also come receptacles made of volcanic stone, spearheads, axes, and other objects.

Contemporary art, of which the Usiai are the real exponents, includes admirable works; the fine workmanship is reminiscent partly of the Tami, partly of the *korwar* style (see NEW GUINEA), but affinities with the Solomon Islands are also present. Preeminent in the field of sculpture in the round are the ancestor figures, of small size and usually naturalistic. The high point of this art is reached in the decorative woodcarving (human figures and crocodiles) and in wooden containers, sometimes of gigantic size and at times in the form of animals, with spiral or anthropomorphic handles in openwork (PL. 452). Also outstanding are the ladles, spatulas, and gourds for betel, with poker work, the ornaments, combs, slit drums, and weapons, and the objects modeled from the pulp of the Parinarium nut. The few pottery vessels are undecorated.

Saint Matthias and Tench. Because of their geographic isolation and consequent lack of outside contact, these two islands have retained several archaic cultural traits and have assimilated few important cultural elements from the adjacent archipelagoes. However, a number of manifest similarities prove beyond question the existence of relations with the Admiralty Islands and New Ireland.

Contemporary art excels in the decorative ornamentation of the posts and gables of the chiefs' houses, in zoomorphic sculpture (on Tench, two anthropomorphic figures also have been found), and in the decoration of objects with shell inlay.

SOLOMON ISLANDS. Discovered in 1567 by Álvaro de Mendaña de Neyra, subsequently forgotten, and rediscovered by Bougainville in 1768, this archipelago includes a large number of islands, many of which — Buka, Bougainville, Choiseul, Guadalcanal, Malaita, New Georgia, Nissan — have very distinctive art. The northwestern portion of the archipelago is administered by Australia as the Kieta district of the Territory of New Guinea; the remainder has been a British protectorate since 1893.

Throughout the archipelago there are striking reminders of the past, particularly the stone artifacts (bowls, pestles, and adz blades), figural in some instances, such as two turtle-shaped vessels from Vella Lavella (New Georgia), probably from some pre-Melanesian phase, and the pestles of San Cristobal, some of which terminate in the head of a bird or snake. On this last island can be seen menhirs and dolmens, as well as fine stone sculptures, sometimes of great size, preserved within the meetinghouses; the earliest are of diorite, the later ones of limestone. Outstanding are the sarcophagi carved in bas-relief, discovered on Choiseul (see ESCHATOLOGY; MELANESIAN CULTURES). Because of the vast extent of the Solomon Islands, contemporary art is not homogeneous; even from the anthropological standpoint, the most striking contrasts are apparent between the very dark-skinned Melanesian groups and other lighter-skinned ones who reveal extensive infusion of Polynesian blood. Each island has developed its own type of material culture, but the artistic craftsmanship of each object, even those intended for ordinary use, the weapons, ornaments, and ritual objects, everywhere is of an exceptionally high level. Architectural sculpture is lacking, as is sculpture relating to the cult of the dead; masks are confined largely to the northern islands, from Nissan to Bougainville, and are artistically undistinguished. The shields, found from Choiseul to Guadalcanal, are plaited, those for formal use being inlaid with mother-of-pearl. Anthropomorphic figures are uncommon and are limited to Nissan, Buka, and Bougainville; the depiction of birds (frigate birds) and of fish (bonito; IV, PL. 449) is more widespread. The island of Rubiana is the center for artistically modeled skulls, decorated with delicate inlays of mother-of-pearl.

The working of mother-of-pearl and shells generally, either figurally (VI, PL. 52; see GEMS AND GLYPTICS) for ornamental purposes, or for inlay in wooden figures and containers (PL. 452), attains in the Solomons a perfection reached nowhere else in Melanesia. Geometric motifs are favored in painting, basketry, engraving, mother-of-pearl inlay, and other crafts.

SANTA CRUZ ISLANDS. An archipelago of volcanic origin, administratively a part of the British Solomons, the Santa Cruz Islands have yielded no traces of prehistoric or archaeological art. Because of the location of this group at the northeastern edge of Melanesia, many foreign, Micronesian, and Polynesian influences are evident in the contemporary art. In sculpture, depiction of the human figure is second to that of animals. The finest local art is the decoration of utilitarian and ornamental objects; in this field the Santa Cruz archipelago has developed a highly individual style, especially in the decoration of the wooden dance sticks, painted white, on which the decorative motifs stand out in red and black, as well as in the *kapkap*. Together with a variety of purely geometric motifs, stylized representations of birds with extended wings and of fish (PL. 242) are frequent.

NEW HEBRIDES AND ADJACENT GROUPS. Discovered in 1606 by Pedro da Queirós, the New Hebrides, with the Banks Islands, an Anglo-French condominium, includes some forty islands and islets; the chief ones are Malekula, Espíritu Santo, Efate, Ambrim, Oba (Aoba), Eromanga, and Tana. Archaeological finds are outstanding: on Gaua, in the Banks Islands, have been found stone vessels, regarded as sacred by the natives; on Malo, amulets connected with the fertility of pigs, generally with carved male figures, reclining or dancing, which in the earlier pieces were always in low relief; on Achin, near the northeastern coast of Malekula, stones carved into human faces and figures of sharks, used in rain magic; on Malekula are found monoliths, some of which are phallic and others figural. A variety of stone artifacts (bowls, pestles, phalli, pierced stones, etc.) are found on nearly all the islands in the archipelago. The rare petroglyphs are mostly symbolic geometric.

The New Hebrides are inhabited in certain localities by people of small stature, as well as by the tall dark-skinned Melanesians. In several islands, chiefly in the southern part of the archipelago, an obviously Polynesian strain is evident; in the art this is marked by a total absence of figural elements (statuary, masks, and similar expressions). Conversely, the art of the northern and central islands (Malekula and small islands near Ambrim), including the Banks Islands, is not only rich but exhibits a number of distinctive features, particularly the sculpture carved from tree-fern pith, including ancestor images, either naturalistic or stylized, and posts of emblematic significance (Malekula); the modeled skulls of Malekula; statues to which actual human skulls have been attached; and vertical slit drums, generally carved in the likeness of a human face.

The production of masks is one of the activities of the Suque secret society. Among the outstanding art products are the plaited mats, used for clothing and adorned with lozenges or appliqués in relief.

The art of the Banks Islands, quantitatively rather meager, is notable for the formal beauty of its products, both utilitarian and ornamental: basketry, knives with openwork handles, and bamboo ear pendants.

NEW CALEDONIA AND THE LOYALTY ISLANDS. Discovered by Cook in 1774, New Caledonia is an overseas territory of France, of which the Loyalty Islands (Lifu, Maré, and Uvéa) are an administrative department. Of all the Melanesian islands, New Caledonia is geographically the most isolated and has therefore had virtually no contact, not even ethnological, with the other cultures of Melanesia. Under these circumstances it has been able to develop and conserve, since remote times, a completely autonomous culture, which in its art reveals both its great antiquity and an exceptional expressive power.

Throughout the island there are many remains of ancient settlements, megalithic dwellings in conjunction with which are found large numbers of stone instruments (which in the eyes of the natives are of magical nature) as well as pottery fragments of diverse styles and epochs; these fragments are similar to the pottery of the present-day inhabitants. There are numerous petroglyphs, mostly of geometric motifs between parallel lines like those of New Hanover and those on the Australian rock carvings and churingas (see AUSTRALIAN CULTURES). The rare figural petroglyphs have peculiar physical characteristics, among them long ears, suggesting that they are the work of a people different from the present inhabitants, and thus from an earlier epoch. More modern in character are the rough anthropomorphic limestone sculptures from the Loyalty Islands, which may derive from Polynesian influences: the spherical head, with the face rather realistic but without relief, is barely separated from the thickset trunk carved in the round; the slender arms, raised upward with the elbows sharply bent, are very sketchily treated. The figures end slightly below the navel in a sort of pedestal.

Of special interest in the contemporary art production are the ornamental carvings of the houses, particularly those of the doors, decorated with human faces with characteristic hooked noses, below which the body is represented in completely abstract fashion. Also worthy of mention are the roof spires, of ceremonial nature, representing mythological symbols or figures. The masks, not connected with secret societies, include a vast range of types, the best-known being that with a gigantic hooked nose, very common in the northern part of the island (PL. 443). A connection can be established between this type of mask and the type of money prevalent in the island, in the form of small carved heads having the features of the masks.

Anthropomorphic sculptures in wood are less common. Peculiar to the island are the bamboo carvings of genre scenes, some of which deal with historical subjects and represent a rudimentary form of writing. Other noteworthy products are the jade and shell ornaments and the beautiful jadeite ceremonial adzes.

FIJI ISLANDS. The archipelago of the Fiji (or Viti) Islands, discovered in 1643 by A. J. Tasman, includes over 250 islands and islets, only 80 of which are inhabited. Attached to this group, a British colony, is the remote island of Rotuma; the principal islands are Viti Levu, Vanua Levu, Taveuni, and Kandavu. In its geography, anthropology, and culture, the archipelago forms a zone of transition between Melanesia and Polynesia. The inhabitants exhibit predominantly Melanesian physical traits, but naturally in the small eastern islands more Polynesian blood is apparent than in the large western islands, particularly in Viti Levu and Vanua Levu. It is a historically proven fact that in the pre-European period the Fijians were in continuous contact with Polynesia, especially with Tonga; Polynesian influence on local art production seems particularly strong. With

the sole exception of pottery, which never penetrated farther east in Oceania, all elements of Fijian art are typically Polynesian; examples are the highly advanced technique and designs of the tapa cloth (PL. 458), the carved motifs on clubs and other instruments, the ornamental bindings of beams and supports in the temples and houses, the style of the ornamental objects, and the extremely rare anthropomorphic figures carved in wood or sperm-whale teeth. On certain islands of the group, petroglyphs have been discovered, some depicting turtles, the significance and age of which are still unknown; the ruins of megalithic structures have also been found. In the contemporary art typical Melanesian products are absent. The carved geometric decoration on the weapons and utilitarian objects is restrained but attractive. The typical local pottery is characterized by individual forms painted in monochrome, usually in a greenish shade, with high luster.

Herbert TISCHNER

MELANESIAN CULTURES. In comparison with the other areas of Oceanic art (the Australian, Micronesian, and Polynesian cultures, qq.v.) the art of Melanesia is outstanding in its richness of form and color, figural dynamism, and elaboration of ornament. Superficially it may seem inaccurate to speak of "Melanesian art" as an entity, because each ethnographic region, tribe, or island has developed its own characteristic and unmistakable forms and styles; nevertheless, it is possible to discern in all Melanesian art, despite its infinite variety, a single magico-religious source of inspiration, apparent even in objects such as weapons and implements of a clearly utilitarian nature. Thus the content of the art, even though it is not always readily interpreted, reveals that it has arisen from an integrated cultural milieu. To understand its true meaning, it must be borne in mind that the cultural tradition has been profoundly modified by contact with European civilization. Indigenous Melanesian art is now virtually extinct except in a few isolated or inaccessible places, and even in those a more or less slow process of decadence is taking place.

SUMMARY. General considerations (col. 697). Prehistoric and archaeological art (col. 701). New Guinea (col. 703). Paramicronesia (col. 705). Bismarck Archipelago (col. 707): *Admiralty Islands*; *New Britain; New Ireland; Saint Matthias and Tench.* Solomon Islands (col. 717). Santa Cruz Islands (col. 719). New Hebrides and the Banks Islands (col. 720). New Caledonia (col. 723). Fiji Islands (col. 726).

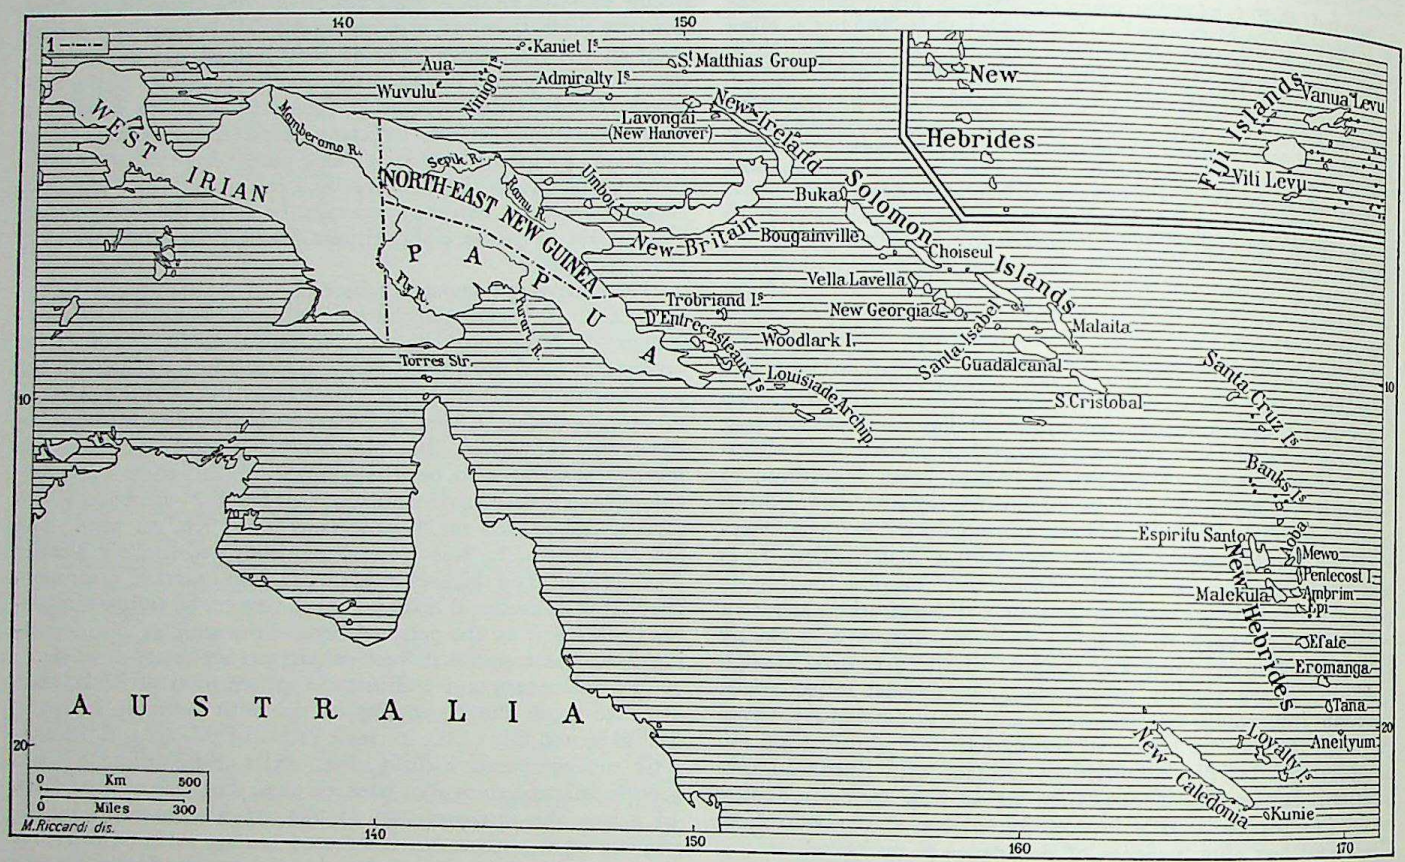
GENERAL CONSIDERATIONS. Among the "primitive" arts of the world, that of Oceania was the last to become known and appreciated in the Western world. The delay in this "discovery" (which was precipitated by the interest of avant-garde artists in the modern European movement) was largely due to the difficulty of understanding, from objects exhibited in museums, the intrinsic character of an art that was profoundly bound up with the magico-religious life and was conceived to be seen in movement, in the course of highly dramatic and dynamic ritual acts.

Among the various arts of Oceania, that of Melanesia is distinguished for its dazzling richness of both form and color, the multiplicity of materials, the perfection of the figural sculpture — both independent and architectural — the extraordinary luxuriant ornamentation of surfaces by means of carving, piercing, inlay, or pictorial decoration, and the abundance of embellishment with feathers, shells, leaves, bark, ivory, or other materials. Melanesian art achieves its highest expression in its sculpture, which is characterized throughout by a vigorous dynamism and a particular method of handling the human figure which tends to distort, twist, and combine it in various ways until it may become completely metamorphosed into ornamentation. Examples of figures that are representational but conceived in a unique manner are the *uli* statues of New Ireland (PL. 448), which are bisexual, in conformance with certain supernatural beliefs; certain figurines from New Guinea and Paramicronesia, which combine naturalistic and vigorously modeled heads with bodies that are disproportionately small or barely suggested and appear to serve mainly as supports; and a number of seemingly realistic representations from the Admiralty Islands, in which particular stress is laid on the ornaments (headdress, distended ear lobes, etc.).

In both figural and ornamental sculpture an extremely strong esthetic sense is apparent in the tendency to combine different figures, colors, and materials; this is especially prominent in the *malanggan* style of New Ireland and in the delicate mother-of-pearl inlays in the wooden sculpture of the Solomon Islands. All Melanesian sculpture tends to produce a strong emotional effect, inspiring wonder, consternation, or repulsion, as in the case of certain masks from New Guinea, New Caledonia, and the Gazelle Peninsula (PLS. 442, 443). A compositional harmony prevails both in the independent figures and in group compositions (though the latter are rare; PLS. 444, 445).

Decorative art appears essentially as a supplement to the sculpture. In contrast to the other areas of Oceania (see POLYNESIAN CULTURES) and also to Negro Africa (e.g., see BANTU CULTURES), here the human figure carved in wood, either in the round or in bas-relief, seems almost subordinate to the plethora of ornament that covers the surface, everywhere interrupting the sculptural planes. The planes are apparently regarded primarily as surfaces to be decorated, in accord with a strongly compulsive horror vacui similar to that found in the wood sculpture of the Maoris in New Zealand (q.v.; XI, PL. 205). The few exceptions to this general tendency, with their slender (PLS. 445, 451) or thickset lines (PL. 448) and marked disproportion between head and body (PL. 445), seem to be isolated instances resulting from the personal bent of the sculptor and departing from the traditional lines of Melanesian art as a whole.

The discovery and enthusiastic appreciation of Melanesian art date from the beginning of the 20th century; however, the understanding of the intrinsic values of this art and the analytic and comparative study of the styles of the different island groups followed somewhat later, through the work of specialists. In a way the interpretation of this art was impeded by the wholehearted enthusiasm it aroused among artists (with psychological implications not based on a true understanding of its genesis, evolution, and significance), and also by the tendency of ethnologists to consider it simply another cultural element in primitive art as a whole, quite apart from its own esthetic and ideological values. Only in recent years have efforts been made to perform studies in depth, at once art-historical and cultural, of this multifaceted art. These studies have made it possible to differentiate independent local styles and trace relations between distant archipelagoes, influences from Indonesia, and in some cases the complete evolutionary cycle of a given style or art form. Decisive influences of natural environment, religion, and economic activity, as well as of the racial make-up of peoples producing the art have been recorded. In a number of localities excavations have been undertaken and finds have been made of art from earlier periods that is totally unrelated to the output of the present inhabitants. Moreover, within the proliferation of local styles, it has been possible to discern the existence of two great artistic traditions, one tending toward dramatic effects and a riot of color, especially prominent in central Melanesia (Sepik River region and Gulf of Papua, in New Guinea; the New Hebrides; certain areas in New Britain), and the other highly decorative and at times extremely delicate, found in the Solomon and Admiralty Islands, but also in the Massim area of New Guinea (FIG. 705) and adjacent archipelagoes. Only New Ireland, with its flourishing local development, represents a unique style unrelated to the two foregoing tendencies. An isolated phenomenon within the frame-



work of the Melanesian is the peripheral art of Paramicronisia, New Caledonia, and Fiji; the last is a Polynesian outpost within the Melanesian cultures, of which, however, it is ethnically a part.

Aside from these general stylistic traits, analysis of the objects has revealed affinities of form and content among widely separated islands, sometimes belonging to different racial and cultural milieus. For instance, there can be no question about the kinship between the figural sculpture of the Sepik River and that of the Gulf of Papua (see NEW GUINEA), between certain parts of New Zealand and Easter Island (see POLYNESIAN CULTURES), nor between the artistic production of the Massim and that of the islanders of the eastern Solomons. Indonesian influences (see INDONESIAN CULTURES), especially from the Moluccas (Spice Islands), are evident in northwestern New Guinea, while in the Paramicronesian islands of Wuvulu (Matty) and Aua (Dourour) influences from the Palau Islands (see MICRONESIAN CULTURES) are apparent.

Notwithstanding numerous specific traits, the essential features of Melanesian culture are those common to the other inhabitants of Oceania: ignorance of writing and metallurgy, up to the time of contact with Western civilization; an economy of early neolithic character based on fishing, farming with a digging stick or hoe, and the raising (though not everywhere) of dogs, pigs, and chickens. Hunting, although more intensively practiced than in Micronesia and Polynesia, is decidedly secondary because of the paucity of big game. Hatchets and axes of polished stone or shell are used for cutting trees and building huts and boats, and for all types of woodworking. The knowledge of pottery is general where the raw material has been available. Weaving is limited to a few marginal areas and has been almost entirely replaced by the production of bark cloth (see TAPA), as in Polynesia.

It is difficult to survey the art of Melanesia in terms of its forms, because large numbers of variants exist within single formal categories, which are in turn determined by environmental, anthropological, social, and religious factors; Melanesian art should rather be treated by large geographical sectors.

Aside from a small number of pygmy tribes who live in the mountainous interior of New Guinea and have no outstanding art production, Melanesia is the home of two large native groups, the Papuans and the Melanesians. The former, who were the earlier group to settle there, occupy the greater part of New Guinea and are present in New Britain (the Sulka and Baining) and in Bougainville (Solomon Islands); their language lies outside the large Austronesian, or Malayo-Polynesian, family, to which practically all the other languages spoken in the archipelagoes of Oceania belong. The latter occupy the remaining area of Melanesia; in certain places they have crossed with the Papuans, in others with Polynesian elements, as has happened, for instance, in Fiji.

Geographical area showing the diffusion of indigenous Melanesian arts. *Key*: (1) Modern national boundaries.

Certain islands of the Melanesian archipelago were discovered in the first half of the 16th century, but only with the voyages of Tasman (17th cent.), Cook, and Bougainville (latter half of 18th cent.) did their cultural traits begin to become known in Europe. Also dating from the later period of exploration is the first appearance in European museums of art objects and other creations of these remote peoples. The earliest specimens preserved in museums and private collections are qualitatively the best; later examples show increasing signs of decadence. In some islands, after contact with Europeans, either the traditional art disappeared completely or there was a shift to standardized production of inferior items designed for the tourist trade.

It has been noted that the content of Melanesian art derived mainly from the religion, principally from ideas pertaining to the ancestor cult; in order to ensure the presence of his ancestor's ghost, the Melanesian prepares a dwelling for the spirit of the dead relative. As in life, so after death, too, the skull in particular was considered the seat of the soul; accordingly, it was modeled and painted and took on the nature of a portrait, the most faithful one possible (IV, PL. 449; see ESCHATOLOGY). These skulls were preserved in special structures, generally

inside the men's houses, together with such other ceremonial paraphernalia as masks, sacred flutes, bull-roarers, and drums (see MUSICAL INSTRUMENTS). Even commoner was the full figure of the ancestor, at first consisting of a body of wood or other plant material, to which was attached the skull of the deceased. Later, the entire statue was carved from wood, the pith of tree ferns, limestone, and other materials. The ancestor figure is an outgrowth of the skull cult; there was a gradual departure from the naturalistic reproduction of the human figure, resulting, in certain cases, in purely abstract decorative forms, except for the head. The Melanesians on certain occasions seek to materialize the ghost of the dead in visible and active form. To this end — particularly during the ceremonies of initiation and commemoration of the dead, but on other occasions as well — they employ various types of masks. During the rites the wearer of the mask loses his own identity and embodies the spirit of an ancestor. The existence of this identification is extremely clear in the case of the rare and definitely archaic masks made from actual human skulls. Also a close connection between the use of masks and the institution of the men's societies is evident virtually everywhere.

The application of figural art extends to most of the implements and objects of everyday use. Not even in this case, however, is the ornamentation an idle decorative adjunct or one of purely esthetic nature; rather, it represents the essence of the object itself, for, according to the Melanesian concept, bound up with the decoration are the forces of magic, which are capable of guaranteeing the efficacy of a weapon or the usefulness of a tool. The decoration was handed down from the ancestor in its particular form, and it must not be altered. Fear of the anger of the spirits of the dead and the desire to ensure their aid and beneficent power, their mana, constitute a strong religious tradition throughout all Melanesia.

PREHISTORIC AND ARCHAEOLOGICAL ART. Scientific exploration of the grottoes, caves, and subsoil of Melanesia may yet turn up some surprises that will permit clarification of the traces of the past: heretofore, what has come to light has been the result of chance discoveries and nonsystematic excavations, and only in the immediate past did the contributions of specialists begin.

Even though the natives deny any knowledge of the origins and creators of the art works from their dim past — frequently objects of veneration — it is plain that most of these works are not very old, some antedating the European discovery by only a few decades. Any general effort to establish a chronological order would be premature, however, though it is interesting to observe that many of the present instruments and, in some instances, certain types of decoration still used by the natives stem from archaeological prototypes. According to A. Riesenfeld and certain subsequent authors, all ancient Melanesian art, including the rock art and pottery, should be related to the great body of megalithic art; actually, this art is the product of migratory waves that varied in composition and period: pre-Austronesian, megalithic, Austromelanid, or Melanesian, to the last of which, it is maintained (A. Bühler), most of the art works mentioned are to be ascribed.

Except for New Guinea, where fairly systematic investigations have been conducted, and the Solomons, where prehistoric lithic art appears to be most highly concentrated, finds have been rather infrequent except for isolated manifestations or occasional importations. The findings in Fiji exhibit markedly individual traits.

The rock art of New Guinea is generally scattered along the coasts, with the heaviest concentration around McCluer Gulf (west New Guinea), while the artifacts (pestles, sometimes bird-shaped; cups; axheads; some figure sculpture) are concentrated mostly in the east. The rock carvings show some similarities to those discovered in New Hanover, but the rest of the stone art remains an enigma and for the most part is without parallel elsewhere. Some motifs in the rock art, for instance, certain complicated arabesques, are reminiscent of Indonesia, while others, observed on the dance belts of the present-day Buang (Territory of New Guinea), were probably figural originally but are now completely absorbed into purely ornamental designs. On the other hand, the strange human face that appears in the rock paintings of the McCluer Gulf is reminiscent of present-day examples in the Sepik River region; the group of rock carvings discovered by W. Strong near Port Moresby exhibit, besides ornamental motifs, almost shapeless anthropomorphic figures akin to contemporary ones produced in the region of the Gulf of Papua, while the patterns in the rock art of the D'Entrecasteaux Islands hark back to tattooing and boat decorations. Thus, despite the apparent lack of cultural continuity, the art of the past seems to be linked somehow to that of the present.

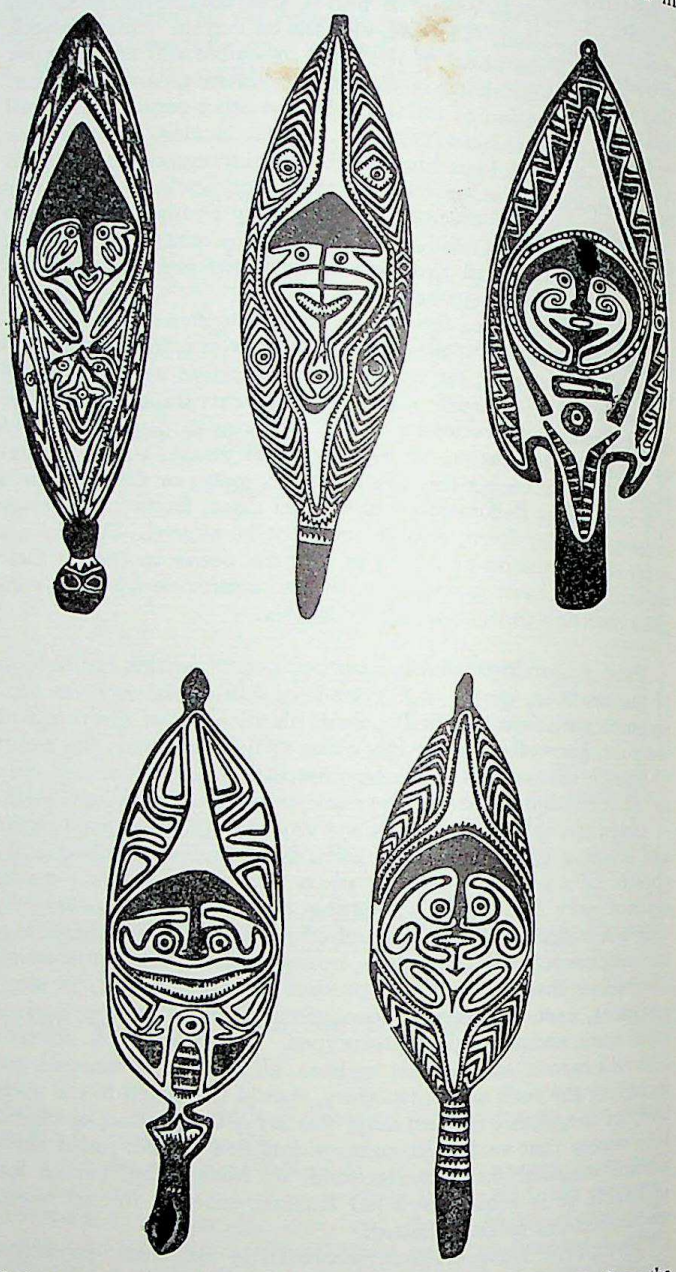
The rock carvings of New Hanover, because of the V motif used to indicate the eyes and nose, are reminiscent of the style of Tami Island, in Huon Gulf (see NEW GUINEA). The closest parallels, however, are to be found in the rock art of distant New Caledonia; and there is no lack of influences from New Ireland, nor of points of contact with the geometric-symbolic rock carvings of the New Hebrides. On the other hand, the decorative motifs of New Caledonian rock art (circles; semicircles; Latin, Greek, Maltese, and Lorraine crosses; and spirals) also recur in the incised decoration of bone and bamboo in Portuguese Timor (see INDONESIA) and in European prehistoric art. According to G. Luquet, these motifs presumably derive from the intentionally stylized representation of the human body and, in particular, of the face, and are said to have originated with the ancestors of the present-day Kanakas. Archambault, who studied them on the spot from 1898 to 1922, attributes them to a race with Euro-Asiatic affinities (the Ainus?) and to the same stock responsible for the megalithic mounds and the bird-beak clubs, the latter being repeated in wood by the present-day Kanakas. Sarasin saw in the New Caledonian rock carvings a kinship with those of Australia and with the motifs incised on the churingas (see AUSTRALIAN CULTURES). Moreover, the prehistoric finds of Kunie (Ile des Pins), along the New Caledonia coast, where sizable mounds, signs of the production of stone blades, and potsherds have been observed, show striking similarities to the prehistoric artifacts on the island of Watom, near New Britain.

Compared to the rock art, the other prehistoric creations seem of secondary importance. Stone figures of birds, probably used as pestles, have been discovered in different parts of New Guinea, New Britain (where it seems they were connected with the secret society of Ingiet), and San Cristobal (Solomons). The remarkable stone sculptures of Buka, Choiseul, and San Cristobal (all in the Solomons) show many points of kinship with the stone sculpture, likewise very old, of Oba (Aoba; New Hebrides). At Buka there are erect monoliths, about 6½ ft. high, generally round in section, with geometric and ornamental incised decoration. According to the natives, these stones were erected in very remote times as commemorative monuments on the occasion of the funeral of a chief. According to C. Fox, similar monoliths are also found over tombs on San Cristobal.

In the Basel Museum für Völkerkunde there are two remarkable stone sculptures from Choiseul. One is a crouching human figure about 24 in. high, which has become worn with time; nothing is known of its significance or origin. The other, even more remarkable, consists of the upper portion of a vertical sarcophagus of volcanic stone and a monolith completely hollowed out and filled with bone fragments. The front is adorned with a relief depicting a male figure, with the feet turned inward and the ears singularly protruding and elongated. Underneath can be seen a head treated in similar fashion. The upper portion of the sarcophagus rested on a block of stone about 39 in. square, bearing on the front two relief figures of the same nature. The conception and workmanship of these figures differ, in point of form, from everything presently known in the Solomons and in Melanesia generally; if anything, they are reminiscent of certain Indonesian styles. The natives have been able to furnish only extremely vague information as to their origin. Another sarcophagus, found near the two pieces mentioned above but not transportable, bears signs which, according to the discoverer, are reminiscent of the ideograms of Easter Island (see POLYNESIAN CULTURES). The two figures of limestone or tufa, from Oba, discovered about the 1930s, are thoroughly

baffling and unusual. The first, preserved in the Basel Museum für Völkerkunde, represents a boar with tusks, carved in the round; it is about 24 in. long. The other, in the Hamburg Museum für Völkerkunde, is in the form of an outrigger canoe with a bird on the prow. Both these sculptures have rounded wedges on the upper portion, about $2^3/_4$ in. high and slightly concave, carved out of the rock itself; two of these are located on the concave back of the boar and three on the boat, also concave. Nothing is known of the meaning, origin, or purpose of these sculptures, which have been ascribed to an extinct people; however, the presence and position of the wedges suggest that they served in the ceremonial preparation of kava.

The New Georgian net sinkers, unquestionably very old, are either figural or ring-shaped and show kinship with similar Polynesian implements (Marquesas, New Zealand). Affinities with Polynesia (Marquesas, Tahiti) are also apparent in the remarkable limestone "idols" from Lifu (Loyalty Islands), with spherical heads and lifelike features; these are actually not very old. In substance, the archaeological art indicates the existence of contacts among the various archipelagoes since very early times, and even though the present-day inhabitants seem generally detached from these remote art expressions, many prehistoric styles and motifs persist in the contemporary art.



Ernesta CERULLI

NEW GUINEA. The stylistic areas of New Guinea (q.v.) constitute by far the richest and most important zone in Melanesia. Although in art, as in every other sector of culture, boundaries fluctuate, making it impossible to draw precise limits, specific characteristics and distinct local traits serve to divide the island into nine geographically bounded stylistic areas: the northwestern coastal area, consisting largely of Geelvink Bay, with the islands and islets adjacent to the Vogelkop Peninsula; the northern coastal strip around Humboldt Bay and Lake Sentani; the Sepik River basin; the Huon Gulf area (FIG. 705), with the island of Tami (PL. 354); the Massim area and adjacent archipelagoes; the Gulf of Papua area, principally near the mouths of the Purari and Fly rivers; the Torres Strait Islands; the coast east of Frederik Hendrik Island, inhabited by the Marind-anim, or Tugeri; and the southwestern coastal zone, which coincides approximately with the area of the Mimika and Asmat cultures. In the northwestern zone, art and culture display unmistakable Indonesian influences, especially from the Moluccas.

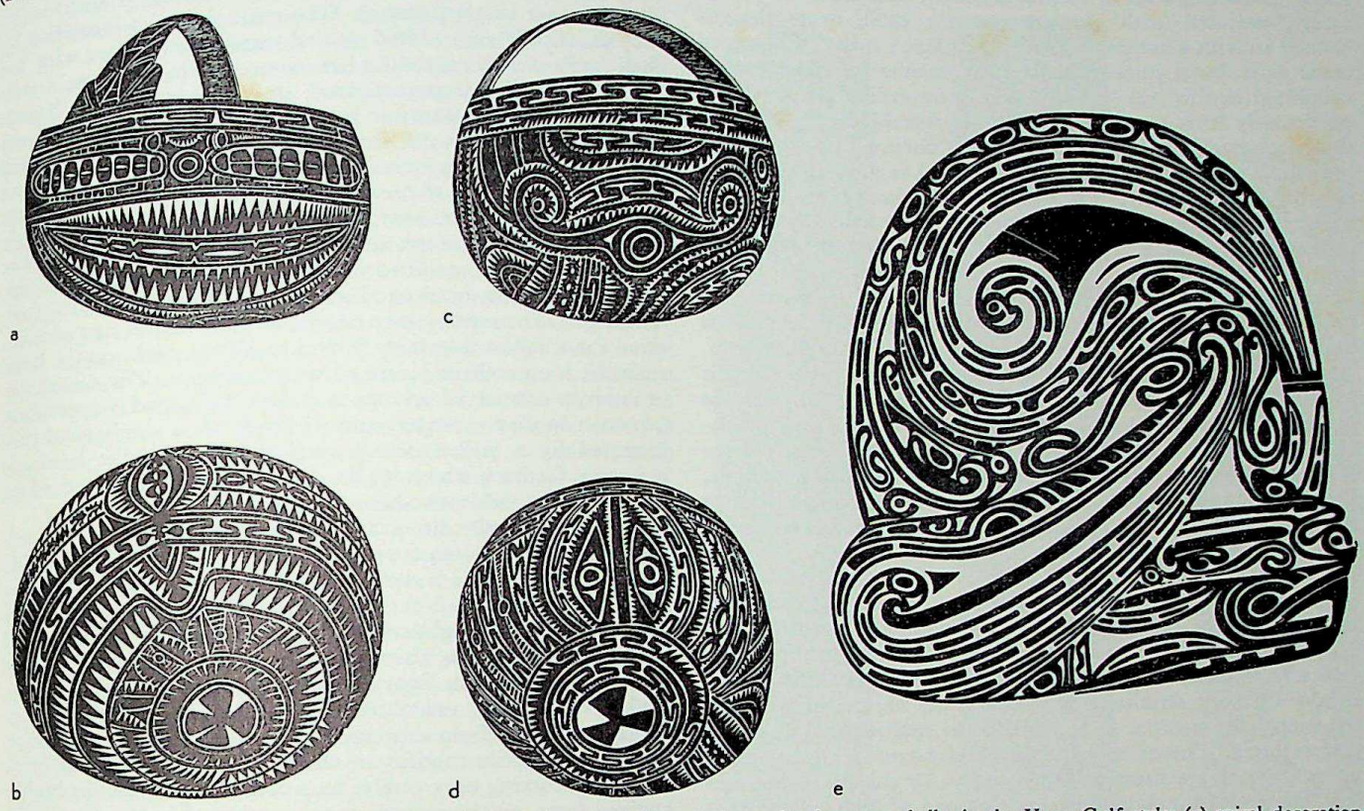
Except in those zones inhabited by certain mountain or interior tribes, with poor art or almost none, artistic creativity has been lavished on everything, from the gigantic meeting- or community houses to the most modest personal ornament. The wood sculpture, frequently painted in the characteristic colors of black, white, red, and yellow, represents the highest achievement and includes the most striking works of art. Most imposing, certainly, are the ceremonial *bisj* poles of the Asmat, reaching almost 33 ft. and discovered only recently, and the corresponding *bitoro* poles from the Mimika district, which represent human figures harmoniously combined with ornamental rinceaux carved in openwork. Consonant with the native fauna, the most frequent zoomorphic motifs are crocodiles and birds, often used together in the carvings of the ornamental boat prows.

The meeting- or cult houses in the Sepik River area and in the Maprik Mountains on the northern coast, and the *dubu-daima* of the Gulf of Papua, noteworthy for their architecture, are veritable temples of art, with anthropomorphic, zoomorphic, or conventional carvings on the beams and posts, multicolored paintings on the gables and interior walls, and numerous objects, mostly of ceremonial nature preserved in them: masks (PL. 358), ancestor figures (PL. 444) and panels (PL. 444; FIG. 704), bull-roarers (PL. 156), flutes, dance drums (see MUSICAL INSTRUMENTS), suspension hooks, and neckrests (PL. 457; V, PL. 426; see FURNITURE). Near the Sepik, these houses also shelter splendid ancestor skulls, realistically modeled with clay and painted; clay figurines, however, are very rare. New Guinea is also the principal zone where war shields are found in quantity; of countless types and forms, generally incised, sculptured, and painted, they form an essential category in the decorative art (PL. 444; FIG. 705; I, PL. 436). Weapons such as clubs, swords, spears, bows, arrows, and daggers rank second to the shields, though they, too, nearly always bear ornamental or figural motifs. The daggers made from human bones with fine incised decorations are works of art of a high order.

Preeminent among the utilitarian objects are the betel mortars, spatulas, and containers, modeled and decorated in

Various types of motifs incised and carved on ancestor panels from the Purari delta, New Guinea (*after A. Buell Lewis, 1931*).

a variety of ways. The containers, usually carved from oblong gourds or, less frequently, from bamboo, are always decorated with pyrography. In the Sepik River area even the lids of the gourd containers, decorated with notable carved motifs of crocodiles and birds, rank among the distinctive achievements in the minor arts, along with the wooden grips of spear throwers, bearing similar motifs.



The New Guinea masks display immense variety in materials, size, and decoration; not always carved from wood, in a number of areas they are made of such materials as rattan or tapa cloth, or even several materials combined, while in the Torres Strait Islands they are nearly always of turtle shell (PLS. 251, 441). Also of turtle shell are the arm bands, about 8 in. wide and with

incised bands of ornamentation, typical of the northeastern areas.

Melanesian pottery reaches its peak of technical and artistic perfection in the lower and middle regions of the Sepik River (see CERAMICS), the principal center being the Keram (Potter) River, a tributary on the right bank of the lower Sepik, named for the activity there in pottery. The earthenware bowls are completely covered with painted ridges (PL. 455), and the huge jars for storing sago, adorned with the pig's-snout or bird's-head motif, are unmatched elsewhere (PL. 453; III, PL. 127).

Among the excellent paintings on tapa cloth, common over wide areas of the island's coast, those in the characteristic Sentani style are outstanding. Some even show figural motifs. New Guinea is the only part of Melanesia in which the inhabitants have produced authentic independent painting; it is of exceptionally high quality, as evidenced by the extraordinary varicolored pictures painted on sago-palm bark lining the inner walls of the cult houses along the Sepik, as well as those which, in the Maprik area, completely cover the triangular gables of the meeting- or ghost houses, to a height of nearly 33 ft. (PLS. 454, 458).

Near the Keram River, a local specialty is the feather mosaic, made from multicolored feathers arranged in definite patterns of figures (PL. 450; see FEATHERWORK); the basketry products (II, PL. 230) are also distinctive.

Decorative incised and painted motifs from New Guinea: (*a*, *b*, *c*, *d*) Receptacles made of coconut shells, in the Huon Gulf style; (*e*) spiral decoration of a dance shield, in the Massim style, from the Trobriand Islands (*after A. Buell Lewis, 1925*).

PARAMICRONESIA. From the anthropological and ethnological viewpoint, Paramicronesia differs sharply from the other Melanesian island groups and cultures, especially in its art. Despite the proximity of differing cultures characterized by a rich and highly developed art of figural wood carving (New Guinea, the Admiralties), in Paramicronesia this art is either completely absent, as in Wuvulu, Aua, Luf, and Ninigo, or present only sporadically, as on Kaniet (PL. 445); here, only a few examples of independent figures have survived, representing ancestors or deities. Their style is so unlike other known works that they must be regarded as local expressions of an indigenous art. According to the sparse accounts from ancient times, the Kaniet statues were placed in front of the "temples." Unlike those seen in neighboring zones, they are not painted; their effect is achieved entirely by their simple straight lines and the extraordinary austerity of the bearded heads, elongated and bent slightly forward, which make up nearly half the height of the figures. With the simplest means the sculptures have been given an exceptionally intense force of expression. The formal characteristics of these figures recur on Kaniet in the paired human heads carved on the handles of wooden combs and occasionally on the handles of the beaters used for making tapa cloth. The abstract depiction of a flying bird on a dance drum from Kaniet is an isolated occurrence.

Individuality of form and skilled workmanship characterize the small boat-shaped wooden containers, also from Kaniet, with ornamental openwork carving on both ends. Suspended from carefully plaited cords, they are used by the men to hold a variety of articles. The tips of the masts of the outriggers of Kaniet are bifid and decorated with a carved double spiral. These are similar to the ones from Luf, but on Kaniet these spirals are turned toward each other, and in Luf they are turned outward.

Many betel gourds and spatulas from Kaniet and Luf resemble one another so closely that they cannot be distinguished; they probably originated on Luf, where the spatulas are small and exquisite works of art (PL. 456). The spiral motif predominates in the wood carving and ornamentation on Luf and is at times repeated in complex combinations, as in the large light-colored wooden spatulas for betel, carved in openwork with the utmost delicacy and refinement.

In the past there were large war canoes on Luf, with rectangular matting sails and magnificent carving on the prow and stern and painting on the sides. The predominant motif was the spiral, painted on the sides in red and white or carved on the slender, high, nearly semicircular bow.

The artistic development of Wuvulu and Aua, whose cultures are homogeneous, represents an autonomous area within Paramicronesia. The art of these two islands differs basically from that of all the other small islands of this archipelago.

Sculpture is completely absent, and there is no painting in bright colors. The implements, weapons, utensils, and boats are distinguished by the elegance and simplicity of their forms. The most notable examples are the food bowls, exquisitely carved from the much-prized dark-red wood of the Calophyllum and decorated with straight and swirling lines combined in various ways. Ornamentation is restricted almost exclusively to pyrography, executed with glowing coconut shell, or to designs stained in with a natural corrosive substance made of chopped areca nuts, betel juice, and lime; all manner of objects were decorated in this way — bowls, clubs, swordlike weapons, and particularly lime gourds. Only the pyrographic decoration of the betel gourds is clearly visible; that obtained by staining is indistinct against the very dark wood and is generally revealed only by close scrutiny. The motifs on lime gourds are predominantly geometric or consist of figures of fish and fishhooks, although even these are reduced to almost abstract decorative forms. The motifs used in the stained decoration on other types of objects comprise human and animal figures (mice, lizards, crocodiles, turtles, birds, and fish), plants, and even landscapes and representations of complete scenes (palm trees with fruit, people dancing, war and harvest scenes, traders with animals loaded on boats, boats surrounded by flocks of birds). All this is very unusual in Melanesia and the South Sea area; unquestionably it indicates a heritage from Micronesia, particularly from Palau (Western Carolines), where, on the coast opposite Indonesia, the famous representational paintings on the gables and beams of the men's houses are an ethnographic curiosity (see MICRONESIAN CULTURES).

BISMARCK ARCHIPELAGO. *Admiralty Islands.* Compared to the islanders of New Guinea the inhabitants of the Admiralty Islands might seem to be only modestly talented in art. They lack a number of those elements which elsewhere in Melanesia produce a very striking impression — the objects of large dimensions, the manner of treatment, the multicolored and grotesque forms. There is no impressive architecture with sculptured elements, nor are there painting, masks, or shields. Nevertheless, the art of the Admiralties is rich and of high caliber; it is restricted largely to the figural or ornamental decoration of utilitarian objects, mostly small and modeled in artistic forms. Such objects include wooden food bowls (PL. 452), ladles, water vessels, boxes, betel gourds and spatulas, dorsal war ornaments (PL. 446), combs with handles, pectoral ornaments (*kapkap*; PL. 457), spears, daggers, and dance headdresses.

There is no stone sculpture; in wood sculpture the commonest and most significant motif, after the human figure, is the crocodile. Ranking first are the ancestor figures, male or female, ranging in height from about 8 in. to 3 ½ ft.; another group of statues over 4 ft. high (PL. 446) are the tallest in this archipelago. The style of the anthropomorphic sculptures varies little and is intended to be naturalistic. The complete figure is always built up symmetrically with correct proportions; the arms hang loose, with the hands resting on the hips or upper thighs, and the legs are generally slightly flexed at the knee, though not so much as in many figures from New Guinea. The crouching position, typical of the Melanesian and Indonesian islands, is completely absent in the Admiralty Islands. Ancestor figures frequently stand on a cylindrical or conical pedestal cut from the same piece of wood as the figure. Often the feet and lower portions of the legs are fused with the pedestal so that the feet are not represented. Peculiar to this stylistic area are the heads, which are either oval, with a flattened outline around the chin, or rectangular, narrowing toward the bottom. In all cases a pronounced prognathism is apparent, in which the mouth, wide and slightly open (with or without indication of teeth), is placed on the lower margin of the jaw, occupying almost its entire width. The nose, small and straight, widens only slightly toward the base or exhibits a heavy flaring of the nostrils. Some figures have very small close-set eyes; in others, the eyes are almond-shaped and larger, taking up virtually the entire breadth of the face. The ear lobes, often hanging down to the shoulders in a long open ring, faithfully reflect the custom of piercing the ear lobe. In the female figures, the short hair is often realistically represented, while most of the male statues have a chignon carved in the wood, not hanging from the nape, as in life, but standing upright on top of the head. Some large statues, like some of the figurines on the betel spatulas, even have two chignons (PL. 446). The male figures sometimes wear the dorsal war ornament reproduced in wood.

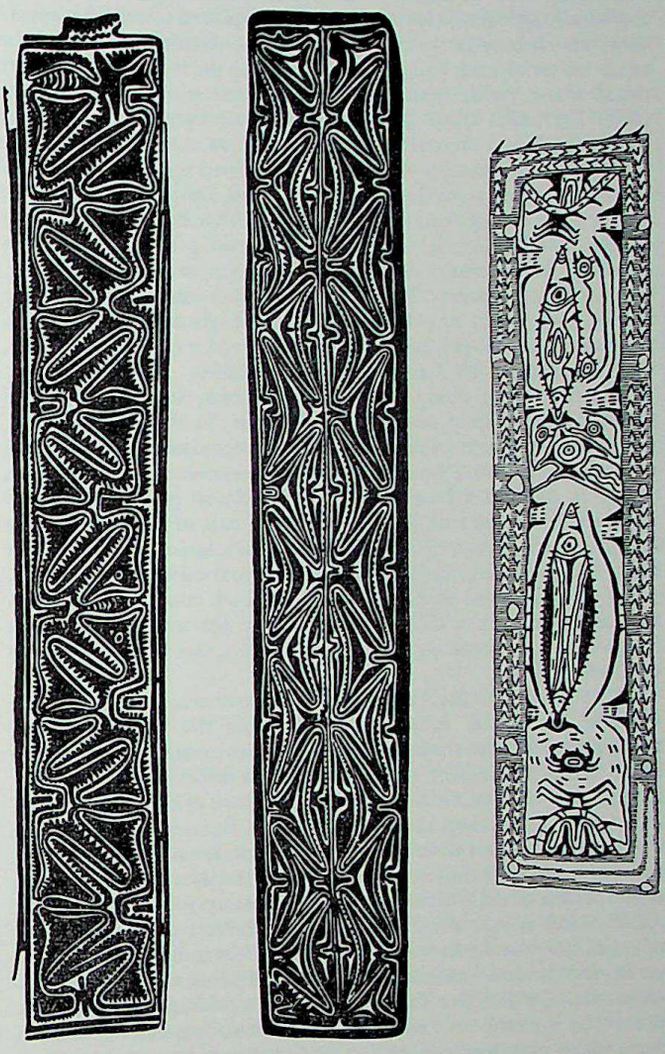
Also found are figures paired back to back, a man and a woman, on a single pedestal. The male figure is identified by the realistically reproduced genital organ, sometimes with the shell penis sheath reproduced in wood, while the female statues are sexually uncharacterized; only rarely are the breasts indicated. All the ancestor figures are covered from forehead to legs with ornamental lines and other designs, sometimes raised, but more often incised and filled with white lime, standing out distinctly against the red background. These lines represent tattooing or sometimes arm and leg bands. Included in this style is all the anthropomorphous sculpture, both the large ancestor figures and those combined with every kind of utilitarian object, such as doorsteps, betel and lime spatulas, spear points, daggers, dorsal war ornaments, canoe prows, and the figural legs of beds. Even the smallest figurines, from 2 to 2¾ in. high, on the betel spatulas, are excellent pieces of wood carving. The dorsal war ornaments consist of an upper portion of wood representing a human head, two superimposed heads, or a single head surmounted by a bird; inserted vertically beneath the head are sea-eagle feathers, about 12 in. long and with serrated edges (PL. 446); the ornament hangs obliquely across the back.

On the figurally decorated house steps (a stepped beam), the human figure often appears in association with the crocodile motif. The crocodile is the preferred animal motif for ornamental carving throughout the Admiralty Islands. It occurs as an ornamental element, about 2 in. long, on the betel spatulas, and in freestanding figures, about 5 ft. long. It is found on all objects on which the human figure appears, as well as on net floats, wicker or wooden containers, headrests, war swords, water containers made from coconuts, and women's carrying sticks. Other zoomorphic motifs are the pig, dog, turtle, and bird, the last occurring only rarely, on weather vanes and, in highly stylized form, on the carved ornamentation of boat prows. The almost complete absence of the fish motif is probably due to the fact that the Manus, who live on or near the coast, have no carved art of their own. The more artistically gifted Usiai live in the interior.

Preeminent among the artistically decorated utilitarian objects are the wooden food bowls, admirable examples of wood carving, ranging in diameter from about 10 in. to 3 ft. or more. Even the largest specimens are carved from single blocks of wood, except for the attached handles. The bowls, mostly round and only slightly concave, rest on four feet; some have no handles, but many bear along the upper edge a band of carved ornament, and at times the figure of a crocodile or lizard is carved in relief on the convex surface. Many of the finest examples are distinguished by two extremely elegant slender handles carved in an openwork spiral at the ends of the bowl, continuing the swelling line of the container (PL. 452). Many of the smaller containers have two human figures as handles, so designed as to appear to be looking into the container. Less common are the bowls in the form of a dog or a bird. In the last type, the two handles are formed by the head and spread tail feathers, and in the intervening area the wings are indicated in a finely stylized manner.

Of definite artistic merit are the horizontal slit drums (X, PL. 225), often quite large, with handles frequently shaped like the head of an animal (dog?) or like a human being, in which case one end of the drum represents the head and upper portions of the body, and the other end the legs, the whole drum being conceived as a human body. Several bands of ornamentation, emphasizing the curvature, complete the decoration. The wooden handles of the coconut-shell ladles are patterned after a human figure or a crocodile or may be decorated in various other ways.

Peculiar to this archipelago are the figural and ornamental objects modeled from the pulp of the Parinarium nut; before the pulp has completely hardened, the motifs or human figures,



in the round or, more frequently, in relief, are modeled upon the handles of combs, obsidian daggers, spears, or coconut-shell water containers, and then painted red, black, and white. Since this pulp is extremely adhesive, it makes a lasting bond between different materials. There are also water containers carved from a single coconut and provided with a small spout affixed with pulp and an ornamental band, also of pulp; other types have ornamentation carved directly into the coconut shell.

The *kapkaps*, characteristic also of New Ireland, are among the finest personal adornments in all Melanesian art (PL. 457). They consist of a thin white disk painstakingly carved from the shell of a Tridacna (giant sea clam), on the upper surface of which is appliquéd a very thin plaque of dark tortoise shell, carved in openwork; the effect is enhanced by the contrast with the dark skin of the natives. The *kapkaps* of the Admiralty Islands, 4 to 8 in. in diameter, are distinguished by the triangular motifs incised around the edge of the disk. Similar incising is noted on the nose plugs, also carved from Tridacna shell and inserted in the pierced nasal septum as an ornament, or perhaps also as an amulet. The arm bands carved from Trochus shell, with similar ornamentation along the outer edge, are purely ornamental. The penis sheaths are carved from the oval white shell of the Ovula snail; these are adorned with incising, and the incised portions are painted black so that the design stands out distinctly. The spherical pottery containers, sometimes with double spout, have only a simple geometric incising.

This part of Melanesia appears to be devoid of rock drawings. Pyrography, on the other hand, is a highly developed art. It is applied mainly to the hourglass-shaped gourds used for holding betel lime, and to the less common lime containers carved from cylindrical sections of bamboo. In addition to the pyrographic decoration applied by means of glowing charcoal, the larger surfaces are usually stained with a natural corrosive substance, probably the same as that employed on the neighboring Paramicronesian islands of Wuvulu and Aua. The motifs on the bamboo containers may be purely geometric forms, regularly arranged over the entire surface or in horizontal rows, or figural motifs (fish, turtles, etc.).

New Britain. From the ethnographic viewpoint, Umboi (Rooke) Island, the Siassi Islands (Dampier Strait), and the French Islands to the north belong to New Britain, the second largest island in Melanesia. Except for the Gazelle Peninsula, in the northeastern part of the island, the exploration of New Britain has so far been inadequate; the interior particularly, covered with dense virgin forest, is still virtually unknown. It is, however, definitely established that the population, like that of New Guinea, is heterogeneous in both race and culture: Melanesian elements are discernible, together with pre-Austronesians more or less intermingled with Papuan tribes, but each tribe, region, or district has specific cultural traits, and the separation of the different cultures is more marked than in other areas of Melanesia. The close proximity and resultant lively traffic with New Guinea explain the correspondences or affinities between certain cultural elements of the two islands. These are naturally more distinct toward the west of New Britain. Among the artifacts common to the two islands are masks and shields, which predominate in the art of New Britain. Unknown in the Gazelle Peninsula, the shield is found only in New Guinea and New Britain, including the French Islands (FIG. 710), except for a few in certain areas of the Solomons. Masks, on the other hand, which are generally associated with the men's secret societies and initiation ceremonies, are a very common element in Melanesia.

Very little is known of the cult life and, consequently, of the masks of most of the New Britain tribes. It is known, however, that here the use of masks is not necessarily connected with the secret societies; there are even secret societies, the Ingiet of the Gazelle Peninsula, for example, in which masks are not used. The most remarkable masks are those created from human skulls by the coastal inhabitants of the Gazelle Peninsula. These bore no relation to secret societies but were worn on such ceremonial occasions as the division of money, the deeper significance of which is unknown. Although the original significance of the skull mask is no longer known to the islanders, it may be considered the oldest form of ghost mask. It consists of the facial portion — including the jawbone — of the skull of an ancestor, modeled in mastic and painted, with human hair glued on, and a modeled beard. The wearer held it in place before his face by gripping a small wooden handle between his teeth. Artistically insignificant, but very popular, are the hat masks of the Duk-duk secret society, also from the Gazelle Peninsula. They probably originated in southern New Ireland and reached New Britain through the Duke of York Islands. Conical headgear about 40 in. high, they are made of netting or wickerwork with various ornaments on the tip; sometimes they also have large round painted eyes and a cloak of leaves hanging from the edges. The *tubuan* masks, also of the Duk-duk, are smaller in size and have a tuft of white cockatoo feathers on the tip. Similarities of form suggest that perhaps a great many other masks of this island are derived from the Duk-duk masks. The *sisu* masks of the Sulka, a tribe living in the southern part of the Gazelle Peninsula, are similar. These consist basically of more or less conical caps on which a face is depicted (PL. 449). Another type of Sulka mask comprises an undecorated conical cap surmounted by a wide variety of human, animal, and spirit figures, in some instances in dramatic poses, in others expressed in simple rounded or elongated images. Since the Sulka masks are of considerable size, they are made of extremely light materials; the framework is of basketry,

covered with leaves and the light pith of a species of elder. The animals (e.g., birds with spread wings) and the human figures are carved from wood. Most of the masks are painted in many colors: the major surfaces are red, but black, white, yellow, and a bright green found nowhere else in Oceania are also used. A very unusual type of Sulka mask is the umbrella form produced in the area around Cape Orford; on the tip of the cone concealing the wearer's face is placed a large flat round disk, which may be as much as 58 in. in diameter, made of the same material and painted on the lower portions, in the colors noted above, with typical Sulka geometric motifs. Among the umbrella masks there are many variants; they may even have ornamental and figural additions, such as zoomorphic figures of wood. An example which is unique and of unknown significance is a Sulka mask acquired in 1908, during the Hamburg South Seas expedition. It differs from other such masks in that its gigantic "umbrella" rests on two joined conical masks, each of which represents a face; thus, it is in a sense a twin mask, worn by two dancers. Related to the Sulka masks are the dance shields; flat, thin, and tapering, and as high as 12 ft. or more, they are made of painted bark, with a border of red wood pith, and are shaken by hand during the dance.

Farther west along the southern coast, between the gulf of Montague Island and Moewe Harbor, in the Arue district, are still other kinds of masks. One type consists of an oval piece of bark, bent into a semicircle, which conceals the head and on which is painted a face reduced to an almost purely decorative element; the mask terminates above in a tuft of leaves, while the lower edge is trimmed with grass. Characteristic of the masks from the gulf of Montague Island are animal carvings (fish, birds, pigs) of light wood perched on a small bark cone; hanging from the lower edge is a cloak of leaves that conceals the wearer's body. Some of these sculptures are among the finest art works of New Britain.

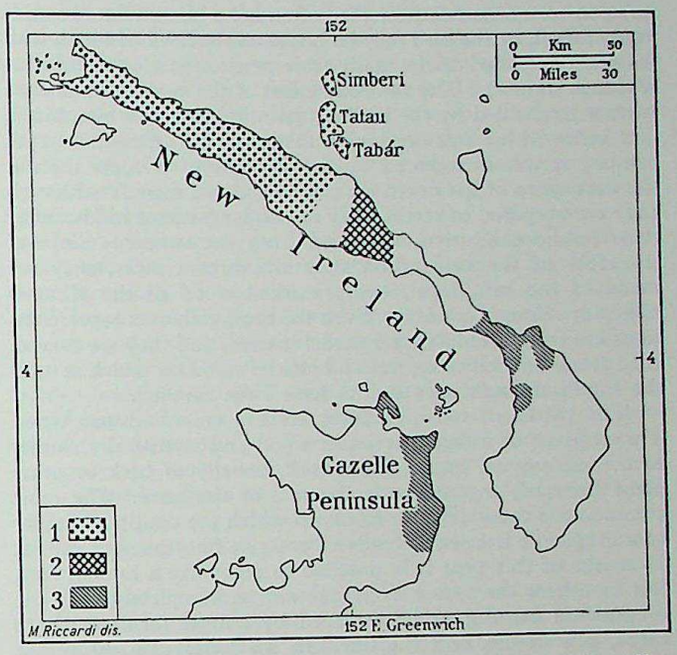
The masks of the Baining, pre-Austronesian natives of the Gazelle Peninsula, differ markedly from the others of New Britain and Melanesia in general. The entire art activity of this small tribe, at present almost extinct, is devoted to mask making; in this limited field, however, they have evidenced astounding talent and imagination. Since the Baining represent the most primitive and archaic ethnic element, it must be presumed that they adopted the use of masks from neighboring Melanesian tribes, subsequently developing a completely independent style. All Baining masks are made of painted bark on a framework of small twigs or withes. They vary in shape and size, from about 20 in. for the head masks (PL. 442) to 98 ft. or more for the *hareiga* masks, which are the tallest in the world and must be supported by a number of men with long bamboo poles. The Baining masks have no connection with the secret societies. They are used mainly in the initiation ceremonies; in extremely dramatic celebrations, in which live snakes are also used, they represent ghosts and mythical ancestors. For this reason, the human face is recognizable in only a very small number of such masks; of exaggerated size, they represent fabulous, grotesque, and imaginary creatures, their immense eyes suggesting insects magnified to monstrous proportions. The colors used are always red and black, conspicuous against the natural gray of the bark; for the red, human blood drawn from the tongue is used.

After the masks, the most important art objects are the shields. The main types are those of the Sulka and the Mengen and those from the South Cape district; the shields from the French Islands (FIG. 710) strongly resemble those of the Mengen (Jacquinot Bay). The shields from New Britain are oblong, sometimes rectangular; those of the Sulka are oval. They are carved from a single piece of wood (except those from the South Cape, which are carved from three planks joined vertically), and on the inner face have a handgrip carved out of the thickness of the wood. Often they are partially sheathed with red-painted bark and rattan; they have a plaited border of the same material, which, among the Mengen and on the French Islands, may be decorated with feather appliqués. In most instances both surfaces have carved ornamentation and are painted the usual black, white, red, and sometimes green. A number of the decorative motifs resemble the eye; in the tripartite shields from the South Cape, the spiral predominates. In the French Islands bird figures are sometimes placed in the center of the shields.

Sculpture, including the carved representations on the masks, is moderately developed. The best works, which show the influence of New Guinea, are found on the western islands, on Umboi and the Siassi Islands, where there are fine house posts carved with combinations of human and animal (particularly fish and crocodile) figures. Most unusual is the stone sculpture of the Ingiet secret society of the Gazelle Peninsula, mostly animal figures and less frequently human figures and other motifs. The sculptures are intended as ancestor dwellings and are venerated and kept in secret places.

The remaining art production of New Britain consists of the ornamentation, rarely figural, of utilitarian objects: betel gourds and spatulas, carved coconuts, food bowls, hourglass dance drums, reed flutes decorated with pyrographic designs, net floats, paddles, bull-roarers, bamboo combs, and other ornaments, among which are the finely incised turtle-shell bracelets derived from a New Guinea prototype. On the large outriggers of the Siassi Islanders, who are intrepid sailors, the prows and especially the sides are adorned with carving and painting in a characteristic style showing a close and unmistakable affinity with that of the island of Tami (FIG. 710; see NEW GUINEA). Pottery appears in only a few places; the potbellied spherical containers are either unadorned or have simple scratched designs.

New Ireland. On the long narrow island of New Ireland, separated from New Britain by the narrow Saint George Channel, various racial elements can be distinguished, but they are so thoroughly intermingled that no clear geographic distribution of peoples can be established. In the art, however, a number of distinct stylistic areas have remained isolated by the great length of the island (ca. 230 mi.).



New Ireland, with New Hanover (Lavongai) to the north and the small groups of nearby islands including the Tabar Islands, has long been known as one of the most important art centers in Melanesia. It is the land of those extraordinary art works, the *malanggan*, completely different in style from all other Melanesian objects. By *malanggan* is meant both the rites commemorating the dead and the sculptures used in the ceremonies, including the *uli* statues; the decorative carvings, in the round or on boards; the individual sculptured objects, mostly zoomorphic; a wide variety of masks; and other kindred objects used in religious rites or in the dance. These objects are found within definite geographical areas — the *uli* only in the central district, the decorative *malanggan* and the *malanggan* masks only in the northern third of the island and in the Tabar Islands, and a completely different type of mask in southern New Ireland. The third important stylistic area extends from Namatanai southward to the Rossel Mountains, making up the transitional area between the broad southern section of the island, poor in art, and the central region. In this third area are found the limestone figures, which differ widely from *malanggan* art and are undoubtedly connected with the very similar sculpture of the Gazelle Peninsula. These singular figures, called *kulap*, are carved from a limestone consisting of foraminifera from the Tertiary and calcareous mud. Made to order by specialized artists on the occasion of a death, these ancestor figures are kept in special huts, where food is brought to them. After a certain period they are destroyed. The *kulap* are kept hidden from the women. This complex of ideas, together with stylistic affinities between the limestone figures of New Ireland and those of the Gazelle Peninsula, may be regarded as a clear indication that the two groups are of common origin, although the New Ireland figures, unlike those from the Gazelle Peninsula, never depict animals, but only human figures. They are reproduced in the simplest manner, without adjuncts, and are thus completely different from the *uli* and from the *malanggan*. In the same area as the *kulap* there are also found wooden statues of similar form, equally unconnected with the *malanggan*. The style of the *kulap* is highly uniform, although rigid and angular figures can be distinguished from other softer ones that also show a tendency toward individualization of the facial features. Charac-

teristic of the *kulap* are the cylindrical shape of the torso and the extremities, the exaggeratedly large oval head and flattened facial portion, the large protruding ears, and the heavily marked brow ridge; the face is characterized by large round eyes and a large half-moon mouth. The arms are always bent at the elbow and joined together over the body or on the chest. Face and body are often painted with several series of red, black, and yellow lines to indicate tattooing scars, while sometimes on the upper arm a number of parallel ridges indicate the arm band of Trochus shell, greatly prized in New Ireland. The legs are disproportionately short and slightly bent at the knees. All the *kulap* are nude, and both sexes have greatly enlarged and realistic genitals, while the breasts are barely indicated. Figures of women with infants, evidently commemorating women who died in childbirth, occur infrequently. Figures of men and women, standing back to back or shoulder to shoulder, are more common. The height of the *kulap* ranges from about 8 in. to over 3 ft.; the smaller ones perhaps represent children.

The art production of southern New Ireland is the most modest of the whole island. Toward the north the art becomes gradually richer and multiform, ultimately attaining, in the *malanggan* of the northern area and the Tabar Islands, a particular impressiveness.

Three art products give the central area a special stamp: the *uli*, the large solar *malanggan*, and the extraordinary friction drums and rubbed wood instruments. The last, restricted to the mountaineers of the area, are known under the indigenous names of *livika*, *nunut*, and *lauka*, among others. They consist of an elongated rounded block of wood with an average length of about 20 in., sometimes carved in a zoomorphic shape. According to the natives, this represents a bird, but it looks more like a dog or pig. The terminal portion, generally decorated, clearly represents the head, and the eyes are often enhanced with the gleaming red and green shells of the Turbo snail. Sometimes the back bears geometric ornamentation. The front and hind feet and the tail are fashioned to form three tongue-shaped appendages which, when rubbed with the hand, produce loud sounds of different pitches. The instrument expresses the voice of the spirits (as do the bull-roarers) and is designed to frighten away the women at the time of certain rites, obviously relating to the cult of the dead. More significant as works of art are the solar *malanggan*, round or oval compositions of 5 ft. or more in diameter, made out of branches and small rods held together with tree bark and painted white, yellow, red, and black. The outer edge is surmounted by a radial corona of sticks. Projecting from the center of the "sun" is a composition of leaves, like the calyx of a flower, executed with great artistic skill; this surrounds an aperture in which, at the time of the ceremony, was generally placed the skull of the deceased person being honored. These "suns" were shown in special huts, and women were forbidden the sight on pain of death.

Although to the natives the feast of the solar *malanggan* is more important and sacred than the *uli* ceremonies, the *uli* sculptures are more interesting and significant artistically. The meaning of the word *uli* was known to the natives as late as the 1930s, but it was never revealed and is now irrecoverable. All conjectured interpretations seem highly improbable, and none is confirmed by the natives: for instance, it has been suggested that the name derives from that of the ginger plant (called *uli* in the interior of the island), the stalk of which is used as a brush to paint the figures. The *uli* are ancestor figures, probably of an impersonal collective character appropriate to all important deceased men, such as chiefs, and are venerated during the *malanggan* celebrations. Unlike the "decorative" *malanggan* of the north, the *uli* are not destroyed at the close of the ceremonies but are kept in huts especially built for them. The *uli*, which range in height from about 20 in. to life-size, are the most forceful and expressive of all Melanesian sculpture. They are perfectly symmetrical in structure and have a finished quality that sharply differentiates them from the *malanggan* of the north. Despite the unmistakable unity of concept, it is possible to distinguish at least twelve types, simple or complex, for which the natives employ different terms. The simplest form is that with the arms hanging at the sides and with lateral slats, while other types are distinguished by secondary figures attached on the shoulders; the *uli* may also have another figure above or in front of it. There is one *uli* representing a man astride a pig. Often the *uli*'s face has a beard of plant fibers; the head is always disproportionately large, a trait common to the sculpture of many sections of Oceania, probably to be explained by the importance attributed to the skull; the eyes are often of concave shells. The *uli* wear either a wooden headdress like a rooster's comb, as do the limestone figures from the south, or a triangular

Bismarck Archipelago, distribution of individual sculptural styles. *Key*: (1) Decorative *malanggan* of the north; (2) *uli* figures; (3) limestone statues.

headgear very similar to the women's caps or pandanus leaves. A singular characteristic of these statues is their bisexuality, indicated by the representation of both the male genital organ and the breasts. One theory relates the *uli* to the moon, which in New Ireland mythology may be male or female in the same being. It is more likely, however, that the sexual attributes are intended merely to express and accentuate strength and fecundity in general (PL. 448; see ESCHATOLOGY). One type of *uli* is characterized by relief carving of a rope that encircles the neck, crosses the chest, and reaches to the waist; according to A. Krämer, this probably represents the rope used to capture prisoners and thrown around the victim's neck to strangle him. The colors used on the *uli* — red, white, and black — are often renewed, since the statues are exhibited at every celebration; some very old specimens are completely blackened by smoke.

Directly north of the *uli* district, opposite the Tabar Islands, lies the most important art region of New Ireland, that of the decorative *malanggan*, characterized by an enormous variety of forms, a multiplicity of motifs, and a bizarre and extreme dissociation of structural elements. There are three principal groups: independent statues, friezes or figural boards, and masks. The terms that recur in the literature (*totok*, *marandan*, etc.) indicate the individual types of *malanggan*. Most of the freestanding anthropomorphous *malanggan* show unmistakable affinities with the *uli* and vary considerably in the structure, proportions, and composition of the constituent elements. No two pieces are identical, even when the content is similar, but all have in common the dissociation of forms and a complexity of accessories so elaborate as to subordinate the principal figure to the resulting counterforms in space. This is more marked in the freestanding *malanggan* (PLS. 447, 448), in the form of columns which may be over 30 ft. high, than in the friezes or figural planks. The significance of the *malanggan* can no longer be interpreted, since even the natives do not know it. The only certain fact is that the

malanggan for the most part represent ancestors, that is, they are human figures, frequently accompanied by animals which, in most cases, may be considered totemic. These animals are the pig, lizard, owl, hornbill, cock, cockatoo, parrot, crow, dogfish, dolphin, snake, and, in a few cases, the butterfly. A considerable number of such animals also appear in individual sculptures; frequent motifs are the bird holding a snake in its beak, or other animals, particularly fish, swallowing a man. The chief element in a considerable number of *malanggan* friezes is a bird with open wings so stylized as to constitute an openwork ornament; the bird often has a human figure standing before it, or the bird may be borne on the head of a man with his arms extended horizontally (this position is also seen in individual statues). The fantastic effect of the *malanggan* is even further intensified by the brilliant painting in red, white, black, and yellow; blue was originally unknown, but in the mid-19th century it was introduced by the Europeans. Unlike the *uli*, the *malanggan* of the north are not considered sacred. Although they are prepared in secret, they are no longer kept hidden after their public exhibition, not even from the women. Since at the close of the celebration they are thrown away, they are made of the soft, light, easily worked wood of the *Alstonia villosa* or *Alstonia scholaris*. Even the most elaborate representations are freely executed: no model is used, and they are carved, with stone or shell tools, from a block of wood on which at most the important reference points have been marked.

The masks of northern New Ireland are of several types. They consist of a face, carved in wood and stylistically similar to the *malanggan*, and a framework, usually of bark or other plant material, that conceals the rest of the head. The most common are those called *tatanua*, in which the cranium, similar to a dragoon's helmet, is made of coconut fiber painted yellow. In masks of this type it is possible to recognize a human face, but in others the face may merge almost completely with the ornamental carving or be replaced by animal forms, such as birds, pig snouts, and the like. In the latter case the masks probably have some totemic significance. Many masks have an extremely high plank-shaped superstructure with incised decoration and gigantic wooden ears (PL. 442) decorated with incising. The masks are brilliantly polychromed and are kept or displayed temporarily in special huts, sometimes splendidly painted, which are destroyed after the celebration.

In the southern area of the island, in the district around Muliama, are found masks of less artistic interest, consisting of a bark framework with elongated protruding eyes. In certain dances masks are replaced by wooden bird figures held erect in the mouth.

The ancestor skulls in New Ireland, unlike those in the Sepik region, were modeled in wax. Some were completely black, and others were painted white, red, blue, and yellow; the eyes were carved out of the green shell of the Turbo snail, a detail which gave them an intense expression. The skulls were burned in the course of certain ceremonies or were kept in special huts. In the central district they were also used in the magic rainfall rites; for this purpose they were sometimes affixed to carved wooden figures.

Other products of the secular art of New Ireland include house posts, ornamentally modeled and at times even decorated with human figures (in the southern area resembling the limestone statues); hourglass dance drums with geometric ornamentation; eating bowls; bamboo combs; betel containers; prow carvings; paddles; and boat paintings. Outstanding among the ornaments are the *kapkaps*, similar (or related) in form to those found on the Admiralty, Solomon, and Santa Cruz islands, but of notable delicacy and variety of modeling. The finest come from Gardner and Fisherman's islands, near the eastern coast of New Ireland. Pottery is unknown on New Ireland. On New Hanover there are petroglyphs rather similar to those on New Caledonia, as noted by Bühler. In addition to geometric designs, such as concentric circles, anthropomorphous figures also appear.

Saint Matthias and Tench. At the beginning of the 20th century the Saint Matthias Group north of New Ireland, which from the ethnological viewpoint includes the islet of Tench, had no contact with the outside world. But a series of elements in its culture are typical of the nearby archipelagoes, showing that in the past the situation must have been different. The closest ties seem to have been with the Admiralty Islands, New Hanover, and New Ireland; also discernible, though to a lesser extent, are Micronesian influences.

Although the art of Saint Matthias contains various elements that correspond exactly to those in the art of the neighboring islands, it lacks certain essential traits of their culture — the masks of New Ireland, the sails and, because of the lack of raw material, the pottery of the Admiralties. Characteristic of Saint Matthias is the house with barrel roof; on Tench even the small shops, built on piles for protection against rats, have roofs of this type. The communal houses of Saint Matthias and Tench, though built accurately and with sound technique, are only modestly ornamented or entirely without ornament, while, as in nearly all Melanesia, the chiefs' houses and men's houses on Saint Matthias (they do not exist on Tench) are distinguished by their rich decoration: painting on the triangular gable, sheathing with carved and painted planks, and carved posts in the interior (IV, PL. 393). The posts perform the important structural function of supporting the horizontal beams, but the planks of the gable are purely ornamental. All the village men participate in the construction of the chiefs' houses and the meetinghouse, each one preparing a decorated plank as well as performing other tasks. Because of the differences in talent and manual skill, the products are of somewhat uneven artistic quality. Some bear simple linear designs, such as triangles, rhombs, or wavy lines, while the planks executed by skilled artists may be decorated with zoomorphic motifs (fish particularly) which, according to the natives, are without totemic significance. It is not known whether the full-round carving on the posts inside the chiefs' houses is merely decorative or whether it has also some religious significance. One post decorated with a human figure represents, according to the natives, the captain of a European sailing ship that visited Saint Matthias about 1900; at most, this may be termed a commemorative image. Only a partial interpretation of the decorative motifs is possible; for instance, the carving known as *laine* represents a very highly stylized fish with the caudal fin raised, while another type suggests such plant forms as star-shaped flowers or cotyledons. According to the natives, the horizontal swellings around the posts are intended to represent arm bands made from the Trochus. Some posts are partially worked in openwork lozenges, in which, as in the center of the floral motifs also, are inserted shells of the Turbo snail, with beautiful dark-green tints. This is a technique typical of New Ireland, where it is used to decorate many objects and to represent the eye on dance masks and *malanggan*. Presumably it was imported from there to Saint Matthias. Aside from the infrequent human figures carved on the house posts, there are also freestanding male and female ancestor figures, averaging in height from 19 to 23 in., with pedestals carved from the same trunk and sometimes decorated with simple wavy lines or similar patterns. The structure of these figures is perfectly symmetrical; the slender arms hang at the sides, the hands touching the hips or, less frequently, resting on the body. The proportion of the limbs is comparatively accurate, and a general tendency toward naturalism is noted. However, the legs are abnormally separated where they are joined to the body; they are rather straight and in profile show a strong accentuation of the calf muscles. The male genitals are clearly represented, while the female ones are indicated simply by a dark coloration; the breasts are not reproduced, but on the male figures the nipples are indicated. The torso is carved in a cylindrical shape, without further modeling. The neck is sharply differentiated from the shoulders. The head is spherical or oblong, the most prominent feature being the chin, which projects obliquely downward; at times a slat, in the form of a crest, runs along the central axis of the cranium, indicating the headgear of a chief. These last characteristics are typical also of New Ireland, especially of the *uli* figures, and the profile of the statues, too, shows unmistakable New

Ireland derivation. The ancestor figures are always carved and painted, the male figures more lavishly than the female. In the former, the face, torso, and thighs particularly are decorated in red and black with zigzag lines, circles, and leaflike designs. The female figures are decorated only on the face and chest. Figures similar to the ancestor statues, but unpainted, also appear on dance sticks and betel spatulas.

The Hamburg South Seas expedition of 1908–10 brought to light two anthropomorphous wood sculptures from Tench, both crudely worked and unpainted. One is a complete standing figure; the other comprises two busts, one larger than the other, placed back to back and joined below. The eyes are indicated by the green shells of the Turbo. The significance of the Tench sculptures is unknown, but they may well be ancestor figures.

The wooden figural sculptures of Saint Matthias and Tench include birds, fish, and turtles; though not numerous, these pieces surpass the ancestor figures in artistic merit. On Saint Matthias, bird figures decorate the ridgepoles of the houses, dance paraphernalia, and the prows of boats, and also serve as toys. The bird figures used as prow ornaments of the large ceremonial boats are fairly naturalistic, while the heron motif on Z-shaped dance sticks is sometimes treated in a highly abstract fashion. A favored motif is the royal kite with a fish in its claws. Definitely derived from this type are the other motifs used in prow ornamentation, so fully assimilated into the decoration as to be undecipherable without reference to the natural model. The head, with the large sharply crooked beak, is still clearly discernible among the abstract forms. In the case of the prow ornamentation, it is therefore possible to reconstruct an entire evolutionary scale, from the naturalistic representation of birds, through the total dissolution of the figures into incomprehensible ornamental forms.

On Tench, even the figures of fish reveal the artist's fine sensitivity and excellent powers of observation; they may be single or coupled, that is, two fish attached by the tip of the tail or by a piece of wood; the latter type is held and shaken during the dance. The type of fish depicted is flat with broad head, long fins, and forked tail. Inserted into the wood, which is unpainted and retains its natural brown color, are the green shells of the Turbo, reproducing fish eyes, and incised in the figure are a number of lines, filled with white lime, which stand out sharply against the background and are probably intended to indicate the bones. Naturalistic wood representations of turtles resemble those of the fish. The pattern of the shell is traced by shallow furrows filled with lime to enrich the general effect. The significance and purpose of these zoomorphic figures — except for the ichthyomorphic dance sticks — are completely unknown.

These are the only types of sculpture found on Saint Matthias and Tench; the remaining art production is purely ornamental but very diverse in material and technique. Painted objects include splendid and often gigantic men's combs with handles, rain cloaks made of palm leaves, and spiral ear ornaments also made of palm leaves. Carving appears on the spears, the dance sticks, the betel spatulas, the coconut scrapers, and ear pendants of tortoise shell. Incised decoration is used on the penis sheaths made of Ovula shells; and etched designs are made by painting with a natural corrosive substance on the bamboo combs and flutes and especially on the hourglass betel-lime gourds. The last, in spite of their different ornamentation, show a close kinship to those of the Admiralty Islands, as do the penis sheaths, indicating the existence of cultural connections between these two island groups.

Solomon Islands. The Solomon Islands, despite the early date (1567) of their discovery, remain one of the most inadequately known cultural areas of Melanesia. Their geographic isolation and the notorious warlike spirit of the inhabitants have made it virtually impossible to maintain any consistent lasting cultural contacts with the inhabitants of other islands. Thus their art and culture in general have developed independently and differ markedly from those of nearby New Ireland. Only at the beginning of the colonial period, when the inhabitants of the northern Solomons, Buka especially, were used as a police force and as laborers in the Bismarck Archipelago, did external cultural influences make themselves felt; but these were of little importance in art. The art of the Solomons differs not only from that of other Melanesian regions but also within the archipelago itself, where distinct stylistic regions have developed as a result of the enormous length (ca. 150 mi.) of the double chain of islands and, perhaps primarily, of racial differences. The art is virtually devoid of the monumental features and multicolored decoration that represent the main art activity in other archipelagoes: the sculpture used in conjunction with architecture, ancestor figures, and the secret societies, the masks, and the shields. Although such objects are not entirely absent, they are limited to a few areas and a few types; moreover, they are polychrome only in the northern part of the archipelago, and even there to a limited extent. Masks are employed only in the extreme northern islands, from Nissan to Bougainville, and even there are too uncommon to affect the general panorama of culture and art; nor can they compare with those of other Melanesian areas. Shields, common in several of the large islands between Choiseul and Guadalcanal, are made of basketry, elongated in shape and relatively small but executed with great technical skill. Certain ceremonial or display shields, perhaps intended for the chiefs, are painted or decorated with figural mosaics of mother-of-pearl set in a mastic base; these exhibit such a degree of abstraction and artistic perfection as to rank among the most notable achievements in Melanesian art, but they are quite rare and only a few examples are preserved in museums.

Utilitarian objects — weapons, ornaments, and many objects of everyday use (PL. 452) — are distinguished by elegance and surety of construction, particularly the work in basketry and mosaic.

Disregarding the more subtle differences, it is possible to distinguish in the Solomons two different styles distributed approximately according to the old political division of the archipelago between the Germans and the English: the first is observed in the northwestern islands from Nissan to Bougainville; the second in the other islands, from New Georgia (VI, PL. 52) to San Cristobal and the islets of the south, Owa Raha and Owa Riki, which show strong Polynesian influence. The northwestern section forms a comparatively homogeneous stylistic area; to what extent it is justifiable to include Choiseul and Santa Isabel therein is a problem calling for further study, but these islands probably represent a zone of transition and intermingling between the two styles. Typical of the zone are the paintings on carved surfaces, and the decoration of spears, arrows, clubs, ornaments (combs especially), and other objects with extremely fine plaited work in red and yellow bark. Human figures appear in freestanding wood sculptures, sometimes of uncertain function, as in the case of the extremely uncommon, manifestly male figures of Nissan. Fuller information is available on the statues of Buka; about 40 in. tall, they are carved in soft wood and are used in marriage ceremonies to represent the future daughter of the young bride. In this predominantly matriarchal organization, female offspring are desired. The figure is fairly well proportioned, very rigid, and absolutely symmetrical, with the arms hanging at the sides and hands almost touching the hips; the breasts and vulva are clearly modeled. The elongated head bears a high conical headress. The face, otherwise entirely black, is painted with white lines, and the greatly elongated ear lobes protrude obliquely from the head (PL. 451). Similar statues, male and female, from Bougainville play a special role in that phase of the initiation ceremonies pertaining to the rite of donning and doffing the *upi*, a remarkable large spherical headdress of pandanus leaves. The *upi* is worn by the youths until their hair has grown long enough to fill it completely; then, during the act of initiation, it is cut away together with the hair. Partially painted in widely differing patterns with a red plant sap, these headdresses are now limited to Bougainville, although they were perhaps once used in the more northerly islands as well, including Nissan. On these islands are found many paddles and paddle-shaped dance sticks decorated with human heads or full figures,

painted or in relief, wearing a large spherical headdress apparently representing the *upi*. This motif is usually painted in red and black on a white background. The anthropomorphous figures are depicted either standing or crouching, the latter posture being characteristic of the freestanding statues from the central Solomons, in particular Choiseul and New Georgia.

While in the north even the painting of objects is important, the style from New Georgia southward depends not on painting but on form and material, in contrast to neighboring New Ireland and most of the other Melanesian archipelagoes. In the southern style the inlay technique characteristic of these islands reaches its zenith (PL. 457); black-painted figures and other objects — earplugs, head-hunters' boats, the skulls of chieftains, modeled in black — are given added interest by the insertion of small plaques of mother-of-pearl and shell, cut in various shapes. The most admirable objects are the previously mentioned ceremonial shields, found from Guadalcanal to Florida Island, which are veritable mosaic images.

In the anthropomorphous wood sculpture of the southern style the crouching position predominates. A salient feature of these figures is their prognathism, even more pronounced in the small figures than in those of the tall slender prow ornaments of the splendid canoes, representing the guardian spirits of the boat and its crew (PL. 452). These figures, too, are adorned with mother-of-pearl inlay. Outstanding among the other objects are the vessels and bowls, some of finely worked smooth black wood, the majority without inlay but finely incised (PL. 452). These are supported by two small human figures or bear representations of animals, predominantly fish and birds. In the sacrificial vessels, which sometimes are over 6 ft. long, the two animals are combined: the receptacle is the body of the bird, which holds in its beak a fish (probably a whale or dolphin) of diminutive size. In some cases these vessels, decorated with inlay, rest upon pedestals formed by other figures of fish. Less common are the pig-shaped wooden vases. The shark is also effectively represented in large pieces of wood carving, the body hollowed out and used as a case for the chiefs' skulls (cf. IV, PL. 449); they are hung in the sheds where the canoes are kept. There are also huts for the skulls, made of wood or reeds and supported on poles or stones, sometimes of artistic merit; gable ends are made of Tridacna shell, approximately $1\frac{1}{8}$ in. thick, in which openwork figures of dancers or geometric elements are laboriously carved out.

From Rubiana come a few rare and extremely old ceremonial objects, staff-shaped and magnificently adorned with inlay; the principal motif is sometimes a crocodile with open jaws, near which is a standing or crouching human figure, or else a turtle; their meaning is unknown.

Pottery is limited to the northern area, as far as the Shortland Islands, excluding Nissan; it has spread into other parts as well, Choiseul for instance, through trade. The pottery consists of potbellied containers and taller vases with rounded bases (pointed, on the Shortland Islands), of little artistic merit, the decoration being limited to incised geometric designs, triangles grouped in rows, or simple wavy lines on the upper edge of the container; infrequently there is some incising on the lower portion.

SANTA CRUZ ISLANDS. The culture of the Santa Cruz Islands is still inadequately known. Although social and religious aspects of the life are little understood, it is known that there are no male secret societies comparable to that of the Suque of the New Hebrides and no masks, but there are indications of a skull and ancestor cult. Anthropomorphous sculpture seems to be limited to a few wood figurines of no great artistic merit, probably representing spirits or ancestors. Nevertheless, the art of Santa Cruz cannot be considered poor; it includes fine zoomorphic sculpture, and the islanders have developed a distinctive two-dimensional art that shows a keen artistic sensitivity. Characteristic of this art is the ornamentation covering most of the objects, including neck rests, boats, and betel gourds, as well as the three-dimensional representations of fish (PL. 242), birds, and pigs, and the remarkable dance sticks. The last are wooden staves, slightly curved and terminating in a point at the top, the upper decorated portions of which are triangular or semicircular in section. At the end of the rounded grip are fastened rattles made of nutshells or long tufts of plant fibers. According to F. Speiser, these tufts represent bird feathers or wings, and their form is supposed to derive from the figure of a bird, as are nearly all the other formal elements in the ornamentation of the Santa Cruz Islands. The decoration is never carved but merely painted on wood, and the designs in black and red stand out effectively against the painted white surface. Analysis of the ornamental elements found on these islands is enlightening for the study of the entire art production of Oceania, since it shows how the depiction of an animal (in this instance, a bird), realistic at the outset, becomes through continual repetition increasingly stylized until it is a simple abstraction, a mere composite symbol of two crossed lines ending in a hook. Later, when this symbol is no longer understood, the artist begins to play with the motif, combining it or repeating it rhythmically, with the sole aim of filling the surface. However, since man tries to see something familiar in every ornamental element, the original bird form gradually is transformed into a fishlike motif, until eventually the series of transformations comes full circle in a realistic representation, that of a fish. It is not surprising that the bird should be the predominant art motif in the Santa Cruz Islands, since among the animals known to these islanders the bird, as soul bird and as death bird, occupies the most important place in religious thought. The complete abstraction of the bird figure appears clearly in the local pectoral ornament (similar to the *kapkap*), among the most beautiful creations of all Oceania. Against the round white surface of the Tridacna, which may attain a diameter of about 6 in., appears the stylized figure of the frigate bird, carved out of a thin piece of dark turtle shell.

In tattooing, in addition to designs harking back to the bird motif, there are others depicting fish. There are also almond-shaped eating bowls representing fish. One door lintel has been found with two affronted fish carved in relief, but in general few houses have carvings or other decoration. Only the gable of a ghost house was completely covered with vertical rows of black triangles against a white background. Other products include bark cloth with geometric designs, loomed mats for clothing, and knapsacks.

NEW HEBRIDES AND THE BANKS ISLANDS. South of the Santa Cruz Islands stretch the Banks Islands and the New Hebrides, which should be dealt with together, in view of their close cultural affiliation, although the arts are not equally developed in both. Strong Polynesian influence is noted in some of the artistically impoverished southern islands of the New Hebrides: Eromanga, Tana, Aniwa, Futuna, and Aneityum; even in the main island, Espíritu Santo, the art production is rather modest. Areas of outstanding art production are the Banks Islands and the central New Hebrides, especially Malekula, with the adjacent islets of Vao, Achin, and Rano and the larger island of Ambrim.

Among the most striking and ethnologically most distinguished art works of the New Hebrides are the vertical slit drums, characteristic of this archipelago. While undecorated drums are found through the whole territory, the vertical drums are from an area extending from Pentecost Island in the north, across Malekula, Ambrim, and Epi, to Efate in the south, excluding the Banks Islands. Although the vertical drums also occur in simple form, nearly all are distinguished by ornamental carving above or alongside the slit, or by the depiction of human heads, sometimes arranged in rows. Ranging in height from about 3 to 16 ft., the drums play an important role in the ritual of the Suque male secret society. On Ambrim, for example, the type of carving and the number of human faces portrayed indicate the rank of the drum owner, while on other islands this is indicated by the height of the instrument. Certain drums, with a head standing out sharply from the upper part of the trunk, indicate that the entire drum is conceived as a human figure; in a number of specimens the arms are even carved alongside the slit. According to Speiser, the vertical

drums derive from a combination of the horizontal drums and the ancestor figures and can thus be considered hollow ancestor figures. They are kept in the dance clearings or nearby, frequently together with other statues indicative of rank; often they form rather dense clusters.

Ancestor figures and the statues indicating rank comprise the bulk of the sculpture of the Banks Islands and the New Hebrides; they are lacking, however, on Espíritu Santo, Oba, Maewo, and the more southerly islands. There are three types of ancestor figures: those of hardwood, those of tree-fern pith, and those capped with skulls. The last are of special interest, as they are a local peculiarity limited to the southern part of Malekula; they are reproductions of the human body, made of plant material, on which are placed the actual skulls of the deceased, modeled in a compost of fibers, clay, and resin. (They are similar to some figures found in the Sepik River region of New Guinea.) Statues of this type, kept in the men's houses, commemorate the deceased who held high rank in the Suque. Certain attributes added to the statues, such as the jawbone of a pig, a conch trumpet, or a particular kind of painting, indicate the rank held in the secret society by the person depicted. The ethnological importance of the statues with skulls stems from the fact that they can be clearly distinguished as the original representations of the ancestor figure; they are the type which preceded the image of wood or tree-fern pith.

Preeminent and typical of the Banks Islands and some parts of the New Hebrides are the ancestor statues and the emblematic poles carved from the pith of tree ferns, a substance that is easily worked, porous but resistant to wear. In order to secure poles of sufficient thickness, the tree is tightly bound at a height of about 5 ft. above the ground, so that the part below the ligature thickens. Several stylistic types may be distinguished: some depict the full human figure, in a plainly naturalistic style, although in most cases the disproportion of the head is emphatic; others depict only the head. Characteristic of Ambrim Island, where only statues of tree-fern pith occur, is the type distinguished by the extraordinarily large eyes, represented by mere cavities or by large flat round or oval plates. The nose and mouth are usually indicated, but the latter is often merged with the chin. The representation of the limbs, if present, is rudimentary, probably because of the fragility of the material. Another type, also from Ambrim, depicts two superimposed figures or a two-faced figure. While in some figures it is impossible to determine the sex, in others this is clearly indicated. In the female statues of the Banks Islands, the breasts are realistically reproduced. In contrast to the rather uniform Ambrim type, the statues of the Banks Islands vary widely. Alongside some quite naturalistic representations can be seen others that are highly abstract or handled in decorative fashion. The head often consists of an elongated acute triangle, the nose is reduced to a line, the eyes to mere dots, and the mouth is remarkably small. Many of the figures from the Banks Islands and Ambrim have crossed legs, while only in those from the Banks does the particular position of the arms sometimes occur in which, instead of resting lightly flexed on the lower part of the body, they are bent slightly upward so that the elbows are held above the chest and the hands horizontally under the head. This position of the arms may be related to R. H. Codrington's observation that ghosts can be recognized by their bent limbs. Also from the Banks Islands are statues that represent only two nearly discoidal faces, surrounded by indented crowns and placed on a slender trunk, above and below which are depicted birds carved from the same block of wood. On Malekula there are emblematic poles of tree-fern pith in which five or six human heads are arranged above a full-length human figure. As in the case of the drums, these statues were executed for persons of the highest rank in the Suque society; the number of faces or heads corresponds to the rank attained.

In style, the sculptural treatment of the wood statues corresponds to that of the statues in tree-fern pith, but in the harder material the details are naturally worked with greater finesse. Within certain limited areas there are widely divergent types of sculpture: for example, a wood statue about 10 ft. high, from eastern Malekula, has the unusual feature of disproportionately long legs, and the head is very small; in another figure of more or less the same height, from the islet of Rano, near the eastern coast of Malekula, the legs are barely indicated by the short thighs, while the elongated almond-shaped head takes up half the length of the entire figure.

All the ancestor and emblematic figures are placed near the men's houses, sometimes in the bush; when they belong to a high dignitary of the Suque society, they stand near the entrance of the person's dwelling. If the figures stand inside the houses, they serve as supports for the ridgepole of the roof. In the Banks Islands and on Vao a representation of a flying bird — evidently the soul bird — forms the end of the beam and extends through the gable. The technique used to make the birdlike figures is simple but ingenious: the sculptors use for this purpose the roots of the tree trunk from which the beam has been hewn, selecting and cutting into the desired shapes two ramifications which between them form the angle necessary to represent the wings, leaving another piece to form the body and removing the rest. Similar soul birds, with their elegant wings from 3 to 6 or 7 ft. long, are found at the acute angle of the terminal points. In a number of areas, such as the Banks Islands and islets adjacent to the northeast coast of Malekula, special huts are built for the ancestor figures. There are very few nonhuman figures; one, surrounded with carved tonguelike projections in superimposed rows, apparently is to be interpreted as a highly stylized representation of a pig jaw. The actual jawbones of sacrificed pigs are hung on poles and preserved near or inside the men's houses, as a visible reminder of the sacrificial ceremonies. In this region of Melanesia, the pig, with artificially deformed teeth, is the most important animal; frequent pig sacrifices lead to increasingly higher rank in the Suque society, ensuring great prestige in life and a happy lot after death. All efforts are therefore directed toward the raising of pigs and, ultimately, toward the Suque society, which has exerted a decisive influence on all art expressions. Where this society does not exist, as in the southern islands, art is absent. To virtually all objects capable of artistic treatment some Suque symbol is applied; foremost are the representations of ancestor spirits, in the form of human faces or full figures; the jawbone of a pig or a single tusk, as a symbol of the sacrifice; birds; and occasionally sharks. These symbols, some realistically depicted and others highly stylized and reduced to mere ornaments, are also found on the clubs used to kill the sacrificial pigs; these are totally unlike the war clubs, the shape being more reminiscent of stone axes. Most of the masks and ritual implements used in the dance and ceremonies, such as dance sticks, hatchets, ornaments, magic stones endowed with mana, and amulets bearing faces like those of the sculpture, all pertain to the Suque ceremonies. Since wherever statues are absent — Espíritu Santo, Malo, Oba, Maewo, Efate, Eromanga, and Tana — masks are also lacking, it is obvious that the whole institution of masks is closely bound up with the cult of spirits, ancestors, and skulls.

At the outset, probably, all Suque masks, with the addition of a cloak of leaves designed to conceal the body, were intended to disguise their wearers as spirits. It was the intention to terrorize the nonmembers of the secret society by means of these sinister masks. The later forms, used in the dance, were designed more to amuse, even though there may not always be a clear-cut distinction between the two types. While the basic type of mask is a human face, horrifyingly deformed in various ways in order to inspire terror, nevertheless, representations of animals, for instance, birds and lizards, are also used for masks. Pigs' tusks may be inserted into masks. Explicitly zoomorphic masks, consisting of a covering of coconut leaves and representing a pig, are found only on Malekula. The great range of mask types in this part of Melanesia shows a lively imagination in the modeling; and since the masks are generally made of perishable materials and are often thrown away after use, it is possible that not all the types are known. Appearing in the southern part of Malekula also is a two-faced mask, and there are even some with four faces, the significance of which is unknown. In the New Hebrides the masks, unlike the statues,

are not of a very high artistic level, no doubt because of the use of unsuitable material. This seems to be proved by the fact that the masks of Pentecost and Ambrim islands, the only ones made of hardwood, surpass all other masks in this archipelago (PL. 443). Unique products in the New Hebrides are the masks made in southern Malekula of tree-fern pith and those made partly of spider webs. In order to obtain this unusual material, the natives go into the jungle carrying outspread branches, on which they gather the tough threads of the spider web into a thick mass.

In the Banks Islands, the counterpart of the Suque society is the Tamate secret society. The few specimens preserved indicate that the masks of this society are markedly different in form, material, and ornamentation from the New Hebrides masks; they are of bark or plant fibers, sometimes topped by long appendages which are bent forward and probably derive from fish or bird figures. A notable feature of these masks is their painting: on a white background, aside from large black eyes, there are purely geometric designs and figures, strongly resembling those of Santa Cruz. Even the utilitarian objects exhibit considerable artistic skill: the weapons, especially the clubs and spears, beautiful in form and differing from island to island; the household utensils, including food bowls, knives, and pestles; and the various articles of adornment, outstanding among them the earplugs, with rich incised decoration. The remarkable figural designs on the minor art objects of the Banks Islands strongly resemble tattoo patterns and suggest that even the seemingly nonfigural motifs on the earplugs of Oba and Maewo may have been derived from the human figure. Thus, for the majority of the motifs scratched and incised on a great variety of objects, the inevitable conclusion is that there is an underlying figural significance. This is certainly true of all the motifs indicating rank in the Suque society.

In several islands of this archipelago are found woven mats with highly decorative geometric motifs in red or dark purple, achieved by means of tie dyeing. The parts to be reserved are covered, prior to dyeing, with cords and molds cut from banana wood.

Besides the painting of objects, on the Banks Islands and especially on Gaua, painting exists as a separate art form. Planks, generally with a background of dark red, are painted with white figural representations in simple outline. Since these shapes show an extraordinary likeness to certain statues from the same area, the explanation furnished by the natives appears to be correct; according to them, these are sketches made by the carvers for their sculpture. However, these paintings are also valued in themselves and are used to cover the gables of the ancestor houses and men's houses.

Pottery, completely lacking on the Banks Islands, is found in the New Hebrides only in two villages on Espíritu Santo (VII, PL. 311). Here the women model potbellied containers and ladles; the former often have a distinct raised border, wavy or jagged, while the decoration is almost entirely confined to horizontal or vertical rows of dots, sometimes arranged in zigzags. Although pottery fragments have also been found on other islands of the group, it cannot be assumed that pottery was once produced there also; since all the discoveries were made along the coasts, it is more likely that all came from Espíritu Santo through trade.

NEW CALEDONIA. The small group of the Loyalty Islands — Uvéa, Lifu, and Maré — represents an area of geographic and cultural transition between the southern New Hebrides and New Caledonia. Like the southern New Hebrides, it has been influenced by Polynesia and is artistically poor. It reflects, on a smaller and more modest scale, the culture of New Caledonia, from which its art derives. Masks, which are so typical of New Caledonia, as well as the major forms of sculpture, are absent. The art, like the whole culture of New Caledonia, exhibits an unmistakable autonomy — probably because of its geographic isolation — and indications of remote antiquity. One of the earliest types of artistic expression is the conical-roofed hut, the structural elements of which show New Caledonian carving at its best. The doorframes and the carved ridgepoles are typical of this art. In the interiors the posts are sometimes carved with human faces; in rarer instances a human figure is also carved on the central support.

The doorframes consist of two jambs and a crossbeam, the stylistic peculiarities of which date from early times and reveal no outside influences. The jambs, about 40 to 80 in. high and about 12 to 40 in. wide, are slightly convex in section. They generally adorn the chiefs' houses, and their decoration is almost always the same, representing, more or less recognizably, a man, probably an ancestor. The face is depicted fairly realistically, and in most cases it is characterized by an exaggeratedly long nose and an equally wide mouth. The tongue sometimes protrudes, probably to ward off demons and evil forces; this feature is rather unusual in New Caledonia and in most of Melanesia, being found to a marked degree only in the Sepik River region of New Guinea, where it appears fairly frequently in the masks on the gables of men's houses and on shields. The small eyes of the figures on the doorjambs are almond-shaped or round; they are incised or may protrude like buttons, as do the eyes of certain masks from the same island. (Other variations of style in representation can be ascribed to the island's great length, 248 mi., which has tended to isolate separate stylistic provinces.) Above the foreheads of these figures runs a slender horizontal slat on which zigzag lines are incised; this must surely represent the rope of the slingshot, since the island's discoverers, on Cook's second voyage, noted that the men wore their slingshots tied around their foreheads. The figures are therefore definitely male, contrary to the statement of a native chief that these figures were supposed to represent the wives of the man depicted on the peak of the roof. It is usually hard to see clearly the upper part of the faces of the figures *in situ*, since they are thickly covered by the overhanging thatch roof. The carving below the face, unlike the head, is so highly stylized that if it were considered separately and without knowledge of all the intermediate phases of its development, it would be virtually unrecognizable as a human figure; it is completely abstract, entirely absorbed into an ornamental design composed of rhomboid forms between zigzag lines. Only in a single piece (of uncertain provenance) is it possible to distinguish, beneath the ornamentally carved torso, the legs below the knee, realistically carved in the round. In two other doorjambs, probably originating in the southern part of the island and now preserved in the Museum of Bordeaux, even the faces, represented in superposed rows, assume the form of elongated triangles.

The lintel, nearly 5 ft. above the ground, repeats substantially the same facial motif as the jambs. Formerly the doors of the important huts also had a beam between the doorposts, but its use ceased about the beginning of the present century. One specimen collected by M. Leenhardt is divided into three vertical rectangles, each surrounded by a border and covered with lozenge-shaped carving. The framework of the doors is painted black and red. Near the doorjambs are occasionally observed small slender wooden poles planted in the ground; each is about 39 in. high and bears a small carved head, sometimes with a long drooping beard. No definite information is available regarding the significance of these poles; apparently they are in some way connected with the rank of chief. Occasionally wall posts are made from massive tree trunks about 5 ft. high and bear a carved human face with a long stylized beard. On one particular example on top of the central post of a hut, a very realistic human figure is carved in the round, with the legs extending along the post and the arms, with elbows bent, raised upward.

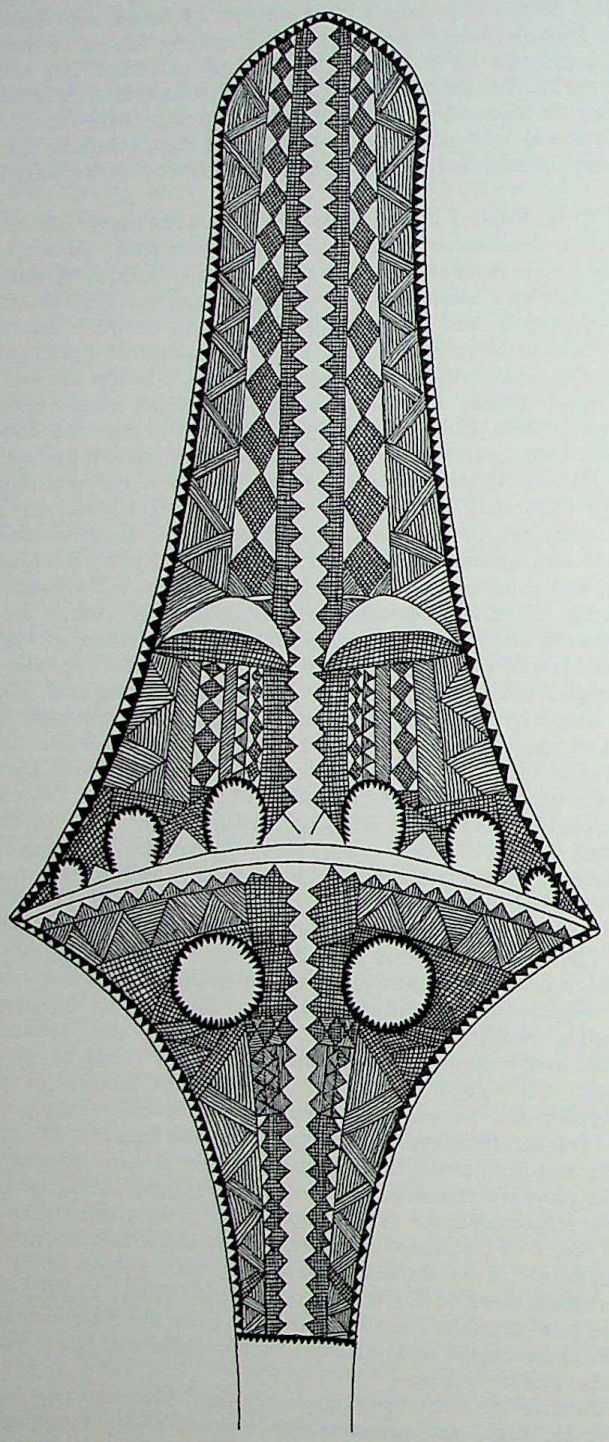
Sculptures of great variety are placed on the roofs of the circular huts; they are probably symbols or representations of mythical family founders and are ritual in nature, since they are found also on tombs and sacrificial sites and as taboo signs in plantations. Three stylistic types can be discerned among them, which probably developed chronologically: realistic figure sculpture; sculpture in which parts of the human body and stylized accessories are intermingled; and abstract geometric shapes. The commonest figures are evidently intended to represent masked persons, as shown by the large spherical

headdress and feathered costume concealing the body, indicated by horizontal rows of indentations. In all these figures the legs are carved separately. Extremely rare is the figure of mother and child, and nude male figures are also uncommon. With a few exceptions, these figures are rigidly symmetrical. In those of the second type, which are mostly in the form of planks, only the faces are recognizable; the S-shaped lateral appendages that frame the face are to be interpreted as legs and arms, as confirmed by the statements of the natives. Also discernible in some sculptures of this group is the decorative slat representing the slingshot cord. To this is joined an ornament in the shape of an inverted heart indicating the spherical headdress. At the tip of the ornament is a slender staff to which are attached large white Triton shells. On the roof sculptures of the third style, in which the face is handled in a purely decorative manner, Triton shells are also found on the terminal pole.

The presence of masks is remarkable, since there is no trace of men's secret societies. The masks are perhaps a secondhand, though not a late, acquisition; this would follow from the fact that the mask represents a sea spirit and, according to tradition, probably reached the island from the north. It seems likely that in New Caledonia the wearing of a mask is a privilege reserved to a few people and that the masks are used on ceremonial occasions, primarily in the *pilu* preceding a declaration of war, and have no ritual use. The individual style and peculiar characteristics of New Caledonian masks suggest that they must have existed there since very remote times. Depending on their origin, different types can be distinguished and classified according to the stylistic treatment of the wooden facial portion; for example, the enormous hooked nose, grotesquely incurved, is typical of the northern part of the island (PL. 443). New Caledonian masks consist substantially of three parts: the face, always carved of dark hardwood; a spherical headdress, often immense, of human hair; and a cloak of Notu-dove feathers knotted into a mesh. Artistic interest attaches only to the facial mask, consisting of a semiovoid piece of wood with the face depicted on the convex portion. In the north of the island, the face is characterized by an immense hooked nose with wide flaring nostrils, a large upturned half-moon mouth, and comparatively small almond eyes. In other parts of the island there are masks with small, strongly protruding round eyes, a broad flat nose, and a small mouth, often horizontal. In all New Caledonian masks the wearer looks out through the open mouth, with its naturalistic teeth, since the mask eyes are always closed. Above, fastened to the wooden part of the mask, is the plaited cylindrical cranial ring, from which rises the spherical headdress of hair, and on the side is the plaited work which encircles the occiput; hanging from the lower edge of the last is the feather cloak, with openings at the sides for the dancer's arms. The face is generally framed at the sides and bottom with tufts of hair and a long beard, also of human hair. The masks are entirely black, and only in a few cases are the nostrils colored red and the teeth white; in one particular type the mouth is bordered with a row of red Abrus seeds, affixed with wax. The person wearing the mask carries a spear in one hand and a club in the other.

There are no other large-scale art works, though numerous smaller objects have decoration of merit. Closely resembling the masks, for instance, are the small wooden heads fastened to the ends of the strings of shell money, which are kept in small wooden boats. Similar small carved heads, and in rarer instances full figures, are found on the light assagais. Of greater importance are the small freestanding wood sculptures representing the human figure; little precise information is available on their meaning. In many cases they may be ancestor figures, perhaps employed in rain magic, as was stated in one case by the natives. Various figures carved in relief on a small wooden board are considered a magical means of obtaining offspring (PL. 247); an infant in a plaited cradle is often depicted. Zoomorphic representations are almost entirely lacking; there is sporadic use of the lizard motif in pottery and on roof gables; one completely isolated specimen is a wooden dove of unknown significance.

A feature peculiar to New Caledonia, but not found in the Loyalty Islands, are the bamboo tubes with incised motifs. Opinions as to their significance and use are divergent: it is thought that they may be emblems of rank. Besides purely ornamental designs, which are probably the prototypes, the bamboo pieces also show a large number of figural representations, many of which are fairly late, including figures of Europeans, persons on horseback, guns, and sailboats. An early observer, E. Lambert, reports that the New Caledonians usually incised on bamboo depictions of the history of their ancestors; many pieces indisputably depict historical events, such as feasts or wars between two villages (see CALLIGRAPHY AND EPIGRAPHY).



FIJI ISLANDS. The art of the Fiji Islands has many characteristics in common with that of central Polynesia, particularly Tonga; there is an almost total absence of independent sculpture on houses and boats, and certain traditional cultural elements, such as masks and shields, are lacking. In complete contrast with Melanesian custom is the tendency not to color art works; even the tapa-cloth ornamentation (PL. 458), in the absence of the most intense and luminous colors, seems almost monochrome. Also almost entirely absent in Fiji are the carved figures which are the predominant expressions in the art of the rest of Melanesia. In a sense, therefore, the art of this archipelago may be regarded as meager. However, in Fiji the epicenter of art production has shifted to other fields. These include the decoration of tapa cloth and pottery (PL. 455) and, less common but nonetheless noteworthy, the ornamental carving of various wooden articles, especially clubs. As in Polynesia, many utilitarian objects are the product of highly skilled workmanship and an exquisite esthetic sense of modeling: examples are the cups for kava and other bowls and plates, the headrests, the splendid pectoral plaques of mother-of-pearl and of sperm-whale teeth, and the carved sperm-whale teeth, with the long tips turned upward; the last, strung on a cord, are the most highly prized ornament of the chieftains. Especially noteworthy among the weapons are the many types of clubs carved in rare wood — the root, pineapple, morning-star, gunstock, paddle (FIG. 727), and lotus-flower clubs, most of which have carved handles (the large head carved as well, in the last two types), often with star- and moon-shaped decorations.

The human figure is found only on the rare wooden suspension hooks and figurines carved of sperm-whale teeth, which are objects of veneration and, according to the Polynesian religion, probably represent divinities rather than ancestors. These ivory carvings were kept in shrines made of plaited coconut-fiber rope, in the great *mbure* cult houses (perhaps temples), and were used by priests for oracular ceremonies. The few surviving specimens suggest that the figures of divinities were not numerous, and since in their severe symmetrical style they are reminiscent of those of Tonga, they may have been imported from this group of Polynesian islands or are the result of influences emanating from there (see POLYNESIAN CULTURES). Two statues of tree-fern pith preserved in the Nationalmuseet of Copenhagen, although found in Fiji, must have been brought there by craftsmen from the New Hebrides; later these figures were adorned with necklaces of sperm-whale teeth typical of Fiji.

Several of the remarkable tree-fern pith statues, about $39^1/_2$ in. high, are preserved in museums, for example, in the Nationalmuseet of Copenhagen. The relatively late date of their acquisition, together with stylistic details and testimonials that these statues were taken to Fiji by craftsmen from Gaua (Banks Islands), make it virtually certain that these are to be ascribed to a Melanesian influence from the latter islands, where this type of sculpture is very highly developed.

The only class of zoomorphic sculpture (turtles) is evident in the highly developed pottery. Fijian pottery is of special importance, since Fiji is the easternmost point to which pottery spread and also because pottery is the only art of the islanders that has no relation to Polynesia (where pottery is completely absent). It is noteworthy, however, that Fijian pottery bears almost no resemblance to that of Melanesia; it differs in both technique (with a glossy coating of resin, similar to a varnish) and form (PL. 455). Characteristic of Fiji are spherical or

potbellied vessels, with or without necks, as well as extremely unusual vessels in the shape of a double boat or of round fruit, two or more pieces of which are joined together by pottery

Decorative motifs on a "paddle" club from the Fiji Islands.

handles. Most of the ornament consists of geometric designs impressed with the fingernail or with a stick.

Decorative ornamentation is applied mainly to bark cloth, with its highly individual motifs often made up of zigzag lines and star-shaped figures (PL. 458). The colors employed against the natural light background of the material are black and a very dark red. Although the making of tapa cloth is a technique not limited to Polynesia, but found also in most of the Melanesian archipelagoes, the Fijian tapa shows a distinctly Polynesian character, in its perfect craftsmanship, decorative technique using dies and matrices, and other features.

MELOZZO DA FORLÌ. Italian painter of the Romagna (b. Forlì, 1438; d. 1494). Little is known of his training or of his early style. He is thought to have been trained by Piero della Francesca and possibly through him to have come in contact, at Urbino, with Justus of Ghent and Pedro Berruguete. Actually such hypotheses are undocumented; but in Melozzo's first certified work (VII, PL. 274), a fresco representing the nomination of Platina as prefect of the Vatican Library by Sixtus IV, features of Piero's art are prominent. The assured perspective, the Albertian grandeur of the architecture, the harmony of proportions, the characteristic generalization of specific historical personages, and the fluent equipoise of recession and two-dimensional design all reveal Melozzo's debt to his Umbrian predecessor. Except for the crumpled-drapery style in the figure of Platina, the Humanist custodian of the Vatican Library, no connection with Flemish art — or specifically, with that of Justus of Ghent — is discernible. Another source, however, is significantly present in Melozzo's Vatican fresco: the art of Mantegna. A knowledge of Mantegna, possibly of his Camera degli Sposi of 1471–74 (PLS. 328, 329), one of the earliest group portraits in Italian painting, is suggested by Melozzo's fresco. The low eye level is another feature derived from Mantegna. Seen from below, the figures appear larger and more monumental as a result, while the architecture not only implies recession but also, in filling so much of the picture, forms a strongly decorative element.

Soon after completing the Platina fresco, Melozzo painted the apse of SS. Apostoli in Rome; the surviving fragments of this work, which represented the Ascension, have been detached (Mus. Vat.; Pal. Quirinale). The remaining figures, radically foreshortened and illusionistic in a manner again reminiscent of Mantegna, are among Melozzo's most inventive, and the

achievement was highly praised by Vasari. In this fresco, also, the garments are closer in style to the narrow, clinging folds of Mantegna; at the same time, the facial type of Christ and the emphasis on detail may reflect increased awareness of Justus of Ghent. In Melozzo's later work — the frescoes executed in Loreto (VIII, PL. 204) and the designs carried out by Palmezzano at Forlì (XI, PL. 99) — the pliable organic quality of his earlier figures is subordinate in a far greater degree to purely decorative intentions.

Melozzo's distinction lies in his felicitous blending of elements from the art of Piero and of Mantegna. Moreover, the continuing concern of Melozzo with creating monumental decoration, imposing scenes with full-bodied figures in splendid architectural settings, gains him a place as a significant predecessor of High Renaissance painting.

MAJOR WORKS. *Sixtus IV Nominates Platina Prefect of the Vatican Library* (1477; Mus. Vat.). – *The Ascension* (ca. 1477–81; frescoes originally in SS. Apostoli, Rome; fragments, Mus. Vat. and Pal. Quirinale). – *Prophets, Angels, and Cherubs* (ca. 1480–84; frescoed vault, Loreto, Sanctuary of the Holy House), with assistants. – *Prophets and Cherubs* (1493–94, destroyed; vault frescoes, Forlì, S. Biagio, Feo Chapel), execution largely by Marco Palmezzano (d. 1539), pupil of the artist. – *S. Giovanni Battista* and *S. Benedetto* (fragments, Uffizi).

MEMLING, HANS (JEAN, JAN MEMLINC). Painter (b. Seligenstadt, near Frankfurt, ca. 1440; d. Bruges, Aug. 11, 1494). On Jan. 30, 1465, "Jan van Memmelynghe, Harmans Zuene, ghebooren Zaleghenstat" was recorded as a new citizen of Bruges. To judge by the family name, the Memlings probably came from Mömlingen, a small village near Seligenstadt. Memling's German origin is confirmed by Marcus van Vaernewyck (*De historie van Belgis*, Ghent, 1574), who mentions him as "den Duytschen Hans." The Italian historians of the same period altered his name to "Hausse" or "Ausse": this is the case, respectively, with Giorgio Vasari (*Vite*, Florence, 1568) and Lodovico Guicciardini (*Descrittione di tutti i Paesi Bassi*, Antwerp, 1567). Since these historians furnish not the slightest proof of their assertion that Memling learned his art in the studio of Rogier van der Weyden (q.v.), the statement remains questionable. The apparent influence of Rogier on Memling will be discussed below, but it is not in itself sufficient to prove the direct relation of pupil and master. So far Memling's master is not known and neither is the location where he received his professional training. Leaving Seligenstadt he had to pass through Cologne to reach Flanders. He probably spent some time in Cologne, because in his paintings on the St. Ursula shrine (1489; PL. 461) he included some accurate views of that city. However, it would be stretching the evidence to maintain that he was influenced by the school of Cologne; his art has nothing whatever in common with, for example, that of Lochner (q.v.).

The few facts about his life that are known with some certainty support the supposition that he was born about 1440. In 1467 he was received into the painters' guild of Bruges, where he had established residence. His painting must have brought him a considerable fortune, because in 1480 he was obliged (along with 245 other notables) to lend a large sum to the city of Bruges to help Maximilian I cover the enormous costs of his war with France. Yet this contribution far from exhausted Memling's resources; during the same year he bought three houses in the port area. His marriage to Anne de Valkenaere must also have taken place about this time: not much later, because she bore him three sons before she died in 1487, and not much earlier, because the boys were still minors at the painter's death in 1494.

An indirect source made it possible for Henri Dussart to publish in 1891 in the *Annales de la Société d'Émulation de Bruges* the following note relating to the death of Memling by the painter's contemporary Rombout de Doppere, canon of the Collegiate Church of St-Donatien at Bruges: "Die XI augusti [1494], Brugis obit magister Johannes Memmelinc, quem praedicabant peritissimum fuisse et excellentissimum pictorem totius tunc orbis christiani. Oriundus erat Magunciaco, sepultus Brugis ad Aegidii." This invaluable text furnishes both the date of Memling's death (Aug. 11, 1494) and his burial place, the Church of St-Gilles at Bruges. It also shows the esteem of his contemporaries, who hailed him as "the best painter in all Christendom." However, the statement "Oriundus erat Magunciaco" ("his origin was Mainz") cannot be taken literally. The most likely explanation is that in those times Mainz was the most important of the cities near Seligenstadt, and Rombout de Doppere meant that he came from the region of Mainz.

The only other facts to be gleaned from contemporary texts relative to Memling's life show that, following the practice of his time, he occasionally took on an apprentice: Jan Verhanneman in 1480, Passchier van der Mersch in 1483, and a certain Louis Boel at an unspecified date. The lives and works of these followers are not known, but it is reasonable to attribute to them as a group, and to various others whose names are unknown to us, the innumerable panels attributed to the studio of Memling which appear in so many churches and museums throughout the world.

The inscriptions and coats of arms found on some authentic panels, along with certain more or less ingenious reconstructions, make it possible to draw up a list of the principal patrons and amateurs who dealt directly with the master. There is no more reliable testimony to the exceptional esteem in which he was held throughout his career, even beyond the borders of the Burgundian Low Countries. Oddly enough, the earliest work of Memling that can be dated with some precision was destined for England, and the very last for Germany. An English lord, Sir John Donne of Kidwelly ordered the *Donne Triptych* (PL. 460) in 1468, while he was in Bruges with his wife, Elizabeth Hastings, and his daughter, to attend the marriage of Charles the Bold, Duke of Burgundy, and Margaret of York. The late (1491) commission for Germany, the Passion triptych (of which the Crucifixion panel is in Lübeck, St. Annen-Mus.), is easily explained by the commercial relations of the port of Bruges with the Hanseatic League towns. Heinrich Greverade, a merchant of Lübeck, chose Memling when he wished to honor the memory of his brother by a painting in the family chapel. There were also Spanish commissions. A diptych, *The Deposition*, and a panel, *The Virgin and Child*, datable about 1475, were in the collection of Isabella I of Castile, and still adorn the Capilla Real in Granada. In addition Memling executed for the organ of the Church of S. María la Real in the Castilian town of Nájera three enormous panels (*Christ Surrounded by Angel Musicians*, Antwerp, Mus. Royal B.A.).

It is understandable that numerous English, German, and Spanish patrons turned to a Flemish painter for lack of masters of equivalent stature in their own countries, but it is surprising that commissions also came steadily from Italy, which was at that time in the midst of a great artistic flowering. Memling enjoyed the patronage of more than one representative of the Medicis at Bruges. The *Last Judgment* (ca. 1473), now in the Church of St. Mary, Danzig, was commissioned by Angelo Tani for a chapel in Florence. Shortly after the marriage of Tommaso Portinari to Maria Maddalena Baroncelli in 1470, a triptych was ordered from Memling (central panel missing; half-figure side panels, showing Tommaso and his wife at prayer, now in New York, Met. Mus.). These patrons also appear in another of Memling's works, *The Passion* (Turin, Gall. Sabauda). In 1487 Memling produced an altarpiece for the Church of S. Maria Novella in Florence; two panels, a St. Benedict and a portrait of Benedetto Portinari, are now in the Uffizi; a panel bearing the portrait of Benedetto's wife is lost; *The Virgin and Child* (Berlin, Staat. Mus.) completed the work. Memling also counted among his customers the Italian

medalist Giovanni Candida, who worked for Mary of Burgundy from 1477 to 1479 and of whom Memling painted a portrait (Antwerp, Mus. Royal B. A.).

Naturally Memling worked less often for foreigners than for patrons from his adopted country. Among the latter were, for example, the canon Gilles Joye, a composer attached to the court of Burgundy, who commissioned a portrait in 1472 (Williamstown, Mass., Clark Art Inst.); and Jean Crabbe, a Cistercian abbot from the Abbey of the Dunes at Koksijde to the north of Dunkerque, who commissioned an altarpiece, the parts of which are now dispersed: *The Crucifixion* is in Vicenza (Mus. Civ.); the wings are in New York (Pierpont Morgan Lib.); and the rear panels of the wings are presumably to be identified with two panels in Bruges (Groeninge-Mus.). Two burgomasters of Bruges were also Memling's patrons: Martin van Nieuwenhove, who is represented opposite the Virgin and Child on the diptych of 1487 in the Musée Memling, Bruges (PL. 462); and Guillaume Moreel, who is shown kneeling with members of his family on the *St. Christopher Triptych* (1484; Bruges, Groeninge-Mus.). Here St. Christopher is represented between St. Maurus and St. Giles. Moreel and his wife, Barbara van Vlaenderbergh, are also shown in prayer on the wings of a triptych (ca. 1483), of which the central panel has disappeared (the wings are in Brussels, Mus. Royaux B. A.).

It was for a local institution, the Hospital of St-Jean in Bruges, now housing the Musée Memling, rather than any individual patron, that Memling painted the greatest number of works. The triptych *The Mystic Marriage of St. Catherine of Alexandria* (1479) was donated by the friars Anthonis Seghers and Jacob de Keuninc and the nuns Agnès Casembrood and Clara van Hulsen. The friars Jacob Floreins and Adriaen Reins each donated a triptych, *The Adoration of the Magi* (1479) and *The Lamentation* (ca. 1480). The most celebrated of all these commissions, the St. Ursula shrine (1489; PL. 461; XII, PL. 369), was the gift of two nuns who were also connected with the Hospital, Jocosa van Dudzeele and Anne van den Moortele. This summary of Memling's patrons by no means constitutes an inventory of his works. Nonetheless, it is the nucleus, except for the very numerous panels executed for the rich *bourgeoisie* of Bruges. The names of only a few of these are known, among them the spice dealer Jean du Celier, for whom a diptych, *The Mystic Marriage of St. Catherine of Alexandria* (Louvre), was painted about 1475, and the tanner Pieter Bultync, who commissioned the panel *Scenes from the Life of Christ and of the Virgin* (erroneously called *The Seven Joys of Mary*; Munich, Alte Pin.) about 1480. But the subjects of many bourgeois portraits by Memling, men and women, remain unidentified.

It is striking that Memling seems never to have produced a painting unrelated to his religious beliefs and to those of his clients. This is obvious in the triptychs, diptychs (PL. 462), and single panels representing Biblical subjects. It was consistent with the social and religious tradition of the time to show one or two donors, or whole families of patrons, presented to the Virgin by patron saints (PL. 460). To grasp the religious spirit implicit in the art of Memling, one must note that even individual portraits, usually in the attitude of prayer (PL. 459), were intended for private chapels or served as wings to a central panel (later lost), as in the case of the works for Moreel and Portinari mentioned above. The diptych with Martin van Nieuwenhove (PL. 462) and the panels of St. Benedict and Benedetto Portinari in the Uffizi are rare instances of portrait panels still accompanying their religious counterparts. The hands of all the patrons, joined in prayer or posed in gestures indicating serious meditation, eliminate any possibility that the adjoining panels could have been nonreligious in character.

The whole *œuvre* of the master contains only one work which, from a religious point of view, might disconcert the spectator, the very realistic and beautiful *Bathsheba* (ca. 1485; Stuttgart, Landesmus.), which some prudish collector mutilated by replacing the upper left corner with a much more discreet and ordinary representation of David moved by his adulterous passion. The detached fragment survives in the Nationalmuseum in Stockholm. The panel in its original form transformed the Biblical narrative into a genre scene, throughly intimate, to be sure, but with a healthy candor consistent with the mentality of Memling's time. In spite of the difficulty of representing with delicacy a woman leaving her bath, Memling's nude does not lack dignity, grandeur, or even a certain reserve. The spirit of this painting is such that, in spite of its subject, Memling remains a religious painter.

Too many art historians still assert that this famous painter of Bruges was a patient and careful miniaturist who simply replaced the small page of parchment with a medium-sized oak panel. Certainly this judgment is applicable to a considerable number of Memling's works, from *The Passion* in Turin to the St. Ursula shrine, but to apply it to his work as a whole would be to overlook a radically opposing aspect of his art, the colossal dimensions of some of his triptychs. The Danzig *Last Judgment* (without the frame) measures about 7 ft., 3 ½ in. × 10 ft., 6 in., and each of the three monumental panels formerly in Nájera measures about 5 ft., 6 in. × 21 ft., 8 in. These are extreme cases, but there are other examples such as the Lübeck *Crucifixion*. Furthermore, on more than one of the smaller panels the dimensions of the figures are life-size, including the Stuttgart *Bathsheba*, and the saints and donors of *The Mystic Marriage of St. Catherine* and of the *St. Christopher Triptych* in Bruges.

The great difference in dimensions from one panel to another does not result in two or more techniques or styles according to the surface to be covered. On the contrary, whether the work was monumental or a small portrait such as that of Giovanni Candida, Memling consistently expended the same care, to the minutest detail of the work. From this point of view the term "miniaturist" can appropriately be applied to the master. In addition, the number of figures included in a picture is entirely independent of the dimensions of the panels. For example, on the *St. Christopher Triptych* the three saints, Christopher, Maurus, and Giles, are alone on a large central panel, while on the considerably smaller panel of *The Passion* in Turin there are dozens of figures.

The Passion, certainly the most synoptic of all the paintings, leaves the impression that one can absorb at a single glance all the pages of a manuscript. The painter has narrated here about twenty events from the end of the Saviour's life on earth, from the Entry into Jerusalem to the "Noli me tangere." There can be no doubt of the influence of the medieval theater on the scenes. From contemporary mystery plays Memling borrowed the simple little houses juxtaposed and open on one side toward the spectator. It would be incorrect to assume that this simple device resulted from the painters' inexperience and was discarded later, for the same composition can be found ten years later, in 1480, in the *Scenes from the Life of Christ and of the Virgin* in Munich. It is clear that the scenes on the side of the St. Ursula shrine of 1489 also belong to this anecdotal and synoptic genre, and even the last dated work of the artist, the Lübeck triptych (1491), retains this medieval convention, although the central panel of the Crucifixion is separated from the Biblical narratives, from the Mount of Olives to the Resurrection, which animate the wings.

Comparison of Memling's works reveals a fundamental characteristic: his style presents no marked evolution or logical development; on the contrary, the curious fact is that he perfected his genre at the very outset and thereafter felt no need or found no means to improve on it. His great masterpiece, *The Mystic Marriage of St. Catherine* of 1479 (Bruges), is not greatly superior to the fine *Donne Triptych* of 1468 (PL. 460), nor is it in the least inferior to the Lübeck *Crucifixion* of 1491. In short, the whole group of his mature works must be considered as nuances of a single standard of perfection. That being the case, it is sufficient to enumerate the general characteristics of his style, since they are applicable to practically all his works.

Nothing is more immediately evident than the sweet, celestial, mystical atmosphere of Memling's paintings. While the religious tone may seem to modern eyes to be marked by an excess of tenderness and sweetness, or even mundane bourgeois charm, it is nonetheless the reflection of a natural and confident spiritual fervor, quite different, for example, from the rigorous Spanish asceticism of the same period. At the end of the 15th century in prosperous Flanders, religious faith did not exclude

fine clothes, splendid jewels, sophisticated hair styles, or elegant furnishings. Memling's figures are slender with small, rather pretty heads and delicate limbs. The female saints look so much like princesses that serious but unsuccessful attempts have been made to identify some of them with actual persons. The resemblance between King Balthasar in both Adorations of the Magi (Madrid and Bruges) and Charles the Bold of Burgundy is undeniable. The environment of this period is far removed from that of the middle of the 15th century, when the rigorous ideas of the Brethren of the Common Life were imposed on such painters as Dirk Bouts and Hugo van der Goes (qq.v.). The last echo of that past influence is barely noticeable in the extreme reserve, the determined silence, and above all, the physical and spiritual isolation of Memling's figures. Each figure has a life apart from those around it. From each of Memling's works emerges a feeling of sovereign and poetic serenity that is most moving. The sparkling color, still as fresh as the day it was painted, fills each panel with a beautiful luminosity, almost as if it were sunlit. Certain compositions might seem loosely organized but for the lighting that comes from a single source and gives the composition a unified effect, as in the Turin *Passion*. In other more rigid compositions, even those with absolute symmetry of figures and setting, light plays a harmonizing part. Memling applied a nearly constant formula: the foreground and the landscape background, both brightly illuminated, are separated by an intermediate zone immersed in shadow. Constantly striving for a general harmony, the painter always avoided overaccenting, by lighting or other means, any single element in his paintings; instead he strove for equality among all the components of a painting.

In Memling all the most lively tendencies of 15th-century painting are epitomized; an attentive observation of everyday reality in all its aspects provided him with the forms and colors of his settings and his figures, but at the same time he idealized them, transcending the combination of elements to create an extraterrestrial world consistent with his imagination and his faith.

Mention was made above of the hypothesis that Memling served an apprenticeship in the studio of Rogier van der Weyden. It is undeniable that at the beginning of his career Memling often made use of certain angular forms, as in *The Martyrdom of St. Sebastian* (ca. 1470; Brussels, Mus. Royaux B. A.), and even the entire interpretation of certain subjects, as in *The Adoration of the Magi*, that conform to Van der Weyden's types. The fact is, however, that this dependence on Rogier, aside from a few diversions, continued up to the last works of Memling; the group of holy women in the Lübeck *Crucifixion* still shows Rogier's influence. Yet Memling, even in subjects of the same character, never attained, or rather never sought, the same degree of dramatic intensity. In other words, there was no psychological affinity between these two masters. Memling was continually inspired by Rogier but never directly imitated more than his superficial forms.

Toward the end of his life Memling introduced certain decorative elements from the Italian Renaissance into his works: putti discreetly enliven the Washington *Madonna with Two Angels* (ca. 1480–85; Nat. Gall.); they also appear holding heavy garlands of fruits and flowers above the *Madonna with Two Angels* in the Uffizi (ca. 1485) and the Louvre *Resurrection* (ca. 1490). Apart from these small features Memling remained absolutely unaffected by the radical innovations in the Italian art of his time.

In conclusion, the extremely high technical quality of all of Memling's work cannot be overstressed. Considering his abundant output, such consistent quality is extraordinary. Even the occasional small weaknesses are due for the most part to the increasing activity of his collaborators.

Memling's world-wide reputation is founded on two genres of painting, portraits (e.g. XII, PL. 95) and representations of the Virgin. In portraiture he was especially successful with male subjects. The portrait of Guillaume Moreel, which may be considered his best, exemplifies the characteristics common to most of his work in this category: the panel is small; the figure, a three-quarter bust in a pose of meditation or prayer, occupies so much of the available space that the minutely painted background landscape, viewed from a great height, is barely noticeable; and the diffused light does not accentuate the already sufficient relief of the model. Kneeling donors on either side of the central religious subject, usually with their families, are frequent. In the *St. Christopher Triptych*, commissioned by Moreel, the family group occupies the wings. It is not unlikely that some of Memling's saints were modeled after persons known by the artist; the three saints in this triptych would seem to indicate that he followed this practice. The only figure clearly excepted is that of the Virgin. Memling's treatment of the Virgin is the finest aspect of all his work. She is a continually recurring theme, appearing in one manner or another as the principal figure or the focal point of nearly all his religious compositions. Two major types of composition are frequent. In one the Virgin is enthroned, surrounded by a celestial and effulgent choir, in a sumptuous imaginary interior with columns through which can be glimpsed a radiant landscape. In the other type, the small diptych panels (such as the Nieuwenhove diptych, PL. 462), the bust of the Virgin is shown in fullface or with the head slightly inclined, and the donor forms a companion panel. Between the Virgin and the Child there is rarely a strong expression of rapport. Memling's Virgins more often have the hieratic, stiff appearance of the Queen of Heaven than that of the affectionate and attentive mother. This is because the artist invariably gave her the same face — bland, meditative, and spiritual. The art of Memling, despite, its naturalistic aspects, is more one of religious conviction, of poetry, than of earthly realism. Therein lies the secret of its survival.

MENDELSOHN, ERIC. German architect (b. Allenstein, East Prussia, Mar. 21, 1887; d. San Francisco, Calif., Sept. 15, 1953). After study at the Technische Hochschule, first that in Berlin (1908) and then in Munich (1909), where he was in contact with the expressionist artists of the Blaue Reiter group, Mendelsohn graduated and began his own practice in Munich in 1912. Before and during World War I he produced many remarkable and visionary project sketches that were at once expressionist and mechanistic (I, PL. 408). Such imaginative early aspirations were realized in the Einstein Tower (V, PL. 104; FIG. 236) at Neubabelsberg, near Potsdam, designed in 1919 and completed in 1925, among the most remarkable architectural products of the 1920s. Already in 1920 his hat factory at Luckenwalde was of a severe, angular design; and in a series of buildings throughout the rest of the decade — Herpich store, Berlin (1924), Schocken department store, Stuttgart (1926–27; V, FIG. 238); Schocken department store, Chemnitz (1928; V, PL. 105); Metalworkers' Union, Berlin (1929); Columbus Haus, Berlin (1931) — he moved even closer to the dominant "international style" of the period.

Leaving Germany in the early 1930s, Mendelsohn next worked in England, where he built, among other structures, the De La Warr Pavilion at Bexhill (1933–34), in partnership with Serge Chermayeff. From 1934 to 1941 he was in Palestine. His major works there — the Hadassah University Medical Center (1936–38) and the Anglo-Palestine Bank (1937–38), both in Jerusalem — illustrate an imaginative and reasoned response to a hot climate and a different cultural background; the Medical Center is perhaps his finest work. Settling in America, he built the Maimonides Hospital (1946–50) and the Leon Russel residence (1950–51), both in San Francisco. He also designed a series of synagogues and Jewish community centers: B'nai Amoona, St. Louis, Mo. (1946–50); Cleveland (1946–52); Mount Zion, St. Paul, Minn. (1950–54); and Temple Emanuel, Grand Rapids, Mich. (1953). In these something of the expressionist elaboration of form seen in his early work returned.

Recognized from the early 1920s as one of the four or five most important modern architects of Germany, Mendelsohn — like his contemporaries Gropius and Mies van der Rohe — contributed as much or more to world architecture as to the architecture of his homeland. His reputation rose and fell with tides of taste, and to these tides he was not unresponsive. Yet always his work had, as he intended it should, a strongly personal character, and his finest buildings will remain among the landmarks of 20th-century architecture.

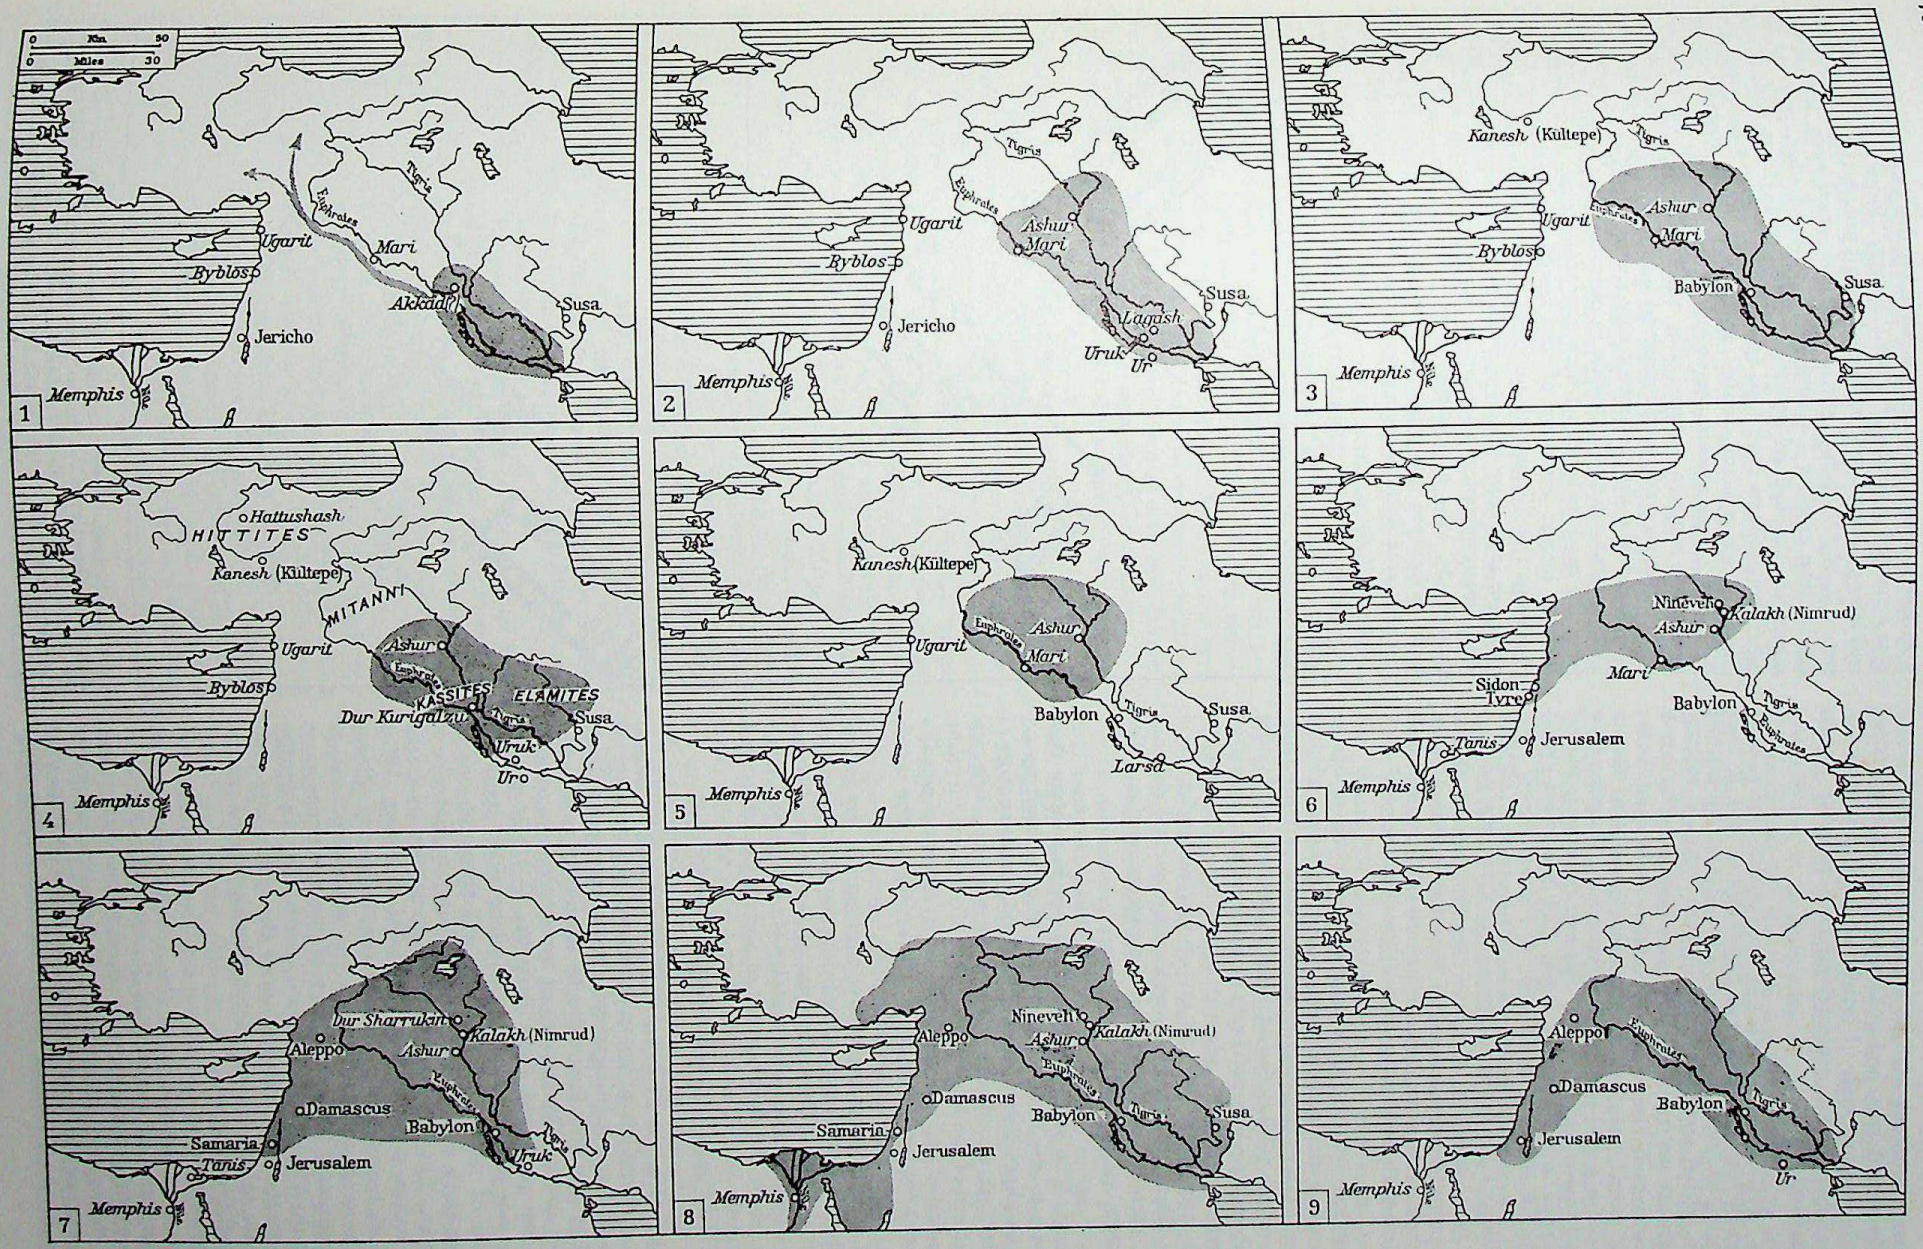
Henry-Russell HITCHCOCK

MERYON, CHARLES. French etcher (b. Paris, 1821; d. Charenton, Feb. 14, 1868). He was the son of a French dancer, Mlle Pierre Narcisse Chaspoux, and an English physician, Charles Lewis Meryon, who deserted his family a few years after his son's birth. When Meryon was sixteen or seventeen years old his mother died insane. At about this time he entered the French Naval Academy, cruising in the Mediterranean and, in 1842–46, in the South Pacific. In 1847 he resigned because of ill health, but all his life he continued to swab his floors barefoot, sailor-fashion, and kept his room as neat and anonymous as a ship's cabin. He studied painting until, when he put red waves into a picture of the South Seas, it was discovered that he was color blind. He then learned to etch from Eugène Bléry, a mediocre print maker, and copied fifteen 17th-century etchings, being especially influenced by the simple and direct copperplate views of Reinier Zeerman, whom he called "my master and sailor."

In 1850, with his first original etching, *Le petit pont*, Meryon began the series of 22 *Eaux fortes sur Paris*, his masterwork, which he etched during the next four years. The lunar hardness of these hallucinatory views of Notre-Dame, the morgue, and the bridges over the Seine fascinated Baudelaire, one of the first writers to discover poetry in the modern city. During 1860 Baudelaire repeatedly offered to write a text for the etchings, but Meryon merely "stared at the ceiling and said nothing." The enthusiasm of a few collectors could not sell these original visions, even at a mere 20 to 40 cents each, or 5 to 6 dollars for all 22.



Meryon's derangement began to be evident in some of his later prints, which show balloons, flights of hawks, sharks, and war canoes invading the skies of Paris. His first violent insanity is said to have been brought on in 1856 by the strain of composing five little daguerreotypes of San Francisco into a panorama of the city; for this work he had to accommodate edges distorted by the primitive camera and reconcile conflicting shadows. During 1857–58 the Duc d'Arenberg induced Meryon to take daguerreotype lessons in order to make views of the duke's château at Enghun, Belgium; but the views were never etched, and the daguerreotypes have never been published. From 1860 to 1866 Meryon was lucid enough to etch from sketches made on his youthful cruise in the South Pacific, but he died in the madhouse of Charenton on St. Valentine's Day, two years later. He had lived for 46 years, had etched for about fifteen, and had crowded the creation of his masterpieces into five.

Meryon used the direct sharpness of 17th-century copperplate techniques to express romantic poignancy. The clarity of his style affected many French etchers, and its influence is apparent in Whistler's Thames Set. Meryon was one of the first to discover that everyday places can haunt and hypnotize, a discovery that became more explicit in the early work of De Chirico and Charles Burchfield. Meryon's manner of working was as individual as all else about him. He drew buildings from the ground up (because that is how they are built) with a sharp, hard pencil on tiny squares of paper concealed in his palm. He then pasted these squares together in his compositions, often combining different points of view.

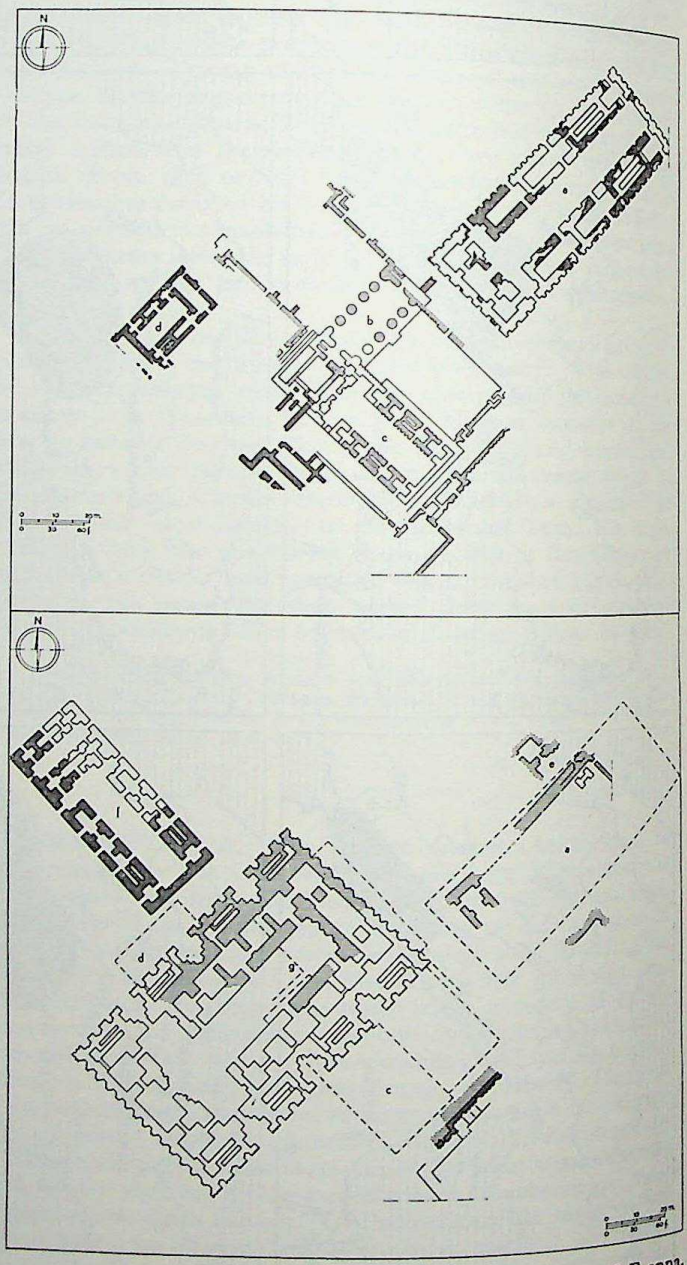
MESOPOTAMIA. The ancient western Asian land of Mesopotamia — "the land between rivers," the Tigris and the Euphrates — was from the end of the 4th millennium until the middle of the 1st the site of a mighty civilization that in antiquity and in duration is comparable only to the other great river-valley civilization of the Near East, that of Egypt (see EGYPTIAN ART). Egyptian art, however, as a result of ethnic homogeneity and geographic autonomy, was relatively isolated and self-contained; whereas Mesopotamian art, sprung from a complex of prehistoric and protohistoric cultures (see ASIATIC PROTOHISTORY; MEDITERRANEAN PROTOHISTORY), drew on a diversity of ethnic elements (Sumerian, Semitic, Indo-European) and underwent great vicissitudes in history, achieving a remarkable variety and manifesting a great power of expansion. This power, which made the art of Mesopotamia the pivot of art development in its area (see ASIA, WEST: ANCIENT ART), was manifest at least from the beginning of the 3d millennium in Elam (see IRANIAN PRE-SASSANIAN ART CULTURES) and to some extent in Egypt itself; at least from the 2d millennium in Anatolia (see ASIA MINOR, WESTERN; HITTITE ART; URARTU) and Syria-Palestine (see SYRO-PALESTINIAN ART; PHOENICIAN-PUNIC ART);

Mesopotamia, the civilizations and reigns of major historical importance from the 3d to the 1st millennium B.C. (shading indicates extent of dominion). (1) State of Akkad (ca. 2350–2150); (2) Neo-Sumerian civilizations (2150–1950); (3) Amorite states in Mesopotamia (first half of 2d millennium); (4) Kassite and Elamite dominion (second half of 2d millennium); (5) Assyria in the reign of Shamshi-Adad I (ca. 1758–1726); (6) Assyrian empire in the reign of Ashurnasirpal II (883–859); (7) Assyrian empire in the reign of Sargon II (721–705); (8) Assyrian empire in the reign of Ashurbanipal (668–626); (9) Neo-Babylonian empire (625–538) (*based on Parrot, Sumer 1961, and Arts of Assyria, 1961*).

from the 1st millennium in Arabia (see ARABIAN PRE-ISLAMIC ART), in Achaemenid Iran, and in Greece. Thus Mesopotamia appears as the major center of artistic and, more broadly, of cultural irradiation of the ancient Near East, in other words, of the preclassical world.

SUMMARY. Protohistoric periods (col. 739): *Architecture: a. Uruk VI–IVb; b. Uruk IVa; c. Jamdat Naṣr period; Figural Arts: a. Uruk VI–IV; b. Jamdat Naṣr period.* First period of transition and Mesilim period (col. 746): *Architecture; Figural Arts: a. Transition period; b. Mesilim period.* Second transition period and period of Ur I (col. 752): *Architecture; Figural Arts: a. Sculpture in the round; b. Relief.* Akkadian period (col. 756): *Architecture; Figural Arts.* Gutian and Neo-Sumerian period (col. 760): *Architecture: a. Temples of the gods; b. Royal temples and palaces; c. Funerary monuments; Figural Arts: a. Sculpture in the round; b. Relief.* Old Babylonian period (col. 765): *Architecture: a. Cult buildings; b. Palaces; Figural Arts: a. Sculpture; b. Painting.* Middle Babylonian (Kassite) period (col. 768): *Architecture; Figural Arts: a. Architectural sculpture; b. Wall painting; c. Sculpture in the round; d. Relief; e. Glyptics.* Old and Middle Assyrian period (col. 772): *Architecture; Figural Arts.* Neo-Assyrian period (col. 775): *Architecture; Figural Arts.* Neo-Babylonian (Chaldean) period (col. 781): *Architecture; Figural Arts.* Conclusion (col. 785).

PROTOHISTORIC PERIODS. The great creative phase of Mesopotamian art was the protohistoric, called by some scholars "protoliterate," which is linked to levels VI–IV of Uruk (Bib. Erech) and to the period named after the village of Jamdat Naṣr. For about four hundred years (3100–2700 B.C., according to the "short chronology" adopted here) there flourished a monumental architecture and an art of vast dimensions and high quality. Both are related to certain fundamental religious conceptions, sketched at the end of the present section. (See also ASIA, WEST: ANCIENT ART.)



Architecture. The landscape of archaeology in western Asia owes its aspect to the "tell," the mound of ruins built up by the continuous alternation of destruction and reconstruction of villages, cities, or sanctuaries. These alternations early influenced the form of the temple. Through the repeated leveling or transformation of previous constructions in centers of worship there originated the temple on an elevated platform, the prototype of the "high temple" (*Hochtempel*).

The role of antecedent prehistoric structures in the formation of buildings is best illustrated at Eridu, the oldest Sumerian cult city, and at Uruk. There the ruins of E-anna, the "House of Heaven," which are the oldest remains of monumental structures known, show the development of architecture through a first phase (levels VI, V, and IVc–b) and a second one (level IVa); level III belongs to the Jamdat Naṣr period.

a. Uruk VI–IVb. At Eridu, as early as the middle Aëneolithic period, a chapel about 7 × 10 ft. in area was transformed into a temple of characteristic ground plan: a rectangular chamber bordered on the two long sides by subsidiary rooms, one of them a stair room. The remains of three successive temples of this type are preserved there from the al-'Ubaid period. The entrance was always on one of the long sides; stairs led up to a terrace of undetermined height and shape; on one of the short sides there was sometimes a podium and opposite it a hearth or altar. The four corners were accentuated by means of projecting rooms, a device that later fell into disuse. What remained typical, however, was the disposition of sacred edifices along axes diverging about 45° from the main directions of the modern compass. That buildings of the same type were also erected in the Uruk VI–IVb period is proved by the equally impressive sequence of structures under the much later Anu ziggurat of Uruk. Here, too, the rectangular chamber is accompanied by subsidiary rooms.

The examples cited so far show a continuous architectural tradition from the Aëneolithic to the Jamdat Naṣr period. E-anna, the sanctuary of the goddess Inanna at Uruk, on the other hand, was twice fundamentally altered during this time. Level VI has yielded only minor, hardly distinguishable remains of great edifices, but the sanctuary of levels V–IVb (FIG. 740) is largely known. An L-shaped terrace enclosed a court about 7 ft. lower down, with an entrance on the southeast and walls that consisted at first of *Patzen* ("lumps," large unbaked bricks) and later of *Riemchen* ("striplets," small unbaked bricks measuring $2\,^3/_8 \times 2\,^3/_8 \times 6\,^1/_4$ in.). On the southwest the terrace carried the smaller "Temple A," built of clay, and on the northwest the hall of columns, about 100 ft. in width, with pillarlike supports over 6 ft. in diameter. These supports were covered with a black, white, and red pattern formed by the flat butts of terra-cotta cones embedded in the clay. Similar terra-cotta mosaics covered the walls of the court, the long sides of which were partly resolved into joined half columns (X, PL. 172), while the northwest side formed a kind of platform. The patterns are clearly textile in character and probably derive from the reed mats with which clay walls were once protected.

The largest building of the sanctuary belonging to this phase was the "limestone temple." Given the strict symmetry prevalent in that period, it is possible to reconstruct its ground plan, a rectangle of 230 × 98 ft. enclosing an enormous T-shaped area 203 ft. long and about 38 ft. wide. Since such a width could be bridged only with huge tree trunks, it may be assumed that this area was an open court. The rooms on the long sides

Uruk (Erech, mod. Warka), the early phases of the sanctuary of E-anna. *Above*: First phase (levels V–IVb): (*a*) "limestone temple"; (*b*) hall of columns; (*c*) Temple A; (*d*) Temple B. *Below*: Second phase (level IVa): (*e*) "Red Temple"; (*f*) Temple C; (*g*) Temple D; buildings of the preceding period (*a, b, c, d*) indicated by broken lines (*adapted from Heinrich, 1950*).

were disposed symmetrically, as were the two stairways that led to the flat roof. Most important, no doubt, was the room on the south short side, which was flanked by two small rooms and opened on the court through a wide gateway adorned with niches. Cult niche, altar, and podium are missing, but the sacred character of the building is conveyed by its mighty dimensions and the decoration of the walls with niches — an infallible index of sacred function in western Asia from earliest prehistory through thousands of years. The temple owes its name to the surviving walls of limestone blocks. Their use, of which no instance could be found in the succeeding phase, is exceptional in Mesopotamia, probably because it was not in keeping with the spirit of the architecture rather than because the stone was difficult to obtain; it would have been no more difficult to obtain roofing trunks.

Another method of building more durably than with clay alone is illustrated by a complex at Uruk contemporaneous with E-anna IV, lying between the sanctuaries of Anu and Inanna. There, in a court with terra-cotta cone mosaics, stood a building with wall reinforcements of white alabaster cones and red and black limestone cones. This kind of reinforcement may be an earlier form of the use of terra-cotta cones, an earlier adaptation of reed hangings. Later, this technique, too, was abandoned.

Analogously, it may be supposed that the supports with terra-cotta cones in the hall of columns were derived from stone pillars. Neither stone-block construction nor pillars and columns were to determine the forms of later Mesopotamian architecture, although they were always known — as the arch was shortly to be — as structural elements serving to overcome the force of gravity. Sumerian architecture was not devoted to expressing the functions of load and carry, or tectonics, but rather to artistic effect achieved by decoration of wall surfaces.

b. Uruk IVa. The second protohistoric phase of E-anna marks a peak of artistic development. The sanctuary was thoroughly transformed (FIG. 740). True, there were again two cult buildings of different sizes at right angles to each other, but their position was altered. Where the limestone temple had stood, there was only a big storehouse or administration building. The principal temple, D, assuredly the successor of the limestone temple, covered the whole area previously occupied by the terrace with the hall of columns and Temple A, as well as by the large court with cone mosaics. To the northwest spread Temple C, obviously placed in relation to Temple D and of the same type as the limestone temple. As a matter of fact, it is the best-preserved example of the type. Its ground plan differs solely in that the fore (or westernmost) section was nearly independent of the oblong court complex that lay perpendicular to it in a northwesterly direction. It is noteworthy that no niches appear on the external walls but that the interior compartments of the fore portion were provided with very small niches along their whole extent. Accordingly, it alone may have served cult purposes, and the oblong court complex those of administration.

In Temple D the use of niches both on the external walls and on the interior courtyard walls reached such proportions that it must be regarded no longer as purely ornamental, but rather as a disposition of space. Whereas triple-stepped niches provided a normal articulation of the short sides of the powerful structure — which must have measured 180×262 ft. — the niches of the long sides, because of their extreme depth and partly because of their cruciform design, assumed the character of independent rooms. After a group of three niches about 5 ft. deep came a cruciform niche about 20 ft. deep and over 16 ft. wide. However the elevation was carried out in detail, there appears a marked loosening in the masses of brick, of which only a delicate shell, so to speak, remained. It becomes clear that the breaking-up of walls with niches is a transposition into clay of an extremely ancient construction technique with wooden posts.

c. Jamdat Naṣr period. The best-known building of the third protohistoric phase is the so-called "White Temple" at Uruk (PL. 463; I, FIG. 859). It was the product of a centuries-old tradition and corresponds in all details to the type of the Eridu temples. The continuous alternation of destruction and reconstruction made of it, too, a "high temple"; it rises on a terrace, all sides of which slant downward. Its particular importance lies in its good state of preservation. Incasement by a later terrace left the walls standing to a height of 10 ft.

The White Temple can be linked with Temple A of E-anna, also a "high temple," and is perhaps related to the other group, temples C and D and the older limestone temple, through the device of articulation by niches and common features in the spatial disposition of the fore sections. Two similar temples of this time became known in the 1940s: that of Tell 'Uqayr, with its mural paintings, and the "Eye Temple" of Tell Brak in northern Mesopotamia, with a podium decorated on the vertical faces, in true Sumerian style, with gold and colored stones.

The sanctuary of Inanna at Uruk underwent a marked transformation between level IVa and level III, which with two lesser enlargements (IIIa–c) lasted through the Jamdat Naṣr period. The heart of the layout, henceforth, was a terrace on which there probably stood a temple of the same kind as the White Temple, surrounded by numerous buildings for residence and administration, which were frequently altered. It is uncertain whether these subsidiary structures were already connected, as later, to form court complexes and enclosures. By comparison with earlier stages, all clarity and spaciousness have disappeared. Instead of symmetry we encounter confusion of plan in many sections; in others the thick walls of *Patzen* take up more room than the free spaces. Still to be found, however, are the *Riemchen*, though disposed somewhat differently, and the walls with cone mosaics.

To summarize, the Jamdat Naṣr period presents, on the one hand, the continuation of tradition in the architecture of the "high temple," in the decoration with niches, and in the revetments of cone mosaics; on the other hand, something entirely new in the unskillful layout of E-anna. A similar duality may be seen in the other arts of this period.

Figural Arts. Before the turn of the 4th–3d millennium there were but two outlets for figural art in Mesopotamia: polychrome pottery and stamp seals. Whereas pottery in the Aëneolithic era had developed toward abstract ornament, glyptic art for the first time attempted narrative based on observation. Some of the representations were distributed freely on the decorated surface; others were disposed symmetrically, in the manner of mirror images.

a. Uruk VI–IV. Whether seal engraving was the sole form of art practiced during the first phase of the protohistoric period is uncertain; the fact is that no other has been preserved. At Uruk a new kind of seal was devised: the cylinder seal, a stone roller that provides a larger decorated surface than the stamp seal. Although it is not clear how this new shape came into being, there is no doubt that the continuous band of ornament was congenial to the Sumerian spirit. The cycle returning upon itself is the theme of innumerable large and small compositions in ancient western Asia.

Surviving examples consist chiefly of impressions from cylinder seals on the closings of jars; of the seals themselves only a few have been found. Some of the subjects became trend-setting in western Asia: cult processions, sacrifices, battles, and hunts. Others are typical for the protohistoric period: wild beasts running free, domesticated animals, hybrid creatures in heraldic poses. Animals in general already played an important role as symbols of the forces favoring or threatening life. Of fundamental significance, no doubt, was the worship of the gods and of the ruler as warrior and high priest. Human representation was mastered all at once. The distribution of the figures in space remained free of any heraldic arrangement.

Observation of nature and symbolic abstraction operated side by side and from the very beginning determined the character of Sumerian art, which attempted both individual pictorial elements and over-all articulation. These two methods of approach, fundamental to all art, preoccupied the artists of western

Asia for centuries, but no valid equilibrium was ever achieved, as it was in Egyptian and in Byzantine art. There exists a series of seal impressions that, from the time of the limestone temple and then increasingly until the following Jamdat Naṣr period, show a preference for symmetrical, unrealistic arrangements of animals and hybrid beings. Nonetheless, the art of this period gives the prevailing impression of a vigorous nature-oriented spirit, not yet aware of a profane world distinct from a holy, suprasensory one. Even where the animals are built up into artificial heraldic groups of symbolic significance, the individual creatures remain strikingly true to nature. It is obvious that the artist strove for round, full, lifelike forms; even his fabulous beings testify to uncommon sharpness of observation in their component parts.

The distinction of two phases of the Uruk VI–IV period in architecture is not possible in glyptics, even though the heraldically composed animal groups came to light predominantly in the more recent subdivision of level IV.

b. Jamdat Naṣr period. The Jamdat Naṣr period corresponds to levels III and II of Uruk, where Sumerian culture remained centered, although it had by this time extended its influence to Elam, northern Mesopotamia and even the valley of the Nile. The period presents two completely different groups of works: on the one hand, examples of a stylistic continuation of Uruk VI–IV, with a multiplication and enrichment of art forms; on the other, works of a style which, though it seems at first to betoken regression or decadence, was to be of key importance for the future of Sumerian art. The two stylistic trends must have existed simultaneously.

The first group, which preserves the content and the forms of the previous period, marks the zenith of protohistoric art both in the quality and in the diversity of the works. The stone cult vessel particularly inspired the artist. Sometimes it is decorated in low relief, sometimes in high relief, occasionally approximating sculpture in the round in its detachment from the surface of the vase. Vessels in the form of animals, too, were leading to sculpture in the round. The subjects include domestic animals (cattle and sheep) and beasts of prey (lions and eagles), shown individually, aligned, or in combat. Sometimes a naked hero protects the domestic animals, as on the fragment of a limestone vase from Uruk with highly protuberant reliefs (PL. 465). The Sumerian disinclination toward tectonics is here evident once more. Unlike Greek vase painting, for example, the decoration does not emphasize the structure of the vessel, but conceals it. The strict heraldic disposition of the figures tends to be overlooked in the liveliness of the execution.

Totally different in effect are the vases with bas-reliefs, one of the most important of which is a cylindrical alabaster vase from Uruk, adorned with three bands of figures (PL. 466). Doubtless thematically related, the three friezes present in detail a cult procession, condensed versions of which are known from seals of the Uruk IV period. The nearly obliterated figure of the leader in the top register is familiar from numerous seal representations and can be reconstructed from them. He wears a garment of transparent netting and is accompanied by two attendants who carry, one a long cloth sash, the other a basket of fruit. In the middle register naked servants follow one another, bearing baskets, bowls, and libation vases, filled with fruit and beverages. The bottom register displays a file of sacrificial sheep and, underneath, the source of all life, ears of barley and palm shoots aligned over water. The entire procession is met, in the top register, by a woman in a long coat and a pointed, probably horned, headdress. Behind her, two reed bundles indicate the entrance to a temple or storehouse containing sheep, several receptacles with gifts (among them, zoomorphous vases), and a stepped platform with reed bundles; on it stand two human figures, praying and sacrificing.

The reed bundles show that the procession is in honor of the goddess Inanna of Uruk, the embodiment of eternal life. The man in the net skirt must be her lover, the half-mythical king of Uruk, Dumuzi (called Tammuz by the Semites), who personified the dual principle of generation and decay. This vital principle, which ruled the cosmos and linked the world of the gods with the community of men, was the mythic kernel of early Sumerian culture and one of the fundamental tenets of Sumerian culture as a whole.

If the headdress of the main figure indeed carried horns, the scene represents an episode from the myth of Inanna and her lover. The vase would then be the oldest example of anthropomorphic representation of a deity. But it is also possible that the scene depicted is a cult ceremony such as was celebrated every New Year's Day, after the pattern of the myth, by the first personages of the city and the high priestess. A truer interpretation, however, would eliminate the sharp distinction between myth and reality. The protohistoric Sumerian world was actually in every respect a union of the divine-sacred and the human-profane, of the real and the supernal, of nature and abstraction. Man, not yet dissociated from the community by a consciousness of individuality, achieved through his prince a bond of the utmost closeness with the godhead, gaining thus a share in eternal life. Like an animal or a plant among its kind, he was still living the boundless life of nature and its divine powers.

In a stone trough also from Uruk (PL. 465) the delimitation of the picture areas follows the contours of the receptacle, thus emphasizing its singular form. The narrative sequence of the vase is here replaced by the mirror-image symmetry already familiar from the seals. A group of maned sheep — ram, ewe, and lamb, symmetrically duplicated — stands beside a reed hut. The reed standards on either side of the hut again demonstrate that the scene is a symbolic one related to the cult of Inanna and her sacred herd. As in the heraldic glyptic representations of the preceding phase, the abstract qualities are restricted to the composition; the animals themselves are entirely true to nature.

The images on the short sides of the trough — two reed bundles, two lambs, and two eight-leaved rosettes, symmetrically disposed — can be understood through contemporaneous cylinder seals. For in the glyptic art of the Jamdat Naṣr period too, the sacred herds and sheepfolds and the royal shepherd play a primary role. As in relief sculpture, different artistic principles operate side by side. A comparison of two cylinder seals — one in London (BM 116722; see Frankfort, 1939, pl. 51), the other in Berlin (VA 10537; VI, PL. 33) — on the same subject, the feeding of the sacred sheep of Inanna by a personage in a net skirt, demonstrates that the first exemplifies the narrative approach, the second the symbolic.

Western Asia is indebted to the Jamdat Naṣr period not only for the vase relief but for the relief-adorned stele: the upright stone block bearing reports, at first pictorial, later also written, on the deeds of the kings. From Uruk comes such a stele, about 3 ft. high, on which a king, identified by his diadem, wig, and beard, is shown twice as he combats lions, in the upper register with a spear, in the lower with bow and arrow (Frankfort, 1954, pl. 9a). One side of the stone block was slightly roughhewn to obtain the picture surface, which, however, was not delimited or framed. The two episodes, belonging to different points in time, are depicted one above the other without separation by a strip or even a base line. As for the distribution of the figures, it is not so much free as lawless. This composition is far removed from the abstraction and the orderly narrative of the works considered above. The pictorial field is not yet perceived as an abstraction of space and time allowing the depiction of unfolding events; the stone block itself, the vehicle of the image, has not yet evolved its shape.

Approximating sculpture in the round, like the prominent reliefs of some of the stone vases, is a certain kind of wall sculpture of the late Jamdat Naṣr period that includes some of the outstanding animal figures of all time. The animals lie with their bodies along the wall, their heads turned at a right angle. While the bodies are merely scored over to suggest the coat, the heads, especially of the rams, show a sculptural, broad-surfaced treatment of the various parts. The asymmetry of the horns further enhances the verisimilitude, indicating that the artist conceived of the animals not only as elements of nature but also as symbols of a transcendent principle.

Animals provide theme and form for an extraordinarily large

number of amulets — pendants simulating domestic animals and their enemies, beasts of prey, prolific species such as frogs and fish, and even hybrid creatures uniting the strength of two animals. These amulets, modeled in the round, entered into combination with cylinder seals and stamp seals. They were halved lengthwise, and their flat sides were generally covered with crude signs; or else they were joined to cylinder seals as handles.

Nearly all the stone amulets in the form of quadrupeds represent the animals lying down with their legs folded close to them. Here the capacity of the material to determine style plays its part. The only animal to stand on its legs is a bronze lion from Uruk, one of the few examples of toreutic art preserved from this period (E. Heinrich, *Kleinfunde aus den archaischen Tempelschichten in Uruk*, Leipzig, 1936, pl. 13a). Only small sculptures of bronze, copper, and silver have survived; but large pieces probably existed too, for they would have been produced in the same way, namely by solid casting.

Nothing is so characteristic of Sumerian art as the predilection for piecing together figures from parts made of different materials and thus obtaining color contrasts. Black and white stones were used prevailingly, but lapis lazuli also enjoyed great favor. No less popular was the combination of stone and metal — copper (bronze) as well as silver and gold. In plane work this taste led to inlaid friezes and intarsias; in works in the round, to a technique that thousands of years later, in Greece, reached its ultimate peak in chryselephantine sculpture.

The finest example of a composite animal statuette is the figure of a bull about 3 in. long, made basically of white limestone ("Siebter vorläufiger Bericht . . . Uruk," *AbhPreussAk*, Phil.-Hist. Kl., no. 4, 1935, pl. 24b). The head is perpendicular to the body. At the base of the neck and on the rump are large irregular cavities in which differently colored stone was inserted, doubtless to reproduce the piebald hide of the animal. Hollows in the shape of four-petaled flowers, which must have held colored stones, are found on the loins, back, and neck as well as between the eyes. Of the various extremities — ears, horns, tail, and legs — only the silver hind legs, modeled, like the body, with exceptional realism, have survived. The sculptor's attempt to overcome the limitations of his medium, stone, could be accomplished only with the help of metal. That the organic coherence of the whole suffered thereby did not deter the Sumerian artist, to whom coordination was more congenial than subordination.

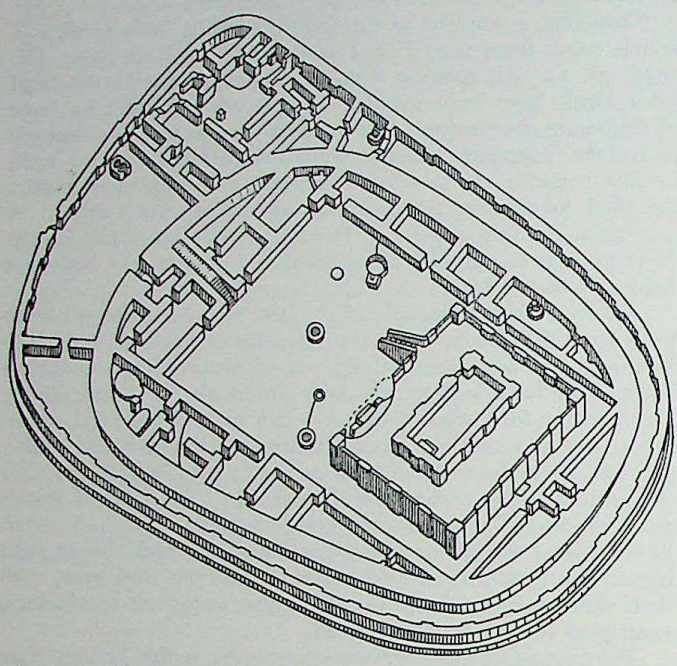
To the category of polychrome and composite sculpture belongs a female "mask" of alabaster (PL. 464), discovered, like the small bull just described, at Uruk in a stratum of the Jamdat Naṣr period. It indubitably marks the apogee of all surviving protohistoric art and is most likely the earliest example of truly distinguished sculpture in the round. Nearly life-size, it is not a fragment in the ordinary sense but one part of a female likeness composed of various segments of different materials. The back of the head is missing; the reverse of the face is flat and shows holes for the fastening of other parts; the few planes indicating the hair and the deep indentation of the part were meant to accommodate a gold wig. The eyebrows meeting over the nose must originally have been inlaid with lapis lazuli, and eyeballs of another material were doubtless let into the large sockets between the finely modeled lids. A formal dichotomy is evident in the piece, as in those reliefs in which fully realistic figures are combined in formulas of a heraldic character. There is a striking stylistic contrast between the schematic, generalized upper part of the face and the almost portraitlike austere mouth; the barely suggested folds between the nose and the corners of the mouth produce the kind of expression that can emanate only from an individual. Perhaps it is the tension between likeness and symbol, exemplified by many protohistoric works, that is the source of their value and significance.

The works of the Jamdat Naṣr period considered so far, though some are superior in quality to those of the preceding period, must be regarded, from a stylistic point of view, as outgrowths of the Uruk VI–IV period. There are works of another style, however, that cannot be similarly explained as an evolution from Uruk VI–IV. Nor can these works — any more than the parallel manifestations in architecture — be dismissed with such terms as "poor quality" or "decadence," even though they include many examples of lesser quality, notably a group of cylinder and stamp seals with hastily executed ornamental representations. What these works may well be taken to indicate is a dissolution of the protohistoric style.

Providing a pendant to the female acrolith from Uruk is a female mask from the "Eye Temple" of Tell Brak (*Iraq*, IX, 1947, pl. 1). All realistic touches such as those in the head from Uruk have been avoided in that of Tell Brak in favor of deliberate abstraction. For the first time in the protohistoric period there appears in the depiction of the human figure itself, in this instance the face of a woman, a distortion of nature intended to express the spiritual essence of the subject. A new principle was coming to the fore in the art of the Jamdat Naṣr period; it signified the end of the golden age, but to it belonged the future.

An even clearer example of the new trend is a second stone head from Tell Brak, in which the parts of the face, especially forehead and eyes, are entirely out of proportion — doubtless because the head is that of a deity (ibid., pl. 2). Astonishingly like it in the formation of the eyes is a small fragmental stucco relief with the goddess Ishtar (Inanna), painted black, white, and red, from the archaic strata of the Ishtar Temple at Ashur (W. Andrae, *Die archaischen Ischtartempel in Assur*, Leipzig, 1922, pl. 28c). It presents the goddess frontally, in high relief. She is naked except for heavy jewelry at the neck, breast, and hips. The eyebrows are excessively large; the oval eyes, with their outer corners sharply sunk, almost cover the cheekbones, exactly as in the Tell Brak head.

Painting assumed a greater importance in the Jamdat Naṣr period, although it did not attain the rank of an art form in its own right. Adorning walls, vases, and reliefs, it served architecture, ceramics, and sculpture; it plainly also served as a substitute for other, probably more expensive techniques, such as that of cone mosaics.



It is interesting to observe with what ease and rapidity all branches of protohistoric Sumerian art evolved from a central world view, from the idea of an all-creative, all-preserving, ever self-renewing life force existing in immediate relation to the godhead — from the myth of the royal shepherd chosen as the lover and spouse of the queen of heaven, Inanna. The protohistoric repertory of motifs at Uruk centers on the figure of Tammuz, who must die in order to save the goddess from the underworld demons of death. In him is embodied the profound idea that only at the cost and with the help of life can any higher life be preserved. To this idea the early Sumerians joyfully assented, because it held the seed of a higher organization of society and state. Such was the ideological origin of the first monumental temple architecture and of the body of art works that in reality existed solely in its service.

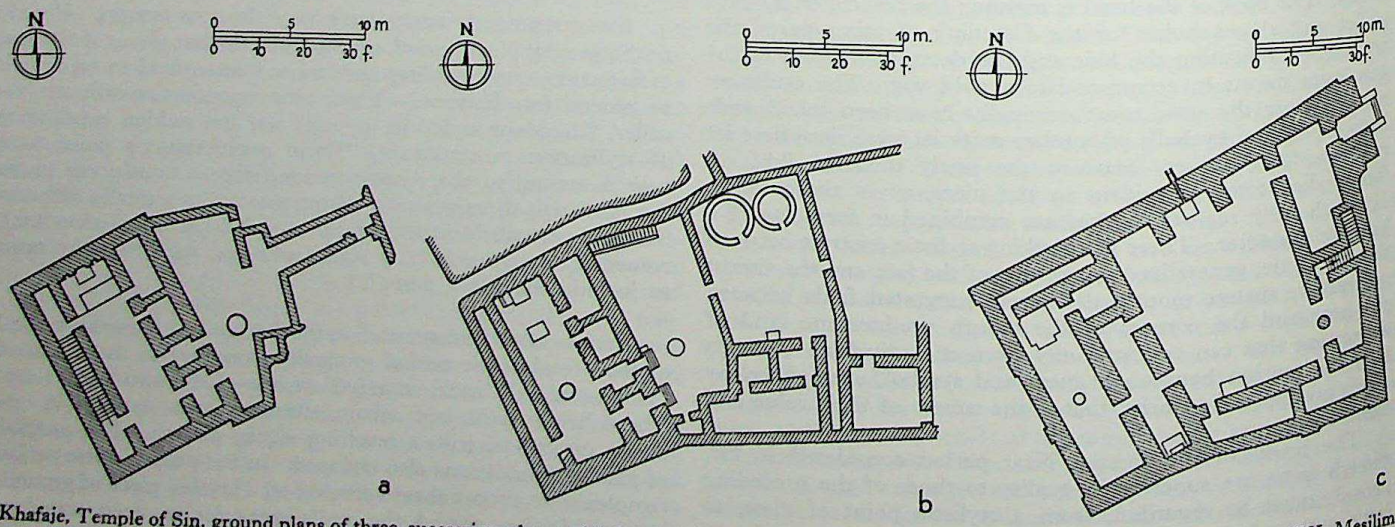
FIRST PERIOD OF TRANSITION AND MESILIM PERIOD. Already in the Jamdat Naṣr period, especially in the last phase of E-anna, architecture was revealing new traits that seemed to commit it to general formlessness — traits contemporaneous with the so-called "decadent style" in glyptics and the sudden appearance of stylization in sculpture. These manifestations point to a new direction, to the reconstruction, after a transitional phase during which all values were disintegrating, of a totally different Sumerian art world in the Mesilim period (ca. 2700–2600 B.C.), named "protodynastic" by some scholars, who take the term to include the Ur I period.

Architecture. In construction the *Patzen* and *Riemchen* typical of the protohistoric period gradually gave way to the so-called "plano-convex" brick, rounded on one of the two large sides. These bricks were laid aslant, alternate rows slanting in opposite directions, with a resulting zigzag pattern. The method of placing foundations also changed. In the protohistoric period temples were almost always erected on a leveled piece of ground; in the Mesilim period the walls were set in deep trenches. Perhaps dedicated to the same idea — fusion of the edifice with

the earth — were the foundation figurines that made their appearance. These were pegs or nails with an anthropomorphous upper portion, generally placed at the four corners of the foundation. Their function may also have been to protect the building against subterranean demonic forces.

Another previously unfamiliar idea is expressed in the effort

Khafaje, the "oval temple," axonometric reconstruction (*from Parrot, 1946, vol. I*).



to separate the temple as distinctly as possible from its secular surroundings. The entire "oval temple" of Khafaje (FIG. 747), which dates from the height of the Mesilim period, was erected over clean sand filled into an excavation 26 ft. deep. A usage that expresses a similar idea — and one that survived into the Neo-Babylonian era — was to encircle the foundation wall with a second one, the *kisu*, which looked like a thick retaining wall and delimited the building from its immediate surroundings.

Since, unfortunately, no informative remains of temple cellae have been preserved in the heart of the Sumerian territory, their development must be deduced from the well-known sanctuaries of Khafaje, Eshnunna (mod. Tell Asmar), and Tell Agrab, all somewhat peripherally situated in the Diyala region. The connection, difficult to establish, with the type of ground plan exemplified by the White Temple can be made with the least difficulty, comparatively speaking, for the earliest strata of the so-called "Temple of Sin" at Khafaje, which date back

to the Jamdat Naṣr period (FIG. 747). But even here the rooms flanking the large central rectangle were already rather exiguous. The entrance, on one of the long sides and placed at a distance from the holy of holies, led to a kind of court of irregular shape. At first not clearly planned, the Temple of Sin in its sixth stratum acquired a definite shape. All the smaller rooms bordered a court, which a gate room and stairway separated from the outside world. The main room, so placed as to make the holy of holies the spot most difficult of access, even from the court, was preceded by an antecella. The freestanding, outward-facing edifice of the protohistoric period, which testified to the bond between the world of the gods and the world of men, became a residence of the god, in which he dwelt in cloistered seclusion, surrounded by those consecrated to his cult. A very similar development can be observed in the various ground plans of the temple of the god Abu at Eshnunna, where numerous superposed levels of construction have been uncovered. In many other Sumerian localities (Ashur, Mari), temples of the same type were built during the transition and the Mesilim period; they show only local divergences and no fundamentally new characteristics.

Today we know two sanctuaries from the Mesilim period, outwardly very different but each in its own way a product of the conceptions of the time and a monumental expression of them: the "oval temple" of Khafaje and the Shara Temple of Tell Agrab. In these sanctuaries not only has the sacred cella attained its new shape, but whole temple complexes with residences for the priests and administrative quarters have been brought into coherent form in accordance with a fixed plan. At Khafaje a "high temple" rose on a terrace 20 ft. in height, within a rectangular court (FIG. 747). The whole was surrounded at first by one oval enclosure wall, later by two. Between the two enclosures was built a priests' residence, akin in ground plan to a section of the great sanctuary at Tell Agrab. But whereas the "oval temple" of Khafaje still employed the rounded enclosure, characteristic during the transition to the Mesilim period, the Shara Temple adopted a nearly square one with buttresses; the wall, many feet thick, enclosed the various parts of the sanctuary according to a well-thought-out plan which joined together several rectangular court complexes.

The sanctuary of Tell Agrab, which attained full flower in the Mesilim period, reveals the end of a protracted development that the Sumerian temple had to undergo after the breakdown of the first great protohistoric civilization. If the separation between sacred and profane is observable in this development, it is not strange that during this period the first evidence of a purely secular state architecture appeared. The palace at Kish is the earliest monumental building that did not belong to a sanctuary. It comprises an older complex to the north, surrounded by a double enclosure, and a monumental gateway preceded by a flight of stairs and flanked by towers. The heart of the palace appears to have been a square court with rectan-

Khafaje, Temple of Sin, ground plans of three successive phases: (*a*) Level II, Jamdat Naṣr period; (*b*) level V, Jamdat Naṣr period; (*c*) level VIII, Mesilim period (*from Frankfort, 1954*).

gular rooms on the north, west, and south and smaller rooms, domestic quarters, on the east. A more recent structure to the south shows two long rectangular rooms in the west; a row of bases following the long axis of the larger room must have carried wooden columns to support the roof. In over-all plan this oldest nonreligious Sumerian edifice differs from everything that preceded it. It is fully turned inward and has many of the features of a fortress. An exact application of the right angle prevails. It is far different from the dissolution of form that had begun in the Jamdat Naṣr period and dominated the time of transition to the Mesilim period.

The first city walls probably began to be built at this time. That of Uruk, in its oldest form, consisted of a double enclosure about 6 miles long. In the Epic of Gilgamesh it is designated as the work of that hero and king of Uruk, who, in contrast to his predecessor Dumuzi, was an enemy of Inanna, the chief divinity of the city. Here too, then, is an expression of the dualism born in the Mesilim period and reflected in architecture by the tendency to separate temple and palace.

Figural Arts. a. Transition period. After all the old artistic principles were relinquished, a process that began in the Jamdat Naṣr period, Sumerian art did not succeed in creating new forms until the height of the Mesilim period. The period of transition was marked by a far-reaching tendency to disorder and confusion, of which the oldest relief from Lagash (mod. Telloh; PL. 467) is an example. The representation, in bas-relief, with an internal scratched design, is of a man in a cross-hatched skirt, presumably of netting, who stands in a posture of salute before two tall maces, symbols of the god Ningirsu. The schematism becomes apparent by comparison with works of the protohistoric period featuring the man in the net skirt: the disposition of the figure and objects in the pictorial field is planless; nor are the elements composing them brought into orderly relation with one another.

The character of the writing helps to place in the transition period a second work, a small stele with reliefs on all sides, probably from Larsa and now in the Metropolitan Museum (*BMMA*, Apr., 1960, fig. 5). It shows in several compartmented scenes the encounter between two main figures, one male, the other female, each with followers and separated by an altar or the door of a temple. The women are depicted exactly like the principal female figure on the great alabaster vase from Uruk. The chief male figure, however, is clearly differentiated in posture and apparel from the man in the net skirt. He wears a skirt with a rolled belt and a broad tufted hem. His beard is long and pointed; his hands are folded together on his breast, the elbows jutting out sharply from the body. The skirts of the followers are vertically slit in front, with one side tucked up to allow freedom of movement; this male costume is encountered frequently in the Mesilim period.

The tendencies to a breakdown of forms in the transition period are most noticeable in glyptics. The drill technique applied in the abstractionist ornamental seals of the Jamdat Naṣr period (the group of the so-called "decadent style") continued in use; where animals and plants still occurred, they were broken down into lines and dots. The "seal-impression stratum" under the royal cemetery of Ur has yielded the most examples. Ornamental and figural elements were here used in the same manner; the picture surface no longer represented a space but merely constituted a vehicle for ornament. Signs similar to written characters, but no longer readable, were also employed.

b. Mesilim period. The more recent excavations have yielded a wealth of works of the Mesilim period. The Diyala region, especially, produced an abundant series of statuettes; but important material has also come from Kish, Lagash, Shuruppak, Nippur, Ur, and Mari, which proves that the new style embraced the whole area identified with Sumerian culture. True, the north, subject to a stronger Semitic influence, seems to show a quantitative and a qualitative superiority.

The period owes its name to an inscription, the oldest known, on a relief-decorated macehead that King Mesilim of Kish consecrated at Lagash (PL. 470). The powerful macehead, 7 1/2 in. high, is decorated along its vertical face with a continuous frieze of lions with heads fullface, each leaping at the one before it. The relief covers nearly the entire vertical surface. The bodies are chiseled out in low relief; the manes, confined within the body outlines, are stylized into groups of short, curved, parallel scratched lines. The animal faces resemble masks with eyes and tongues that were inlaid and angular foreheads on which the ears are planted like handles. By comparison with the full-blooded lions of the preceding period, these appear rather like figments of the imagination. The same is true in even greater measure of the hybrid being depicted on the upper surface of the macehead, a lion-headed eagle presented frontally. The heraldic disposition of the outstretched wings and claws, the masklike lion's head, and the schematic stylization of the feathers endow this figure with the hitherto unknown character of a life-threatening, superior force.

A technique even better suited than bas-relief to convey the incorporeality striven for during this period was line engraving. One of the finest examples of it is to be seen on a bronze spearhead, likewise consecrated at Lagash by a king of Kish (Moortgat, 1935, pl. 15). To judge by its size, it must have been part of the standard of a deity. The rampant lion, engraved in outline with the slightest of interior designs, illustrates the classic Mesilim style. A motif taken from nature has been transformed into a symbol. Dematerialization could go no further, and no greater contrast with the compact, muscular lions of the Jamdat Naṣr period is conceivable.

In addition to the new types of animals and demons there appeared a new type of human figure, illustrated with particular clarity in the remains of inlaid mural friezes from the already mentioned palace of Kish. Among the representations are sheep in walking stance, music-making women, men probably engaged in milking, and warriors with prisoners. The technique of inlaid friezes is known from the Jamdat Naṣr period, but the Mesilim friezes, in which the light-yellow limestone contrasts with the dark surroundings, are different in effect from the works in high relief from Uruk: no appearance of plasticity is intended. Characteristic for the human figures are the meager legs, feet with exaggeratedly high instep, big noses, and long pointed beards.

A form not encountered before the Mesilim period is the square or rectangular stone plaque with a hole pierced in the middle (PL. 470). The function of such plaques is not clear, but they are an excellent source from which to study the development of the relief in this period, and their representations are fundamental to an understanding of a large portion of western Asian art. The central motif is the so-called "symposium" scene: an enthroned woman opposite a man, evidently of lower rank. Both hold drinking cups and often branches in their hands, and a big mixing jar generally stands between them. They are served by attendants and are frequently entertained by musicians and dancers. The second (and often the third) register depicts the bringing of gifts of all kinds and of sacrificial animals. One relief, from the Shara Temple at Tell Agrab (Frankfort, 1943, pl. 63), proves that this motif is connected with the second leading theme of the period, one already known from the protohistoric period: the combat of the hero with the beasts of prey.

That the two themes belong together is also demonstrated by several impressions of double-register cylinder seals of the time. Animal combats, however, furnished the dominant subject of Mesilim seals (PL. 496, second row, left). Many of these, in response to the impetus toward abstraction inherent in the endless ribbon of the cylinder seal, show rampant quadrupeds crossing each other to form the so-called "braided band." The impulse to denaturalization led even further. The trio of the hero subduing two lions underwent a process of abstraction and condensation into a human torso merging below with the bodies of two lions. The "hero" — or is it the upper portion of a bull-man? — grasps the tails of the lions. The component parts of the figures show similar tendencies to simplification: the bodies often become excessively long and stringy; the extremities are reduced to dashes; the face and hair of the "hero" in the fused trio are geometrized into ball ornaments.

Typical for sculpture in the round of the Mesilim period are the many praying figures of stone, one-third life-size at most, which stood in the temple cellae (PLS. 468, 469). They express the chasm between the divine and the human that can be bridged only by prayer and sacrifice. A striking illustration is found in the upward, god-seeking gaze of a bald priest from the hoard of sculptures discovered at level I of the so-called "square temple" dedicated to Abu at Eshnunna (mod. Tell Asmar; I, PL. 501). The two largest pieces by far, a man and a woman, occupy a position apart. In their tiny hands, which bear no relation to the size of the bodies, they hold small cups. Their oversized eyes have inlaid black pupils, likewise abnormally large. The excavator, H. Frankfort, thought the masculine figure was the god Abu, to whom the temple was consecrated. But since it shows none of the marks by which the god was habitually characterized (e.g., a horned cap), it is more probably the likeness of a prince or a high priest, whose function it was to represent the god at the ritual marriage celebrations.

Such worshiper statuettes have been found in many Sumerian cities. They include the whole personnel of the temple, from ministrant to high priest to ruler. Most are men, with long rectangular beards and wigs with a central part or, if they are of lower rank, with heads completely shorn. The clothing is the same as in the reliefs and intarsias: below the bare torso, a half-length skirt with a fringed hem. The hands are folded together on the breast and occasionally hold a cup. The eyeballs and pupils consist of inlays of a different material. The feet and the lower portion of the legs — with or without support, as stability dictates — are worked free from the stone. The elbows are swung sharply outward and pointed. The beard and wig are stylized in horizontal waves or zigzag lines. The hands are generally too small, sometimes altogether atrophied. The back is very often divided into two halves by a sharply etched line. Of this composite picture the innumerable statuettes offer many variants, with marked differences in quality. Common to all, however, is the tendency to stereometric construction.

A variant style is illustrated by a headless statuette from level IX of the Temple of Sin at Khafaje (PL. 468). The skirt is particularly elaborate. The lower portion consists of very long tufts that are deeply modeled, and the upper portion, of several rows of shorter tufts laid in a diamond pattern. At this time, apparently, the form of the skirt underwent a change that was later to gain special significance.

There seems to have been no desire to impart the strongly spiritual cast of the male figures to the statuettes and heads of women, which are generally inferior (PL. 468). The shape of the body in the female figures is concealed by a heavy robe that leaves uncovered only the right arm and shoulder. The fleshy faces under their elaborate crowns of braids appear soft and sensual; only the inlaid eyes look unearthly. Where the robes are overlaid with tufts arranged in rows of scales or scallops, the figures acquire a pleasing quality also present in male statuettes of the same type. In these figures, which doubtless belong to the end of the Mesilim period, there is a beginning of relaxation from the rigid constraints that prevailed in this era.

A group of sculptures from Mari (I, PL. 502; IV, PL. 16) shows that liberation from abstract schemes made considerable progress in the Mesilim period. The Ishtar Temple at Mari has yielded two sculptures bearing the oldest known Akkadian inscriptions; one of them, the seated figure of Ebih-il (I, PL. 503), paleography places in the Mesilim period. This sculpture proves that art was still dominated, as in the Jamdat Naṣr period, by the antinomy of abstraction and observation of nature. There is no purely stereometric treatment of any portion of the statuette. The only particulars that recall the stone worshipers previously described are the hands folded before the chest in a schematic pose and the lower arms that taper off too rapidly from the projecting elbows. All else forms a contrast to such works as those from Eshnunna (I, PL. 501): the soft modeling of the naked torso, as well as the free and natural rendering of the fleece of the skirt; the carefully stylized beard falling in vertical locks spaced by drill holes, as well as the quite normally proportioned skull and the natural-looking eyes inlaid in color. Stylistically inseparable from Ebih-il are two inscribed pieces of Ur-Nanshe (also called Ur-Nina) found in the temple of Ninnizaza at Mari: one a seated figure representing her praying (*Syria*, XXX, 1953, pl. 23), the other a fragment representing her as a harpist (*ibid.*, fig. 9). The fragment in particular, with the harp held free in space, seems a defiance of the stonecutter's craft. But the better-preserved representation of the praying Ur-Nanshe, squatting cross-legged on a cushion — originally, no doubt, with hands folded — likewise conveys in its design the greatest ease and freedom of form.

Similar qualities are revealed by the few remains of contemporaneous bronze sculpture, such as the statuettes found at Khafaje and Tell Agrab, once parts of offering stands. The best examples show begirt, but otherwise naked, male figures, slender and fine-limbed, with hair and beard worn in the fashion of the period (PL. 475). They assume a walking stance, with the torso inclined slightly forward and the head slightly raised, the arms separated from the body, and the hands folded and thrust forward. The whole image, in harmony with the spirit of the Mesilim period, expresses beautifully the fervor of prayer and the humility of surrender to the deity.

A further example shows how toreutic art in this period achieved the liberation of the figure from the mass of the material. The bronze head of a bull in Berlin, one-half life-size, combines, quite in the spirit of the times, the ornamental stylization of natural forms with the attempt utterly to disengage the extremities from the raw material (Zervos, 1935, pl. 154). Mouth and nostrils are double volutes. The magnificently curved horns issue from a tubular extension of the forehead. In comparison with the bulls of the Jamdat Naṣr period, with horns lying along their heads, this work, with its soaring freedom, seems to have shed all cumbrous mass.

SECOND TRANSITION PERIOD AND PERIOD OF UR I. The epoch of the 1st dynasty of Ur (ca. 2500–2350 B.C.) is the first that falls under the full light of history, thanks to the numerous inscriptions of its kings and of the governing priests (*ensis*) of Lagash. The city of Ur now became the center of political and intellectual life. But between the Mesilim period and the Ur I period proper there must have been another period of uncertain length; so much is plain from the clay tablets and cylinder-seal impressions found especially at Fara, the ancient Shuruppak. The second transition period, however, cannot, like the first, have been one of general cultural upheaval. In architecture and monumental art it cannot be strictly delimited and must be regarded as a developmental phase that apparently left behind the ideals of the Mesilim period, yet did not beget any new formulations or ideas. Writing excepted, the only field in which a more precise subdivision is possible is glyptics. Here three phases can be distinguished, of which the first, that of Imdugud-Sukurru, corresponds to the transition period, the second is connected with the Royal Cemetery of Ur, and the third with the later governing priests of Lagash and the kings of the 1st dynasty of Ur.

Architecture. From the second half of the 3d millennium the temples of the Diyala region and of Uruk, Ur, and Ashur were continued, altered, or renewed; but nowhere do fundamentally new plans or forms occur. The plano-convex brick remained in use, where it had been previously employed, until shortly before the end of the Ur I period. Influences emanating from the west (square cella, baetulus) seem to have made themselves felt only at Mari, on the middle Euphrates, in several sanctuaries such as those of Ninnizaza and Ishtarat. Such manifestations, however, were altogether peripheral.

All in all, the types of building, ground plans, and architectural forms remained the same as in the Mesilim period. Only the disappearance of rounded forms — the "oval temple" of Khafaje was transformed into a rectangle — as well as of the plano-convex brick at the end of the period, suggests the relinquishment of certain features that had appeared after the Jamdat Naṣr period.

Figural Arts. In the protohistoric period god and nature were one. When such a unity could no longer be experienced,

an effort was made in the Mesilim period to spiritualize nature through art. But the tension inherent in this effort was not one that could be maintained indefinitely. One day a reaction had to set in. Thus sculpture in the round became ever more blocklike; spiritual values, which in the Mesilim period had also dominated bas-relief, yielded to material values; gods turned into men.

a. Sculpture in the round. The praying figure, familiar from the Mesilim period, is also the most widespread type of representation in the succeeding period as well (PL. 474). The inscriptions on these figures indicate that they were supposed to worship the divinity in lieu of the subject and obtain prolongation of his life. In the many male and female seated figures there is apparent toward the end of the period a coarsening and a growing superficiality, despite occasionally good technique. At first, however, as in the statue of the priest Urkisalla from the Temple of Sin, level IX, at Khafaje (PL. 473), the unconstrained style of the Mesilim period continued to hold sway. Still Mesilimic in the geometrization of the naked torso and the separation of the arms from the body is an outstanding figure from Nintu Temple, level VI, at Khafaje, which, although it is quite free from the later blocklike massiveness, yet cannot be placed in the Mesilim period on account of its bald head and its skirt made of many rows of horizontal tufts, a type of garment that became characteristic after this period and remained so until the Akkadian era (Frankfort, 1943, frontis., pls. 19–20). The so-called "Consistorial Councilor" from Ashur (W. Andrae, *Die archaischen Ischtartempel in Assur*, Leipzig, 1922, pl. 30a) unfortunately lacks feet; otherwise this figure would probably give much the same impression. Its small hands and detached arms are still quite Mesilimic, but the fleshy face and the well-fed rounded body do not convey unworldliness. The mass of the heavy tufted skirt begins to dominate the over-all effect. A number of statuettes from Mari belong to the same phase. The transformation into blocklike shapes was not restricted to the lower portions of the body; the torso, too, with the arms cleaving to the sides, became a single unit.

From the period of the governing priests of Lagash, whose line began with Ur-Nina, comes the statuette of King Lamgi Mari of Mari, which, even though the feet in stepping position recall the Mesilim period, exemplifies the new style full-blown (Parrot, *Sumer*, 1961, fig. 145). The fleecy material of the skirt here also covers the left shoulder and arm, and only the right arm emerges from the mass of the stone block. Besides the costume of the Ur I period, there appears here for the first time the hair style of the kings, one magnificently represented by the gold wig from the grave of the younger Mes-kalam-dug in the Royal Cemetery of Ur (VI, PL. 243): hair parted and waved, a crown of braids held by a diadem, and a knot at the back of the head.

The culmination of the development toward ever blockier forms is illustrated by a diorite figure of Entemena excavated at Ur (*Baghdader Mitt.*, I, 1960, pl. 8, 1). The difficulty of working the stone surely explains, in part, the chunkiness of the figure, which seems to have remained embedded in its medium. The lower portion of the legs and the feet, in high relief — they are not worked free in back from the mass of the stone — are not even on the axis of the body. Clearly the two chief means employed in the Mesilim period to overcome the dead weight of matter — the geometrization of natural shapes and the disengagement of forms from the material — had been utterly relinquished. This marks the end of another epoch, for Entemena may be considered approximately contemporary with A-anni-padda of Ur, the second and last king of his dynasty.

b. Relief. In glyptics it can be well observed how the old motifs — especially the figured frieze, but also the "symposium" scene — were employed in art without the stimulus of new ideas, while figures of schematic aridness were slowly changed back into creatures of flesh and blood; plastic roundness, as far as possible, was brought to all that had been linear, symbolic contractions were rooted out, and the abstract organization of space was gradually loosened up.

The second transition period is represented in glyptics by the seal impressions from Shuruppak that are associated with a piece bearing the inscription of one Imdugud-Sukurru (E. Heinrich and W. Andrae, *Fara*, Berlin, 1931, pl. 44n). In this group men and animals have once more taken on a plastic corporeality; the lions' manes project jaggedly beyond the body outlines; the bison have acquired human faces. Even more exuberant are the animal forms on a big seal of King Mes-kalam-dug from a grave in the Royal Cemetery of Ur (C. L. Woolley, *Ur Excavations*, II, London, 1934, pl. 196, 55). Finally, we have the impressions from the time of the last governing priests of Lagash and of King Mes-anni-padda of Ur, among which there is a near identity of style. At the end of the Ur I period the artist became sufficiently bold to break up the frieze of intertwined figures and to group men and animals loosely by twos, threes, and fives. He also brought out the musculature of his creatures plastically, with a resulting discrepancy between the spiritual content of the figured frieze, meant to symbolize the cycle of life and death, and the individual figures, overflowing with life and unmistakably of this world. It is important to note that, for example, on one cylinder seal of this period (VA 3878; Moortgat, 1940, no. 144) a god of entirely human shape is presented with decided realism, only the horned cap distinguishing him from his worshipers. Characteristic for the whole history of ancient western Asia, anthropomorphism — the representation of the deity in purely human form — finds complete expression here. Deviations were to be infrequent and transitory.

Also human in aspect are two divinities, one leading the other by the hand, on a little engraved shell plaque from Ur (*AntJ*, V, 1925, pl. 32, 1). Clad in huge bell-shaped skirts, they are equal in girth to the massive figures of the ruling personages of the time. Similar little shell plaques adorn the sound boxes of lyres and harps from the Royal Cemetery of Ur (I, PL. 505). It seems as if even engraving, a technique particularly conducive to effects of immateriality, succumbed to the general striving after compact forms, which produced some of the best works of the period. The engraved silver vase of Entemena from Lagash (I, PL. 504), with its two friezes encircling shoulder and belly — above, a row of squatting oxen; below, lion-headed eagles soaring over lions and goats with heads turned — belongs with the best that exists in vase decoration. The designer succeeded in obtaining that effect dear to the Sumerians, the connected frieze returning upon itself, by repeating the motif of the lion-headed eagle above the animals. The difference from the style of the Mesilim period appears only in the individual figures, in the detailed internal design of the feathers and the lavish manes of the lions, which closely resemble those on the seals of Mes-kalam-dug.

The votive plaque with a central hole had been the chief vehicle of the relief in the Mesilim period. It continued to be used in the Ur I period, but what had been until then the most important theme, the "symposium" with a procession of gift bearers, disappeared with only few exceptions (a piece from the Diyala region, two fragments from Mari). Most of the preserved works — from Lagash, Ur, and Nippur — present enthroned gods receiving libations and sacrificial offerings (PL. 475). It is no longer the mystical union between man and the chthonian deity that comes to the fore; dominant now are the luminous gods of the pantheon, whose favor could be won only by constant prayer and sacrifice. The best example of the new type of votive plaque is a little limestone slab found at Ur in the Gig-par-ku (see below), near the sanctuary of the moon god Nannar (IV, PL. 204). The upper frieze carries a libation scene with three priestesses before the enthroned god (note the massiveness of his frame). The lower frieze probably depicts a libation before the temple at the presentation of the bride of the god. She alone in the procession turns her head toward the spectator; her frontal aspect duplicates that of the enthroned goddesses of the period. Here, too, the over-all effect is one of rusticity and squatness. The same applies to a plaque with the high priest Dudu, dating from the time of Entemena (PL. 475).

In this piece, which exactly reproduces the ponderous style of contemporaneous statuettes, the attempt at narrative has been given up; only isolated symbols are presented.

The votive plaques of Ur-Nina (I, PL. 502), the oldest *ensi* of Lagash, are mediocre in quality, but Ur-Nina introduced an otherwise hardly documented theme. On the so-called "family reliefs," in which he had himself portrayed with his wife, his children, and court officials, all identified by name through legends, he appears repeatedly as temple builder with a building basket, containing clay to mold bricks, on his head. The motif of the basket bearer was to have a certain importance in later art.

To De Sarzec's excavations at the beginning of the century we owe a historical and artistic monument that has remained the prime exemplar of the art of relief of its era: the Stele of the Vultures of Eannatum, the greatest *ensi* of Lagash (I, PL. 506). This monument, a sandstone plaque rounded at the top, was placed by Eannatum, in celebration of victory and as a warning, on the boundary between Lagash and Umma, after his god Ningirsu had won back a disputed piece of territory. All four sides were covered with reliefs, the intervening spaces being filled with extensive inscriptions. Only a part of the stele could be reconstructed out of many fragments. From both a pictorial and a literary point of view it is the first sizable composition that succeeded in at once articulating and unifying a comprehensive subject. The main theme, Ningirsu as triumphator, is presented on the obverse. His left hand holds his foes imprisoned in a net, like fish; his right, a club to beat in their heads. On the reverse we see, in the top register, Eannatum at the head of his phalanx of warriors, marching over the corpses of his slain enemies, also pictured in the rounded area above as being torn to pieces by vultures. In the register below he returns victorious from battle, followed by his men, while in the one next below he attends a ceremony of libation and animal sacrifice at the common grave of the fallen heroes. The lowest frieze, unfortunately poorly preserved, must have depicted a further campaign. The reverse, then, is concerned only with happenings in the world of men, while the obverse treats the conquest of Umma symbolically, as a divine action. The dualism of the later Sumerian world here fully reveals itself, even in the style. The bodily compactness of the individual figures, also observable in contemporaneous statuettes, is more pronounced on the reverse, for example in the naked priest of the burial scene. Mass scenes, doubtless in response to the temper of the times, are here for the first time a subject for art.

Unlike the historical stele, which made its first appearance with the fully evolved example just described, the work of art combining different materials played an important role from the earliest times. Many finds of the Ur I period belong to this category, which includes tools, friezes, and sculpture (PL. 471; I, PLS. 505, 509; VI, PL. 5). The pieces of frieze found at the foot of the ziggurat of al-'Ubaid (H. R. Hall and C. L. Woolley, *Ur Excavations*, I, Oxford, 1927, pls. 31–33) must have been linked with the temple of the goddess Ninkhursag that rose on top of it. Among the subjects are birds and cattle, carved in shell or limestone. One strip pictures two heifers coming out of a pen, to the right of which squatting men are milking cows, while to the left other men are busy straining milk and making butter. The light limestone figures rest on dark shale plaques, fastened on wood with bitumen and bordered along top and bottom with bronze strips. The kinship with the sheepfold scenes of the protohistoric period is evident. However, the strongly numinous character of the earlier representations has here become genrelike. The great goddess of life has become a landed proprietress.

The examples of inlay technique from the shaft graves of the Royal Cemetery of Ur are not works of art in their own right, but merely decorations for tools and furnishings. Nonetheless, they are of prime significance, for — like the shaft graves themselves, in which as many as thirty followers of the ruler would join him in death, as though fulfilling a natural condition of their own existence — they testify to the survival of the views on life and death evolved by Sumerian culture in the protohistoric era. The reliefs and sculptures of varicolored materials from the tombs preserve the protohistoric motifs linked with the tree of life and the man in the net skirt, not, however, in the spiritualized form characteristic of the Mesilim period, but with a vivid naturalism heightened by the colors. Animals, since protohistoric times the incarnation of chthonian and magical forces, here are depicted with human features. Indeed, in a reversal of all ideals, they are shown, on the sound box of an instrument, travestying the most sacred ritual, the great feast of the holy nuptials, with banqueting, music, and dancing (I, PL. 505). Death itself, in the guise of a lion, celebrates the feast of life, symbolized by the hero above, who embraces two oxen. These colored incrustations constitute an artistic climax — in their composition, uniting freedom with control, and in their truth to nature, which transcends all stylization.

Part of a piece of furniture was a pair of goats, each upstretched against a shrub (I, PL. 509). The core is carved of wood; the head and legs are gold-plated; the belly is covered with hammered silver plate; horns, beard, and mane are made of lapis lazuli; the coat is carved in shell, with the tufts stylized exactly as in the fleece garments of contemporaneous stone statuettes. The old symbol of life, the tree between feeding animals, has never appeared more joyous.

Finally, it is interesting to compare a gold and lapis-lazuli bull's head of the Ur I period (I, PL. 505) with one from the Mesilim period. Once the representation was a dematerialization of the worldly, an abstraction; now it shows the face of an individual animal sparkling with life, a naturalization of the transcendental, the supernatural drawn into the realm of tangible reality.

It is perhaps no accident that we have found the best examples of composite art where the tradition of the Inanna-Tammuz cult maintained itself with the greatest tenacity: on the one hand, near the temple of a goddess who must have been close in spirit to the Inanna of Uruk; on the other, in the royal tombs of Ur, necessarily connected with the idea of life and death.

AKKADIAN PERIOD. This period spans but two centuries (ca. 2350–2150 B.C.). It is the first in the history of Mesopotamia in which political and religious changes can be traced to the steady infiltration into the isolated Sumerian world of Semitic immigrants from the steppes. For this reason the absence of an unbroken sequence of monuments is particularly regrettable. True, the survival of earlier structures into the Akkadian period has been established at many sites, but of new edifices only very few have survived.

Architecture. Bricks of this period were generally rectangular or square slabs, measuring as much as $20\,^1/_2 \times 20\,^1/_2$ in.; foundations were built in trenches. From such details, however, little can be deduced about the character of a period. Of greater significance seems a transformation such as that undertaken in the ground plan of the ancient Abu Temple at Eshnunna (Tell Asmar). The cella of the so-called "single-shrine Abu Temple" was divided by a wall into cella and antecella. This layout was followed for centuries in the typical Babylonian cult edifice. If it had been possible to excavate the principal cities of the Akkadian empire — Sippar, the city of the sun god Shamash, and the unlocated Akkad, the city of the heavenly Ishtar (Inanna) — the architecture of this period might have revealed the same fundamental changes as are to be seen in fragments of large and small works of art. The plans of some buildings in outlying localities support the inference that, with the king's assumption of divine prerogatives, the palace acquired a greater importance than in Sumerian times, when the temple was dominant.

At Tell Brak the great Naram-Sin, the next to last Akkadian ruler, erected a powerful structure, 120 sq. yd. in area, where the "Eye Temple" had stood in the protohistoric period. The construction of a palace, at once royal stronghold and caravansary, on the sanctified ground of a temple was an enormity of a kind that only a god-king such as Narem-Sin could allow himself. Besides the main court, on the axis of which lay a mighty gate building, the nearly square enclosure, with walls 33 ft. thick, encircled three smaller court complexes. In comparison with the courts, the covered rooms must have taken up

a relatively small area. Of the elevation and the interior fittings of the rooms nothing is preserved, but the compactness and clarity of disposition of the ground plan give us some insight into specifically Akkadian characteristics. That the importance of this imposing structure was not merely military and economic is suggested by its resemblance to the original layout of the so-called "Old Palace" at Ashur, which in this writer's view probably dates from the Akkadian period, since an Akkadian clay tablet was found in the foundation trenches, later covered over. This palace at Ashur seems never to have been completed; yet, as witness a number of fragments of basalt statues and a spearhead with an inscription of Manishtusu, the Akkadian rulers were active at Ashur, too.

Figural Arts. The remains of Akkadian figural art works are more numerous than those of architecture. There are a number of pieces securely dated by inscriptions, most of them, however, in a much-fragmented state. Their discovery was due not so much to systematic search as to chance: many were found at Susa, where they had been brought by the Elamites.

From Susa come the fragments of a victory stele of the great Sargon I, the founder of the Akkadian empire (VII, PL. 252). There is no sharp break between it and the reliefs of the Ur I period. It belongs in theme and composition in the immediate succession of the Stele of the Vultures of Eannatum; and if, as seems probable, a fragment representing the enemy imprisoned in a net is part of the Sargon stele, the continuity of the tradition receives further confirmation. Nonetheless, there are clear signs of new tendencies. Sargon, under a parasol, marches as overlord at the head of his fellow combatants; the warrior who slays the prisoners in the net is no god but Sargon himself, for the action takes place before an enthroned divinity, identifiable, by means of the barely preserved symbols on her shoulders, the maces, as warlike Ishtar; the tufts on the garments of the warriors and the goddess are shaped like tongues of flame and lack the internal design found in the Ur I period. These details indicate the altered position of the king in the state, as well as the Akkadian sculptor's rejection of stiff, lifeless forms.

A number of sculptures in the round from Mari, Lagash, and Susa may be grouped with the stele. Bearing a particular resemblance to the enthroned goddess on the stele is a seated goddess from Susa, in the same tufted garment (ibid., fig. 203). A praying figure carrying a sacrificial lamb recurs frequently, as in contemporaneous glyptics.

A limestone relief from Ur (Univ. of Pa., *Mus. J.*, XVIII, 1927, pp. 238, 240) is the most instructive piece of a group of inscribed fragments and sculptures belonging to the period of the sons of Sargon, Rimush and Manishtusu, and his daughter Enkheduanna, divine bride at Ur. The relief, which bears Enkheduanna's votive inscription on one side and a libation scene on the other, gives a conception of the relief technique, the composition, and the costume of the period. Enkheduanna's dress is a many-tiered flounced garment in which each tier consists of vertical tucks made by the incision of wavy parallel lines; on her head she wears the heavy bolsterlike diadem worn by the priestesses and goddesses of the Ur I period. Her two ministrants are a little smaller than she. Strict isocephaly, therefore, does not prevail. The wide spacing between the figures gives an effect of airiness.

Three heads of female statuettes can be stylistically connected with the relief: one from level G of the Ishtar Temple at Ashur (W. Andrea, *Das wiedererstandene Assur*, Leipzig, 1938, pl. 36d–e) and two from Ur (C. L. Woolley, *Ur Excavations*, IV, London, 1956, pl. 43 above). Of these last, one, an alabaster head with a heavy roll-shaped diadem, comes closest to Enkheduanna. The second, a little diorite head, was discovered in the Gig-par-ku at Ur. The inner greatness that it radiates in spite of the miniature scale speaks for its Akkadian origin, as does the entirely un-Sumerian physiognomy. The hair, caught up in back in a chignon, is held by a broad but flat diadem — a hairdress similar to that of the head from Ashur, which, however, is covered with a cap.

The fundamental difference between the Sumerian and the Akkadian worlds is well illustrated by the lower portion of a statue of Manishtusu — the upper part of the body and the head are missing — found at Susa (*Baghdader Mitt.*, I, 1960, pl. 9). This sculpture, for the first time in the history of western Asian art, is not a statuette but a life-size statue. The garment, worn approximately as it was earlier, is made of another fabric than the fleecy material customary in the Ur I period: a firm woollen stuff with a short fringe along the bottom edge and a tasseled border along the vertical edge. In contrast to the Sumerian tufted covering, which deformed the human body into a lifeless block, the fabric here drawn around the body in long slanting folds transforms the inert mass of stone, by the play of light and shadow, into an image of rippling movement which Sumerian sculpture never achieved and, indeed, never attempted.

Another life-size statue of Manishtusu (ibid., pl. 14), made of diorite, was found at Ashur in a stratigraphically undetermined position. Andrae, the excavator, favored attribution of it, as well as of the "Old Palace" at Ashur, to Hammurabi's great rival, Shamshi-Adad I; both style and costume, however, rule out such an attribution. This piece, too, is incomplete, but only the head, hands, and feet are missing. The fabric of the garment is very light, for where it is not draped (on the left arm and shoulder and on the back) it reveals the forms of the body, and the belt is less thick than usual. The disposition of the fabric duplicates that of the statue from Susa; the waves of folds are merely suggested but are essentially the same. The Ashur statue, instructive in that it shows the handling of the musculature, makes all Sumerian sculpture in the round appear schematic by contrast, even though the shoulderblades are treated like small round shields. There were several such statues at Ashur; another example is a torso reconstituted from innumerable fragments found there.

Only a few remains of sculpture in the round have survived from the time of Naram-Sin, the son of Manishtusu. They include the base of a statue from Susa, which shows only the feet, beautifully chiseled, excellent in technique (ibid., pl. 12, 2), and the fragment of a torso with a much-battered surface (ibid., pl. 13). How Naram-Sin was portrayed we learn reliably only from reliefs. On the fragment of a stele in Istanbul (Zervos, 1935, pl. 164) he appears in a long flounced garment like the one worn by Enkheduanna. The narrow pleats of the flounces are merely incised wavy lines. The fabric is so soft and supple that it reveals the curves of the breast. But for the beard and the inscription, the delicate right arm might be taken for that of a woman. Both wrists carry heavy bracelets. In each hand the king holds the haft of a weapon or scepter, unfortunately half broken off. The face is rather battered but shows, nonetheless, a striking resemblance, in all particulars of feature and complicated arrangement of hair and beard, to one of the most important Akkadian works of art, the life-size bronze head of a king brought to light at Nineveh (I, PL. 508). This head is a unique and magnificent testimony to the existence in the Akkadian period of a highly developed art of metal sculpture, sovereign in its mastery of a technique that ranged from hollow casting to the most delicate chiseling. Though not a portrait in our sense of the word, it yet brings before us the countenance of a prince from Sargon's great line of rulers and heroes. The name of this prince cannot be specified with certainty; some have identified him as Sargon himself; but, as already noted, the head (apart from the conical cap in the relief) can be matched feature for feature with the Istanbul relief of Naram-Sin.

A better-preserved stele of Naram-Sin, one more piece carried off to Susa by the Elamites, celebrates his victory over the Lulubaeans, an Iranian frontier tribe (I, PL. 507). It was erected at Sippar, the city of Shamash; whether the eight-pointed stars at the top are in any way connected with this fact is uncertain. The theme is otherwise the same as that of Eannatum's Stele of the Vultures (I, PL. 506). Whereas the Sargon stele retains the old subdivision into horizontal registers separated by strips, the Naram-Sin stele achieves a unified composition in which the movement of the individual figures is communicated to the whole; the victor storming upward and the enemy precipitated downward irresistibly draw along

all the figures. The landscape, present here in the true sense for the first time, partakes of this dynamic composition. Four base lines, one above the other, rise in a wavy movement from left to right, carrying trees on the right and crowned by a steep conical hill. At the foot of it stands Naram-Sin, the divine hero with horned helmet, armed with ax and bow and arrow, far bigger than his fellow warriors, trampling his fallen opponents underfoot. He is the focus of the entire composition, from whom all else — the whole scheme — derives its stimulus and significance. A millennium and a half elapsed before similar effects were attempted in Assyrian mural relief.

The glyptic art of the Akkadian period underwent a stylistic development similar to that of the larger sculpture (PL. 496; VI, PL. 33). Although not one of the many Akkadian cylinder seals can be connected with Sargon, good examples survive from the time of his daughter Enkheduanna. The seal of her steward Adda (C. L. Woolley, *Ur Excavations*, II, London, 1934, pl. 212, no. 307) carries a frieze of figures entirely in the Sumerian tradition. Only the degree of modeling and a greater freedom in the composition, as well as certain details of dress, distinguish it from pieces of the Ur I period. The seal of Enkheduanna's scribe Kikudug, on the other hand, is characteristically Akkadian, with a very early example of the typically Akkadian species of cattle, the arna, a buffalo with long curved horns (L. Legrain, *Ur Exacavations*, III, London, 1936, pl. 31, no. 537). The difference in style of later Akkadian glyptics, of the time of Naram-Sin and Shargalisharri, can be seen in the seal of a scribe of Shargalisharri's, from the De Clercq Collection (Frankfort, 1939, pl. 17c). Over a broad strip, symbolizing a river between mountains, stand two powerful arnas, perfectly symmetrical and turned away from each other, their heads raised to drink from the overflowing vessels held out to them by two naked heroes, presented with head fullface, on bent knee. The space between the horns is occupied by an inscription in eight columns. A classic combination of picture and text, the image forms a decorative entity controlled, and yet not fettered, by the spatial restrictions of the Sumerian period.

There are also cylinder seals on which, as on the great victory stele of Naram-Sin, the figures are so distributed as to give a genuine effect of space. An example is a seal impression from Lagash, dated by the name Shargalisharri (E. de Sarzec, *Découvertes en Chaldée*, I, Paris 1884–1912, p. 282, fig. B). It represents the invocation by a shaman before an enthroned woman, "the beloved of the king," behind whom is a female servant. As the conifer set freely in the space suggests, the scene takes place in the open air. Only occasionally, however, in these small pictures can the movement of the composition compare with that of the Naram-Sin stele: in some hunting scenes, for example, in which the base lines move in large waves and men and women sweep across the pictorial field; one such piece is in Boston (Frankfort, 1939, fig. 36).

Glyptics help fill the gaps left by monumental art in our knowledge not only of form and composition but, even more important, of thematic content. Akkadian seals often show representations drawn from the myths of the great gods, whose deeds and whose trials were doubtless sung in contemporaneous epics. But since such texts are preserved only from later periods, few of the representations can be identified with known mythical episodes. That the seal cutters used such themes is surely due to the inherent importance rather than to the suitability of the scenes to the small format of the cylinder seal. Because of the lack of monuments, the question that naturally presents itself, whether the sculptor of large reliefs availed himself of the epic material, the seals being merely copies of the reliefs, cannot be answered yet. Some of the compositions on cylinder seals, at any rate, can easily be visualized on a monumental scale. On a lapis-lazuli cylinder seal about 1 in. high, excavated at Kish (Parrot, *Sumer*, 1961, fig. 204), the victorious combat of three gods against five others is pictured with such delicacy and spirit, such intrinsic greatness, that execution on a larger scale would seem more fitting. Were the monumental counterparts of such works known, it would be even clearer that Akkadian art, in both form and content, constituted the pinnacle of all ancient western Asian art.

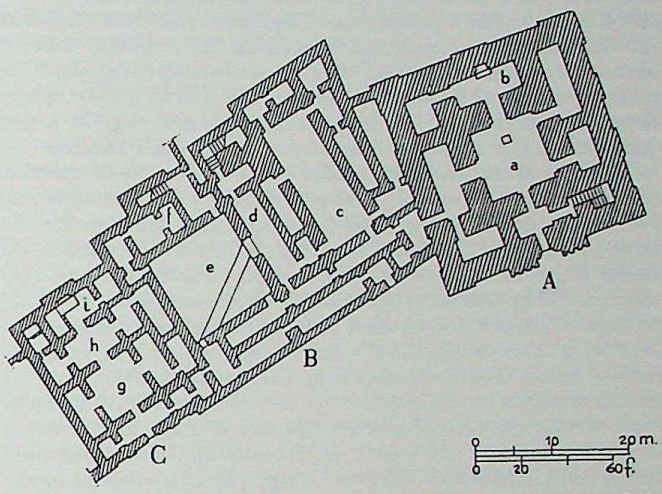
GUTIAN AND NEO-SUMERIAN PERIOD. The empire of the Akkadian dynasty was overrun by savage tribes from the Iranian mountains, the Guti. They seized power in the north and from there tried, under various kings, to substantiate the claim to world dominion of the Akkadian empire. Archaeologically the reign of the Guti is still hardly known. A small group of cylinder seals from Eshnunna (Tell Asmar) that Frankfort attributes to them does not differ thematically from those of the Akkadian period, and the execution is so cursory that no characteristics of style can be deduced. Observing that the Ishtar Temple at Ashur has a quarrystone foundation in only one level, F, the excavator, Andrae, was led to suppose that this type of foundation was Gutian; but other stone foundations have been discovered since which surely date from other periods. New in the time of the Guti, however, is the replacement, among the offerings placed in the foundation, of the earlier "nail figurine" (see col. 747) by a kneeling god with four-horned crown who plants a peg in the ground (G. Contenau, *Les Antiquités orientales*, I, Paris, 1928–30, pl. 27, 1).

The Sumerian south, which was largely spared the devastations of the Guti, was the site of a political and cultural restoration linked to the pre-Akkadian period. During the Gutian dominion Lagash, the city of the god Ningirsu, seems to have grown into a cultural center under the priest-prince Ur-Bau and his son-in-law Gudea. After the expulsion of the Guti, Ur became the political head of the Neo-Sumerian world under the 3d dynasty of Ur. At this time, about 2000 B.C., new immigrants of western Semitic origin began to move into the country and gradually assumed power in a number of city-states, such as Mari, Ashur, Eshnunna, Larsa, Isin, and Babylon. The political end of the Sumerian period can be fixed about 1950 B.C., but art-historically it can be prolonged through certain strata by about a century.

Architecture. a. Temples of the gods. Characteristic for the building technique of this time was the more frequent use of baked bricks for the exterior of buildings — bricks of new dimensions and bearing inscriptions rather than stamps. Two new types of structure seem to have been created in the Neo-Sumerian period: the true ziggurat and the *Tieftempel* or "low temple" (one not elevated on a terrace or ziggurat), with a broad cella (a cella with entrance and altar on the long sides of the rectangle). Neither form has been found earlier; both were to have a long history. It is not possible to deal here with the mass of buildings erected in all Sumerian cities of any importance during the Neo-Sumerian period, which was one of great building activity, especially under Ur-Nammu, the first king of the 3d dynasty of Ur.

At Ur and Uruk are found the best examples of the ziggurat, the artificial substructure about 60–100 ft. high, with sloping or stepped exterior walls, which carried the *Hochtempel* or "high temple" dedicated to the current divinity of the city. The best-preserved ziggurat in Mesopotamia is that of the moon god Nannar at Ur, which owes its relatively good state to Ur-Nammu's having had a thick revetment of bricks laid around the core (I, FIG. 867; III, PL. 485). The four corners are oriented toward the four cardinal points. The revetment is articulated by niches and buttresses. The temple stood on the top stage and was probably reached by means of the straight central stairway; the lateral stairways joined the central one at the first stage.

It was likewise Ur-Nammu who erected upon previously existing terraces the ziggurat of Inanna at Uruk. It was a simpler structure than the ziggurat at Ur: a revetment of unbaked bricks, the outer walls articulated with buttresses but not stepped. Here the inner construction of the ziggurat can be studied more easily than at Ur. Between the layers of sun-dried bricks of the core, reed matting was inserted at regular intervals to equalize the structure; in the upper sections the matting was replaced by layers of reed straw. In addition, the core was pierced by horizontal channels containing reed ropes as thick as an arm, which doubtless served to anchor the outer walls, counteracting the pressure of the central masses of brick. Nearly square in base (each side ca. 184 ft.), the structure



must have been about 46 ft. high, rising to a height of 120 ft. above the plain. Of the temple that crowned it, Loftus still saw some remnants in the mid-19th century.

It is not yet possible to say whether the artificially built-up ziggurat, as known from the time of Ur-Nammu, was the expression of a new religio-cultic idea or whether it was merely continuation of what had previously occurred automatically as temples underwent repeated reconstructions over the centuries: the raising of the main sanctuary on a high platform. Since Ur-Nammu erected the ziggurats of Ur, Uruk, Eridu, and other cities in the very places where the elevated terrace for the main temple had previously risen, it is natural to assume the existence of a religious tradition. If the assumption is correct, our knowledge of the ground plan and interior fittings of the early Sumerian "high temples" (the White Temple of Uruk, the temples of Eridu and Tell 'Uqair) may be correlated with Herodotus' description of the temple on the ziggurat in the late, already post-Babylonian period in Babylon, in order to gain some insight into the significance of the ziggurat. All the ruins mentioned show a temple with an inner chamber having along one of its short walls a kind of stage or podium, well suited by its dimensions to serve as a resting place; next to it, in the middle of the room, is a kind of offering table, made of bricks. According to Herodotus (I, 181), the temple on the ziggurat contained as prime requisites of the cult a bed and a table. He also states that the sacred marriage between Marduk and a selected woman took place in the temple. It would follow that the temple on the ziggurat, or at least one of its parts, was the *gigunu*, often mentioned in cuneiform texts as the place where the marriage was wont to take place; and this, in turn, would explain why, on the bricks employed in a ziggurat at Chuga Zanbil, near Susa, which an Elamite king had erected in the 2d millennium B.C., the *gigunu* is also mentioned as a part of the "high temple."

The second new element of Neo-Sumerian architecture, the broad cella of the "low temple," is illustrated at Ur by two excellent examples, of developed form, with an antecella. In the harbor area, in the southeastern portion of the city, King Bur-Sin (Amar-Sin) dedicated a small temple to the god Enki, in which the features of the new temple are characteristically embodied. The broad cella and the equally large antecella preceding it formed a rectangular central block lying on the main axis of the whole complex; the entrance to this central block, in the middle of one of the long sides of the antecella, was flanked by towers; a customary feature, a niche placed axially on the inner back wall of the cella and probably intended to harbor a representation of the enthroned divinity, has not been discovered here. A rectangular enclosure lined on three sides with connected rooms surrounded the central block, leaving space for a forecourt. An axially placed gate room connected this court with the exterior. The prevailing axiality was deliberate, as was the sequence of gate room, forecourt, antecella, and cella. That the goal of this sequence was the throne niche is proved by the use of the same fundamental scheme in other sanctuaries that otherwise differ in many particulars. The southern portion of the Gig-par-ku at Ur (the conventlike fortified building in which for thousands of years the daughters of kings lived as the consecrated brides of the god Nannar) formed a self-contained temple, of which the nucleus, a broad cella preceded by an antecella of the same proportions, was ringed by a whole complex of rooms. Here the passage through the enclosure was not axial to the niche of the cella but perpendicular to it; from the first forecourt, however, strict axiality prevailed.

b. Royal temples and palaces. At Eshnunna the same axial plan, but without antecella, is found in a temple that the governor of the city, Ituria, began for his divinized overlord, King Shu-Sin (Gimil-Sin) of Ur (FIG. 762, *A*). It has been suggested that the royal dwelling in the guise of a temple signified the exaltation of the king to the level of the gods. More likely, however, a reverse process took place: the gods became ever more human, living in grand edifices and surrounded by royal courts; access to them, regulated by court ceremonial, required the intercession of a divine patron. Such humanization of the gods explains why, from the Neo-Sumerian period onward, presentation to the deity became the central motif of art, relief as well as glyptic. The temple with a broad cella may well be taken as deriving from the idea of a divine audience.

It was a nondivinized prince, Ilushuilia, the son and successor of Ituria and a contemporary of Ibi-Sin of Ur, who built an annex (FIG. 762, *C*) next to the palace of the governors of Eshnunna, west of Shu-Sin's temple. This annex is an exact replica of the temple and must have served for the audiences granted by the prince to the petitioners solemnly brought into his presence. True, the walls are thinner, the rooms somewhat smaller. The difference between god and prince was apparently only one of degree.

Eshnunna (mod. Tell Asmar), temple of Shu-Sin and the palace of the governors. (*A*) Temple of Shu-Sin: (*a*) court; (*b*) cella. (*B*) Palace of the governors: (*c*) great hall; (*d*) throne room; (*e*) court; (*f*) private rooms. (*C*) Audience building (?): (*g*) court; (*h*) antecella; (*i*) cella (*from Frankfort, 1954*).

The palace of the governors of Eshnunna is the only one of the Neo-Sumerian period that has become known, at least in ground plan (FIG. 762, *B*). Serving residential and administrative purposes, it included an oblong hall of stately proportions (*c*), with a door on the southwest leading to a court (*e*). Unlike the court of the audience annex, that of the palace proper was difficult to reach, being accessible only through a small gate room, long narrow vestibules, and a washroom.

c. Funerary monuments. The tombs of the kings of the 3d dynasty of Ur were built in large part of bricks carefully set in bitumen and are therefore relatively well preserved. Architecturally they are vastly superior to the shaft graves of the 1st dynasty of Ur, which are famous chiefly because of the discovery that they harbored the king's following as well as a wealth of offerings. The architectural value of the tomb lies chiefly in the structure erected aboveground, after the elimination of a provisional one, over the subterranean vaulted burial shafts. Excavation has brought to light unequivocal evidence that the underground shafts were opened after a given interval and emptied — not robbed — even before the house, or rather temple, of the dead was erected. The central structure of the 3d-dynasty tombs (VIII, FIG. 294, *k*), which is made of bricks bearing the stamp of King Shulgi (Dungi), is such a temple. However, it does not have the same form as other temples. Its ground plan, as well as that of the more modest annexes on the southeast and northwest, recalls a Babylonian house with central court. Rectangular rooms are disposed along the inner sides of the enclosing wall in such a way as to leave a court free in the middle; on the northwest side five rooms merge into an apartment; two rooms lay in an upper story (nos. 6 and 12; see *Antj*, XI, 1931, pl. 45). Doors, jambs, and thresholds seem to have been inlaid with gold plate and lapis lazuli; several libation tables were covered with gold plate. The inclination to monumentality manifest in this funerary

architecture, as in the architecture of the period generally, is characteristic for other late periods, too.

Figural Arts. a. Sculpture in the round. In sculpture the Neo-Sumerian period is represented by a wealth of examples. The numerous life-size statues of Gudea that De Sarzec found at Lagash (Telloh) toward the end of the 19th century made Sumerian art known to the modern world for the first time. Today the likenesses of the *ensi* of Lagash (PL. 472; I, PL. 511) are regarded no longer as an artistic climax but as a phase in a long development. In content they attain neither the spirituality of the best statuettes of the Mesilim period nor the warmth and life of the Ur I sculptures. They take over from Akkadian art dimensions and material, as well as the costume, with its natural treatment of folds. But a comparison with the fragmentary statue of Manishtusu (*Baghdader Mitt.*, I, 1960, pl. 9) shows that nothing of the inner restlessness and urge to action conveyed by it animates the diorite of Gudea's statues.

Like the artists under the 1st dynasty of Ur, the Neo-Sumerian sculptor sought to exploit the static gravity of the stone block. Hence, no doubt, the esteem for diorite as a medium for the large statues of Gudea, an esteem to which the inscription on statue B in the Louvre (A. Parrot, *Tello*, Paris, 1948, pl. 14c) testifies: "The statue is neither of silver nor of lapis lazuli, neither of copper nor of lead; nor yet has it been fashioned in bronze; it is of diorite . . . ." Hence, too, the striking massiveness of most Gudea statues, with the ponderous head resting almost neckless on the shoulders. In view of the obvious technical virtuosity, such characteristics can scarcely be attributed to the hardness of the stone. A statuette in Copenhagen dedicated to Geshtinanna (Zervos, 1935, pl. 199), though made of a soft stone, steatite, appears as foursquare as many of the other statues. It cannot be disputed, however, that in the course of three generations of *ensi*s of Lagash a certain softening took place; witness the so-called "Woman with the Scarf" (PL. 478); or compare the statuette of Ur-Bau, Gudea's father-in-law (ibid., pl. 177), with that of Gudea's son Ur-Ningirsu (PL. 479), who must have been alive when the 3d dynasty of Ur came to power.

The extensive inscriptions that cover large portions of the Gudea statues replace the cartouches bearing the subject's name found on many older monuments. They enumerate the deeds accomplished for the gods by the prince, that in return the gods might grant him life. The sculptures must therefore be regarded not as mere likenesses but as magic substitutes for the worshiper, imbued, through the mouth-opening ceremony, with a life of their own. They bear names and require their own offerings in order to render perpetual service to the deity in their turn. This interpretation of Neo-Sumerian works may be extended both to earlier and to later votive sculpture, for the eternal life these statues solicited was always the goal of humankind in the ancient East.

Little has been preserved of the sculpture of the great kings of the 3d dynasty of Ur; even Shulgi, the mightiest of these kings, is represented only by fragments. In contrast to the much older pieces from Lagash, these remains reveal a predilection for details of dress arrangement and decoration. This deviant style is even more pronounced in some statuettes and statues from Mari, which differ from one another in details of apparel. While the statue of Ishtup-ilum (Frankfort, 1954, pl. 61a) comes closest to the statues of Gudea, the best example of this style is one of Puzur-Ishtar (PL. 485), identified as a contemporary of Ibi-Sin, the last king of the 3d dynasty of Ur; or it might be that of a god-king, Puzur-Ishtar's overlord perhaps, to whom he consecrated the statue. The decorative prominence given the fringes, the indication of arm and chest muscles, the folds of cloth on the upper left arm, all recall Akkadian art, but the execution is dry and schematic. The figure lacks the compactness of the Gudea statues but resembles them in its quadrangular structure.

The finest female statue of the Neo-Sumerian period might well be that of Eannatum (En-ana-tuma), the daughter of Ishme-Dagan of Isin, but erroneous restoration has led to misinterpretation (cf. *AntJ*, VI, 1926, pl. 52a, and Univ. of Pa., *Mus. J.*, XVIII, 1927, pp. 223–29). Better preserved are a number of statuettes from Lagash of female relatives of the *ensi*s Gudea, Namakhni, and Urgar; the best piece of the series, however, is without inscription (Zervos, 1935, pls. 206–07). Artistically these pieces offer nothing new; but besides the altered costume they show a new physiognomic type, the male counterpart of which is found in some bald heads (PL. 477) that probably — especially the so-called "White Head" in Berlin — represent Gudea. Whether this type came to Mesopotamia with the Guti and to what ethnic element it belongs are questions still unanswered.

No large-scale bronze sculpture from the Neo-Sumerian period has been found. The only surviving bronze pieces are foundation figurines that continue the tradition of the genre, with the addition of some new types. From the period of Gudea come the kneeling god driving a big conical peg into the ground (Van Buren, 1931, figs. 10–13); the crouching calf on a nail (PL. 480); and, for the first time, the basket bearer as builder, standing on a nail (ibid., fig. 14). From the time of Ur-Nammu we have two variants of the basket bearer. The first variant, also produced under Ur-Ningirsu of Lagash, transforms the lower portion of the body into a conical nail (ibid., fig. 18). The second is completely anthropomorphous: a bald, beardless figure with naked torso and a long belted skirt, holding on its head with both hands a basket resting on a cushion (ibid., fig. 16).

b. Relief. The force of the cultural reaction that followed upon the fall of the dynasty of Sargon is demonstrated even more plainly in relief. Nothing remained of the Akkadian spirit. A considerable number of works from Lagash as well as from Ur itself have survived, most of them fragmentary, yet in a sufficiently good state to give us an idea of the types of relief and their artistic level. It is symptomatic that the vehicles of relief were once more the ancient, pre-Akkadian ones: stone cult vessels (PL. 481), votive plaques with central holes, and cult steles. Thematically the reliefs owe more to the state pantheon than to the gods of life and vegetation. The representations include cult ceremonies, with music and processions of sacrificial animals, and sometimes lower divinities, such as the animal attribute of the god Ningizzida, the patron of Gudea. Votive plaques bear the enthroned Ninsun, mother of Gilgamesh, no doubt receiving a petitioner (PL. 480), or the goddess Bau seated on Ningirsu's knees (A. Parrot, *Tello*, Paris, 1948, fig. 35g) — surely an episode from the feast of the sacred marriage. What is striking in every one of these works is a formal idiom completely without dynamism.

Though the apparel of men and gods is the same as in the Akkadian period, the rigidness with which the figures are bound to the abstract space symbolized by the pictorial field is Sumerian and pre-Akkadian. Men and gods have once more renounced their yearning toward the infinite. Like the Stele of the Vultures (I, PL. 506), the stele of Gudea in Berlin (Parrot, *Sumer*, 1961, fig. 284) and that of King Ur-Nammu in Philadelphia (ibid., figs. 279–82) are divided into several horizontal registers neatly separated by strips; thus once again events are subjected to the constraint of a fixed framework, as before the time of Naram-Sin. Such steles, probably the most important Neo-Sumerian works in relief, were aligned on pedestals in the courts of temples and had fundamentally the same religious function as the statues in the round of priestly rulers and kings. A subject of both steles is the presentation to the deity. The Berlin stele is very effective in the presentation of Gudea, bareheaded and clean-shaven, to the god Ea (Enki) by his tutelary god Ningizzida and a divine herald. The presentation to Nannar and Ningal of Ur-Nammu, wearing a beard and a cap with a brim — an indication of his rank — is the only scene on the Philadelphia stele sufficiently well preserved for continuity to be assured. The similarity of design in the two steles, especially in all details of the gods' apparel — the horned cap, for example — suggests provenance from the same workshop.

The theme of presentation to a god is treated in the same way on many cylinder seals of the period. Presentation to a god-king differs only in details. This ceremony, too, unrolls in

broad cellae, where the rulers of the 3d dynasty, enthroned like gods, receive the petitioner with his tutelary deity.

In short, the Neo-Sumerian striving after monumentality took various forms: expansion of building activity, projection of towering ziggurats and mighty temple complexes, copious production of statuary. But this monumentality was not accompanied by a surge of new, creative ideas; nowhere is there a sign that a fresh world view was unfolding. The Neo-Sumerian period was not a classic peak but a late phase.

OLD BABYLONIAN PERIOD. Not long after the fall of Ibi-Sin, the last king of the 3d dynasty of Ur, Mesopotamia was swept by a new wave of western Semitic peoples whose personal names provide the only clue to their nationality and religion. In time the western dynasties came to power at Mari, Ashur, Isin, Eshnunna, and Babylon, bringing forth great rulers such as Shamshi-Adad I of Ashur and Hammurabi of Babylon (ca. 1728–1686 B.C.), after whose dynasty, which endured until about 1550 B.C., the period is named. Unfortunately the Old Babylonian stratum could not be excavated in Babylon itself, the ground-water level being too high, and we are obliged to fall back on other cities for information.

Architecture. a. Cult buildings. At Ishchali, in the Diyala region, excavators uncovered a large complex comprising three temples, of which the chief one must have been consecrated to the Ishtar of the city of Kiti (Ishtar-Kititum). The complex still existed at the time of Ibalpiel II of Eshnunna, a contemporary of Hammurabi, but had already passed through several stages of development during the rule of his three powerful predecessors. Its ground plan formed a rectangle of 262 × 164 ft. In the north and west stood the three temples, each with its own courtyard. In the southeast, on a somewhat lower level, lay a large forecourt that led through a tower-ornamented gateway to the court of the western main temple. A similar gateway gave access to this court from the south; it lay on the same axis as the temple itself, which rose at the opposite end of the court. This temple was virtually a replica of the one with broad cella and antecella previously encountered in the Neo-Sumerian period (see col. 761). On the exterior the antecella was furnished with towers, adorned with fluting. The second temple, which occupied the northeastern corner of the complex, was of the same type, but it lacked an antecella and did not have a gateway on the same axis as the holy of holies. The third temple presented a different aspect. With its rectangular court, it occupied the space between the other two temples on the north side of the complex. A gate flanked by fluted towers on the west side of the court here led not into a broad cella but into an oblong chamber with a deep, narrow niche in its west wall. This form of the cella, not thereafter encountered in Babylonia, may be traceable to western Semitic influences. It can hardly have played a part in the further development of the temple, for the broad cella remained the normal Babylonian form until the 6th century B.C. and at Uruk survived until the Seleucid epoch. Another example of the broad cella in the Old Babylonian period is to be found at Tell Harmal, a ruin in the vicinity of Baghdad.

An odd structure at Eshnunna, the so-called "Audience Hall of Naram-Sin," was dedicated to the cult of the king. It seems to have found no successor in the history of architecture.

b. Palaces. By far the most important architectural monument from this period is the palace at Mari, to which King Zimrilim made the last contributions and which was destroyed by Hammurabi (PL. 483). It is extremely well preserved. On excavation the walls still reached a height of 13–16 ft. Some of the places where the beams for the ceilings were let in could still be recognized.

The palace covered an area of 5–6 acres. The enclosing wall varied in thickness and followed an irregular course, at certain points presenting a fortresslike aspect. In the northwest corner it formed a bastion with casemates; in the southeast, it was rounded. The rooms had no windows; light penetrated through the very tall doorways. The walls were coated with clay or plaster and were richly adorned with paintings. The over-all layout clearly shows that, unlike the palace of Naram-Sin at Tell Brak, for example, this palace was not built according to a unified plan but attained its final shape by slow organic growth.

The design of the whole construction helps to explain the way of life and complex functions of royalty in the Old Babylonian period. Protected by the bastion in the northwest lay the apartment of the king, the supreme war lord, together with a smaller apartment for the queen and rooms for the retinue. Immediately to the south of the royal apartment were the rooms set apart for governmental and administrative purposes, among them some, on the order of schoolrooms and archives, where the scribes worked (PL. 483). In the southwest lay the storerooms; in the southeast, the workshops and other handicraft rooms. West of the workshops was a cluster of rooms that the excavators took to be the remains of a temple; they may also have been part of a funerary monument. The palace was linked with the outside world by a gate building to the northeast that included a gate room, a forecourt, and a caravansary.

The nucleus of the palace consisted of two big courts and the rooms that delimited them. The eastern trapezoid court, the more extensive in area, was connected with the forecourt of the complex through a wide room with nonaligned doors. This large court must have had a special, perhaps ritual, significance, for to the south of it lay one of the most unusual rooms of the palace (no. 132): a rectangular room oriented lengthwise and approached by a semicircular staircase, with a podium against the far short wall and a niche in the east wall, near the entrance. In it were found poorly preserved mural paintings in superposed registers, depicting sacrifices before enthroned deities. The second court (no. 106) could be penetrated only by detours, through a door in the north wall that lay along the north–south axis and permitted a view of the podium in the big transversally oriented room (no. 64) to the south of the court, where the king must have held his large audiences. The south wall of the court bore the most important extant painting of this period (I, PL. 513), the central panel of which represents a kind of investiture of a ruler. Behind what may be identified as the throne room (no. 64) was another court or room (no. 65), with an elevated broad cella to the east. In this part of the palace the conception of kingship must have attained its apotheosis.

Figural Arts. a. Sculpture. In sculpture as in architecture, Babylonia itself yields but little for this period. Information must be derived from finds in outlying areas: the results of the more recent excavations at Mari and Ishchali and especially the discovery in Elam of booty that Shutruk-Nakhunte carried off from Eshnunna and Sippar.

From Susa comes the famous stele inscribed with Hammurabi's legal code; many such steles were set up in the cities of his realm (PL. 486). The crown of the stele (I, PL. 512) consists of a relief in which the king stands before an enthroned god, probably Shamash, in the attitude of the worshiper. Everything in this relief belongs to the Sumero-Akkadian tradition: its inner spirit and the formulation of the theme, even the details, such as Hammurabi's coat, his cap with a border, and his beard, as well as the god's flounced garment and horned headgear and his throne in the form of a temple. The same motif is found on a cylinder seal in Berlin (VA 3330; Moortgat, 1940, pl. 40, 305).

A group of standing and seated statues, likewise from Susa, that are now in Paris (Louvre) bear subsequently added Elamite inscriptions in which they are designated as plunder from Eshnunna. One statue shows remains of the original inscription, which T. Jacobsen would fill out to the name of the *ensi* Ur-Ningizzida of Eshnunna. A seated statue from the same group, with a coat unadorned at the hem and an imposing rectangular beard, is related to the Hammurabi stele (*Baghdader Mitt.*, I, 1960, pl. 22). The clearly projected curving folds, like many iconographic details also noticeable in glyptics, indicate an attempt during this period, at least in some parts of Mesopotamia, to work in the Akkadian tradition.

Noteworthy is a diorite head from Susa in the Louvre often referred to as "The Aging Hammurabi" (I, PL. 512). Although the cap with a border and the beard are Akkadian — compare the beard with that of the Akkadian bronze head (I, PL. 508) — the individuality and realism of the features are a contradiction of everything known of the Sumero-Akkadian and the later Babylonian-Assyrian mode of representing human beings. Neither the worn features nor the form and stylization of the beard are reconcilable with the known likeness of Hammurabi. Discovered at Susa, the head may be one of the many pieces of plunder found there and originating from the Sumero-Akkadian territory; but it could also be the image of a native Elamite prince. (The Elamites were the only people in the Sumero-Akkadian-Babylonian world who knew genuine portraiture.) Should the head be a Babylonian work after all, its subject might be the old Rim-Sin or his father Kudur-Mabuk, a possibility that suggests itself on account of their Elamite origin.

The life-size statue of the goddess that stood in a court of Zimrilim's palace at Mari as a kind of divine fountain combines grandeur with charm in the expression of the face, softness of sculptural form, and delicacy of surface design with freedom of attitude (PL. 485). Possibly the fragment of a group of two similar figures of uncertain origin in the Louvre is Old Babylonian and not, as has been suggested, Akkadian (*Encyclopédie photographique de l'art*, Paris, 1935, pls. 216–17). Not only is the idea the same as in the statue from Mari, but the neck ornament, with a long counterweight down the back, and the waves with fish on the dress are duplicated too. Also from Mari is the statue of Idi-ilum now in the Louvre (PL. 484).

Old Babylonian toreutic art is known through three unusual pieces. One, from Larsa, shows a genuflecting worshiper on a base decorated with reliefs (PL. 491). Face and hands are covered with gold foil. A votive inscription states that the statuette was dedicated by one Awil-Nannar to the god Amurru for the life of Hammurabi of Babylon. The piece is of value for its theme, because such praying figures did not occur in previous finds. The two other pieces, small bronzes from Ishchali, are even more peculiar. One is a god in a flounced dress, with a long scimitar in his right hand and a flat horned cap on his head, who steps with his left foot on a small crouching ram (IV, PL. 216). The other is a goddess ensconced on a simple stool. She wears a long gown crossed on her breast and holds a flowing vase in both hands (Parrot, *Sumer*, 1961, fig. 352). Her dress is incised with wavy parallel lines running up and down and probably symbolizing water. On her head she wears the same flat cap with horns as the god, but surmounted by a heavy cylinder carrying the design of a temple façade. The cylindrical headgear, characteristic of goddesses in the Syrian domain, here at Ishchali may be one of the motifs imported by the western Semites. What is strangest about the two figures is that each has four faces — a number not encountered elsewhere, even though Janus-faced representations are known, especially of Usumia, the minister of Ea.

b. Painting. The appearance of Sumero-Akkadian painting must be deduced from the motifs transposed to inlay work and vase painting, for only one example has survived: the painting on the podium of the temple of Tell 'Uqayr. From the Old Babylonian period, the palace of Zimrilim at Mari has preserved several types of painting. In many rooms there were remnants of ornamentation painted on plaster. In Room 64, tentatively identified as the throne room, the surface of the podium was treated to simulate marble slabs (A. Parrot, *Mission archéologique de Mari*, II, 2: *Le Palais*, Paris, 1958, pl. 15). Remains of a wooden framework or lattice originally hanging on a wall exemplify another type of plane art (ibid., pl. 3). The excavator, Parrot, assumes that the compartments of this lattice were covered with fabric. It is not certain whether the representations it bore were painted or woven.

The existence of tapestries with figural compositions is attested by the large investiture scene in Court 106 (I, PL. 513). In this painting a wide strip with a spiral pattern frames a field $8\frac{1}{4} \times 5\frac{3}{4}$ ft. Two additional borders above and below unmistakably reproduce in stylized form the knotted-fringe tassels of a tapestry; the narrow smooth strips along the short sides copy the selvage. In short, the painting imitates a wall hanging. The organization of its field recalls that of the wooden lattice; the whole composition serves to bring into relief the central investiture scene and to underline its significance.

The less well-preserved murals of Room 132, reconstituted from many fragments to form five superposed registers with figures, seem to have been composed quite differently (ibid., pl. 17). The subjects include porters walking toward the right, a soldier struck by arrows (perhaps from a scene of combat), sacrifices before divinities (on two large bands), and servants carrying fish (on a smaller band). Two aspects of the composition are clearly established: the subdivision into registers and, in several instances, the lack of separation between two apparently unrelated scenes. A comparable want of transition is observable on Syrian seals of the Old Babylonian era and also on Babylonian seals of the period, in which the Neo-Sumerian presentation scene is accompanied by other motifs.

Even freer in composition seems a procession of servants and sacrificial animals, large fragments of which were preserved in Court 106 (PL. 482). The leader of the procession, probably the king himself, in a rich pleated garment with a belt and a double row of fringes, cuts across the two registers into which his followers are grouped; such overlapping, as far as we can tell, was avoided in the other wall paintings. The figures differ from the Babylonian type in their tall caps, short mustaches and beards, and sharp, somewhat pinched profiles. It cannot be determined as yet whether the differences among the wall paintings are attributable to differences in theme — a more or less hieratic content — or to differences in the date of execution.

None of the works that have survived from the Old Babylonian period — except the paintings, which are of particular significance — bespeak a break-through of new ideas. A return to Akkadian ideals was balanced by the presumable influences brought to bear by immigrant populations — Elamite influences in the portrait, western Semitic ones in certain architectural elements, in details of costume, and in the beginnings of greater narrative verve in glyptics and the popular art of terra-cotta reliefs.

MIDDLE BABYLONIAN (KASSITE) PERIOD. The Kassites, a mountain people who had threatened Babylon from the time of Samsuiluna, Hammurabi's son (17th cent. B.C.), found their path clear after the transient conquest of Babylon by the Hittite king Mursilis I (ca. 1550). None of the known architectural monuments of Kassite origin, however, dates back further than the 15th century; they continue until the 12th century, when Kassite domination ended. This period, regarded in the past as one of complete decadence, is gradually being revealed, both on a literary and on an artistic plane, as rich in original and fruitful departures. If documentation were not still relatively sparse, such departures would doubtless appear even more striking.

Architecture. Many ancient sanctuaries in the main cities were restored and altered in the Kassite period. One example is the great sanctuary of the moon god Nannar, at Ur, which was entirely in ruins when Kurigalzu I undertook its restoration at the beginning of the 14th century. Generally speaking, he did not make any fundamental changes. The only entirely new structure, and one that is difficult to interpret, seems to have been the Ningal Temple, to the southeast of the ziggurat. The E-dub-lal-makh, a very ancient sacred edifice on the southeastern side of the enclosure of the Nannar sanctuary, Kurigalzu renovated by using the remains of an older structure as the base for the new; this method of setting a temple on a podium is one that appears again among the Kassites. The ruins of E-dub-lal-makh were preserved to an extraordinary height. In one place a high doorway with a fully formed barrel vault was found still standing; this type of vault was presumably common in the Kassite period. It is difficult to make out from the tablets what purpose the edifice served, whether it was a sacred sheepfold with a gate or whether it was a hall of justice. At any rate, it seems to have undergone an unusually thorough transformation in the Kassite period.

Even more characteristic is a small temple in another ancient sanctuary: the Inanna Temple erected by King Karaindash in E-anna at Uruk as early as the end of the 15th century. Though modest in dimensions, this building, both by its ground plan and by its elevation, occupies a position apart. It was a rectangular structure oriented lengthwise; its southwest short side constituted the façade, in the center of which was the entrance gate. The oblong cella with a podium near the inner short wall was preceded by a pronaos and flanked by corridorlike rooms. The four corners of the building were reinforced by bastionlike double towers. Unlike earlier oblong cellae, which formed an integral part of a structure oriented inward toward a courtyard, this oblong temple stood free on all sides, comparable in the effectiveness of its exterior aspects to a Greek temple. The elevation can be reconstructed with considerable probability by reference to the façade, which had a high base of molded bricks forming a frieze of alternating mountain gods and water goddesses, all standing in niches and holding flowing vases (Frankfort, 1954, pl. 70a). This frieze must have encircled the whole structure.

Since Kassite architecture was able to leave its impress at Ur and Uruk, centers of Sumerian tradition, it is not surprising that it should have done so to an even greater degree in places founded by the Kassites themselves. An entirely new conception of this architecture may be gained from the preliminary results of excavations undertaken during World War II at Dur Kurigalzu (mod. 'Aqar Quf), northwest of Baghdad. Kurigalzu I had a new residence erected there, which stood until the late Kassite period (12th cent.). What makes the ruins an attraction to all visitors to Baghdad — the stump of a ziggurat still rising to a height of more than 100 ft. — is not a typical Kassite monument, but one that belongs in the mainstream of Sumero-Babylonian development. However, the temple complex connected with the ziggurat and the palace lying farther to the northwest are characteristic of Kassite architecture. The nucleus of the temple complex seems to have been a rectangular block of sun-dried bricks, the top of which could be reached by a stairway at the northeast corner. Probably the temple itself stood on the block, in the same way as E-dub-lal-makh rose on the remains of an older structure; for Mound A at 'Aqar Quf has yielded a similar block, upon which the outline of the superstructure is still preserved. Close to the block of sun-dried bricks lie several court complexes with nearly square enclosures, in which rooms and doorways, but no cult rooms, are preserved. Between the block and the enclosures, only a very narrow passage was left free — an innovation in plan that, because of the incomplete results of the excavations, cannot as yet be explained.

A new kind of plan is also shown by the palace of Dur Kurigalzu, a little over half a mile from the temple, on Tell Abiad. The structures comprise a central court complex (A), a garland of smaller complexes adjoined all around (B-G), and a later annex (H). The annex differs from the other groups of buildings in that it has many doors in the walls of the court; it must have been built during the very last phase of Kassite dominion, for it lies on a considerably higher level than the remainder of the palace, which subsisted from the time of Kurigalzu I (1380) until that of Mardukapaliddina I (1176–1164). The nucleus of the palace is a square court with one side adjoining a block of sun-dried bricks, which, once again, may be the terrace of a building as yet unexcavated. The groups of rooms on the other three sides are all of the same type. In each instance smaller rooms surround a central rectangular one that must have overtopped them to permit the entrance of light, for the few doors leading from the big court into the smaller rooms could not have admitted enough. The walls are of enormous thickness. To the north and east of the central court complex staircases probably led to the towerlike bastions. The smaller complexes have no wall in common with the central room; the delimiting walls are always clearly separated by a groove.

Kassite architecture, then, although still far from adequately known, reveals a number of characteristic traits, the discovery of which has invalidated the former view that the period was one of stagnation for Babylonia.

Figural Arts. a. Architectural sculpture. This art form in particular must have undergone a signal development in the Kassite period: so much is clear even from the little that has survived. The wall relief composed of molded bricks pressed from a form and then baked must have been widespread. Molded bricks were found at Dur Kurigalzu; at Ur, Woolley came upon something similar in the E-nun-makh of the Kassite period. The best-preserved example, however, is the previously mentioned façade of the Innana Temple at Uruk. The alternating mountain gods and water goddesses, all seen frontally and connected by the stream of the water of life, are perhaps a translation into brick of the stone orthostat with reliefs typical of the architecture of the other mountain peoples. Be that as it may, the frieze of molded-brick reliefs presents a contrast to all that came before. Not an outer layer concealing structure, but true architectural sculpture, it employs structural elements — bricks — with an effect of supporting the building and holding it together.

b. Wall painting. The remains of Kassite wall painting in the palace of Dur Kurigalzu are of two kinds: ornamental patterns, of which scanty remnants were discovered in the older portions of the palace, and figural compositions that imitate wall hangings, as from time immemorial in western Asia. Peculiarly Kassite features are to be sought, perhaps, in the position of the paintings and in the choice of subjects. Rows of striding functionaries or officers depicted on long rectangular fields in ornamental frames decorate the very thick jambs of the doorways, the painting reaching around corners as if to mask the sharp edges, like tapestry (*Iraq*, VIII, 1946, figs. 4–7). The paintings do not reproduce any myth or, it would seem, any religious rite, but record activities once of common occurrence in the rooms where they are found: the coming and going of officials in the fulfillment of their ceremonial duties. With their big heads set almost neckless on their broad shoulders, the figures present a sharp contrast to the elongated ones of the early Kassite period. The evolution from overslender to stocky can be observed over and over in Kassite art, for example, in the stone reliefs of the typically Kassite *kudurru* (boundary stone) and in glyptic art. Although this trend toward the thickset figures of the late Kassite period is surely significant from the point of view of stylistic development, it may also be an indication that the Aramaean element, after steadily gaining ground in Babylonia, was coming into its own.

c. Sculpture in the round. Kassite sculpture in the round was unknown before the discovery of some diorite fragments in the main court of the temple complex at Dur Kurigalzu. Among these was a well-modeled life-size foot, perhaps part of a statue of Kurigalzu, whose name occurs in inscriptions on the fragments. The head of such a statue may perhaps be conceived on the model of a masculine terra-cotta head (ibid., fig. 9) whose expression recalls that of the officials in the palace of Dur Kurigalzu. This technically remarkable piece is partly hollow, partly solid. The eyes are covered with a layer of white stucco, which was probably painted. Hair and beard were painted black. Another piece which appears to be unique, a terra-cotta hyena, is fashioned with striking skill and expressiveness (ibid., fig. 14).

d. Relief. Kassite stone reliefs are best known through the *kudurrus*, on which the king published by word and picture his tax-free gifts of land to individuals and to temples (PL. 486). The examples of greatest importance for the history of art were discovered at Susa, where, like so many other monuments, they had been brought as plunder. Those with extensive reliefs all date from the late Kassite period, a large number from the time of King Melishipak II, who reigned in the early 12th century (II, PL. 20; IV, PL. 203).

A *kudurru* of Melishipak from Susa provides an example of the pure stele form (*Encyclopédie photographique de l'art*, Paris, 1936, pl. 265). It is a stone slab rounded on top, with text on the principal face and the narrow sides. The reverse bears symbols of the gods, not all of them interpretable. In the top

register are the lunar sickle, the solar disk, and the star of Venus — the symbols of the three most important celestial bodies: Sin, Shamash, and Ishtar. Below, in the same register, lie the symbols of the three highest Babylonian divinities next to or upon temple-shaped thrones: the horned cap (Anu or Enlil), the ram's head and the goatfish (Ea), and the double volute (Ninmakh). In the register underneath are the symbols of several war gods, followed, in the next register, by those of the younger generation of the gods: a *mushkhush* (or *mushrusshu*, a horned dragon) with a hatchet (Marduk), a *mushkhush* with a tablet and stylus (Nabu), and a dog with a woman's bust (the goddess of health, Gula). Next below we find lightning (Adad), the plow of a god of vegetation, and the lamp of the god of light (Nusku); and, in the lowest register, a shell, a scorpion, and a horned snake, all three doubtless symbols of gods of the underworld. The order followed on this *kudurru* reflects the naïve conception of a cosmos stratified from highest heaven to nether regions. The entire divine hierarchy is here summoned to protect the document. Since the gods are represented only by abstract signs or by their animal attributes — probably symbolizing their vanquished enemies — it is possible that the Kassites felt a repugnance toward the anthropomorphization of divinities.

If such a repugnance existed, however, it was not absolute, as other *kudurrus* of Melishipak demonstrate. On one of them (IV, PL. 203), the record of a gift of land by the king to his daughter, Melishipak is presenting her as a priestess to the goddess Nana (Inanna-Ishtar). Of the symbols of the gods, ordinarily so numerous, there remains only the constellation of Sin, Shamash, and Ishtar. The goddess is shown enthroned. Her garment, somewhat different from the old flounced dress, is made of bands winding aslant around the body. Instead of the horned cap she wears the feather crown customary during the Kassite period. The king appears in a simple belted robe with straps crossing on his chest and a semihigh polos on his head. His daughter carries a harp. All three participants in this ritual scene are stocky, recalling the late Kassite figures in the palace of Dur Kurigalzu.

Other *kudurrus* of Melishipak, employing mythological motifs, are set apart by their design and shape. The base is nearly rectangular. The lower part simulates a fortress with towers at the corners connected by walls, on which the text is generally inscribed; the gods and their symbols often appear on the truncated pyramid above the fortress. The most interesting example of this type, one with an incomplete inscription, comes from Susa and is probably also attributable to Melishipak (ibid., pls. 266–67). Like most of the *kudurrus*, it is crowned by a ringed snake, here surmounted by a crouching bull; at the bottom a second powerful snake supports the fortress. Two friezes of reliefs, one over the other, unroll between the towers and the upper snake. The first is filled with the already familiar symbols of the gods, of which some also appear immediately above the battlements. The second differs from everything else so far known in western Asia. A solemn procession of men marches toward the right, each playing a lute and followed by an animal — a lion, a panther, a goat or a ram, an ostrich. On their heads they have pointed helmets, in some instances bordered with horns, and they wear short skirts with belts hanging down between their legs; on their backs they carry bow and quiver. At the end comes a woman, also carrying a bow and a quiver, who beats a cymbal and dances.

Although the sculptural technique, in a strict sense, is not of the highest quality, it must be conceded that in these reliefs Kassite art attains a spiritual zenith. A "canonization" of the literary heritage — a selection and ordering of epic literature according to ethical criteria — is known to have taken place in the late Kassite period. The same world-ordering spirit is perceptible in the *kudurru* just described. It is a symbolic representation of the cosmos, in which the fortress of the gods bridges the space between the heavenly bull and the chthonian snake, and the two friezes that surmount it evoke the victory over chaos of the luminous gods of light, represented by their symbols, and the subjection of the wild beasts through the power of music.

e. Glyptics. Middle Babylonian glyptic art could not have come into being through the mere preservation of depleted Old Babylonian motifs and compositional schemes. The engravers who produced the cylinder seals in Babylonia from the end of Hammurabi's dynasty until the so-called "2d dynasty of Isin" undoubtedly contributed ideas and formal devices of their own; indeed they brought about a relatively swift and lively development of glyptic style from the 16th to the 14th century. In the period of kings Kurigalzu I and Burnaburiash II most seals (PL. 496) bore a long inscription, a prayer or an invocation to the gods, and a single praying figure of the same exaggerated slenderness as other early Kassite figures, such as the mountain and water divinities of the small temple of Karaindash at Uruk. In time the figures became as heavy-set as those in the late wall paintings of Dur Kurigalzu.

Although at first Kassite glyptic art drew on the past, initiating nothing new, in the 14th century, during the reigns of kings Kurigalzu II and Nazimaruttash II, contemporaries of the great Middle Assyrian kings Ashuruballit I and Adadnirari I, it produced some pieces that are among the supreme examples of western Asian art. It is open to question whether seal engraving could have reached such heights in Babylon without the aid and inspiration of Middle Assyrian glyptics, especially as the themes of these Babylonian pieces center on the tree of life and favor the motifs of a chthonian faith, otherwise restricted in the 2d millennium to the mountain peoples, particularly in the Hurro-Mitannian and Assyrian domain. By a particular stroke of luck these seals are dated with exactitude: their impressions appear on business documents of the old cult capital of Nippur.

OLD AND MIDDLE ASSYRIAN PERIOD. In the 3d millennium B.C. Assyria was culturally a Sumero-Akkadian province. Yet in the first half of the 2d millennium it was the Assyrian people who resisted longest and most vehemently against absorption by the western Semites, and under the dynasty of Ilushuma and Irishum I Assyria seems to have sought independence from the south in cultural matters as well. Not only did the princes of Ashur found their own agencies in Anatolian cities for the delivery of indispensable raw materials; but in these cities of metics the inhabitants recognized Assyrian law, swore by the sword of the god Ashur, knew only the Assyrian calendar and the Assyrian reckoning of years after limmus — officials whose names were given to the years of their magistracy — and they employed a special cuneiform writing and a special Assyrian orthography. Unfortunately not enough of the art and architecture of this period has been recovered to permit definition of Assyrian characteristics. Even in glyptics such an attempt is unsuccessful, although there are numerous cylinder seals and seal impressions on clay tablets from Kültepe (anc. Kanesh) in Anatolia.

When Assyria, too, finally succumbed to the pressure of the western Semites and under the leadership of Hammurabi's great rival, Shamshi-Adad I, became a center of the western Semitic world, one of the effects must have been a great stimulus to art and architecture. Yet almost nothing of significance exists. Only the stele from Mardin in the Louvre (*Rev. d'Assyriologie*, VII, 1910, pl. 5), depicting a triumphant ruler with his foot on a vanquished foe, can be linked with Shamshi-Adad. It is unlikely that Hammurabi in Babylonia would ever have chosen this subject to adorn a stele; Shamshi-Adad in Assyria was able to do so by a direct reversion to Akkadian art. Between the death of Shamshi-Adad and the renewal of Assyrian power under Eriba-Adad I in the first half of the 14th century there elapsed at least three and a half centuries, a period of dependence on the Hurrians and their ruling caste, the Indo-European Mitanni.

Architecture. A number of indications point to a complete transformation of Assyrian architecture and art during this period. The double temple of Sin and Shamash at Ashur, according to the earliest record, dates back to Ashurnirari I. Its ground plan forms an elongated rectangle. In the middle of the monumental northwest side was the gate, flanked by

symmetrically stepped-back towers. It led into a large central court, approximately square in shape. The two shrines, which faced each other on the southwest and northeast of the court, consisted of a broad antecella and an oblong cella, a layout typical for all subsequent Assyrian temples. It is not certain whether this plan is truly Assyrian or of Hurro-Mitannian origin, because too little is known about the art and architecture of the Hurro-Mitannian empire at its center and in the period of its greatest flowering. Yet Hurrian architecture must have left its imprint in Assyria. The main hall or court of the palace at Alalakh (mod. Tell Atchana), as rebuilt by Niqmepa in the 15th century, was oriented widthwise. It had a door on one long side and contained a hearth. With some smaller subsidiary rooms it formed the heart of the palace. Such a pattern was to be followed in all Assyrian palaces from the 9th century onward. At Til Barsip (mod. Tell Ahmar), for example, a similar group of rooms formed the core of the residential portion of the palace.

Subsequently, in the 13th century, during the great era of political equilibrium in the western Asian, Egyptian, and Mediterranean orbit, Assyria, under the three great rulers Adadnirari I, Shalmaneser I, and Tukulti-Ninurta I, not only entered into its Hurro-Mitannian heritage in the political realm but succeeded in giving fitting expression to its might in art and architecture. Just as the Sin-Shamash Temple of Ashurnirari I at Ashur revealed a new, specifically Assyrian type of cult building, so the palaces uncovered at Ashur shed light on the beginnings in Assyria of a type of secular edifice that, as an expression of the Assyrian conception of kingship, was almost more important in the next centuries than the temple. The remains of stone foundations belonging to one royal palace most likely date back to Adadnirari I (early 13th cent.). This palace differs from an older one on the same site particularly in that the various court complexes of which it was composed were no longer set into a predetermined regular enclosure, but were joined together at right angles and surrounded by a completely irregular, many-cornered enclosure; the court complex containing the gate and that containing the living quarters constituted separate compartments. Adadnirari seems to have been the first to build this type of palace, which was to remain characteristic throughout Assyrian history.

Adadnirari's grandson, Tukulti-Ninurta I, was a great builder and, like his Babylonian-Kassite contemporaries, transferred his residence from the capital to a city founded by himself, Kar-Tukulti-Ninurta. The results of excavations, however, leave too many gaps to permit a coherent reconstruction of his activities. Remarkable is the Ashur Temple at Kar-Tukulti-Ninurta, a "low temple" with a broad cella leading into a square court and immediately adjoining a ziggurat. By what means the ziggurat was ascended is uncertain.

The remains of Middle Assyrian architecture, fragmentary as they are, show plainly that by the 13th century Assyria had become a culturally independent power in western Asia, in spite of all the bonds of tradition with Sumero-Akkadian and Hurro-Mitannian forms and ideas.

Figural Arts. Art, too, underwent a complete transformation in Assyria between 1500 and 1200, a period in which the formal basis was laid for the monumental wall reliefs of the great royal palaces of the 9th century. The process of transformation can be followed only by a laborious study of the early evolution of the various artistic handicrafts, especially glyptics. Examples of large sculpture in the round and large stone reliefs are very sparse (PL. 487). The most important pieces of applied art, which give us some idea of Assyrian design and relief, come from the large grave No. 14630 at Ashur. Particularly important are two alabaster vases, one with a representation of a half-naked goddess presented fullface, who may continue a Hurrian tradition, the other with a representation of a tree between two bulls (A. Haller, *Die Gräber und Grüfte von Assur*, Berlin, 1954, pl. 32a–b). Comparable to the first vase is the bone statuette of a half-divested goddess from Nuzi (mod. Yorgan Tepe), which in turn reveals a kinship with representations on Syrian seals (e.g., the coat with what looks like a rolled scarf wound several times around the waist) and might therefore be Hurrian (R. F. S. Starr, *Nuzi*, II, Cambridge, Mass., 1937, pl. 101*i*). The palmette tree on the other vase has its parallel in the seals called "Kirkuk tablets," likewise of Hurrian origin. The trees on an ivory pyxis from grave No. 14630 (Haller, op. cit., pl. 29) can be compared with shards of late Nuzi pottery. The form of the alabaster vases is related to Egyptian pieces of the Tell el 'Amarna period.

What the Sin-Shamash Temple of Ashurnirari and the palace of Adadnirari I at Ashur have done for Assyrian architecture — namely, to supply proof that Assyria had sloughed off foreign cultural domination — the 14th-century alabaster and ivory offerings from grave No. 14630 have done for art. Confirmation has come from seal impressions, dated by the inscriptions of the first great independent Assyrian kings, Eriba-Adad I and Ashuruballit I. These show how Assyrian stone engravers drew on a fund of inherited motifs to create strictly ordered forms of their own. In the 14th century, they took a still further step forward, devising a free and natural idiom, which in the 13th century carried Assyrian glyptics to heights not attained since the Akkadian period (PL. 496).

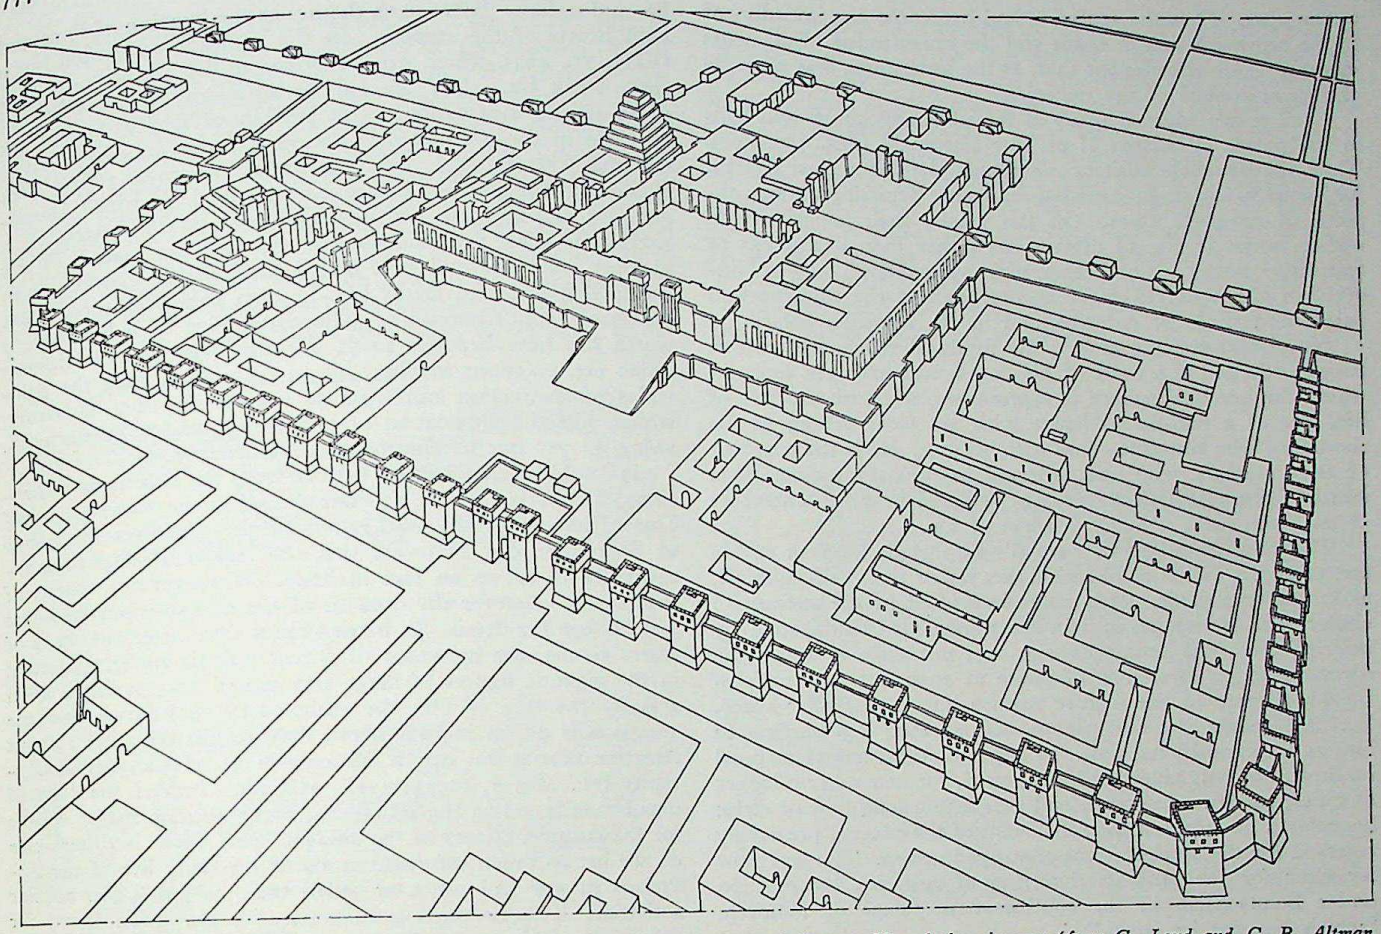
Works of large format comparable in quality to the best examples of seal engraving are unfortunately not preserved. As certain reliefs demonstrate, however, monumental art must have reached a high level in the reign of Tukulti-Ninurta I. A gypsum pedestal, a support for the emblem of a deity, from the Ishtar-Ashuritu Temple at Ashur rebuilt by Tukulti-Ninurta, presents the king, in a single relief, in two phases of prayer before the emblem of the god Nusku (VII, PL. 405). The monument, dated by its inscription, shows that the spatial fusion of different points in time still occurred in the 13th century, as it had in the Jamdat Naṣr period (e.g., the hunting stele from Uruk). The king appears here as an Assyrian high priest, in a wrap-around garment with a rolled belt. A second pedestal is valuable for the relief on its base (unfortunately much battered), which depicts a war episode (W. Andrae, *Die jüngeren Ischtar-Tempel in Assur*, Leipzig, 1935, pl. 29). This piece testifies to the existence of an art form that was to gain increasing importance in Assyrian sculpture: the epic relief. Had the scene on the pedestal vanished completely, the existence of narrative historical reliefs in the 13th century would still have been attested by a small fragment, the cover of a container (Andrae, 1938, pl. 49b). This black marble plate is decorated with a carefully worked relief in two registers that reproduces an incident of war. The composition is utterly free and offers a clear contrast to the nearly contemporaneous murals of Kar-Tukulti-Ninurta (Andrae, 1925, pl. 2). In these paintings, marked by strong Hurro-Mitannian reminiscences, mountain goats were still pictured standing on ornamental branches, without any indication of a base line for the animals. The composition recalls Hurro-Mitannian ones in which the figures are superposed in several tiers, as on the seal of Shaushattar (Starr, op. cit., pl. 118i). The reliefs on the pedestals and on the marble cover have gone beyond this stage of composition. By the 13th century Assyrian sculptors had evolved the means to accomplish the great tasks set them from the 9th century onward by the extensive wall plaques in the palaces of the kings.

The history of Assyrian art in the centuries close to the turn of the 2d millennium is but sparsely documented. There is just enough material to show that, besides the mural basreliefs of palace halls, two other kinds of relief made their appearance in the Middle Assyrian period: the rock relief and the so-called "obelisk." When in the 9th century, under Ashurnasirpal II, the two great vehicles of the Assyrian idea of kingship, the palace and the wall relief, were united, western Asian art reached its last pinnacle. Beside these, the rock relief and the obelisk, which also served the idea of kingship, have only secondary significance.

In contrast to the rock relief, which had a long history before the Assyrian period, the obelisk — a stele with a rectangular or square base and four faces tapering upward — seems to have been employed only in Assyria from the end of the 2d millennium. The significance, origin, and development of this type of stele have not yet been clarified.

Of all Assyrian obelisks the White Obelisk from Nineveh in the British Museum (E. Unger, *Der Obelisk des Königs Assurnassirpal I aus Ninive*, Leipzig, 1932, pl. 15) is the most important, for it helps fill the gap in the history of the Assyrian relief between the reigns of Tukulti-Ninurta I and Ashurnasirpal II. Each of the four sides of the stone bears eight superposed friezes, some of them carrying the representations around the corners. A heavily damaged inscription on the stepped top mentions a limmu, Ashurnasirpal, identified by B. Landsberger with King Ashurnasirpal II (9th cent.), by Unger with Ashurnasirpal I (11th cent.). Since the date cannot be determined by philological means alone, the representations — the style and the iconographic details — must be taken into account. These militate unequivocally against an attribution to Ashurnasirpal II, from whose reign there survive innumerable wall reliefs from his palace at Kalakh (mod. Nimrud) and also remains of an obelisk. Of particular importance is the fact that on the White Obelisk a number of officials wear a fezlike headdress, whereas on every one of the numerous reliefs of Ashurnasirpal II the fezlike covering with a small conical peak is reserved for the king. The obelisk conforms, in the matter of headgear, to the marble cover of Tukulti-Ninurta I, on which the highest official, the turtan (or tartan), as well as the king, wears a fezlike hat, though without conical crowning. Accordingly, the obelisk must be dated, in any case, before Ashurnasirpal II; and thus it is a bridge between the art of Tukulti-Ninurta I and of Ashurnasirpal II, whose whole stock of motifs it anticipates: sieges of enemy fortresses, armies marching through mountain valleys, receipt of tribute by the victorious king, offering of thanks by the king, victory banquets after the battle, chases of various wild beasts by the king. The importance of the White Obelisk, however, is strictly thematic; the execution betrays not only carelessness in the delineation of the individual figures but also a want of skill in the articulation of the material within the eight registers. The images follow one another around corners and across compartments in unregulated succession, without any accentuation. And it is precisely in the particulars in which these reliefs are deficient that those of Ashurnasirpal II show their masterliness.

Neo-Assyrian period. Assyrian art attained its peak between the 9th and 7th centuries B.C., at the same time as the empire achieved its greatest political and military power. The great conquering sovereigns demanded magnificent palaces for themselves, and on the walls of courts and state rooms they had their victorious campaigns, hunting scenes, and cult scenes depicted in relief on alabaster slabs over 6 ft. high, following one another without break. Historical narrative never found more glorious expression in ancient western Asia.



Architecture. The two major rulers of the 9th century, Ashurnasirpal II and his son Shalmaneser III, were both great builders, whose annals mention the construction of numerous temples. Shalmaneser seems to have been especially attached to the old capital of Ashur, where he built a new fortification wall with tremendous gates, in which he placed some of his statues. In his cult buildings in that city — reconstructions of the ancient Ishtar Temple and of the Anu-Adad Temple — he strove for the preservation of tradition rather than the creation of new plans. Ashurnasirpal chose Kalakh for his residence. The imposing palace he built there, the so-called "northwest palace," excavated in the 19th century, belongs to the type created by Adadnirari I at Ashur four hundred years earlier. It consisted of several adjoining court complexes. One wing was reserved for public or ceremonial uses, another for dwelling purposes, and a small temple of Ninurta at the foot of a ziggurat was dedicated to the cult. In the public wing, which included a throne room, the lower portions of the walls in the courts and halls were for the first time given a continuous facing of alabaster slabs over 6 ft. high, bearing extensive basreliefs and, again and again, the so-called "Standard Inscription" of Ashurnasirpal. These revetments provided the opportunity for the great development of the Assyrian relief in the 9th century. Their use in a cult building is seen for the first time in the Ninurta sanctuary and a second little temple in its immediate vicinity. The ground plan of the Ninurta Temple comprised an oblong cella preceded by a broad antecella such as Ashurnirari I had introduced in the Sin-Shamash Temple at Ashur. Clearly most of the innovations pertained to external effects, decoration rather than architecture.

Important from a purely architectonic point of view in the northwest palace at Kalakh is the throne room (B), the characteristic form of which was to endure for centuries in Assyria. Situated in the northern part of the palace, it was an elongated rectangular hall of vast dimensions, preceded on one of its long sides by an anteroom (F), which separated it from a court, and flanked on the west short side by a smaller room (C). Its hallmark, found before a shallow wall niche on the east short side, was a podium with two steps, on which must have stood the royal throne. By the decoration of its doorways and walls, and especially of its niche, with sculptures and reliefs, the throne room constituted a first high-water mark in the development of Assyrian architecture and related architectural sculpture in expressing the idea of kingship that dominated people and state.

After Shalmaneser III the great Assyrian kings continued to regard it as a primary task to express the sense of their destiny and might through the construction and pictorial decoration of new palaces — somewhat as the victorious god in the Epic of Creation, after imposing order on the world, erected a new heavenly castle for the gods. Foremost among the palaces of the 8th and 7th centuries was that of Sargon II. This ruler, who brought the Assyrian idea of kingship to its consummation, gave visible form to his concept of world empire by the construction of a royal castle, or rather royal city, of unsurpassed monumentality: Dur Sharrukin (mod. Khorsabad; fig. 777; I, fig. 870).

A more varied picture of Assyrian architecture emerges with the attempt to envision the magnificent edifices that Sennacherib had executed in ashlar masonry, probably in imitation of Urartian construction. As crown prince, Sennacherib had been entrusted by his father, Sargon II, with the post of governor in Urartu, where he must have become acquainted with the great canals and aqueducts constructed there. When Nineveh had to be provided with an entirely new system of water conduits, he built the tunnel-canal of Maltay, with its reliefs, and the aqueduct of Jerwan, doubtless on the model of Urartian structures. Yet more important is the fact that Sennacherib for the first time erected structures by the ashlar technique at Ashur itself: a quay wall and the so-called "Mushlalu," probably a stairway for the gods taking part in the New Year's procession. Another ashlar structure was the New Year's festival building, the Bit Akītu, which Sennacherib had built after the Marduk cult was transferred to Ashur, so that the ritual ceremonies connected with the feast could be carried out. Although the building technique probably came from Urartu, the idea of the Bīt Akītu, the temple in which Marduk fought the forces of chaos, is Babylonian.

Figural Arts. Unlike sculpture in the round (pl. 492), examples of which are few and, for the most part, mediocre, architectural sculpture is well represented and of outstanding quality; but a full century after its rediscovery its themes remain a complex problem. It can be divided into two classes. The first includes the huge stone figures that provided magic protection for doors. Worked partly in relief, partly in the round, these *lamassus*, genies that gave admittance to the good and drove away evil, combine features of the bull, the lion, the eagle, and man (pl. 488). The second class comprises the various mural reliefs, which in turn can be divided into two groups: (1) those with representations of mythical beings (pl. 489; I, pl. 515; IV, pl. 166), generally winged genies of human aspect, into whose midst the king himself is taken and who are closely linked with the palmette tree, the symbol of life; and (2) narrative reliefs relating the king's exploits in war and on the hunting field. This second type of relief, a species of annals in pictures, first appeared on a significant scale in the White Obelisk mentioned above. Its adoption by Ashur-

Dur Sharrukin (mod. Khorsabad), reconstruction of the citadel with the palace of Sargon II and the ziggurat (*from G. Loud and C. B. Altman Khorsabad, II: The Citadel and the Town, Chicago, 1938*).

nasirpal II for the walls of the throne room of Kalakh was an important step in the development of the Assyrian relief, and it brought this art to its ultimate heights in the 8th and 7th centuries. Between Ashurnasirpal II and Ashurbanipal — that is, between the 9th century and the end of the 7th — a general shift of emphasis occurred, in the palaces of Kalakh, Dur Sharrukin, and Nineveh, from the mythical to the narrative relief.

In the northwest palace of Ashurnasirpal II at Kalakh, mythical scenes, with figures occupying the full height of the wall plaques throughout, still constituted the great majority. In the throne room the principal scene, the key representation of the entire series of wall reliefs, was recessed into the shallow niche in the east wall, before which sat the king, enthroned on a podium with an extensive inscription referring to the foundation of the palace. The relief, a huge slab of double width, is now in the British Museum (Budge, 1914, pl. 11). In the center is a stylized tree: a palmette-crowned stem under an arch of smaller palmettes tied as by ribbons to one another and to the stem. Poised over the tree is a winged sun containing the upper portion of a bearded god who stretches out both hands. The tree is flanked by two images of the king in the garb of a priest, with a mace in his left hand and his right hand raised. This group, in turn, is framed by two human-headed winged genies, engaged in a ritual act involving little pails and pine cones. The cult of the sacred tree and the cult of the king here seem clearly fused, and this picture immediately brings to mind one of the fundamental motifs of ancient western Asian art: the man in the net skirt with a rosette tree in his hands, the dispenser of life to the tame quadrupeds, the sacred herds. Like this royal shepherd, the Assyrian king undoubtedly symbolizes the preserver of life, of the state, and of the people. The symbolism is of Sumero-Akkadian descent. A second tradition that helped determine the character of Assyrian art, one of Hurro-Mitannian origin, is encountered in the winged sun over the king and the sacred tree. Even in the so-called "Kirkuk tablets," the earliest known Hurrian glyptic, the winged sun over the tree was one of the commonest motifs. In Assyrian art the two great streams of Sumero-Akkadian and Hurro-Mitannian tradition flowed together as into a reservoir, one that was to supply all western Asia during the 1st millennium B.C. The language of the reliefs cannot be grasped without tracing the origin and the original meaning of the motifs. The royal shepherd feeding the animals was also, originally, a martial hero constantly battling evil to protect life; and the Assyrian kings attached such importance to the depiction of their exploits because in combating military opponents and wild beasts they were actually fighting the enemy of life.

In the reliefs from most of the rooms of the northwest palace the wall plaque constitutes the compositional unit, especially in the numerically superior group of mythico-ritual reliefs. Each plaque carries a figure, adapted to it in size and format, of a genius, an official, an officer, or the king. A somewhat different disposition characterizes the small group of plaques of the throne room that deal for the first time with the military and hunting exploits of the king (PL. 493). Here the height of the plaque is halved by a median band with inscriptions, in order to obtain space for two superposed narrative friezes. It is an attempt to free the subject matter from the disposition imposed by the form of the plaque and to evolve new rules of composition suitable to it.

Unfortunately there remains no palace erected by Tiglath-pileser III, actually the military and administrative founder of the Assyrian world empire. But chance has preserved some of the relief-decorated wall plaques from his palace at Kalakh. Several of these clearly show that the wall plaque was relinquished as a compositional unit in his time; individual scenes, even single human or animal figures, overlap from one plaque

to the next. Thus the sculptors had overcome one impediment to the representation of space and the organization of elements in space — an impediment that, at the same time, was a source of formal control of the material.

Wall reliefs adorned many of the enormous courts and halls in the palace of Sargon II at Dur Sharrukin (PLS. 489, 490). They picture whole military campaigns, the one against Urartu, for instance, and include cautionary scenes depicting the punishment of renegade allies. On the whole, their superiority to earlier works is one of dimensions rather than of content or expressive power. True superiority was achieved only at Nineveh, in the wall reliefs of Sennacherib in the southwestern palace and those of Ashurbanipal in the northern palace.

Novel and striking among the mythical reliefs with which Sargon adorned the walls of his courts and halls are those in which the heroic shepherd is represented, not with the tree of life, but as a half-naked figure with six locks falling to his shoulders, who restrains a lion with his arm. He is the guardian of tame animals, who had appeared in prehistoric times as a martial hero. At Dur Sharrukin he stood near the entrances of the main halls, a huge guardian of life.

The representations of Sargon's campaigns bespeak an effort to depict events as historical fact rather than half-mythical, as in earlier periods. This effort is evident in the attempt to characterize landscapes and in their frequent identification by inscriptions. The sculptor's aim was not only to rouse the spectator to an awareness of space as such but to transform the ideal space of the picture surface into a particular space. For that reason the wall plaque became ever less binding to him as a compositional unit. In larger pictures he overstepped its limits not only sideways but upward, for he could no longer fit cities, castles, mountains, and seas into a long narrow strip; henceforth he required the full height of the plaque, previously reserved for the single figures of winged genies. The way now lay clear for the ultimate flowering of Assyrian composition under Sennacherib in the southwestern palace of Nineveh, "which has not its equal."

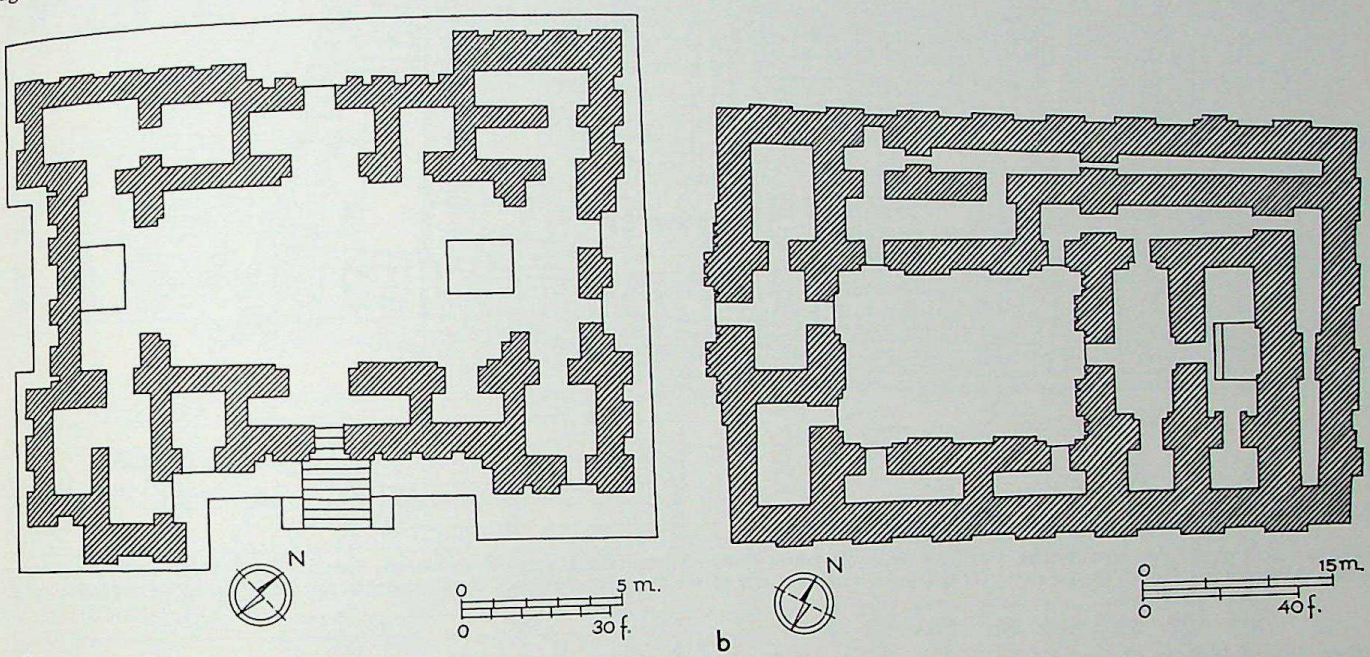
In the wall reliefs of this palace the sculptor seems to have mastered every artifice of composition (see Paterson, 1915). He links together in a simple rhythmic manner the figures of a procession in which the king moves with his following from the palace to the Ishtar Temple; he ingeniously employs the palms of a landscape to give a cadenced, reposeful background to an animated train of tribute bearers or prisoners; he replaces the strip that previously separated the superposed friezes with the wavy lines of a river; by making use of the hilly land rising near Lachish, he imparts the utmost dynamism to a powerful war scene in which the king is enthroned in his tent at the upper right and all lines of the composition lead up to him from the lower left. Yet even these reliefs are not the high point in Assyrian bas-relief composition, which touches its pinnacle in works that nearly achieve perspective representation as they picture armies of workmen transporting immense *lamassu* sculptures for erection in the palace (ibid., pl. 32).

These works were not to be surpassed. When Ashurbanipal, the last great Assyrian king, built his own palace at Nineveh, the dimensions of the wall reliefs were considerably reduced and the sculptors did not attempt to follow the same path as their predecessors. If Ashurbanipal was able to challenge the achievements of the Sennacherib period with something new and original, he succeeded not in the illustrations of the Elamite campaigns, which he had still placed in the southwestern palace, but in the reliefs in his own northern palace at Nineveh; and among these the genuine works of art are not the scenes of war but the symbolic hunting scenes, involving the king (IV, PL. 16).

The reversion to the great beginnings of western Asian art under Ashurbanipal may or may not have been deliberate. That such a reversion occurred, however, can no more be doubted than that an oddly lifelike yet purely artistic idiom distinguishes both the last phase of Assyrian art and that of the protohistoric period. Like the art of the protohistoric period, the reliefs of the northern palace revolve around the royal tamer of animals inimical to life and around the guardian of life and order — hence such themes as the hunting of lions and wild beasts of the steppes. In the well-known garden scene (VIII, PL. 423), which can be linked to the big alabaster vase from Uruk (PL. 466), the old "symposium" receives its last great artistic incarnation. The kinship of feeling toward the universe in the protohistoric period and that of Ashurbanipal emerges with especial clarity in the consummate reliefs from Room E in the northern palace, the so-called "Garden" (Meissner and Opitz, 1940, pls. 10–12). Here, as in a paradise, a harpist soothes the wild beasts through the sound of his playing; good and evil have ended their eternal conflict, as in the golden age, and all of life, in man and beast and plant, has attained full harmony. The conception of a harmonious world has here brought forth, for the first time in western Asian art, creations inspired by an idea other than the principles of abstraction and truth to nature: the idea of beauty, which, like the application of perspective under Sennacherib, seems as yet but to glimmer in the distance.

It would be erroneous to deduce from the enormous dimensions of Assyrian works, as exemplified by the royal citadel of Dur Sharrukin or the wall reliefs of the southwestern palace of Sennacherib at Nineveh, that the Assyrian sought monumentality in art as an end in itself. Whatever the extent of the layout, whatever the breadth of the composition, he never lost his eye for detail. In battle scenes that cover the walls of entire rooms, the crowning of a tent pole is never forgotten; in the gigantic figures of kings and genies who perform ritual acts by the tree of life, the embroidery that ornaments the garments is drawn in such detail that we not only learn about Assyrian fabrics but enrich our knowledge of Assyrian iconography (PL. 489; I, PL. 514; IV, PL. 16). Indeed the love of detail manifested in the reliefs has made them a major source for the cultural history of the ancient Near East. Nowhere else do we get so much information about the daily life of the Assyrians in war and peace or about their religious and secular activities. The Assyrian predilection for the small form, for detail, also finds expression in various branches of applied art: in polychrome enamel painting on vases and brick walls, in goldsmithing, in glyptics — in which, however, the high level of the Middle Assyrian period was not maintained — and in ivory carving, practiced partly under the influence of Phoenician and Syrian craftsmen, partly in an independent style.

To what degree art and handicrafts, monumental and minor arts, flowed from the same source in Assyria is shown in bronzework. The chamfered bowl of Ashurtaklak, the governor of Ashur, is a masterpiece of its kind (Andrae, 1938, pl. 63c). Some bronze bands, gate revetments of the time of Ashurnasirpal II and Shalmaneser III, originating from Imgur-Enlil (mod. Balawat), are closely related to the contemporaneous wall relief in content, but stylistically they present an interesting divergence (PL. 490). The long narrow strips at the disposal of the artist did not have a limiting effect on the composition, as the wall plaque did on that of the stone reliefs. On the unarticulated bronze strips the narrative proceeds, unaltered by such limitations as its medium might have imposed.

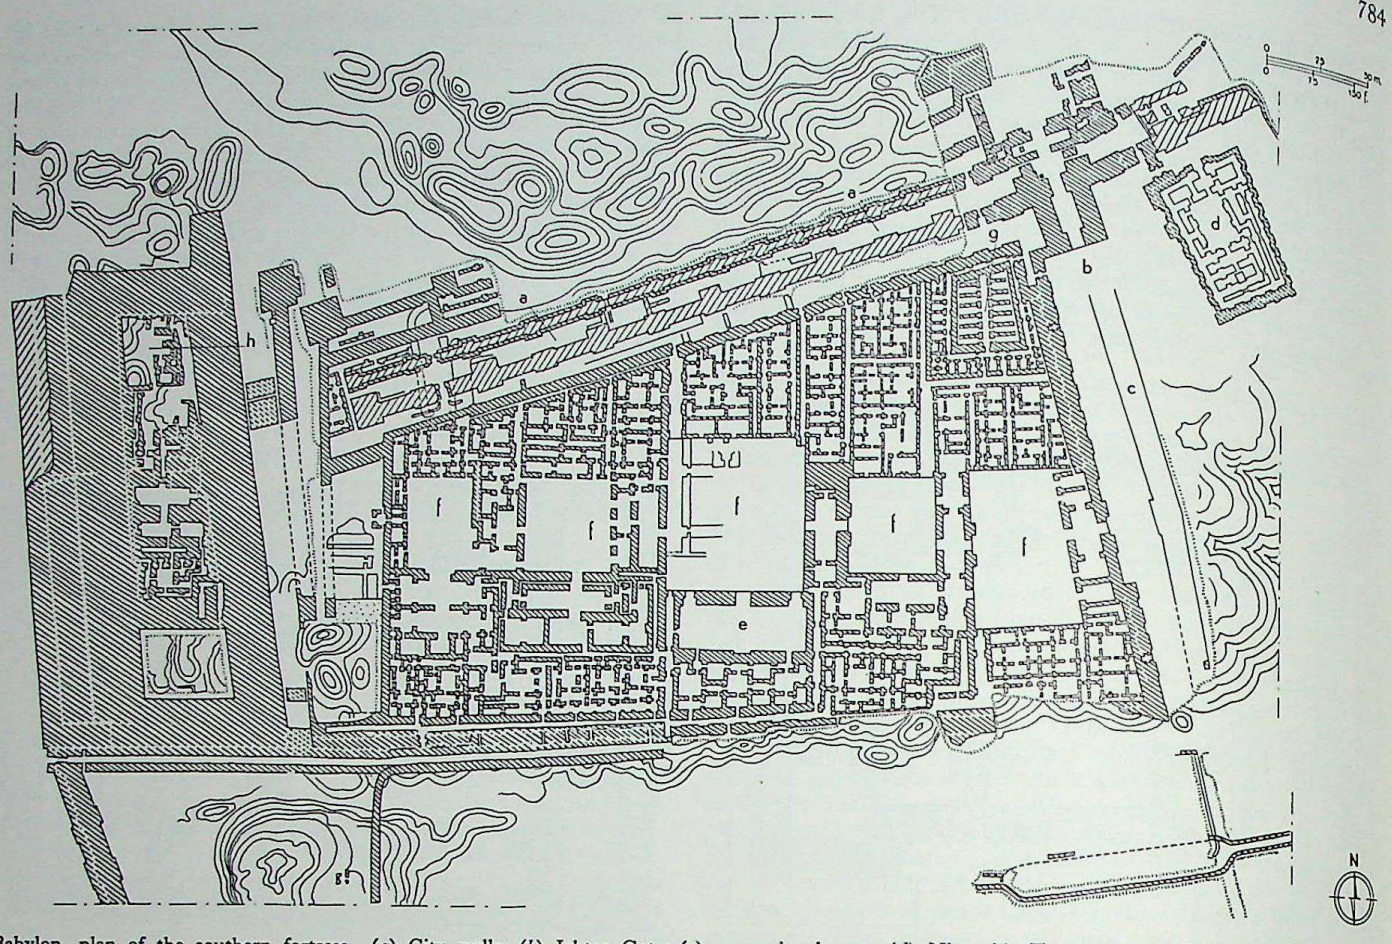


Yet the period of Shalmaneser III, which brought forth the Balawat bronzes, also knew a more disciplined pictorial idiom, as is amply demonstrated by the reliefs of the famous Black Obelisk in the British Museum (PL. 488). The rock reliefs of Sennacherib at Maltay (W. Bachmann, *Felsreliefs in Assyrien*, Leipzig, 1927, pl. 27), which deal exclusively with the adoration of the principal gods of the pantheon by the king, likewise reveal a composition guided by abstract considerations: the figure of the king is duplicated solely on formal grounds — to obtain a balanced group of figures.

Viewed comprehensively, Assyrian art appears unified, notwithstanding its diversity, for in all its manifestations, from the vastest architectural project to the smallest ivory plaque, it served a single idea, that of the king who symbolized in every act the permanence of folk and state. With the fall of Nineveh in 612 B.C., the magnificent synthesis of southern and northern Mesopotamian traditions came to an end, making way for the Aramaean attempt to found a new world empire and give it expression in art.

NEO-BABYLONIAN (CHALDEAN) PERIOD. Two factors contributed to the reemergence of Babylon as the intellectual and cultural center of a western Asian empire after the fall of Assyria in 612 B.C.: the religious power that the city god of Babylon, Marduk, had won in the course of several centuries and the vitality of the Aramaean population, which from the end of the 2d millennium spread over all western Asia and made itself felt with particular rapidity and force in Babylonia. Marduk-apaliddina II (721–711 and 703), the tough antagonist of Sargon of Assyria, had tried to found a Chaldean empire in southern Mesopotamia. What he was unable to achieve was brought about effortlessly by Nabopolassar, ally of the Medes against Assyria. At first only a local ruler of Babylon, he received after 612, as booty from the Medes, a part of the region east of the Tigris and territories along the middle Euphrates. His son, the great Nebuchadnezzar II, won the decisive battle against the Egyptian army, and with it supremacy in western Asia. Just as Hammurabi had epitomized the political and cultural fulfillment of the wave of western Semitic peoples that had washed over all western Asia, so Nebuchadnezzar incarnated the triumph of western Asian Aramaeization. Hammurabi and Nebuchadnezzar both looked for the hub of their power in Babylon; both were champions of the Marduk cult — and here lies the difference between Neo-Assyrian and Neo-Babylonian culture and art.

Sennacherib, in his account of the representations adorning the gate of the Bīt Akītu, the New Year's festival building, at Ashur, describes himself as standing with Ashur in the god's war chariot to battle the forces of the underworld; his annals speak the language of the Epic of Creation. With Nebuchadnezzar, he whom Marduk delegated as the prince of peace, the pretext for narrative art — for annals generally, literary and pictorial — fell away. Architecture, in the Neo-Babylonian period, regained the primacy it had had in the Neo-Sumerian and Old Babylonian periods, and temples again took precedence over palaces.

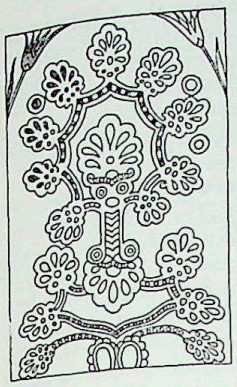


Architecture. Neo-Babylonian architecture did not produce any characteristic new forms. In pursuit of monumentality, it tended to huge dimensions — a hallmark of many late cultures; witness some of the manifestations of Hellenistic and late Roman architecture. Also symptomatic of a late culture is the almost excessive, quasi-archaeological reverence in a ruler such as Nabonidus before edifices of the past, a reverence that he himself expressed in his inscriptions. His great predecessor Nebuchadnezzar and even Ashurbanipal likewise showed themselves faithful, in temple as well as palace, to the Old Babylonian–Neo-Sumerian models. The Neo-Babylonian temples of Babylon — for example, those of Ninmakh (FIGS. 781, 783), of Ishtar of Akkad, and of Ninurta (also known as E-patutila) — are distinguished by a broad cella with a niche for the holy of holies in the middle of the far long wall and a broad antecella on the same axis as the cella. A type thousands of years old, it is exemplified for the Neo-Sumerian period by the Gig-par-ku and the Enki Temple at Ur and by a section of the Old Babylonian sanctuary at Ishchali.

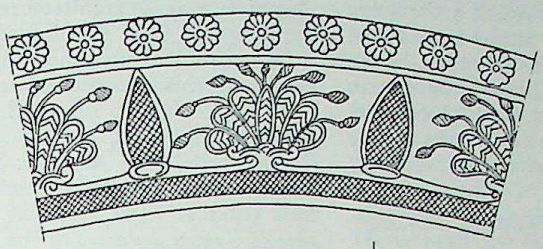
Persistence of basic temple plan in Mesopotamia. (*a*) Eridu, temple of level VII, late Aëneolithic (al-'Ubaid) period; (*b*) Babylon, Ninmakh Temple Neo-Babylonian period (*from Frankfort, 1954*).

It is not solely the nucleus of the Neo-Babylonian temple that was inherited from the distant past. The most overpowering sanctuaries — for example, E-sagila, the enormous complex of the Marduk sanctuary as reconstructed in Nebuchadnezzar's time — also owe their over-all plan combining several court complexes to an architectonic principle applied, in its essentials, to the sanctuary of the moon god Nannar at Ur, about the time of Ur-Nammu. Indeed even that wonder of the world, E-temen-an-ki, the Tower of Babylon, erected in the Neo-Babylonian period, was in principle nothing but a ziggurat, known in the Neo-Sumerian world, albeit on a smaller scale, since the end of the 3d millennium. Under Nebuchadnezzar, Marduk had a temple on ground level (E-sagila), a "high temple" on its ziggurat (E-temen-an-ki), and a New Year's festival building (Bīt Akītu) outside the city. These structures were but fragmentarily recoverable through the excavations of Koldewey, and they are still as difficult to understand as the great Assyrian wall reliefs. The problem, however, is less an art-historical one than one of religious history.

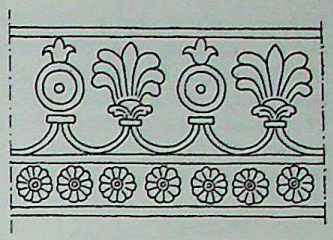
The Neo-Babylonian palace, unlike the Assyrian, did not foster any significant new architectonic ideas. The palaces of Nabopolassar and Nebuchadnezzar were basilically amplified, monumentalized dwellings, in which the court complexes, some with a broad main room on the south side, helped the king fulfill his variegated duties. Artistically the most important part of the palaces in the southern fortress is the broad room (FIG. 783, *e*), of immense size, with a throne niche in the middle of the farther long wall and decorative enamel painting on the exterior front. Here the royal audience took place, a ceremony bordering on the religious since the Old Babylonian period,



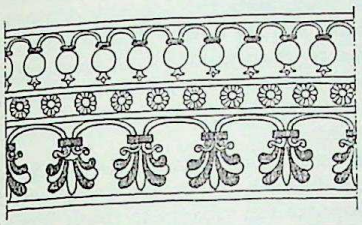
Babylon, plan of the southern fortress. (*a*) City walls; (*b*) Ishtar Gate; (*c*) processional way; (*d*) Ninmakh Temple. (*e-g*) Palaces of Nabopolassar and Nebuchadnezzar II: (*e*) Throne room; (*f*) courts; (*g*) presumed site of the "hanging gardens." (*h*) Fortress on the Euphrates (*from Koldewey, 1925*).



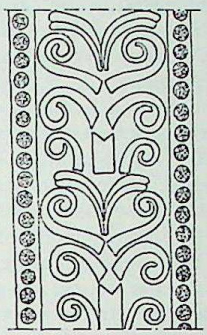
when it unfolded in the rooms leading to Court 106 in the Old Babylonian palace of King Zimrilim at Mari (FIG. 787, *c*).



Figural Arts. The Neo-Babylonian conception of the king as the servant of Marduk, appointed by the god, and as the peaceful shepherd of mankind found adequate expression in the revival of inherited forms and in the increase of dimensions. Unlike the Assyrian conception of kingship, it did not engender an epic art, and the increased size of buildings did not lead to the creation of an architectural sculpture that, like the Assyrian, at once fulfilled its pictorial functions and accentuated the structure of the edifice. The pictorial decoration of Neo-Babylonian architecture can be most easily visualized through the reconstructions in Berlin (Staat. Mus.) of such Babylonian monuments as the processional way, the Ishtar Gate (PL. 494), and the façade of the throne room in the southern fortress. The enamel painting and relief of their brick walls are samples of an ornamental-symbolic art that owes its technical and artistic qualities to the Sumero-Babylonian past, not to an intrinsic creative force of the Neo-Babylonian–Aramaean civilization. Brick relief had already been used on the temple of Karaindash in the E-anna sanctuary of Uruk; as to enamel painting, the Nannar Temple on the ziggurat at Ur must already have had an outer layer of blue glazed bricks. The rows of dragons (*mushkhush*) on the Ishtar Gate, the lions striding over bands of rosettes on the processional way of Marduk, the palmette trees over rows of lions on the façade of the throne room — these images do not illustrate any royal myth, and in neither form nor content are they independent works of art; at most they are stereotyped magic signs without organic connection, repeated in an endless surface pattern. How greatly this type of wall decoration differs from Assyrian architectural sculpture is shown with special force by those palmette trees on the façade of the throne room (see FIG. 785, 7) in which Koldewey still saw an adaptation of columns with volute capitals, supporting an overhang. The Neo-Babylonian glazed-brick revetment is dissociated from the structure of the building, and, like the protohistoric cone mosaics of Uruk, it constitutes a skin, a garment, that conceals rather than emphasizes the supporting framework. Those two artistic principles, the tectonic and the atectonic, were already found side by side in the protohistoric period. Now, after an evolution spanning thousands of years, they confronted each other again with particular bluntness in Neo-Assyrian and Neo-Babylonian art.



The atectonic flow by gentle transitions is more than a formal aspect of Chaldean–Neo-Babylonian art. To see that it is of the very essence of this art, it suffices to compare a Neo-Babylonian with an Assyrian clay vessel. In the Assyrian one there is a clear attempt to differentiate the various functional parts: neck, shoulder, belly, and foot; in the Babylonian one the outline tends to mask the parts. The figures of human beings, too, as exemplified by the few surviving works of Neo-Babylonian sculpture, have the earmarks of structures intended to underplay, to conceal, the supporting elements.



The remains of sculpture in the round — be it the carefully modeled head of a god, of unbaked clay, or an ivory female head — are so few that its principles cannot be deduced with any assurance; but human representations in relief still exist in sufficient number for us to be able to apprehend their distinctive qualities and differentiate them especially from contemporaneous Assyrian ones. These reliefs manifest the survival in the Neo-Babylonian period of the *kudurru* (PL. 495), a type of monument widespread in the Middle Babylonian–Kassite period. Nowhere does the Chaldean–Neo-Babylonian spirit find truer expression than in the *kudurru* of Mardukapaliddina II in Berlin, a black marble stele of exceptional execution (Frankfort, 1954, pl. 120). If the eye follows, say, the outline of the king, who presents his right profile, it will be arrested neither at the neck, nor at the waist, nor at the feet; rather, it will glide along the gentle S line from the tip of the helmet to the toes of the seemingly

Mesopotamian decorative motifs: (1) Tree of life with palmette leaves; (2) rosettes, palmettes, and pine cones; (3, 4) rosettes, palmettes, and pomegranates; (5) foliated shaft with rosettes; (6) palmettes; (7) palmette tree (columns with volute capitals); (8) lotus flowers and buds; (9) flowers between laurel bands; (10) guilloche, meanders, and chevrons.

boneless, plump body. The broad belt, instead of articulating the form, accentuates its flowing quality. It seems to hold the body together in the long garment as in a sack, much in the same way as the powerful horizontal ropes braced the masses of clay of the ziggurats without constituting a true structural framework. The same softness of form characterizes the female figure surmounting a bronze tripod in Erlangen, Germany

Mari, palace of Zimrilim, ground plan. *Key*: (1) Well-preserved walls; (2) poorly preserved walls; (3) obliterated walls; (4) remains of brick pavements. (*a*) Main entrance; (*b*) main court, leading to Room 132 on the right; (*c*) court with paintings (No. 106); (*d*) Room 65 (the throne room, according to the excavator; the author would interpret Room 64, to the left of *d*, as the throne room); (*e*) chamber of the king; (*f*) scribes' room; (*g*) stewards' offices; (*h*) oven; (*i*) court leading westward to the storerooms (*from Parrot, 1953*).

(Frankfort, 1954, pl. 117); and even in a relief that Nebuchadnezzar, like the Assyrian kings, had chiseled out of the rock near the Nahr el-Kelb, a softer contour is noticeable in the human figure, despite the Assyrian model foreign to Neo-Babylonian art.

Conclusion. With the fall of Assyria and the extinction of the Chaldean–Neo-Babylonian empire, the historically integrated cultural and artistic complex we call "Mesopotamian" came to an end. The ideas and forms of expression created in the course of about two and a half thousand years were to make themselves felt both eastward and westward far beyond the western Asian orbit and long after the rise of the Achaemenid Persian empire.

The Achaemenid empire, which succeeded the Neo-Babylonian in its sway over Mesopotamia, had its center not there but on the Iranian Plateau. The differences, however, between Achaemenid culture and art and those of the older civilization were not due primarily to the displacement of the political center or to the fact that the new conqueror did not belong to the same ethnic group as the Sumerians and Semites, the twin pillars of the earlier culture. The Achaemenid Persians, who belonged to the Indo-Germanic family of peoples, constituted only one of the innumerable ethnic elements acting as transmitters of culture in Mesopotamia. More important was the incompatibility of the Zoroastrian religion of the Achaemenids with the Sumero-Akkadian and Babylonian-Assyrian religion. Ahura Mazda (Ormazd) did not belong to the class of gods who, as symbols of great natural forces, conducted a victorious contest against the older powers of chaos, who ordered the cosmos according to laws and revealed the destinies of gods and men. He was, rather, a spiritual and ethical power exalted above everything material.

The belief in deities that were agents of order and proclaimers of fate was one of the great "brackets" that held together Mesopotamian culture from Sumerian protohistoric times until the entry of Cyrus into Babylon. The belief in such gods, who became the masters of the Sumerian city-states, determined the consistent development of Sumero-Akkadian and Babylonian-Assyrian temple architecture. This explains the fundamental similarity of form existing, despite all deviations, between the most primitive examples of Mesopotamian architecture, the earliest prehistoric temples of the al-'Ubaid period at Eridu (fig. 781), and the most fully evolved examples of Neo-Babylonian architecture, the sanctuary of Marduk in Babylon with "high" and "low" temples: E-temen-an-ki and E-sagila.

The other spiritual "bracket" that through the millenniums held together Mesopotamian art was the idea of kingship, the idea of a representative of the divine world orderer, who, like the great forces of nature in the cosmos, defeated the powers of evil, but at the same time constituted a link with a second, probably older group of deities, the powers of life, ultimately sublimated in the great feminine divinity of Uruk, Inanna. The sacred nuptials of this goddess with the battling hero created the bridge between the world of gods and men, the idea that was fundamental to Sumerian culture, with its art and architecture, and laid the basis for a continuous Mesopotamian culture. The unifying conception of kingship explains the identity of theme in the representation of the king as lion killer on a stele of the Jamdat Naṣr period and in the representations of Ashurbanipal in the same role on his reliefs in the northern palace of Nineveh — an identity between works separated by thousands of years of the most intensive development.

In the course of political and social changes the tradition that gave continuity to Mesopotamian art passed from center to center: from the north Mesopotamian villages to south Mesopotamian Eridu, the city of Ea; thence to Uruk, the city of the great goddess Inanna; and from Uruk — as a later myth has it, the city of Dumuzi and Gilgamesh — to Ur, the sanctuary of the moon god. The influence of the Semitic-Akkadian element drew the center of cultural dissemination more toward the north, to Mari, Sippar, and Kish. Doubtless under Akkadian influence, the gods became ever more kingly and the kings ever more godly. The audience with the godlike king, or with the god presiding in state, increasingly dominated the royal and the religious ceremonial and therewith the form of temples and palaces. This trend must have reached its climax at Ur in the period of the 3d dynasty. Then the western Semites, by their wanderings, caused a shift of the cultural center to Babylon. As the might of Assyria came to dominate all western Asia and found its highest artistic expression in the wall reliefs of the palaces, the cultural and artistic center of Mesopotamia shifted once more, to the region of Ashur and Nineveh, where the ancient Hurrian heritage and the Akkadian artistic sense came together. Finally, in the Neo-Babylonian renaissance, Babylon saw the last revival of an art whose origins lay thousands of years back.

METALWORK. The practical use of metal, isolated and shaped by means of hammering or casting, represents a technical conquest made by humanity in a relatively advanced stage of development, only shortly before the invention of writing introduced the historical era. Whether its origin was unique or common to various continents according to the diverse metals available, metalworking was, at first, a strictly functional activity that went hand in hand with the working of wood, stone, bone, and baked earth to produce instruments, weapons, and utensils. Here metal showed new and advantageous qualities of durability, sharpness, resistance, and the possibility of being reused. Only secondarily did metal assume the artistic significance for which its qualities were, in a certain sense, intrinsically predisposed because of the esthetic effect of its luster, the variety of its colors, and its malleability. This manifested itself first in the simplest forms of functional objects and in the use of metals (particularly the precious metals) for personal ornamental objects. Then, always in a more decisive manner, metal became the direct material of decorative and figural artistic expression, lending its surface to design and its mass to modeling in low relief and sculpture in the round. In this sense, wide and definite application was already found in protohistoric civilizations (see ANDEAN PROTOHISTORY; ASIATIC PROTOHISTORY; EUROPEAN PROTOHISTORY; MEDITERRANEAN PROTOHISTORY; MIDDLE AMERICAN PROTOHISTORY).

In the ancient Eastern and Western civilizations metalworking played an essential role in the production of specific classes of objects which merit closer study because of their artistic development (see ARMS AND ARMOR; COINS AND MEDALS; EMBLEMS AND INSIGNIA; GOLD- AND SILVERWORK; HOUSEHOLD OBJECTS; LITURGICAL AND RITUAL OBJECTS; UTENSILS AND TOOLS). Metal is also indirectly involved in other artistic techniques (see ENAMELS; ENGRAVINGS AND OTHER PRINT MEDIA; SEALS) and constitutes the principal means for creating more complex and delicate scientific instruments, which aside from their practical use may also have esthetic qualities (see ASTRONOMY AND ASTROLOGY; AUTOMATA; INDUSTRIAL DESIGN; SCIENTIFIC AND MECHANICAL WORKS; VEHICLES). Lastly, apart from all its functional applications, the working of metal is identified with one of the most preeminent and universally diffused techniques of the visual arts, that of sculpture (q.v.).

With the omission of this last aspect, which must be considered together with the other techniques of sculpture, and with reference to the above-mentioned articles for a more thorough examination of its particular uses, the present discussion is devoted to artistic metalwork in its general and universal framework. Its development is not only concerned with a common technological foundation but is also related to typical forms and decorative elements, which, through their continuity, innovations, transmissions, and characteristics peculiar to each civilization, constitute a history of the art of metalworking.

SUMMARY. Origins and development of artistic metalwork, with particular attention to the ancient world (col. 790): *Metals and alloys: a. Gold; b. Silver; c. Copper; d. Bronze; e. Brass; f. Iron. Beginnings of metallurgy. The working and artistic uses of metal in sheets. The casting of copper and bronze. Artistic applications of bronze casting. Ironwork: The blacksmith. Decorative techniques.* The artistic production of metalwork in Western civilizations from the Middle Ages to the present (col. 798): *Bronze and brass; Copper; Lead; Pewter; Wrought iron; Chiseled iron and the art of the locksmith; Cut steel; Damascened iron; Cast iron; Metalwork in contemporary art.* Aspects of artistic metalwork in Asia, pre-Columbian America, and Africa (col. 812): *The Iranian world; Southern and southeastern Asia; China and Japan; Pre-Columbian America; Africa.*

ORIGINS AND DEVELOPMENT OF ARTISTIC METALWORK, WITH PARTICULAR ATTENTION TO THE ANCIENT WORLD. *Metals and alloys. a. Gold.* In nature gold is found in the free, or native, condition. That is, there are nuggets of gold which provide a metal that is ready for use, as distinct from those metals which must be obtained from mineral ores by means of heat and the reduction process. In the Old World, where the quantity of gold nuggets was limited, most gold was probably obtained by washing alluvial sands and deposits from river beds. Such gold

dust had to be melted together before it could be used by the goldsmith. Mining for gold occurred at a later period, but there is reason to believe that gold mining was established in Egypt during the 2d millennium B.C. In its natural state gold is always alloyed to some extent with silver, forming a substance called electrum, of which the oldest gold objects were usually made. Analysis shows that a method of purifying gold was discovered during the 1st millennium B.C. Gold is a metal of beautiful appearance, soft, easily worked and cast, and thus ideally suited to artistic work. Indeed, it was almost always used in antiquity for ornamental or artistic objects. It is impossible to determine when gold was first employed, but in some regions of the Old World it may well have been discovered in Neolithic times, even before the discovery of natural copper.

b. Silver. Silver was apparently discovered and used later than gold and copper. It is to be found in the free state and may also easily be smelted from silver ore; neither native silver nor silver ores, however, are abundant in the Old World. According to L. Aitchison (1960), after about 2500 B.C. nearly all silver was extracted from argentiferous lead by means of the cupellation process. Mining for argentiferous lead thus acquired importance in early periods, with a notable center in the great mines at Laurion in classical Greece. Esthetically, and in its working properties, relatively pure silver is an admirable material from which superb objects and ornaments are known to have been fashioned since early in the 3d millennium B.C.

c. Copper. In many parts of Europe and the Near East copper is found in the native state, the form in which it was first used by neolithic peoples. Almost all copper, however, and certainly all copper used in artistic production, was obtained by smelting the various copper ores, a process which may have been discovered in the Near East during the 4th millennium B.C. Copper was the most important metal of remote history chiefly because of its abundance and extensive distribution. Although ore was usually obtainable very near the surface of the ground, true mines were developed from the 2d millennium B.C. onward. Copper also became important because tools and weapons, as well as artistic and ornamental objects, could be made from it.

d. Bronze. The great importance of bronze in metalwork inheres in its superb casting qualities; without it the execution of large-scale metal statues and other works of art since protohistoric times would have been impossible. The metal known as bronze is a copper-tin alloy, which was probably discovered by mixing copper and tin ores in smelting furnaces. Later, but still within the Bronze Age, more skilled metallurgists obtained an improved substance by adding tinstone, and occasionally metallic tin, to liquid copper in a crucible process. This practice continued, advantageously increasing to approximately 10 per cent the amount of tin in bronzes of later periods. Though it is not known what people first discovered the process of making bronze, it is established that the Sumerians used a true bronze, though of irregular composition, during the time of the royal graves at Ur. The use of bronze spread slowly from Sumerian times, and for some centuries its full employment seems to have been generally retarded, probably because of the difficulty of obtaining adequate tin supplies.

e. Brass. The copper-zinc alloy called brass apparently does not date from prehistoric times; its discovery is ascribed to the Romans, who used it considerably in coinage and for other purposes. In antiquity and the Middle Ages brass was made by the calamine method of heating together zinc ore, calamine, and liquid copper. Brass is an excellent casting metal, but the major reason for its popularity with the Romans was probably the range of colors it could provide. By suitably proportioning the amount of zinc in the alloy, brass could be made which, when well polished, resembled gold in color, a feature very useful for coinage purposes.

f. Iron. Presumably, iron was discovered in the Hittite regions of Asia Minor, but, apparently, useful iron was not made in quantity before the middle of the 2d millennium B.C. The process of iron smelting was doubtless found by metallurgists who were experienced in copper smelting. Although iron ores were plentiful, the discovery of this process by prehistoric metallurgists was probably delayed because the iron-smelting furnace produced a dirty lump, of nonmetallic appearance, which did not at all resemble finished iron; iron-making progressed with the realization that the lump, or bloom, had to be reforged to obtain useful iron. In large measure this discovery laid the foundations of the Iron Age, in which the use of iron and steel greatly expanded. Valuable as a medium for tools, weapons, and structural devices, iron was originally the material of the blacksmith rather than the founder. However, it has also played a considerable role in the field of artistic metalwork.

Beginnings of metallurgy. Although it is certain that toward the end of the 4th millennium B.C. the technique of working copper had attained a high level in Iran, Mesopotamia, and Egypt, it is not known from which center such knowledge spread, or whether it emanated from only one center. According to R. J. Forbes (1950), archaeology and classical tradition indicate the region of northeastern Iran, and beyond, as the source of the earliest metallurgical knowledge, whence it subsequently spread to the Near East. Archaeological excavations have disclosed that copper metallurgy was also known at an extremely early date in Sumer, although it is unlikely that Sumer was the primary center of metallurgy because its copper ore had to be imported from great distances. In the Iranian highlands, however, the ore was readily obtainable, rendering probable Iran's priority over Sumer as the source of the earliest copper metallurgy. Although copper was well established in Egypt in the Gerzean period, metallurgy apparently developed later there than in Iran or Sumer.

From its primary concentration in Iran and Mesopotamia the new art of metallurgy spread outward around the northern arc of the Fertile Crescent, in time reaching the Mediterranean coast, while there was also a strong westward diffusion through Anatolia, eventually reaching the ancient settlement of Troy, which during the 3d millennium B.C. acquired great significance in the history of metals. Metalworkers, traveling metal experts, and merchants established there a focal point whence technical knowledge and metals passed to the islands of the Aegean and beyond. Metals and the knowledge of metals also diffused from Asia Minor by way of the Hellespont and along the well-known Danubian route far into Europe. According to L. Aitchison (1960), "In broad terms, so far as continental Europe is concerned, the influence of Crete was mainly exerted towards the west, in the islands of the Mediterranean such as Sicily and Sardinia, and along the European shores of the sea as far as Spain. Troy and the other centers of influence in Asia Minor and Anatolia were the principal sources of the influences affecting the peoples living along the land routes that had been developed in and around the basin of the Danube. By 2200 B.C., traders from Troy had penetrated into Europe as far as the site of modern Vienna, and to the Erzgebirge [Ore Mountains] in Bohemia."

By the end of the 3d millennium B.C., primitive metalworking cultures had penetrated northward from Danubian lands into south central Europe and westward from the early copper-using cultures of Spain through western Europe. The art of winning copper was probably widely established in Europe by about 2000 B.C. Shortly thereafter began the European Bronze Age, in which the many important trade routes affected the wide exchange of metallurgical knowledge. Ornamental metalwork appeared in Europe, ultimately achieving the skill displayed in this medium by the magnificent art of classical Greece and Rome.

The discovery of copper smelting marked the beginning of true metallurgy and laid the foundations of the present copper and, indirectly, iron and steel industries. Although the origins of copper smelting have not been determined, it is often speculated that the discovery was made by accidentally placing some copper ore in an ordinary fire, perhaps the campfire of a nomadic people. This is theoretically possible because the

temperature of a large, hot fire might be sufficient to smelt the ore under favorable conditions. It has been shown experimentally, however, that the discovery of smelting in such a manner is unlikely, because the atmospheric and other conditions of a campfire are not favorable to a reduction of the ore. It is also speculated that this discovery occurred through the more ancient craft of ceramics. If a potter were using a copper-bearing mineral to decorate his pottery, the atmospheric conditions within the kiln could cause an accidental reduction of the mineral to copper. The similarity of some metallurgical furnaces to ancient pottery kilns lends support to this theory. However the discovery of smelting was made, success must have depended upon repeated experiment. Because of the distinctive colors of the oxidized surface deposits of copper ore, it is likely that prehistoric peoples experimented with them, as well as other materials, in their search for copper. The temperature of the melting furnace in which the experiments were probably made would have been more than adequate for reduction to occur; its discovery thus depended upon the correct distribution of fuel and ore in the furnace.

The early primitive smelting furnaces were merely small pits, in which charcoal was used for fuel and a bellows provided an artificial draft. Eventually furnaces rose above ground level. Shaft furnaces, used in classical times, were followed by the Spanish Catalan type and later by the larger medieval furnaces, which were carefully built of stone and less wasteful of fuel and ore.

The introduction of bronze brought about considerable economic changes in the Old World. Of the two metals necessary for making bronze, copper ores were widely distributed, while deposits of tin ores were limited. The principal centers of bronze production were thus located near sources of both ores, in order to avoid transporting materials over great distances. Such specialized conditions appear to have been more frequent in Europe than in Asia, occurring in Cornwall and Bohemia, for example; hence Europe gradually achieved preeminence in bronze metallurgy. The concentration of bronze production in specialized locales led to trade with less favored regions. Such trade was conducted by traveling bronzesmiths, both traders and artisans, whose great bronze hoards have often been found. Because of its diffusion by trade and its superior properties as compared with copper, bronze became the predominant metal in Europe and parts of Asia by about 1500 B.C.

The finest bronzework, such as statuary and ornament, was produced in established settlements where craftsmen worked in permanent shops, often in association with city-states and temples. In contrast, the work of early traveling smiths was essentially limited to utility objects, because they had to carry their materials and build their melting furnaces at the various places where they worked. In either instance, the technical and artistic skill exhibited by early craftsmen, who labored under difficult conditions with only elementary tools (in the early periods they did not even possess tools of iron), was a remarkable achievement, especially that of the metalworkers of the ancient Near East. Tools and methods slowly improved, particularly with the discovery and use of iron, although artistic standards declined in several regions after classical times.

The working and artistic uses of metal in sheets. During prehistoric periods and later, artistic metalwork was the product of the art of the smiths and the metal founders. Smiths of copper, gold, and silver used as their basic material thin sheets of metal, to which various manufacturing techniques were applied. For example, the most obvious and probably oldest way in which to hollow, or "sink," a thin circular disk of metal to form a shallow bowl is to hammer the disk into a depression of the desired shape in a block of wood. This method dates, at least, from predynastic Egypt and Mesopotamia. The use of bronze sheets hammered over wooden molds and then applied to a wooden armature to form a statue was termed *sphyrelaton* by the Greeks; the Heraion of Samos has yielded a statue of this type (PL. 503). Another technique employed by the smith is known as "raising," whereby from a thin metal disk of suitable diameter it is possible to "raise" a vessel until it acquires, for instance, the shape of a beaker or a modern drinking glass. Working from a concentric circle that approximates the diameter of the base of the vessel, the smith gradually hammers the metal disk to the desired form by striking it on the outside surface, using a specially shaped hammer and anvil. A number of vessels found in the cemetery of Ur in Sumer were apparently fashioned by the raising process, thus indicating that the process dates from high antiquity; it was probably widely diffused among the metal-using cultures of the ancient Near East.

Another technique used by early artist-smiths was repoussé work, in which a pattern or design in relief was produced on sheet metal by hammering it either from the back or front (V, PL. 36). Examples of repoussé work from antiquity have also been found at al-'Ubaid and Ur. Other processes used by the smith included the fabrication of such objects as buckets and caldrons from thin plates, which were secured by rivets (PL. 503; V, PL. 34); the decoration of art objects by punching and engraving; and soldering and fusion welding. Turning, spinning, and inlay work were also practiced, probably by specialized artisans. The early craftsmen showed great skill in controlling their raw material while working with it. For example, they had excellent knowledge of the annealing process, by which metal is kept soft and workable, and of forging, casting, riveting, and other techniques.

It may be said that from very early times the work of copper- and bronzesmiths included both the traditional and the new. Bowls and other vessels executed in sheet metal largely imitated ancient pottery shapes and represented the traditional element of copper- and bronzework. Vessels were also made of gold and silver, often being most skillfully decorated, as evidenced by the repoussé work on the gold cups from Vaphio, Greece (IV, PL. 73). Indeed, gold may have been used earlier than copper for objects of art and ornament. Fine goldwork is well known from the royal graves of Sumer. For example, the helmet of Mes-kalam-dug (VI, PL. 243) from Ur, possibly dating from before 2500 B.C., was hammered from a sheet of electrum and ornamented with details in repoussé work; it shows the high standard of craftsmanship attained by early smiths. At Hierakonpolis, Egypt, was found a magnificent head of a hawk, which dates from about 2400 B.C. and is also beautifully fashioned from sheet gold.

An early example of fine silverwork is the vase of Entemena from Telloh (anc. Lagash) in Mesopotamia, dating from the 3d millennium B.C. (I, PL. 504), which was raised in the traditional manner from sheet silver. An outstanding amphora of richly decorated silver (VI, PL. 468), found in a barrow burial at Chertomlyk in southern Russia, was made by Greek silversmiths in about 400 B.C. Silver objects were sometimes decorated with other metals. A silver bowl from Ur is decorated with bands of electrum, and one from Enkomi, Cyprus, dating from about 1400 B.C., is skillfully decorated with inlays of gold and niello.

In addition to traditional work, the artist-smith originated new uses for metal in sculpture and ornament through the fabrication of sheets of copper and gold, for example. Perhaps the finest example of such work is the great Imdugud copper panel, or frieze, from the Mesopotamian site of al-'Ubaid, which dates from the 1st dynastic period of Ur. The frieze portrays Imdugud, the lion-headed eagle of the god Ningirsu of Lagash, between two stags. Its figures are executed in high and low relief and surrounded by a copper-covered wood frame. The entire frieze is covered with copper sheet, hammered to fit over a wood foundation to which the sheeting is secured by copper nails. Also from al-'Ubaid, and equally old, are two copper statues of bulls, which may be the oldest copper statues in existence. They are rather large and are built on a wooden core or foundation, upon which are nailed the separate sheets of thin copper that constitute the animals' various parts. Another remarkable work in copper is the life-size statue of Pepi I, an Egyptian pharaoh of the 6th dynasty, dating from about 2300 B.C. (Cairo, Egyptian Mus.). The statue is made from sheets of hammered copper which are riveted together, but the face, hands, and feet are cast in copper. For technical reasons the casting of copper is not an easy operation, and this work is

unusual, if not unique, for its combination of hammered sheet copper, cast copper, and riveting. Because a statue fabricated of copper or bronze sheets, however well made, can hardly be as perfect as one that is cast, statues made from sheet metal almost disappeared with the perfection of bronze casting.

Sheet bronze was used in the same manner as sheet copper for vessels and for repoussé decoration. Examples of such work in sheet bronze include the decoration on a Celtic bucket of the 1st century B.C. from the Aylesford cemetery in Kent, England, and the foundation of the famous Battersea Shield, which was found in the Thames at Battersea, London (I, PL. 289; see GREAT BRITAIN).

The casting of copper and bronze. Copper objects were first cast in simple clay or stone molds. An impression of the object to be cast was molded in a clay block or cut into the surface of a stone block, and the molten metal was then poured into the depression of the so-called "open mold." Hollow "closed molds," resembling modern molds in principle, were developed for more complex articles. Fine objects were cast in bronze from a surprisingly early date, and as metallurgy itself developed and advanced, so also did the founder's technique. Early in the 3d millennium B.C., not only had bronze casting reached a high technical level, but the cire-perdue, or lost-wax, method of casting had been discovered.

The ancient cire-perdue method of casting, which is used for such complicated shapes as statues, where simple molding techniques are not always applicable, has remained unchanged throughout the centuries. It consists, first of all, of making a wax model of the object to be cast. The model is next covered with a layer of fine molding clay, which, in turn, is covered with ordinary clay of sufficient thickness to make a strong mold. The mold is then heated and baked so that the wax runs out leaving a cavity that corresponds exactly to the model. The clay is ready for use when it is hard-baked enough to contain the molten bronze for casting.

Artistic applications of bronze casting. Because of its special properties, bronze was used from the time of its discovery for making weapons (PL. 500) and other objects (PLS. 501, 503–505); this event was so important as to mark the beginning of a new era. The evolution and typology of bronze objects is of considerable interest. In bronze daggers, the flat, almost triangular blades of early copper daggers, which were both ugly and inefficient, evolved into slender and more shapely forms. At the beginning of the Bronze Age swords were developed from these daggers. The hilts of early types of swords were often secured to the blades by rivets, causing a constructional weakness that was later overcome by casting the blade and hilt in one piece. This stronger construction permitted the development of long, heavy blades much closer in proportions to those of a modern weapon. Such heavy bronze swords continued to be used into the early European Iron Age and were copied by the blacksmiths who fashioned the first swords of iron. Typologically, the bronze sword represented an advanced form that could not have been achieved in copper. In early times, a well-made bronze sword was as efficient as an inferior one of iron, if not more so, for it was not until blacksmiths were very advanced technically that the value of iron was fully exploited. The spear developed typologically from crude and weak tanged forms into the much stronger socketed variety which has remained in use through all subsequent periods to the present day.

Elaborate ceremonial weapons, popular in the Middle Ages and after, have also come down to us from prehistoric times. From Luristan come magnificent and highly ornate battle-axes, dating from about the middle of the 2d millennium (I, PL. 437; II, PL. 5; VIII, PL. 122). Some Hungarian battle-axes of the European Bronze Age are also noteworthy both for their design and decoration. In the Russian Kuban very ornate axes were cast after 1500 B.C. A notable battle-ax from Ras Shamra (anc. Ugarit) on the north Syrian coast, dating from about 1300 B.C., has an iron blade and a socket cast of copper and decorated with gold inlay.

Since remote antiquity, bronze has been a leading metal for statuary and works of art in general. A fine, life-size bronze head from Nineveh (I, PL. 508), possibly representing Sargon I, dates from about 2250 B.C. and is probably one of the earliest cast bronzes of this type. Outstanding examples of surviving Greek bronzes include the *Charioteer* from Delphi (III, PL. 346), dating from about 470 B.C.; the *Poseidon* of Artemision (III, PL. 356), belonging to the mid-5th century B.C.; and the *Youth* from Antikythera (III, PL. 377), executed about 340. All these works are life-size or larger. The Etruscans and Romans were also masters of the art of bronze casting. In this connection, it is sufficient to mention the *Capitoline Wolf*, the *Chimera* from Arezzo (V, PL. 40), the "Mars" of Todi (V, PL. 44), the statue of Aulus Metellus (Aule Metelle) from Sanguineto (V, PL. 53), the equestrian statue of Marcus Aurelius on the Capitoline in Rome (X, PL. 148), and the *Colossus* of Barletta (IX, PL. 60).

Great skill was required in the casting of such large statues, and special molding methods were devised. One such technique was piece molding, in which the molds were made in several sections, or pieces, which could be removed from the core in a manner that is impossible with conventional solid molds. This method was advantageous because it made possible the casting of more complex shapes and because the mold did not have to be destroyed after each casting operation. Large, heavy works of bronze were also executed by casting parts of the work separately and fusing them to the main body of the work. It remained, however, a highly skilled task to construct the cores and molds for large statues and to make them strong enough to support the great weight of the casting metal, which had to be melted in special furnaces built for each statue. (Vanoccio Biringuccio and Benvenuto Cellini wrote of these difficulties.)

Bronze has been used from early times for architectural purposes, particularly for ceremonial doors and gateways. The bronze gates of the Assyrian king Shalmaneser III from the palace of Balawat, which date from 845 B.C., were entirely covered with figures in relief (PL. 490). Roman bronze doors that have survived destruction include those in the central portal of St. John Lateran, which were made for the Curia of Diocletian in the Roman Forum, and the door, which is still *in situ*, of the so-called "Temple of the Divus Romulus" in the Forum. Since the 11th century of the Christian Era, large bronze doors have been made for important buildings and churches in Europe, achieving particular magnificence in Italy. In addition to the large works mentioned above, small ornaments and other art objects have always been cast in bronze, those of classical antiquity being of especial merit.

Although the small cast-bronze cups and chalices of ancient Greece and Rome would be difficult to surpass in grace and design, the same fine sense of proportion is often seen in the larger bronze works, for example, the great bronze crater of the 6th century B.C. which was found at Vix, near Châtillon-sur-Seine in France (I, PL. 354). This work is over 5 ft. high and is decorated with finely modeled figures in relief. Among the elaborately decorated mirrors produced by Celtic bronzesmiths in Europe are the Desborough Mirror from Northamptonshire in England, and the Birdlip Mirror from Gloucestershire (I, PL. 289), both of which have beautiful Celtic designs on the back surfaces.

Ironwork: The blacksmith. The traditions and evolution of the iron industry differed from those of bronzework. The blacksmith occupied a special position in primitive and later societies, and his craft traditions were strong and exceedingly conservative. In both Europe and the Near East his craft generated many myths and legends.

Serving principally for the manufacture of tools, weapons, and practical objects, iron was used much less frequently than copper, bronze, gold, and silver for artistic purposes. One of the early uses of iron was in the making of swords. In the field of ironwork technical improvements in strength and quality also led to esthetic advancement, until swords of great beauty were made. The finest swords were made either by "pattern welding" or by damascening, two very different methods. Those

made by pattern welding exhibit horizontal bands of ornament running down each side of the blade. This technique may have originated with the Celtic smiths and was certainly known to the Romans. The blade of the damascene sword appears mottled, or watered, because of the composition, method of forging, and heat treatment of the steel. The original material for these swords was a special Indian steel from Hyderabad, which was exported to Persia and Syria as early as the 3d century of the Christian Era; both countries subsequently became famous for the production of fine weapons, particularly in the 13th century and after.

The smelting furnace was the most important element in the iron industry, as it was in the copper industry. It evolved from the small furnace of the early Iron Age, which was merely a hole in the ground, to the large furnace, or *Stückofen*, of medieval times. The early iron smelter was probably also a blacksmith, forging and fabricating the iron after smelting the ore. Although the development of the smelting furnace suggests that specialized craftsmen — separate iron smelters and blacksmiths — soon appeared, strong tradition effected the continuation of primitive methods and equipment in many rural areas. By Roman times iron was mined and produced on a commercial scale in the great centers of the industry. It is difficult to determine when the first associations or guilds of ironworkers were established, but it appears likely that there was a local guild of smiths in republican Rome and possibly in Brescia and Milan.

As late as the 12th century of our era iron was being smelted in many parts of Europe by the same methods that were used in pre-Roman times. After the 12th century there was a marked rise in iron production in Europe. The increased demand for iron products led to further specialization in the blacksmith's work and to the formation of such important craft associations as the historic guilds of the City of London. These guilds, however, existed only in large cities, while by far the greatest proportion of ironwork throughout medieval times was still produced in the traditional manner in country districts served by village or traveling blacksmiths. In medieval England much ironwork was produced in monastic settlements by monks who were highly skilled in the forging and fabrication of iron; in fact, in the Anglo-Saxon Christian period monasteries became the most important centers of ironwork. Although no new metallurgical processes were invented during medieval times, significant progress in increased iron production was accomplished by improved, larger furnaces and chiefly by the introduction of mechanical power in the form of the water wheel to operate the bellows and hammers in foundries and forges.

In quite humble objects for domestic use the smith, especially the Celtic smith, exercised a measure of artistic ability. Firedogs were ornamented with forged terminals in the shape of stylized animal heads; an excellent example is the wrought-iron firedog from Capel Garmon in Wales, dating to the 1st century of the Christian Era. In building construction iron was frequently used. Such use varied from the purely practical, such as tie bars to secure the walls of churches and other buildings, to magnificent wrought-iron grilles and screens in cathedrals. An outstanding example of such work is the superb wrought-iron screen in the Chapel of the Catholic Kings (Capilla Real) in the Cathedral at Granada, which combines vast size with a most delicate effect; for art works of this type iron is a particularly suitable medium. The blacksmith also displayed his art to advantage on grilled enclosures for tombs and shrines of saints.

While the Chinese cast statues and other iron objects from at least the beginning of the present era, the Romans and Greeks apparently made no practical use of cast iron, although it is possible they knew how to obtain it. In Western Europe methods of making and using cast iron have been known only since the 15th century. The ancient and medieval craftsmen found iron an inexpedient metal from which to fashion statuary because it did not readily yield a sound and flawless casting; also, it cannot equal bronze and the precious metals in beauty of finish and color.

Herbert H. COGHLAN

Decorative techniques. The decoration of metals is achieved chiefly by means of insertions of metals of different colors. There are two such techniques: damascene and niello. The techniques of granulation and filigree will not be considered here, since these are techniques applied principally in gold- and silverwork (q.v.).

In damascening, thin strips (or even small sheets of foil) of copper, silver, and gold are applied cold (i.e., not fused by heat) on bronze to form ornamental patterns and, sometimes, even depictions. Examples include the famous daggers from Mycenae with lion-hunting scenes (IV, PL. 71). Sometimes the inserted pieces are so wide that they suggest intarsia, as in a late-antique bronze plaque in the Louvre.

In the niello process a black amalgam (*nigellum*; Lat., *nigellus*, dark) of copper, silver, and lead is poured into the grooves hollowed out of the surface to be decorated. This very old technique is particularly adapted to extremely fine and delicate work. Examples include the ceremonial arms from the tomb of Queen Ahhotep (an ax bearing the name of King Ahmose; PL. 497), cups from Mycenae (Athens, Nat. Mus.), and certain cups of the late Roman period. Niello work should not be confused with the oxidized (i.e., black) silverwork that was so highly esteemed in Egypt (Pliny, *Naturalis historiae*, xxxiii, 46, 131).

* *

THE ARTISTIC PRODUCTION OF METALWORK IN WESTERN CIVILIZATIONS FROM THE MIDDLE AGES TO THE PRESENT. *Bronze and brass.* Bronze was used for much the same purposes in the Early Christian period as in antiquity, but large-scale works were less frequently produced. In the Eastern Empire the doors of St. Sophia (PL. 507), some of which date from the 6th century, are the most imposing works in bronze. In the 11th century similar doors of bronze damascened with silver were exported from Constantinople to Italy, where some are still preserved whole or in part, notably in the cathedrals of Amalfi and Salerno. In the 12th and early 13th centuries Italian founders, mostly under Byzantine influence, produced a series of splendid west doors, including those of the cathedrals at Benevento, Monreale (III, PL. 12; XII, PL. 257), and Pisa (PL. 508). The west doors of S. Zeno in Verona (PL. 508), which show northern influence, are ascribed in part to a German founder. The survival of many bronze censers pierced with foliage of Romanesque design indicates the widespread production of small bronzes in 12th-century Italy.

In the West such liturgical objects as oil lamps, censers, and candlesticks were usually made of bronze, the finer examples being gilded. There was a vast production of bronze articles of personal adornment — especially brooches (fibulae) and buckles — which, being small, were usually gilded; these objects have been recovered in large numbers from graves of the Migration period.

Although documentary sources refer to large works of bronze produced between the 5th and 9th centuries, the only surviving examples were cast in Aachen in the foundry established by Charlemagne. Among them were four pairs of doors with lion-mask ring handles (III, PL. 65) based on antique models and the openwork grilles of the triforium in Aachen Cathedral (III, PL. 390). The same foundry also may have created the so-called "Throne of Dagobert" (III, PL. 68).

The flowering of the goldsmith's art in the Ottonian period (q.v.) was paralleled by great advances in the art of casting bronze, centered chiefly in the Rhineland and northern Germany. The Cathedral of Mainz has a pair of bronze doors dating from the late 10th century, each consisting of eight panels with figures from the Old and New Testaments. The pair at Hildesheim was completed in 1015 (X, PL. 467); their design is attributed to Bishop Bernward of Hildesheim. He, or possibly his successor, Bishop Godehard (1022–38), commissioned — probably from the same workshop — the bronze Easter column, nearly 13 ft. high, with cast scenes from the life of Christ, which are spiraled in the manner of the triumphal columns of antiquity. While most of the German Romanesque bronze doors are cast entirely in bronze, those at the Cathedral

of Augsburg (PL. 508) are cast in separate panels and affixed to a wooden ground. Another outstanding work is the imperial throne in the Royal Hall at Goslar, Germany, the sides and back of which are covered with sensitively modeled and pierced Romanesque foliage. The German bronze founders were equally successful with such monumental works as the huge coronas at Hildesheim (11th cent.) and Aachen (12th cent.) and with such smaller objects as the holy-water bucket from Mainz in the Cathedral Treasury at Speyer and the imaginative aquamaniles. The aquamaniles were made in naturalistic and grotesque forms, including armored knights on horseback, lions, centaurs, and griffins and other monsters; the handle was shaped as a smaller monster or dragon, and the water could be poured through a spout in the larger animal's mouth or chest. All were made by the cire-perdue process, and no two are identical, though in the late-14th and 15th centuries the designs became more standardized.

Romanesque bronzes were often finished with the care and precision worthy of precious metals, and it is, therefore, not surprising to find in this period a particularly close relationship between goldsmith and bronze founder. Bronzes and articles of precious metal were produced in the same workshops, and some of the most imposing creations of early medieval art were executed in bronze rather than gold or silver (PLS. 167, 511).

During the 12th century bronze foundries in Lorraine (PL. 511) and in such Meuse valley towns as Liège, Huy, and Dinant began to compete with German centers. The presence of plentiful zinc deposits near Liège eventually led the Mosan workers to adopt brass, an alloy of copper and zinc, in preference to bronze, the copper-tin alloy which was generally used elsewhere. Though less expensive as a material, brass was disadvantageous in that it could not be finely chased and did not form a satisfactory ground for gilding. Dinant was so famed for its brassware that in the 15th century the term *dinanderie* was used to describe the brass products of the entire Meuse valley. The oldest surviving and most imposing achievement of the Mosan founders is the great font in the church of St-Barthélemy in Liège (V, PL. 319), which was commissioned by the abbot Hellin (1107–18) from Renier de Huy. The font appears to be of yellow bronze, but the composition of the alloys used in the Middle Ages was not determined scientifically and varied from piece to piece; for this reason, some scholars have preferred to use the term bronze for all Romanesque casting. Among the major achievements of the Mosan founders is the series of huge, seven-branched Easter candlesticks, of which fragmentary examples exist in Reims, in the Church of St. Vitus, Prague, and in the Cathedral of Milan (Trivulzio candlestick, ca. 1200). Exactly where these candlesticks were made is uncertain, but they have been attributed to England and Italy. Large ecclesiastical candlesticks were also made in Essen and Brunswick, Germany, and in England, where only the Gloucester Candlestick (see below) survived the Reformation, however. The most imposing 15th- and 16th-century productions of the Mosan founders included fonts and font covers, such as those in the Church of St. Walburga at Zutphen and the Cathedral of St. John at 's Hertogenbosch; eagle or pelican lecterns; and large chandeliers, which were embellished with figural sculpture and elaborate Gothic tabernacle work. The lecterns were widely exported, mainly to Italy, Spain, and England, in all of which examples still survive.

The term *dinanderie* is usually applied to the smaller articles produced in great quantities in the 15th century: candlesticks, dishes, jugs, and cooking vessels. Various objects for the altar were also made of brass, including figures of the crucified Christ which are often speculatively attributed to Mosan or German founders.

While the production of such large objects as lecterns, fonts, and Easter candlesticks was probably exceptional and therefore confined to a few centers, the smaller Romanesque bronzes were produced in many different places. Numerous superbly modeled crucifix figures have been attributed to Anglo-Saxon bronze founders, but the most significant English contribution is the altar candlestick which was made about 1110 for Gloucester Cathedral and vividly displays the imaginative fantasy of medieval artists (VI, PL. 252). The survival of a fine door knocker at Durham Cathedral and the description of a lost candlestick from the same cathedral as being "as high as the vaults of the aisles" indicate that the Gloucester Candlestick was not an isolated achievement.

The monumental or sepulchral brass, a brass sheet engraved with a representation of the deceased which took the place of a monument, was introduced early in the 13th century. The earliest extant example is the brass of Bishop Iso von Wilpe (d. 1231) at Verden. Originally, such brasses were probably numerous on the Continent, especially in the Low Countries and northwestern Germany, but few survive, many having been destroyed to obtain the metal during the Napoleonic wars. They are much more numerous, however, in England, where over 7,000 survive. Flemish and German brasses were usually large metal plates with diapered backgrounds which set the figures in relief. In England, smaller figures, escutcheons, architectural canopies, and inscriptions were separately inlaid in slabs of gray marble or other stone. Brass was not produced in England until the 16th century, prior to which it had been imported from Dinant and Cologne. After brass production began, some of the English brasses were imported ready-made, but most were cut and engraved in England, probably in London. The earliest surviving English brass is that of Sir John d'Abernon (d. 1277) at Stoke d'Abernon, Surrey, although there is evidence at St. Paul's in Bedford of a monumental brass made in 1208. The designs of the early brasses were two-dimensional; later, in the 15th century, engravers attempted to achieve three-dimensional effects by shading with crosshatching, a method unsuited to the medium. Many English brasses of the 16th century are known to have been reused, because there are traces of earlier designs on the backs. These palimpsest brasses were made from earlier brasses that were removed from the churches during the Reformation; many were also imported from the Low Countries. The use of monumental brasses continued into the 17th century, but later examples were generally small and standardized in design. Near the end of the 14th century Nürnberg became an important brass and bronze center; there, founders produced mortars (PL. 510), sets of weights made to fit into each other and having swing handles decorated with grotesque heads, and the usual range of household utensils. Its most significant artistic productions, however, were bronze fountains, the best of which date from the 16th century. Late Gothic bronze founding in Nürnberg culminated in St. Sebald's Shrine (1519), the chief sculpture of Peter Vischer the Elder (q.v.), located in the church bearing the saint's name. North German bronzework included such masterpieces as the 30-ft. tabernacle of the Marienkirche in Lübeck. Large dishes with stamped ornament and calligraphic inscriptions, which were used as almsdishes and baptismal basins or washbasins, were also produced in Nürnberg and became popular throughout Europe. They were made according to a limited number of stock patterns which were still largely unchanged in the 17th century and constitute an early example of mass production.

Although the sack of Dinant by the troops of Philip the Good in 1466 forced many brass founders to emigrate, the term *dinanderie* was still applied to brasswork. This emigration to other towns in the Meuse valley and to France and England introduced similar brass-founding methods to many towns in western Europe, thus rendering difficult the identification of the exact place of origin of the individual object.

The most numerous surviving objects of the Middle Ages are brass candlesticks for both church and domestic use. From the 13th century on, a large range of types was made, beginning with animal or monster figures supporting the pricket on their backs; these are similar in appearance to the aquamanile (cf. PL. 164), though usually of smaller size. In the 14th century, tripod prickets decorated with octagonal moldings were used. Two main types of brass candlesticks were evolved in the 15th century: the pricket, with a tall, domed base, a molded stem, and a large grease pan immediately below the candle spike; and the socket type, with a tall, trumpet-shaped base, to the upper side of which was attached a wide rim or flange serving as a grease pan. In the latter type, the stem was molded

and the socket pierced with a vertical opening, resembling a Gothic window, through which a spike could be inserted to eject the stub. Late medieval candlesticks were generally of uniform design, but local variations appeared in the 16th century, notably in Nürnberg, where an individual type was developed with the stem modeled as a male figure in contemporary dress holding a pricket or socket in each hand (cf. VI, PL. 390).

The brass church furnishings of the Renaissance and later cannot compare with those of the late Middle Ages; one reason for the decline was the increasing use of silver for altar crosses and candlesticks. Apart from the great lecterns that were still made by the brass founders of the Low Countries and such exceptional achievements as the brass choir screen designed by Joannes Lutma in the 17th century for the Nieuwe Kerk, Amsterdam, the most important productions were the many-branched chandeliers for churches. While these were also made in eastern Germany, Poland, and England, the main center of production remained the Netherlands.

Outside Germany and the Low Countries the most important 16th-century works in brass are those known as Venetian-Saracenic because of their mixed origin (VII, PL. 313). The earlier examples of this work, made by Near Eastern masters who had settled in Venice, are hardly distinguishable from those made in their countries of origin, but during the 16th century European elements became more apparent. Among their wares were ewers, dishes, bowls, candlesticks, and incense burners; they were usually Western in form, but the engraved ornament on the earlier examples was composed completely of abstract arabesques. The finer examples were damascened with gold and silver in addition to being engraved. By the mid-16th century, when Italian craftsmen had replaced the Saracenic smiths, figural subjects and floral designs derived from contemporary pattern books were introduced in the ornament. The craft survived the 16th century only in degenerate form.

Bronze plaquettes have been produced as independent works of art for the collector since the 15th century, but they were also employed as elements of other objects, such as the pax used in the Mass, or as decorative additions to furniture, inkstands, lamps, and saltcellars. The first name associated with plaquettes is that of Donatello (q.v.). Most of the famous medalists of the early Renaissance, such as Agostino di Duccio and Bertoldo di Giovanni (qq.v.) are credited with the authorship of plaquettes, but the Paduan masters Moderno and Riccio (VII, PL. 336) were far more productive. Both these masters derived their subjects from classical mythology and Christian legend. Moderno's works are clearly signed and attributions are rather firmly established. During the 16th century most of the great sculptors — among them Sansovino, Benvenuto Cellini, and Giambologna — also made plaquettes. These masters also founded schools, to which many of the plaquettes must be attributed; the main schools were those in Padua, Venice, and Milan. Besides the plaquettes produced by the above-mentioned masters and their schools, there was also a large production of others of slight merit, mostly cast, with religious subjects. After-casts of 16th-century plaquettes were made throughout the 17th and 18th centuries and are, inevitably, of poorer quality than the originals they reproduce. Only the electrotype reproductions of the 19th century achieve the effect of the originals.

About 1500, bronze founders in Italy began to produce a variety of small, useful, and decorative articles in addition to the statuettes, plaquettes, medals, and mortars which had hitherto been their main products. Bronze table candlesticks had appeared in a Gonzaga inventory of 1497, one of which was in the form of an eagle's claw supporting a pricket. The earlier caskets and inkstands were simply rectangular boxes with plaquettes forming the sides, but the inkstands developed into fantastic compositions based on classical vases and surmounted by statuettes. Incense burners and lamps were made in forms that illustrate the exuberant inventiveness of Italian mannerism. At first the lamps reproduced antique forms, but they soon became more extravagant, being made in the form of a foot, a Negro's head, a man with his head between his legs, or quite obscene compositions; some of the most extravagant designs came from the Riccio workshop in Padua. Standing bowls of varying sizes (some roughly finished in the manner of mortars, others superbly chiseled), table bells, firedogs, and door knockers and handles were also made. The bells and door knockers were often decorated with the arms of the owner; the bells were surmounted by statuettes, while the door knockers were often modeled in the form of a human figure. The most original and graceful designs are attributed to Paduan or Venetian workshops. The late-16th-century firedogs were of monumental size and were surmounted by figures. The most important Italian bronzes of the 17th century — other than sculpture — were the great altar candlesticks, many of them based on an original design by Michelangelo.

In the Middle Ages copper had been the preferred ground for enamels, but during the 17th century a cheap form of enameling was introduced in which brass was used as a base. The precise place of manufacture is not known, but the process was very likely not confined to one town or country, probably being practiced in Bavaria, the Meuse Valley, and London. The English type is often misleadingly known as "Surrey enamel." The enamels were of the champlevé type, but, instead of being cut out by hand, the depressions for the enamel were cast in the metal, thus saving a great deal of labor. Such a method was unsuitable for the production of small or fine objects, but it sufficed for such articles as andirons, candlesticks, stirrups, harness bosses, and sword hilts. The range of colors employed in this enameled brassware was usually restricted to blue, red, green, yellow, and white. Somewhat similar enameled brassware was made in Russia, mainly icons and ecclesiastical objects.

In the early 18th century an alloy of copper and zinc, similar to brass but containing a higher percentage of copper, was employed by a London watchmaker, Christopher Pinchbeck (ca. 1670–1732). It had the advantage of resembling gold in color and was, therefore, much used for watchcases, etuis, and cheap jewelry. Though its invention was claimed by Pinchbeck, the same or similar alloys were widely used in 18th-century Europe.

In the 18th century, gilded bronze, which in the previous century had been used mainly for sculpture, was more widely employed. In England the term "ormolu" is normally used to describe useful articles of this material; though the term is of French derivation, it is not used at all in France, where the material is known as "bronze doré." The objects usually made of ormolu in the 18th century included furniture mounts, fireplace furnishings, clockcases, lighting fittings, both candlesticks and chandeliers, sword hilts, and door handles and locks (PL. 517; VII, PL. 346; XII, PL. 181). The fashion for ormolu goes back to the court of Louis XIV of France, and during the century it was produced in the French manner in most European countries, though craftsmen elsewhere rarely achieved the French elegance of design or refinement of finish (V, PL. 444). Ormolu objects were cast, chiseled by hand, and finally fire-gilded; they should be distinguished from those which, though cast from the same molds, were roughly finished in the founder's workshop, instead of being sent to the *ciseleur* for the final process. These last were not gilded, but merely lacquered with a yellow varnish (*mis en couleur d'or*). The quality of ormolu depended on the amount of labor put into the finishing by the *ciseleur*. The finest were almost as expensive as similar articles in precious metal. The most exquisite French ormolu dates from the second half of the 18th century; though lacking the vigor of design of the rococo ormolu, its finish was impeccable. The most distinguished masters of the first half of the 18th century were Jacques Caffieri (1678–1755) and Charles Cressent (1685–1768), who was also an *ébéniste*; Pierre Gouthière, Pierre-Philippe Thomire *fils* (VII, PL. 323), and Etienne Forestier were outstanding during the reign of Louis XVI. Thomire (1751–1843) continued to work during the Napoleonic period, when standards were well maintained. The manufacture of ormolu has continued almost without interruption in France until the present day. Some of the 19th-century work, though not original in design, equaled the quality achieved by the best 18th-century masters and, having been cast from the same molds, can hardly

be distinguished; cheaper 19th-century productions were of poor quality in design and finish.

Outside France the bronze founders who produced articles of gilded bronze have mostly remained anonymous. Some of the best work was done during the Napoleonic period in workshops set up under direct French inspiration in the European capitals. In England the firm of Boulton and Fothergill was established in 1761 with the intention of competing with the French bronze founders. The best productions were made after designs supplied by Robert Adam, executed in the attractive Derbyshire fluorspar (blue john); the finish of the Boulton ormolu is never above criticism, however. In the early 19th century, fine ormolu was turned out by such large-scale goldsmith firms as Rundell and Bridge, as a less expensive alternative to gilded silver.

Copper. Pure copper is not used for cast work but, like silver, is worked in the sheet. It formed the ground in the 12th–14th century for both Mosan and Limoges enamels (see ENAMELS) and was used by medieval goldsmiths as an inexpensive substitute for gold and silver. A large proportion of the surviving medieval church plate from the 11th century onward is of gilded copper, not because it was at the time more usual, but because articles of more precious metal have been melted down for conversion to another form or use. Copper formed a very satisfactory substitute for gold, because the red copper provided an excellent ground for gilding. In the 16th and 17th centuries, caskets, clockcases, and scientific instruments were made of copper, engraved with ornament or gilded. Copper was reserved for flat surfaces such as sides of caskets or cases, while those parts which had to be cast were made of bronze. In some countries, including England, the gilding of copper was prohibited, except for church plate, for fear that dishonest persons would sell the product as pure gold. In Germany, however, flagons, tankards, and standing cups were made of gilded copper in the same way and on the same designs as those of silver. In Italy, inkstands, incense burners, and lamps were made of gilded copper on the same designs as those of precious metal and, because of the mass destruction of the latter, form a valuable source of information about Italian Renaissance goldwork.

Copper was also widely used for cooking utensils on the folk-art level. Some 16th-century Italian ewers and basins were finely engraved, while in the 17th and 18th centuries vessels were roughly embossed with bold floral ornament.

A new use for copper was discovered before the middle of the 18th century in England with the invention of Sheffield plate. In this process a copper ingot was fused between two thick silver plates and then rolled out into a thin composite "sandwich," from which objects having the appearance of solid silver could be made. The process was industrialized on a large scale by the firm of Boulton and Fothergill of Birmingham, and the Sheffield plate found a ready export market. The early and better designs were neoclassic in character, but the high relief of the later Empire style could not be effectively executed in Sheffield plate, and the industry lost its earlier advantage over the goldsmiths. It survived until the mid-19th century, when electroplating on nickel silver took its place as a yet cheaper substitute for silver.

The electrotyping industry, which enjoyed a brief prosperity during the second half of the 19th century, made use of copper which was deposited electrically. Its main function was the inexpensive and exact reproduction of earlier metalwork, mostly goldwork. There has been little demand for such reproductions in the 20th century.

Lead. The low melting point of lead and its freedom from contraction when it cools render it a material particularly well suited for casting; it has generally been employed as an inexpensive substitute for bronze or precious metal. Its most important medieval use was for fonts, of which several Romanesque examples survive in England. They are usually cast with arcades enclosing seated figures. The few surviving examples in Germany and France date from the 14th and 15th centuries. A group of 14th-century French wooden caskets — all of similar design, covered with lead tracery and gilded to resemble precious metal — have survived in church treasuries. Their decoration, consisting of coats of arms within pierced tracery, suggests that they were originally secular in purpose, but they have been preserved because they were used as reliquaries in poorer religious institutions which could not afford silver or gold.

Another medieval use of lead was in the production of pilgrims' signs, small badges that were distributed to pilgrims at the various shrines of medieval Europe and worn subsequently on the hat or person as evidence that the pilgrimage had been completed; they usually bore some allusion to the saint at whose shrine they were obtained. The best-known is the shell of St. James of Compostela in Spain, while the most popular in England was that of St. Thomas à Becket in the Cathedral of Canterbury.

During the 16th century, a number of medallions and plaquettes were produced in lead. It is not quite certain whether these were made as inexpensive substitutes for those of precious metal or bronze or as models for the use of goldsmiths. There is, however, no doubt that after-casts have been made in lead from medals and plaquettes at all times; these after-casts can usually be recognized as such, but it is not as a rule possible to date them. The Renaissance fashion for elaborate ornament of a sculptural nature required a competence in modeling that did not lie within the reach of the average goldsmith. As a result, there grew up among the German patternmakers, such as Peter Flötner, Jonas Silber, and the master H. G. (Hans Jamnitzer), the practice of making lead casts from their models, which they sold to goldsmiths all over Europe. The goldsmith could make a mold from the lead pattern and apply the appropriate ornament to the vessel he was working on. Lead plaquettes seem also to have been used by goldsmiths as patterns for the decoration of *tazze* or of dishes with an embossed subject. In this case, the lead model solved the problem of translating the subject being represented from a flat graphic design to one in relief. The use of lead models accounts for the repetition of the same subject or relief on pieces made by different goldsmiths. (An extensive collection of these lead models is preserved in the Historisches Mus., Basel.) In the 15th century an effective use was found for lead in the making of heads for rainwater pipes. Examples from the 16th century are cast with Gothic tracery and decorative ciphers. In the 17th century lead casts became important features of external architectural ornament, bearing the coat of arms of the owner of the house and the date of erection. The most important external use of lead was for garden statuary (see SCULPTURE). Here it suffices to mention the lead vases and urns which decorated the gardens of most 18th-century mansions. Large numbers were made for Versailles and the many German palaces which imitated it, but the most impressive were the two vases, 15 ft. high, modeled by the Frenchman Jacques Villemotte (d. 1746) for the castle at Schleissheim. Lead was used for sarcophagi from the Middle Ages on. Medieval examples were undecorated, but large, freestanding sarcophagi of classical design were introduced in the course of the 16th century. The most significant are those by Balthasar Moll (1717–85) for the Hapsburg tombs in the Kapuzinerkirche, Vienna, and those by Andreas Schlüter (1660–1714) for the Hohenzollern tombs in Berlin.

Pewter. Pewter is an alloy of tin with copper, antimony, or lead. Since the Middle Ages it has been made in two qualities: The first, known as "fine pewter," does not contain lead and is used for plates, bowls, and flatware; the second and lower quality, into which a percentage of lead has been introduced, is used for hollow ware, such as measures, tankards, candlesticks and other objects which by reason of their forms can withstand rough usage.

The earliest surviving medieval pewter dates from the 14th century and shows a pleasing octagonal form, probably derived from similar vessels made of precious metals or of brass. Pewter was used at first by the richer classes in place of wood, leather, and horn, which remained in use among the poor. Inventories of the household goods of the nobility and the rich clergy in

the later Middle Ages contain long lists of pewter vessels, most of which were employed in the kitchens of their vast establishments. Pewter was also used for ecclesiastical vessels in the poorer churches of the Middle Ages and for the funeral chalices which were made for burial with simple priests. From the late 16th century, pewter flagons were not uncommon in Protestant churches. As time passed, its use became more widespread, until by the mid-17th century there was scarcely a single household vessel that was not made of pewter. Little early pewter has survived; being a very soft metal, it soon became worn in use, whereupon it was returned to the pewterer for melting and remaking in more modern forms.

The earliest surviving English vessels are ecclesiastical, but a number of very fine guild flagons of Silesian origin show that the craft flourished in Germany in the late 15th century. These flagons, which are tall, polygonal, and engraved with figures of saints within elaborate tabernacle work, show the typical elegance of late Gothic design. Tall, baluster-shaped flagons made in the 15th and 16th centuries for the use of the members of German town and city councils rank among the most original creations of the craft. The German city guilds continued to use large pewter flagons long after the members of city councils had acquired vessels of precious metals. These were often extremely large and intended as much for display as for use at guild functions. While the German guild flagons are of excellent proportion, the standing cups modeled on those of precious metals have little merit. Both flagons and cups were made as long as the guilds existed.

The decoration on German guild plate was restrained, and common domestic plate was undecorated; but in the second half of the 16th century a fashion arose for show plate of a type of pewter known as *Edelzinn*. Such vessels were decorated all over with cast ornament and were meant for display on the cupboards and dressers that were a feature of 16th-century dining halls. The designs, based on those of the silver vessels displayed by the very rich, were cast from copper molds, with intaglio made by a specialized craftsman called a *Formschneider*, whose production fell within the province neither of the pewterer nor the goldsmith, but of the medal die cutter. The molds remained in use for many generations, so that designs were repeated in pewter dishes made over considerable intervals of time; they must have been among the most expensive of the articles that were tools of the pewterers' trade.

Edelzinn was produced in Germany, France, and the Low Countries. Its most prominent master was François Briot of Montbéliard (ca. 1550–after 1616), who designed and executed the models for the "Temperantia" dish, so called after the subject of its central panel. The design is much influenced by the mannerist style of the school of Fontainebleau and is notable for the sensitive modeling of its numerous elongated figures. A companion ewer and another dish (the Mars) are also attributed to Briot, who was otherwise occupied as medalist to the Duke of Württemberg. His designs were copied by the Nürnberg *Formschneider* Caspar Enderlein (1560–1633), who also produced a number of original models in the same late mannerist style. However fine the models from which this show pewter was cast, the decoration soon became rubbed if the vessels were used. During the 17th century pewter reverted to its former and only practical function as a material for domestic plate, and those who wished to make a display on their sideboards used silver.

Domestic pewter of the 16th and 17th centuries did not follow contemporary silver design but was made in simple forms more closely resembling those of pottery. The second half of the 17th century was the peak period of pewter in Europe: flagons, candlesticks, tankards, basins, ewers, and saltcellars were all made in bold, simple forms admirably suited to the nature of the material. In England, and to a lesser extent in Holland, a different form of engraving was introduced during the 17th century. The design was deeply cut into the metal in a zigzag line, producing a pattern that was far more resistant to wear than the raised, cast ornament of *Edelzinn*. The engraving was evidently carried out by the pewterer himself and was a form of popular art.

The 18th century marked a general decline in the craft. In England, silver forms were copied and embellished with a simplified version of the decoration appropriate to the precious metal; in France and Germany pewter was sometimes silver-plated, and in Holland it was often japanned. Other materials (e.g., britannia metal) which performed more efficiently the purposes that pewter had served for nearly four hundred years were produced on a large scale.

Pewterers' guilds were in existence by the 14th century, and as early as 1300 an ordinance of the Holy Roman Empire laid down the proportion of lead that might be introduced. At a later date, control marks were stamped on pewter vessels as a guarantee that they were of the necessary hardness and that the proportion of lead was not excessive. In England a statute of 1503 required all pewterers to put makers' marks on the vessels they sold; these consisted of the pewterer's name or initials, or a device. In addition, a quality mark in the form of the letter X with crown or of a crowned rose was introduced, but did not come into general use before the 18th century. On the Continent three marks were used: the town mark, the maker's mark, and the quality mark, which usually consisted of an angel for the first quality or a crowned rose for the second quality.

The mid-19th century indulged in monstrous versions of Renaissance goldsmith's work which were cast in zinc, but pewter returned to favor in the last decades of the century.

Wrought iron. Though iron was used from an early date in the production of weapons and armor, it was not until the 11th century, at the earliest, that any artistic intention can be recognized in the working of it. A number of church doors with elaborately scrolled hinge work of the 12th century survive in England; also, Romanesque weathercocks are illustrated in manuscripts of the period. Several English cathedrals retain 12th-century screenwork, the finest being the St. Swithin grille (ca. 1100) at Winchester Cathedral. In the 13th century, however, the French ironworkers achieved the summit of technical mastery and artistic quality in the hinge work of the west doors of the Cathedral of Notre-Dame in Paris. The design is extravagantly rich, representing the terrestrial paradise, its foliage inhabited by innumerable birds, dragons, and other fantastic beings. Much of the detail of the Notre-Dame doors was produced by the stamping method, first introduced in the 13th century, by which the smith struck hot iron into prepared steel dies, as wax is pressed into a seal; minute detail could thus be achieved with a minimum of effort. Though the process was known and used in England, it suddenly appeared in full magnificence in the Île-de-France. German ironworking in the 13th century was far less ambitious; little or no use was made of stamping, and the smiths were satisfied if they fulfilled their practical function of rendering chests and doors secure from thieves. The best example, from the late 13th century, is the ironwork on the doors of the Church of St. Elizabeth at Marburg. In the 14th century German smiths developed the art of working the cold metal by sawing and chiseling it. New methods were paralleled by new designs, and ironwork was increasingly influenced by contemporary architectural forms. In place of the early Gothic foliate scrolls, geometric forms were adopted, the characteristic grille of the 14th century being a trellis with quatrefoils filling the spaces between the bars.

The earliest Italian grilles, dating from the 13th century, are made up of an iron framework grooved to receive sheet-iron panels. Subsequently, geometric patterns were arrived at by the simple process of riveting straps of iron together. During the 14th century screens composed of quatrefoils became the standard form in Italy; examples of this type of work can be seen in the Cathedrals of Siena and Orvieto, but the most famous are the grilles on the Scaliger tombs in Verona. On the richer grilles the panels of quatrefoils were built into a massive iron framing and surmounted by a frieze of foliage and armorial bearings in bent and cut sheet iron, as in a grille dating from the mid-15th century in the Palazzo Pubblico, Siena, on the frieze of which heraldic shields and the Roman wolf were introduced.

The blacksmiths of the 15th century delighted in copying in iron the elaborate tabernacle work which contemporary stonemasons had, in turn, taken over from the wood carver. Flamboyant tracery could easily be sawed out of sheet iron, and effects of molding achieved by using several thicknesses of sheet. Late Gothic tabernacles were customarily protected by grilles of great delicacy, some of the finest of which are located in the churches and chapels of the Tirol (VI, PL. 389). Outstanding work was also done in this manner in England; the most notable is the pair of gates from the tomb of Edward IV in St. George's Chapel at Windsor Castle, by an English smith, John Tresilian.

During the 16th century the best ironwork was produced in Germany, Austria, and Spain (PLS. 510, 518). Besides door mounts, hinge work, and grilles, which were also made in the Middle Ages, blacksmiths now made choir and chapel screens, staircase railings, and — particularly in the area of Teutonic culture — wellhead screens. The patterns were usually made up of spiral scrolls and trelliswork, in which the bars were interwoven in a manner recalling the elaborate scrolls and flourishes of contemporary calligraphy. The German Renaissance style can be seen at its best in the enclosure of the tomb of Emperor Maximilian I in the Hofkirche at Innsbruck, completed in 1573. The work of Jörg Schmidhammer of Prague, it has 20 panels, each of different design, introducing naturalistic foliage, with an angel holding a shield of arms included in the alternate panels; the effect is heightened by red and gold coloring. The Renaissance spirals continued to provide the basic pattern of German screenwork until the late 17th century; a particularly pleasing example, dated 1678, in the Cathedral of Schleswig introduces a variety of auricular forms into the spirals. During the second half of the 17th century the perspective screens first made their appearance; this favorite baroque device for giving the illusion of greater length appears in a number of the great baroque monastic churches, such as those at Ellwangen and Weingarten (VI, PL. 142), and in the Church of SS. Ulrich und Afra in Augsburg.

The vast screens (*rejas*) in the Spanish cathedrals are the most important 16th-century contributions to the art of ironwork. They were constructed in two or more tiers and reached up to the roof of the nave, a height of 45 ft. or more. At first the uprights were of square section, but spindled balusters of iron, hammered to shape with immense labor, were introduced in the 16th century. Sometimes, as at Toledo, the balusters were heavily plated with silver. The tiers were separated by cornices with chiseled or embossed friezes, and the whole screen was surmounted by a cresting of cut and bent foliage. Spain is so rich in these screens that it is difficult to choose the most significant; the Cathedrals of Toledo, Burgos (VI, PL. 306), and Seville all have outstanding examples.

French blacksmiths set the standards that were followed elsewhere in the 17th and 18th centuries (PL. 519). A French Huguenot *émigré*, Jean Tijou, who made the ironwork for St. Paul's Cathedral in London, completely transformed wrought-iron work in England and raised it from the low standard to which it had fallen during the 17th century. The French smiths succeeded in combining stability of construction with splendid ornament, and their work survives in great quantity, not only in the courtyards of palaces but also surrounding the choirs of Gothic cathedrals (e.g., Amiens and Bourges). Outstanding examples of 17th-century ironwork are the superb staircases of the Palais Royal and the Bibliothèque Nationale by Antoine Lemaître and the Escalier du Roi at Fontainebleau. In the second half of the century the most important commissions were those given by Louis XIV for his palace at Versailles, for which the gates and screen of the Cour d'Honneur cost 32,500 livres. The influence of French wrought-iron work was spread by the numerous pattern books compiled by Louis XIV's court designers, such as Jean Lepautre, Jean and Daniel Marot, and Jean Bérain. The Louis XIV style was based on a combination of interlacing bars with graceful foliate ornament, elements which readily lent themselves to rococo designs. During this period wrought iron for interior use was sometimes finished with a bright polish — as on the famous doors to the Galerie d'Apollon in the Louvre (PL. 520) — instead of with the customary black finish. There are innumerable examples of French wrought iron in the Louis XV style, but the most famous work of the century, executed in the independent duchy of Lorraine, was the gates and screenwork of the Place Stanislas at Nancy, erected for Stanislas I Leszczyński, former king of Poland. In the latter part of the century, screenwork, such as that of the courtyard of the Palais de Justice in Paris, became so massive that the execution presented the greatest difficulty to the smith but could be accomplished with ease by the founder. The polished iron stair rail of the Petit Trianon at Versailles is enriched with chased and gilded-brass foliage. In the 19th century cast iron generally replaced wrought work, and not until the end of the century, under the combined influence of the Arts and Crafts movement and the Jugendstil, did wrought iron return to favor.

Chiseled iron and the art of the locksmith. Pierced and sawed work, similar in character to that applied to tabernacles and grilles, was adopted by the locksmith and used to adorn the whole range of his productions: hinges, locks, knockers, caskets, and clockcases. First appearing in the first half of the 15th century, this style continued well into the 16th, its latest manifestations being found on the wrought-iron clockcases made in the late 16th century by the Swiss clockmaking family of Liechti. The finest work was that of the French locksmiths, though more attention was paid to the decorative features of the locks than to their technical efficiency. The face of the lock was divided by pinnacled buttresses into compartments, each of which was filled with layers of Gothic tracery of varying design, and the ground was covered with scarlet cloth known as *marouflage*. The more elaborate Gothic locks are usually identified as French, but fine work was also done by German and Spanish smiths, the style of the latter being based on German models.

Medieval caskets were made of iron or wood, the latter being supplied with elaborately cut and chiseled iron mounts. It was not until the end of the Middle Ages that recognizable national types appeared. One French type was entirely of iron with an arched lid; the Gothic examples have applied tracery ornament, while the later ones have etched or damascened ornament. The Spanish type was almost rectangular in section, but with slightly curved walls, and made of wood covered with one or more layers of tinned sheet iron pierced with Gothic ornament. The medieval key was of simple design, with the bow in the form of a trefoil or quatrefoil and the shank of plain circular section.

In the late Middle Ages, blacksmiths made a variety of articles of ecclesiastical and domestic furniture. Among them were door knockers roughly chiseled out of iron in the form of an animal or monster and having backplates pierced with Gothic flamboyant tracery; firedogs; hanging chandeliers; font cranes, of which the finest examples were produced in the Netherlands; lecterns; and standing candelabra.

Locksmiths were strongly conservative in their choice of ornament, and it was not until the mid-16th century that Gothic decorative designs were displaced by Renaissance elements. An important development in the history of the lock was the practice, introduced in the late 16th century, of placing the lock mechanism on the inside, rather than the outside, of the chest or coffer. This change diverted attention from the ornament to the mechanism, which became more complex. The German smiths showed particular ingenuity in devising complicated locks and padlocks. A specialty was the lock fixed on the underside of the lids of iron coffers; these shot as many as twelve bolts, all activated by a single key. Nürnberg was the center of fine locksmith work in Germany; there were produced many iron caskets with all-over etched and gilded ornament, similar in pattern to the decorated armor of the period and probably executed by the same masters. While German locksmiths used embossed or etched ornament, that on the French locks of the same period was usually chiseled from solid metal, though in a somewhat coarse manner. However, French locksmiths executed fine door hardware for the châteaux at Fontainebleau and Anet; but even more remarkable than the locks are the keys, which

represent the highest peak of the locksmith's art. During the 17th century the French locksmiths' guilds required apprentices to submit an elaborate masterpiece lock, and the finest examples of this period were thus intended less for use than to display the proficiency of their makers.

French locks of the 17th century were unrivaled; the trades of gunsmith and locksmith were always closely associated, and it is no coincidence that the florescence of French locksmithing coincided with the best period of French gunmaking. Engraved decoration now accompanied the chiseling, but the locksmiths were less skilled with the burin than with the hammer and chisel. Brass lock plates were introduced toward the end of the 17th century, and in the following century they became universal. The locksmith now found himself confined to the making of the lockwork, as cast and chased lockcases were obtained ready-made from the founder. In England some fine door hardware was made to the design of Robert Adam, probably at the Birmingham factory of Matthew Boulton, but the locksmith's trade succumbed to the mechanical methods of production introduced in the 19th century.

The iron chiselers were mostly occupied with the adornment of such small articles as casket mounts, sword hilts, and locks and keys, but they occasionally received commissions to produce larger objects. Most important of the latter is the chiseled iron throne (now in Salisbury, Wiltshire, Longford Castle, Coll. Earl of Radnor) made by Thomas Rucker (ca. 1532–1606) of Augsburg for presentation by the city council (*Stadtrat*) to the Holy Roman Emperor Rudolph II. Signed and dated 1574, it is chiseled with numerous figures in the round and 130 medallions with small figural subjects. The laborious practice of chiseling figures in the round out of iron was continued in the 17th century by the Sadeler family, which worked for the Bavarian court, and by Gottfried Leigebe (1630–83), medal die cutter for the court of the Elector of Brandenburg. Leigebe's most important works are two equestrian statuettes of Emperor Leopold of Austria (Dresden, Albertinum, Grünes Gewölbe) and of King Charles II of England (Copenhagen, Rosenborg Castle), each of which is carved out of a single block of iron. These follow on a small scale the customary baroque monumental style.

Some of the most exquisite chiseled work of the 17th century was executed in northern Italy, in and around Brescia, and by the members of the Acquafresca family of Bargi, near Bologna. Their products included snuffboxes, tweezers, and other small, useful articles. The Brescian wares were ornamented with bold, scrolled foliage in a somewhat rustic version of the contemporary baroque style, while the Acquafrescas mastered a more sophisticated, Louis XIV manner.

Iron chiseling was always a subsidiary craft in the fine arms industry, from which both method and style of ornamentation were taken over. In the 18th century the craftsmen who decorated small swords with chiseled figures of classical deities against a mat-gold ground applied similar ornament to a variety of small luxury articles, ranging from chatelaines to etuis, shuttles, and snuffboxes. The finest work in this genre was done in Paris, but French *émigré* workmen introduced the craft to most European capitals.

Cut steel. Cut steelwork was introduced in England during the 18th century; its manufacture was exploited by the same Matthew Boulton who had set up the manufacture of ormolu in Birmingham. Similar work was done in France and, on a particularly ambitious scale, in the Russian town of Tula, near Moscow (VII, PL. 345). In this technique, a large number of steel studs with faceted and highly polished heads were applied to a metal background. It was used most successfully in cheap jewelry, because the faceted steel reflected the light more effectively than the marcasite which it replaced. In France toilet tables and workboxes of finely figured woods were studded with cut steel, while in Russia furniture and even large mantelpieces were adorned in this way. The steel studs were given their high polish by women who rubbed them with bare hands.

Iron chiseling was revived in the mid-19th century in the capital cities of Europe, mainly for the decoration of weapons, notably firearms. There was also a not inconsiderable production of spurious 16th-century works of art in chiseled steel by Parisian and Milanese craftsmen who, for obvious reasons, have remained anonymous.

Damascened iron. Damascening is the art of decorating one metal with incrusted ornament of another metal. In Europe it has usually involved the decoration of iron with gold or silver, but in Italy brass and copper were decorated in a similar way in the 16th century. The usual process was to roughen the surface of the metal to be decorated, using a file, thereby giving purchase to the precious metal, which was then hammered on in the form of wire or foil. By another, more laborious technique, a groove was cut in the surface to be decorated, and crosscuts were made at intervals; the gold or silver wire was then hammered into the groove. The former technique is commonly known as "false damascene" and the latter as "true damascene." Damascened ornament was widely applied in Europe in the Migration period, particularly on iron sword hilts and belt buckles and clasps; but it fell into disuse in the high Middle Ages, only to be reintroduced into Europe in the early 16th century through Italian, probably Venetian, contact with the Near East. Even when the technique had been fully mastered in Europe, arabesque designs of Oriental origin continued to be employed. Such masters as Hans Holbein (q.v.), Peter Flötner, and Virgilius Solis produced innumerable Moresque designs to be copied by the engraver and damascener. At first applied only to weapons, damascene was soon found suitable for all kinds of iron objects (e.g., mirror frames, caskets, and instrument cases) and was even applied to such large articles as tables and chairs, for which its minute scale made it inappropriate. The main center of the art in the 16th century was Milan (see ARMS AND ARMOR). Draftsmen who had emigrated from Milan were probably responsible for the finest damascening that was done elsewhere; thus the Milanese master Francesco Negroli is believed to have executed the fine damascening on the armor of Henry II of France. Benvenuto Cellini (q.v.) mentions in his *Autobiography* that he had mastered the art. Although later Italian damascening shows the inevitable drawbacks of large-scale production, earlier examples, such as the stirrups of Emperor Charles V by Bartolommeo Campi of Pesaro (Madrid, Armería Real), equal the finest Near Eastern work. After the 16th century, damascening was confined mainly to the decoration of arms, but there was a revival of the art in the 18th century in the south Russian town of Tula. The specialty of the Tula craftsmen was to incrust burnished steel not only with gold and silver but with platinum and copper as well. Like the 16th-century Milanese artists they indulged their ambition to the extent of producing large articles, including tables, chairs, and fireplace furnishings, the most important examples of which are preserved in The Hermitage, Leningrad.

In the 19th century, damascening was revived along with the other arts of the Renaissance. The most remarkable work was done by Eusebio de Zuloaga at Toledo, where the industry revived by this craftsman has survived to the present day. He made caskets, weapons, and clockcases which in style faithfully followed Renaissance prototypes but were unmistakably 19th century in spirit.

Cast iron. Though the technique of iron casting was mastered in Europe by the 14th century, it was not until the very end of the Middle Ages that cast-iron products began to show any artistic merit. Apart from objects of warfare, the main use of the material was in the production of fireplace furnishings; in the 15th century, firebacks, firedogs, and stove plates were made of cast iron. The only known Gothic cast-iron stove is preserved in the Veste Coburg (Castle of Coburg), where it was installed in 1501 by Frederick III (the Wise), Elector of Saxony. A number of 15th-century firebacks have been preserved, however, the finest examples of which come from the Eifel region of Germany. These firebacks were cast from molds that were formed by pressing a wood panel carved with the subject to be reproduced on the fireback into a bed of fine sand; the esthetic merit of the result thus depended on the skill of the wood

carver. The finest cast-iron work was, therefore, produced in those regions which had both a supply of the raw material and a tradition of wood carving. This explains the relatively poor quality of late Gothic English firebacks in comparison with those cast in Lorraine and the Tirol. In the 16th century the iron-casting industry of Germany was particularly flourishing; some of the finest designs, derived from contemporary graphic art, were carved by Philipp Soldan (ca. 1500–69) of Frankenberg, Hesse.

Both monumental plaques and graveyard crosses were cast in iron during the 16th century and later; some of the plaques, cast with heraldic ornament and inscriptions, are of considerable artistic merit, in spite of the coarse nature of the material. The 16th century was the best period for cast-iron stove plates in Germany. Subsequently, in the 17th and 18th centuries, they were no longer decorated with finely modeled figural subjects, but with ornament of a somewhat abstract nature that was intended to conform to the decorative scheme of the room for which they were destined. In 18th-century England the increasing use of coal instead of wood fuel led to the introduction of the dog grate and the obsolescence of the fireback.

Improvements in casting technique during the 18th century made it possible to extend the uses of cast iron, particularly in architecture. The delicately pierced cast-iron gates at Schloss Pommersfelden, near Bamberg, date from 1718. Cast-iron railings were produced on a large scale in England during the 18th century, the earliest examples being those erected in 1714 around St. Paul's Cathedral in London. Cast iron was also used for the bases, capitals, and balusters of wrought-iron gates and screens, but not until the neoclassic period, in the last quarter of the 18th century, was cast iron regarded as a worthy substitute for wrought iron. It is not surprising that England with her great mineral wealth should have been foremost in exploiting the possibilities of cast iron. The first cast-iron bridge was erected near Coalbrookdale in 1779, and the material was used extensively in late-18th-century architecture. The long rows of terrace houses, which were so typical of late-18th-century English town architecture, required miles of railing of repetitive design, a need which could be met most economically with cast iron.

Cast iron was also used for grates and stoves; some of the neoclassic stove designs were of great elegance. Because the black tone of cast iron made it an acceptable substitute for the far more expensive bronze, in the early 18th century many small objects that would previously have been made of bronze were produced in iron; among these objects were paperweights, doorstops, lamps, and vases, which were of good design in the earlier examples but became increasingly fussy toward the middle of the century. Cast iron was also used in sculpture ranging from small statuettes to life-size figures. The mid-19th-century founders' success in producing fine castings led them to make articles in which delight in elaboration for its own sake is apparent. Some of the worst examples were to be seen at the Great Exhibition of 1851, where furniture and mantelpieces of cast iron with a riot of pierced ornament in a degraded Gothic or Renaissance style were much in evidence.

John F. Hayward

Metalwork in contemporary art. In the late 19th century the followers of Art Nouveau (q.v.) contributed to a remarkable expansion in the employment of iron and other less traditional materials in the arts — not only for railings and balusters (I, PL. 468) and for decorative architectural elements, such as the cast-iron ornamentation of façades by Louis Sullivan (I, PL. 469), but also for furniture (q.v.) and other household objects (q.v.). Early in the 20th century the architect Henri Van de Velde (q.v.) predicted "a great future" for iron, lead, and aluminum. Beginning in 1919, the Bauhaus movement gave added impetus to the use of metals in architecture and in domestic objects, with its buildings of metal and glass, with its furniture workshop (whose director, Marcel Breuer, first introduced steel tubing in the construction of furniture; V, PL. 456), and with its development of functional lamp designs. Only in post-World War II industrial design (q.v.), however, have metals found almost universal application in the production of vehicles, scientific and mechanical works, and utensils and tools (qq.v.).

With the emergence of cubism in the first decade of the century the use of metals in art began to assume the totally new characteristics that have become so typical of our age (see CUBISM AND FUTURISM). Such cubist-inspired works in metal as Picasso's *Female Head* (V, PL. 128), Raymond Duchamp-Villon's *Horse* (IV, PL. 82), and Jacques Lipchitz' *Sailor* (XII, PL. 513) retained the mass of traditional cast sculpture, but thin sheet metal also became an important medium for the rendering of the form-dissecting planes of cubism, as seen, for example, in the *Bust* (1916) by Naum Gabo and in works by Antoine Pevsner (qq.v.; V, PL. 137).

As a result of the impact of cubism and subsequent modern movements on sculpture (see EUROPEAN MODERN MOVEMENTS), modeling and representation have lost their supremacy to the quality of the material and its technical possibilities. Metal is often accepted in a coarse state, either as a beautiful form of nature or because it is considered to have a greater emotional intensity. On the other hand, nickel-plating and other methods of treating metal surfaces against corrosion have contributed to the achievement of purity of design, with an almost complete dematerialization of the object, as seen in works by Brancusi, Arp (qq.v.), and many others.

A large and important group of sculptors have adopted industrial and mechanical techniques for working directly in the metal, whereas in the past the artist usually made only the model from which the final work was cast by a founder. The Spanish artists Pablo Gargallo (1881–1934) and Julio González (1876–1942), both of whom created sculpture in wrought iron, were the forerunners of contemporary sculptors who execute their works with the tools of the smith, among whom are the American artists Theodore Roszak and Seymour Lipton (I, PL. 131; see AMERICAS: ART SINCE COLUMBUS).

In the years following World War II metal has generally been used less as a merely constructional element of sculpture and more for its colors and, above all, for its particular material qualities (PL. 521). The roughness of the surface is emphasized, left-over traces of the casting or soldering process remain, and dark, corroding varnishes are used to simulate aging. Iron, in particular, has proved to be a material that readily adapts itself to the creation of highly stylized sculptural images rich in symbolic references. This characteristic of iron as a sculptural medium can be seen, for example, in works of David Smith (I, PL. 132), Eduardo Chillida (V, PL. 146), and Lynn Chadwick.

The chromatic richness of metal resulting from certain surface coatings or from spontaneous aging has also stimulated pictorial compositions that are almost, if not actually, two-dimensional. These may be composed mainly of soldered or even cast panels, as in works by the French artist César (b. 1921), or of sheet metal freely juxtaposed and superimposed, as in Alberto Burri's 1957–60 series of "Irons." Lucio Fontana has used polished tin in place of canvas for compositions consisting of holes and cuts. Metal, especially iron, is also used extensively in the realization of "Neo-Dada" art forms, such as the assemblages of Richard Stankiewicz (b. 1922), which are made primarily of used machine parts, and those of John Chamberlain (b. 1927), which are composed of automobile fragments. (See also MEDIA, COMPOSITE; NONOBJECTIVE ART.)

* *

ASPECTS OF ARTISTIC METALWORK IN ASIA, PRE-COLUMBIAN AMERICA, AND AFRICA. *The Iranian world.* The vast and varied metalworking activity of pre-Islamic Iran was of some importance in almost all the phases of this period, sometimes setting its mark on particular artistic developments and indirectly but persistently influencing the work of later periods (see IRANIAN PRE-SASSANIAN ART CULTURES). The coherent evolution of Iranian art is partially linked to this consistent activity, which profoundly affected the development of style, as can be seen more clearly in diverse aspects of other activities. The Iranian area, like the areas between Anatolia and the Caucasus, was rich in cupriferous metals, and when the use of copper became

common, toward the end of the 4th millennium, the sources of the Sumerian supply of this metal were found in Elam, as well as in Asia Minor and Armenia. The metal was extracted by washing alluvial deposits, and its source has been determined by the correspondence between its impurities and those of the washed sands.

In the Assyrian period the source of supply for the western regions of the Near East was more or less the same. The written records, which distinguish "good copper" from the less pure, emphasize the wealth of both raw mineral and copper products to be found in the Urartu, another very important area for ancient metalwork. The deposits of the Caucasus, which supplied the tribes of the Caspian steppes and other more distant areas (e.g., the valley of the Danube), were also of some importance. The diffusion of stanniferous minerals was responsible for a rapid acquaintance with bronze, to such an extent that one may doubt the existence of a prolonged Copper Age in Iran. According to some authorities, copper was replaced by bronze that contained a small quantity of tin. Classical tradition and archaeological data indicate, nevertheless, that northwestern Iran was the center of an ancient metalworking society, as well as an area of diffusion for the related technical skills. Archaeological and artistic data prove that Elam (the region around Susa) was an equally important area. Here, the first phase of metal production is marked by a predominance of copper pins with the clasp in animal form. These works, which exploit the animal motif so dear to the terra-cotta vase painters, are stylistically linked in various ways to the later productions of the north and already seem clearly Iranian in character. In the following phase, corresponding to the so-called "Royal City" at Susa and dating from the beginning of the 3d millennium, the characteristic types of work done in metal became more varied. There are vases with long, open beaks (derived from clay models), cups, spoons with the bowl divided into five parts, mirrors with handles, pins with terminal bulls' heads, axes, javelins, short sabers, and reinforcing nails for shields. Goldwork became considerably important, possibly because of contact with Mesopotamia, but it differs greatly from that of Mesopotamia, not only in the forms but also in the preference for settings of lapis lazuli (also found in copper objects) and its combined use with bone.

In the north, setting aside Anau, a notable wealth of metal objects corresponding to strata IIIb and IIIc has been found at Tepe Hissar. Copper, bronze, gold, silver, and even lead were used lavishly in goldsmith's work, as well as in functional objects, such as pins, weapons, spiral ornaments, and scepters. The discovery of a considerable quantity of unfinished objects — probably the warehouse of a foundry — has given clear evidence of technical skill and has brought to light other types of work, including small human figures and pins with heads of animals. The working of thin metal plates suggested to the artists of Tepe Hissar the stylized representation of a goat's head as seen from the front; the frontal design, which transforms the large horns of the animal into an almost spiral ornamental motif, was later to be used by the metalworkers of Luristan for similar but much heavier ornaments (II, PL. 6). The working of the metal plates and the stylization of the Tepe Hissar works may also have spread to and reacted by diffusion on the work of India (e.g., the anthropoid figure of copper plate from Bisauli, Uttar Pradesh). There was close contact with the Caucasus and Talish, although the incised decoration differed in the Iranian territory. Nevertheless, certain forms are derived from those of the Caucasus and Talish, such as the daggers and swords with central ribs and a crescent-shaped reinforcement at the base of the blade and with a hollowed-out handle for the grooved inlay work of wood or bone.

The metalcraft of Iran reached its highest point of development in the period of the Elam kingdom. The famous bronze statue of Queen Napirasu, consort of Untash-Huban (Untash-Gal; ca. 1250 B.C.) is sufficient to demonstrate the technical skill achieved by the Elam founders (VIII, PL. 121). Cast in two parts (anterior and posterior), the statue was later soldered with liquid metal that filled it completely, so that, although parts of it are missing, it still weighs about 3,850 pounds. The care with which the figure was executed, the accuracy of the details, the naturalistic vitality of the hands crossed at the waist, the contrast between the softness of the bust and the rigid stylization of the gown, all give this work great creative value, very different from the works of Mesopotamia. Various fragments show that it was a general practice in Elam to use metal bas-reliefs for decorating buildings of importance. The bronze "gates" that were intended to close the entrance to the cella of the fire temple at Susa demonstrate, in their technical skill and dimensions, the ability of the Elamite metalworkers at the time of King Shilhak-Inshushinak (1165–1151 B.C.). An ax from the "treasure" of the same king constitutes a prototype for the image of the griffin which later appeared in the Scythian and Central Asian world. At the same time, this ax, together with the one bearing the name of Untash-Huban discovered by R. Ghirshman at Chuga Zanbil, is undoubtedly an earlier example of the "zoomorphic joint" (a beast's head with wide-open jaws that hold the blade) used by the Scythians and in Luristan. The original source of the zoomorphic joint — characteristic of this metal production — is probably Syrian. Also from the so-called "Treasure of Shilhak-Inshushinak," the dove of lapis-lazuli paste with its collar formed of gold buckles shows the tendency to use polychrome materials and demonstrates the combined use of precious metals with hard and semiprecious stones. A silver hand and a mask from the same place, the surviving parts of a wooden statue of a divinity, show the particular taste and technical skill of the Elamite world. The bronze heads from Hamadan — and particularly the one in the Metropolitan Museum, New York — demonstrate the artist's great effort to translate into metal not only the physical aspect of the subject but, with an acute psychological study apparently of Elamite inspiration, his spirit as well (see PORTRAITURE).

The northern centers, such as Amlash, Hasanlu, and Khurvin (9th–8th cent. B.C., according to the recent chronology), do not seem to have produced monuments nor to have engaged in such a varied activity as that of Elam, but they follow a true decorative sense which shows itself in some exceptional creations of stylistic and compositional ability (II, PL. 5). The qualities of the metal are fully exploited by the sensitivity and technical skill of the artists, and the animal motif is always prevalent. The differences from the corresponding productions in terra cotta, in which the interest in volume is predominant, show that the same taste manifests itself even where the quality of the material necessitates diverse forms. The gold cups of Hasanlu and Amlash, like the well-known one of Kalar Dasht (VI, PL. 249), reveal a mixture of Iranian and Hittite and Syro-Hittite elements. At the same time, it is easy to distinguish those which are purely symbolic-decorative from those which reveal greater involvement and more ambitious intentions. Minor details, such as the triple line indicating the joints of animal limbs and certain other conventional forms, link the production of these northern centers to that of the Luristan bronzes, a production that is certainly more abundant and better known. Divided into two schools or types, that of the mountain tombs and that characterized by large votive pins with round heads (VIII, PL. 123), the production of Luristan also presents noteworthy stylistic variations and, by way of the Caucasus, assimilated influences from Central Asia and China (see ASIATIC PROTOHISTORY). The extensive use of the frontal depiction common to other Iranian centers, such as Geoy Tepe, the ribbon-like stylization of the animal figures, their frequently illogical and monstrous forms (see MONSTROUS AND IMAGINARY SUBJECTS), the highly descriptive quality of the compositions, and the preference for the corded motifs also found at Hasanlu, all are characteristic and distinguishable elements as compared with other works that are more realistic, or conceived on swollen and heavy lines — often of bestial monstrosity — typical of another important aspect of the Luristan production. Differences of time and place are hidden behind these variations, which exploit the qualities of the material by using the most varied techniques, from casting by the lost-wax process to incising and repoussé. Without doubt the artists preferred metal, not only for its esthetic qualities and permanence, but also for the effects that they were able to draw from it. In fact, while the

prevalence of iron was later to drain the creative powers of the Iranian metalworkers, it is easy to see how the pottery work of some localities, such as Sakkiz, adapted details derived from the metalwork and used them as decorative elements. The shapes of the clay and the metal vases are also reciprocally related, without the marked differences in style that often occur in the work of other civilizations. The problematical production of Zawiyeh (VIII, PLS. 124, 125) occupies a separate position and acts as a link between the northern centers, Luristan, Central Asia, and Urartu (see IRANIAN PRE-SASSANIAN ART CULTURES).

The Achaemenian phase inherited the use of smaller statuary, as well as an interest in cups and vases, from the preceding Iranian schools. Some echoes of the Assyrian style, already present at Amlash and Zawiyeh, do not alter the autonomous character of the work, and gold, silver, bronze, and iron were used with great ability. The decorative tendency appears somewhat reduced and modified, though the inclination to use polychrome, especially by means of inlaid steelwork or damascene, still persists. From the stone reliefs of Persepolis and Susa it is possible to confirm the important role that Iranian metalwork sustained in this period as well, and perhaps the detailed descriptiveness of the great Achaemenian works can be traced to the minute work of the goldsmiths, who were accustomed to treating every detail of their figures with great care.

The metalwork of those areas where late cultures and nomadic groups predominated is largely responsible for the vast extension of influence, in different periods and diverse styles, from Achaemenid Iran to a considerable part of Eurasia from the Ural regions to the Altai, and from Central Asia to the India of the Maurya dynasty. It is the metalwork, in fact, that testifies to the presence of this influence in the Ural region (e.g., metal plates of the Iranian-Scythian type found in the valley of Yuryuzan' in Bashkiria, from the 6th–5th cent. B.C.; a bronze Achaemenian plate from the Kama River basin; and vases with Aramaic inscriptions and a sword with a handle of enameled gold from the tombs of Prokhorovka); the style of the few metal ornaments found at Pazyryk confirm the stylistic derivation from Achaemenid Iran of the small works of wood certainly inspired by the Achaemenian figural designs. As R. Ghirshman has noted (1961, p. 103), Achaemenian art is connected with the preceding Iranian currents by the continual use of the animal motif so dear to the nomadic people of Eurasia. The new religious and social ideas that animated the first world empire in history, with the severity of its style, naturally limited the creative imagination of the artists. It is in the minor works of metal, full of force and vitality, that the patterns and ideas of the old schools take on new forms, enriched by the artistic experience of the Medes and the Scythians, the Assyrians and the people of Urartu (VIII, PLS. 138–140). One is reminded of Zawiyeh or Kalar Dasht in the details of the silver plates with various repoussé decorations and incised and damascened geometric motifs, in the rhytons terminating in goats' heads, in the protomas of bulls or winged lions, and in the vases of complex structure. At the same time, certain figural conventions persist (e.g., in some representations of lions) that seem to be connected to the ornamentation of Urartu. The wide variety of Achaemenian gold- and silverwork seen in the gold and silver bracelets, small figurines of lions, sumptuous swords, necklaces, rings, and earrings confirms the Iranian founders' and artists' complete absorption in the working of metal.

In the Parthian period, the production of metal remained very intensive. The large bronze statue from Shami (ht., 6 ft., 3 in.), the head of which was cast separately from the body and completed by chiseling, is sufficient evidence of the continued preference for metal (VIII, PL. 141). The technique of separately casting the two parts of the statue is responsible for a lack of balance in the proportions, which suggests that the head may have come from another place, whereas the body was certainly cast at the site. Minor works, also in bronze, indicate an intensive production of metal in Fars, and although there is a lack of archaeological data concerning the Parthian period, the production and working of metal seem to have been an important activity in the rest of the area. The effect of contacts with the classical world is occasionally revealed by some detail of the small statues, perfume stills, gold and silver bowls, rhytons, plates, ornamental plaques, diadems, necklaces, and earrings (some in clusters). Seen together, however, these works remain exquisitely Iranian and are always inspired by a profound ornamental sense, which the chromatic effects of damascening, inlay, and enamels often enliven. The animal motif remained vital in gold- and silverwork as well as in the bronzes. At the same time, with new technical processes, special use was more frequently made of metal (chain mail, breastplates of superimposed sheets, etc.), and a noteworthy development began with the minting of coins.

When the Sassanians came to power, Iranian gold- and silverwork reached perhaps its greatest development, especially in the working of silver taken from the rich deposits of the territory. The style and forms naturally changed, and the plates, bowls, vases, and bottles often came from craft shops whose work served political purposes, since these much-admired creations were then sent as gifts and signs of friendship to foreign kings and chiefs. This explains the enormous diffusion of these works, which reached as far as Japan (e.g., the lobed bowls in the Shōsōin, Nara), coming from Poland by way of Siberia and China.

The high nobility also had craftsmen at their disposal, who produced silver articles for the personal use of their patrons. In such cases, as Ghirshman points out, the image of the reigning king, often used as the central figure of the design, is a sign of the noble's faithfulness to the supreme sovereign. The stylistic evolution of Sassanian silverwork, which was paralleled by a reduced bronze production and some goldwork, goes from moderate relief toward flat and stylized forms that are very effective. The decorative tendencies remain, and polychromy is obtained mostly through damascening. The remarkable exception to this is the so-called "Cup of Khusrau" (XII, PL. 395), with three circular rows of glass medallions of three colors set in a framework of solid gold, with a rock-crystal medallion at the center bearing the incised image of the king. These works, as well as the silks and other fabrics, account for the widespread influence of Iranian art of the Sassanian period. Still more important, it is easily demonstrated how the large rock sculptures commemorating the ascension to the throne or the undertakings of the Sassanian kings are also animated by a descriptive and compositional sense closely related to that of the silverwork. Once again, therefore, the Iranian decorative sense triumphs through the art of metal production, influencing almost all the plastic art forms (even gigantic works) of the period. The widespread influence of the Iranian creations in the field of gold- and silverwork is truly enormous; it is not only the dancing figures impressed into the molded, terra-cotta floor tiles from the monastery of Harwan in Kashmir (VIII, PL. 359) and the stylized mountains of the Chinese Buddhist paintings of Tun-huang that prove this. In fact, many of the pictorial compositions of Central Asia show the effects of the spatial conceptions of Iranian plastic art, and it is difficult to establish whether these derive from the large rock sculptures or the small compositions in silver. It is certain that in some cases — for example, the painting of Kucha (q.v.) — the attempt to achieve illusionistic relief is replaced by a flattening of the forms. This corresponds to the stylistic development of Sassanian toreutic work. Even after the fall of the empire, the Iranian toreutic tradition continued in "Outer Iran," with works of noteworthy importance created in the western regions of Central Asia, especially in Sogdiana (q.v.). Only a careful examination could define these works as post-Sassanian. On the other hand, both the stylized forms of the last Sassanian works and the likewise stylized works of somewhat later date from Outer Iran eventually inspired the daring and curiously modern compositions of the Islamic ceramists of the vital and fertile center of Nishapur. In their work — more than in the working of metal, which was by now partially modified — are found the last echoes of Sassanian and Central Asian toreutic work.

Mario BUSSAGLI

Southern and southeastern Asia. In the northwestern part of the Indian peninsula the working of metals is of very ancient origin. Precious objects of fine craftsmanship, such as jewels in burnished gold, silver vessels, and a few bronze or copper figurines (II, PL. 7), are among the vestiges of the Indus Valley civilization from the 3d to the first half of the 2d millennium B.C. (see ASIATIC PROTOHISTORY, INDIAN ART, INDUS VALLEY ART). It is known that the advance of the Aryans in the 2d millennium B.C. was facilitated by the superiority of their weapons and of their metalworking in comparison to that of an adversary which remained at the level of the Stone Age. In central India silver ornaments and, sometimes, small gold plaques with repoussé work of the protohistoric period have come to light. The documentary sources compiled in the 1st millennium B.C. (Veda, the great epopees, etc.) show, however, that iron was worked at an early period, at the same time as gold, silver, lead, and tin. These texts reveal the sumptuousness already achieved in gold- and silverwork (q.v.) and in jewelry, a taste which has survived in India. Steelmaking was also known before the Christian Era; from that time on, steel was exported from India to regions to the west. Quintus Curtius Rufus reported that the chiefs of the Punjab presented 100 talents of steel to Alexander the Great during his campaign in the Indus Valley.

The ancient texts also recall the importance of the corporative associations, among which those of the metalworkers held a position of some prominence. Each craft guild was headed by a chief or president, who was regarded as a man of high standing at the court of the sovereign. The crafts and the knowledge which they required were generally transmitted from generation to generation within the same family. Frequently several of these families joined together to form production centers for their own specific crafts, founding villages of potters, of carpenters, of smiths, and of other specialized craftsmen, in which traditions were formed and transmitted. Because of this gradual development of techniques and forms, the art of metalworking, like so many other fields of artistic endeavor, has taken its values from and remained faithful to the spirit of Indian art, even if certain techniques and influences have been absorbed from outside. The hereditary office of goldsmith was one of particular importance, and highly placed families retained one or more members of this corporation in their service, thereby assuring themselves of their products.

From the last centuries before our era (principally from the 2d century B.C.) sculpture and painting offer evidence of the abundance of artifacts produced by the various categories of metalworkers, of the most popular forms, and of the richness of the decoration. Depictions of jewels, weapons, and a diversity of other objects indicate the variety of types. The very rare extant samples from about the beginning of the Christian Era document the ability achieved by these craftsmen; the reliquaries, bowls and goblets in gold, silver, or copper are generally worked in repoussé and are sometimes incrusted with precious stones (VII, PL. 465). The jewels and the majority of the artifacts have come to light at Taxila, Pakistan (VI, PL. 256); they testify to the great variety of techniques then in use, which have survived until the present day. In India, gold and other metals are incised, open-worked, repoussé, chiseled, filigreed, granulated, or incrusted with gems, pearls, and other materials. The cloisonné process was already known, and chains of extremely fine links were made in very early times. Although the high quality of the coins of the Greco-Bactrian princes (3d–2d cent. B.C.) was not sustained (see COINS AND MEDALS), the issues of the Indo-Greek kings retained their traditions. These were still reflected in the coinage of the Kushan and Gupta dynasties, which for a short time reacquired an artistic value, only to vanish after the 5th century (see GUPTA, SCHOOL OF; KUSHAN ART).

The perfect knowledge acquired in the casting of iron during the early centuries of our era is evidenced by the surprising creation of works of considerable massiveness. At Dhar there is an iron column, or lat, more than 40 ft. high, which was raised in about 321. Before the Quwwat-ul-Islām Mosque in Delhi there stands the Iron Pillar, about 23 ft. high, bearing inscriptions of the Gupta king Candragupta II and dating from the beginning of the 5th century; its double capital was intended to be crowned with a statue. The quality of the material and the workmanship were such that neither the pillar nor the inscriptions on its surface have been attacked by rust. Moreover, iron and bronze have been used frequently in Indian architecture as fixing anchors or as clamps to connect stone in masonry. In the Sūrya temple at Konarak, incompletely soldered iron beams replace the usual crossed stone beams that support the great slabs which form the ceiling.

Metal was also used in harnesses (gold rings, elephant hooks, etc.), in the construction and ornamentation of carts, chariots, and boats, and in the decoration of palaces; according to a 16th-century writer, a room in the palace of Vijayanagar was "completely lined with gold."

Although few ancient objects have survived, more recent examples are numerous, and the craftsmen, because of their traditionalism, have often preserved the processes and forms through many centuries, in spite of the partial renewal of techniques and decoration that occurred after the arrival of the Moghuls in the 16th century (see MOGHUL SCHOOL). Precious metals (gold and silver) as well as the base metals (iron, tin, and particularly copper) have been used singly, alloyed, or associated according to various techniques. Certain combinations are peculiar to India or to some of its regions. One is bidri, an alloy of lead, zinc, and tin incrusted with silver; the surface of bidri is blackened to bring out the contrast of values. In similar work from Kashmir a floral decoration is traced deeply on a gilded silver object to create a delicate effect of contrast by allowing the silver to show beneath the gilding. Damascening is now used to decorate domestic articles; it was very much favored for the decoration of arms and armor under the rule of Akbar (I, PL. 454) and of his successors and under the Rajput princes (see RAJPUT SCHOOL). Copper, like brass, has been used for a great variety of purposes and worked in all manner of ways, with openwork, niello, repoussé, or gilt, and by being hammered, chiseled, incised, perforated, and even incrusted with silver. The brass of Benares has a gold luster which has never been equaled. The casting of bronze by the lost-wax process has been used for statuettes and other objects, both in India and in the regions whose culture is Indianized. A remarkable example of this process, which has been known for a very long time, is the colossal copper Buddha of Sultanganj of the Gupta period (5th–6th cent.; Birmingham, Eng., City Mus. and Art Gall.).

The art of metalworking flourished in the regions near India (Nepal, Tibet, Burma, Ceylon) and in the areas of southeastern Asia, where Indian traditions were established early and similar techniques often employed. However, although the same taste for jewelry and sumptuous work in precious metals is fairly widespread, and although the same careful craftsmanship was observed in the manufacture of ritual and sacred objects, local tendencies have nevertheless made themselves felt, and the ornamentation of the artifacts is related to that found on architectural monuments. In Tibet, metalwork — in bronze, especially — has been most widely used for religious purposes in the fashioning of liturgical objects of remarkable quality (PLS. 176, 178). In Burma and Thailand silver, in particular, has been worked with great ability (filigree, repoussé, niello, cloisonné). The craft traditions of Cambodia have survived to the present day, the same careful workmanship being applied to gold, silver, and bronze artifacts, with a similar refinement to be seen in the forms. Although ancient objects have survived (e.g., bells, basins, rings and hooks for litters and palanquins), the reliefs of Angkor Wat and of the Bayon have also contributed to our knowledge of the complexity and refinement of the ornamentation and of the sumptuousness and elegance of personal ornaments and ritual and utilitarian objects. Metal has also played an important part in Khmer architecture (see KHMER ART), in which iron anchors with double dovetail joints and clamps were soldered with lead into the stone in masonry construction; also, bronze plaques, which must have served as facings for the decoration of interiors, have come to light. Even though there are no samples of iron used in Indonesian monuments, Indonesian reliefs recall the ancient forms of metal objects. The sur-

viving lamps, vessels, goblets, gongs, bells, and caskets in bronze and precious metals reveal the beauty of the work and the harmony of the ornamentation, as the jewelry still does. Ironwork reached the peak of its perfection in the hands of the armorers, especially in the manufacture of the kris, or Javanese dagger. By means of a special technique (*pamor*) the blade was made of alternate layers of iron and nickel iron, while the handle, made of diverse materials, was richly decorated.

Madeleine HALLADE

China and Japan. The high technical and artistic standards of the bronzes dating from the Shang dynasty (ca. 1500–ca. 1028 B.C.) found at An-yang and other cities indicate a long development. The lack of evidence for a primitive stage of Chinese bronzes is regarded by many scholars as proof of the migration of a bronze culture to China from the west or northwest. According to this interpretation, the Chinese learned how to produce and cast bronze from other peoples but perfected these techniques to a degree which has never been equaled. Currently, however, there is a tendency among Chinese and Western scholars to minimize the importance of external influence in favor of an indigenous evolution.

An-yang, the royal capital of the late Bronze Age was opened to scientific study through excavations at Hsiao-t'un, from 1928–37 and in the 1950s, which led to the discovery of many weapons and vessels characteristic of this period (ca. 1300–ca. 1028 B.C.). Excavations at Chêng-chou (Chengchow), south of An-yang, and bronzes found at Hui-hsien, still farther south, have augmented finds at Hsiao-t'un, disclosing the Bronze Age culture (ca. 1500–ca. 1300 B.C.) before the capital was moved to Hsiao-t'un. Although the vessels from these sites are more primitive in casting and artistic rendering than the classical bronze art of An-yang, they are still of much higher quality than is usual for products of a new art. They need not, in fact, be regarded as direct predecessors of the An-yang sacrificial bronzes, since they may have been made for secular use. In any case, they do not explain the rapidity with which the Chinese achieved the excellence in bronze casting manifested by the An-yang vessels.

According to a local tradition the copper and tin ores necessary for bronze products were once mined in the mountains northwest of An-yang, the old capital. The crucibles, molds, and other tools found there indicate that all the work involving smelting, refining, and casting could be done at workshops in the capital itself. The proportions of copper and tin or lead are not standardized in Chinese bronze, which shows a tin content ranging from 5–20 per cent and a smaller but varying lead content, differing in this respect from the bronze of the Near East and Europe.

The methods of casting can be divided into three types: single-mold, for articles with one flat side (weapons and decorative plaques); valve-mold, for articles which are symmetrical on both sides; and multimold, with the occasional use of internal cores. The third method has been described as either direct casting with molds and core or as an indirect method, in which piece-molds are used only to prepare for cire-perdue casting. Recent conclusive studies on this subject convincingly show that direct casting with molds and core was used, although H. G. Creel and many other scholars have accepted the cire-perdue method. The problem will not be definitely solved, however, until the fragments of molds found at An-yang and Chêng-chou are fully studied.

The earliest bronzes excavated at Chêng-chou and Hui-hsien show a great variety, which is even more noticeable at An-yang. They can be grouped as follows: food, wine, and water vessels; musical instruments; military weapons; tools; and miscellaneous. Of these categories, the sacrificial vessels have been of special interest to the Chinese at least since the Sung period, mainly because of their inscriptions. While the inscriptions on the Shang-Yin bronzes are short, those on bronzes of the early and middle Chou periods (ca. 1028–ca. 600 B.C.) are more informative. Since antiquity various vessels have had special Chinese names, and each type of vessel has had a somewhat standardized decoration of zoomorphic and unique geometrical forms (see III, cols. 474–77, 481–86). The dominant motif is that of the *t'ao-t'ieh*, a monster mask with large, protruding eyes, heavy nose-ridge, saw teeth, horns, and, occasionally, clawed feet, but lacking a lower jaw; the mask can also be read as a pair of opposed dragons with joined heads (II, PL. 10, FIG. 26). These dragons, *k'uei*, also appear individually in borders around the vessels. Also occurring in vessel decoration are cicadas, snakes, birds, bovine masks, deer masks, elephants, and, more rarely, human heads, while some vessels are themselves shaped like elephants, owls, or rams. The background of the zoomorphic patterns is always geometrical, with hooks and spirals in circular and square shapes, the so-called "thunder pattern."

Bernhard Karlgren has closely studied these patterns, classifying them in two main styles, A and B, and providing a key to the identification of the various patterns. Style A is characterized by the high relief of the masks, dragons, and naturalistic animal heads that cover the main surfaces of the vessels. Dominant in the early Chou period, the secondary Style B dissolves the animal motifs of Style A, making the patterns more geometrical and concentrating them within narrow bands which encircle the vessels; also, the relief is much lower than in Style A. In the Shang-Yin period, together with the incised and relief decoration, turquoise was used as inlay and the geometrical design might be filled with a black paste, the exact composition of which is not known.

The defeat of the Shang dynasty by the Chou kings resulted in the relocation of the capital to present-day Sian (Hsi-an), and the entire bronze culture successively underwent a great change, most obvious in the middle Chou period. Many types of vessels were discontinued, and only a few new types were introduced. The shapes of the latter were generally heavier and the casting much coarser. The *t'ao-t'ieh* masks and dragons were dissolved and simplified, and most naturalistic animal heads disappeared. The patterns, predominantly geometrical, were confined to broad, flat bands and included such motifs as horizontal fluting, scale pattern, and undulating meander. The middle Chou bronzes have been found at many places in China and show local variations of style and decoration.

Revived in the 7th century B.C., the art of bronzework subsequently attained new heights in richness of design and technical skill. At that time there appeared a new hybrid style that combined elements from the Shang-Yin and early Chou periods and borrowed elements from the nomadic art of the western tribes, which was transmitted through the Ordos (q.v.) region. Floral patterns were introduced for the first time, and sacrificial vessels ceded their prominence to such small, everyday bronzes as mirrors, dress hooks, horse and chariot mountings, weapons, tools, and other objects such as the bells found in the graves of rulers (PL. 498). The style of the period, which flourished in parts of China from about 600 to 206 B.C., the beginning of the Han period, has been called the "Huai style" (B. Karlgren) after the Huai River, where the first bronzes representative of this period were initially found; the term covers the late Chou, Warring States, and Ch'in periods, which, until now, have been difficult to separate more definitely on a stylistic basis. Characteristic of the style is the almost "baroque" tendency to cover the entire surface with intricate patterns of *t'ao-t'ieh* masks, dragons, birds, and animals against a background of spiral hooks or "grain pattern." For the first time gold and silver were used in great quantities as inlay (see GOLD- AND SILVERWORK); the inlay was made by hammering thin wires of the precious metal into the cavities. The precious metals were also incrusted with turquoise, jade, and other stones and sometimes affixed to the bronzes with lacquer (see LACQUER). It is likely that many small bronzes were produced at this time by the cire-perdue method, which was probably introduced from India about the middle of the 1st millennium B.C. In the period of the Huai style the art of bronzeworking flourished and dominated artistic metalwork to a degree that has never since been equaled.

During the Han dynasty (206 B.C.–A.D. 221) bronze was used mainly for practical purposes. Small bronze mirrors, still of

fine quality, were made of so-called "white bronze," an improved alloy with a greater percentage of tin and silver, which gave a better reflection and has been used in China ever since, most frequently during the T'ang period (618–906).

Bronze casting was revived in the 4th and 5th centuries with the introduction of Buddhism into China and the resulting need for sculptures of Buddha, bodhisattvas, and other symbolic figures for the temples. Altar sets of varying sizes were also cast in bronze by the cire-perdue method and gilded, and some are of high artistic and technical quality.

In the Sung period (960–1279) the first careful studies of archaic bronze vessels were undertaken, followed by a great interest in archaizing art. Ancient sacrificial bronzes were copied in free versions, sometimes with skillfully inlaid patterns of gold and silver. The imitation of old bronze vessels continued but declined in quality after the Ming period.

Ironwork, which in China never equaled the importance of bronzework, is infrequently discussed in classical texts and is thought to have been mentioned first in 512 B.C., a very late date in comparison with other Eurasian cultures of antiquity. Though it was first employed in weapons which resulted in great military success for the Ch'in state in the West, iron was used almost exclusively for such agricultural tools as plowshares and spades, which were cast, like bronze objects, rather than forged. The most significant finds of iron tools from the period of the Huai style were found in the Hui-hsien tombs. Cast iron was not suitable for swords and spearheads, and sharp weapons continued to be cast in bronze until the Chinese learned to forge iron. The technique was probably introduced from the south, since many forged swords, daggers, knives, and spearheads dating from the 4th century B.C. have recently been found at Ch'ang-sha in Hunan.

In the Han period the iron industry acquired great importance and ironmasters were "richer than the princes"; as a result the industry became a state monopoly in 120 B.C. Excavations of Han tombs have yielded a rich variety of objects, including not only agricultural tools and weapons but also dress hooks, mirrors, chariot mountings, and horse trappings. The iron was sometimes inlaid with gold and silver or incrusted with plaques of jade (on dress hooks), and iron mirrors were covered with decorative sheet gold. Iron ornamented with gold also occurred much later, during the Ming and Ch'ing periods, for example. Iron has also been used in Buddhist and Taoist sculpture since the T'ang period.

Some sacrificial vessels of the Shang-Yin period were cast in lead, which was also used for tomb furnishings, as evidenced by the so-called *ming-ch'i* of the Han and later periods (see CHINESE ART).

Bo GYLLENSVÄRD

In Japan metalworking, which was probably introduced by the Yayoi culture, has not been traced further back than the 3d century B.C. Since bronze and iron appeared there simultaneously, a Bronze and an Iron Age cannot be distinguished. During most subsequent periods, until contact with the West was first established in the 16th century and renewed in the mid-19th century, Chinese art forms and techniques exerted great influence on all fields of Japanese art; for example, it is difficult to discern whether the metal objects of the Nara period in the Shōsōin of the Tōdaiji were made by Chinese or Japanese craftsmen, although an octagonal openwork lantern (PL. 514) is undoubtedly of Japanese origin. The introduction of Buddhism in the mid-6th century stimulated metalworking because of the demand for ceremonial implements and temple ornaments, most of which were made of bronze (PL. 515); in fact, until the 20th century, most Japanese sculpture was Buddhist in motifs. However, the swords and sword fittings (PL. 515), which were produced from the 8th century onward by a complicated technique and in accordance with an elaborate ritual, remain the finest and most characteristic type of Japanese metalwork. For more detailed discussion of this and other areas of Japanese metalwork, see ARMS AND ARMOR, JAPAN, and JAPANESE ART.

Pre-Columbian America. In the Americas before the arrival of the Europeans the knowledge and use of nonprecious metals were remarkably limited compared to the technical and ornamental richness of the gold- and silverwork. The latter were used extensively in the production of jewels and household articles, particularly in the great Mexican and Andean civilizations (see ANDEAN PROTOHISTORY; GOLD- AND SILVERWORK; MIDDLE AMERICAN PROTOHISTORY). Notwithstanding the presence of iron in the American soil, the native peoples of the two continents did not know of or make use of it. Only quite late did they learn how to use and work copper and bronze; in the Americas there was no Bronze Age comparable to that of the Old World.

Bracelets and other articles from the mounds testify to an ancient knowledge of copper among the Indians in the area of the United States (see AMERICAN CULTURES; NORTH AMERICAN CULTURES). These finds show that the metal was worked by cold-hammering (a method still used by the Copper Eskimos), indicating a separate line of development from the other areas of the continent. Native copper, more frequently alloyed with tin in bronze or with gold in *tumbaga*, was worked mainly in the Andean cultural area, including the surrounding dependent areas of Ecuador, Colombia, northwestern Argentina, and northern Chile (PL. 499; I, PL. 212). The period of its maximum diffusion coincides with that of the Inca hegemony, as is demonstrated by the similarity of technical methods found in the entire area constituting the empire of Tahuantinsuyu.

In Mexico and Central America the importance of nonprecious metals, at least from a quantitative point of view, is completely secondary. There, however, and in the Andean region, gold leaf was employed on copper objects, which were either welded autogenously or joined by soldering.

In the Andean region copper was worked by cold- and hot-hammering and by casting with the lost-wax process. Simple instruments were used, including melting furnaces of fired clay, with an opening at the base for ventilation, blowpipes, crucibles, and molds. In ornamental work, techniques used in gold- and silverwork were employed, such as repoussé work, stamping, *mise en couleur* (by which an alloy is made to look like gold), and filigree work.

Naturally, given the quality of the metal, the copper objects seldom rival in beauty those of the precious metals. Peru, however, has yielded beautiful objects of copper and bronze, such as ceremonial knives (*tumi*); large pins having heads decorated with geometric and figural elements; and openwork clips with figures or scenes in delicate frames, which usually consist of juxtaposed spiral motifs. All these objects have particular importance because recent studies (Heine-Geldern, 1954) have shown their surprising affinity to objects of the same materials found in Asia in the sphere of the Dông-s'on civilization (see INDONESIAN CULTURES). A careful analysis has brought to light not only clear formal and stylistic relationships but identical working techniques as well. If other proofs eventually verify this fascinating hypothesis, it would signify that pre-Columbian metalwork does not represent a local development completely independent of the techniques used in the Old World, as hitherto maintained, but that it was imported from southeastern Asia in the period identified, at least for the Peruvian coast, with the Mochica civilization (4th cent. B.C. – 4th cent. of our era). This would mean that metalworking was introduced at about the beginning of our era, which coincides with other datings obtained from northwest Argentina and Ecuador.

In Middle America metalwork was certainly of later origin than in the central Andes. According to our present knowledge, copperwork appeared there in the late classic or even the postclassic period and already had the characteristics of a mature technique. This leads one to believe in its introduction, by way of the sea, from Peru. The articles produced were essentially utilitarian, except for some bracelets of particular value from the famous Tomb 7 of Monte Albán in Mexico. A unique example is a vigorously modeled mask representing the god Xipe which comes from western Mexico (q.v.; PL. 499).

Among the works that the North American Indians produced by hammering copper in a cold state, worthy of mention

are the plaques of painted copper used as money on the northwest coast (III, PL. 416; see COINS AND MEDALS) and an interesting rattle from the same region (PL. 522). On some ornaments recovered from the tumuli of Ohio one can observe the technique of *mise en couleur*, which was undoubtedly obtained by hammering the metal in a hot state.

Ernesta CERULLI

Africa. In tribal art much of the character of the finished work usually derives from the raw material and the processes which have been used to make it. Metalworking techniques are of importance for the present discussion only in so far as they elucidate works of art. It is therefore convenient to distinguish mainly between those techniques in which metal is treated as malleable stone, so to speak, and those which exploit its potentialities as a liquid. The latter, the techniques of casting, are vastly more important for the production of works of art, while the former have been of greater value in most periods for the manufacture of tools and weapons, which are relevant here only in their ceremonial forms.

Most of the metals used in Africa (see BANTU CULTURES; GUINEAN CULTURES; SUDANESE CULTURES) could be beaten or cast; iron, however, could be worked only by hammering because the temperatures required to render it completely liquid could not be attained with the techniques available in the tribal world. In Africa, ironworking first appeared on the west coast late in the 1st millennium B.C., following directly upon the Neolithic period without the intervention of a Copper or Bronze Age; the transitional phase revealed in the Nok culture of northern Nigeria may thus be termed "siderolithic," as opposed to the chalcolithic of western Asia. Nevertheless, there is no evidence of the use of this predominantly utilitarian metal for artistic purposes until fairly recent times, although rust has probably destroyed many earlier works, dating perhaps from the early years of our era. It is likely that the earliest extant iron sculptures, and surely among the most interesting, are two figures about 8 in. high from the Bakuba tribe of the Congo, attributed to King Miele, a great smith who reigned in about the early 16th century (PL. 522).

The massive drop-shaped forging of iron in the shrine of Ogun at Ife, western Nigeria, is also noteworthy; this possibly dates from about the 14th century, but, although not a utilitarian work, it is doubtful if it can be classified as a work of art.

The principal manifestations of the blacksmith's art in Africa are found in the ceremonial axes of the Basonge (Songe; III, PL. 416) of the eastern Congo, in the openwork blades of which from 2 to 82 stylized human heads may be skillfully forged; in the iron standards surmounted by forged birds, chameleons, and other figures, which were used by the Yoruba of western Nigeria chiefly in the cult of Osanyin, the spirit of "medicine" or the life force; in some chiefs' staffs, surmounted by human figures, recently discovered among the Bambara, east of Bamako; and above all in the unique effigy from Dahomey, said to represent the Fon god of metal and war, Gu (the Yoruba Ogun), a "constructivist" masterpiece assembled in the 19th century (PL. 523). The forms of iron sculpture in Africa are conspicuous examples of the influence of technique upon style, being impressively stylized in terms of bent rods and surfaces and differing greatly from products of techniques which involve liquid metal.

The remaining metals may be fashioned either by hammering or casting techniques. The latter are by far the more versatile and important in sculpture, but hammering and related techniques, which are used in Africa more for decorative than sculptural effects, will be considered first.

As with objects of wrought iron, the most impressive works in beaten nonferrous metals have come from the royal court of Dahomey, in the form of human and animal figures from the treasure of the last king Behanzin (Gbehanzin). Outstanding among them is the large, rather naturalistic figure of the war god in sheet brass, the softness of its forms contrasting markedly with the more "abstract" version in iron, and the equally famous lion of finely embossed silver sheets over a wooden core (both, Paris, Charles Ratton Coll.). The Dahomean court style was apparently devised in the 18th and 19th centuries by the newly aggrandized regime through a combination of borrowings from the Europeans and from other African sources of high prestige. One of these sources seems to have been the court art of the neighboring Ashanti and Baule kingdoms; though casting was the principal technique there, some good repoussé work was done in brass (grease pots, or *forowa*) and in gold (some of the soul bearers' badges, or *akrafokonmu*). This syncretistic origin is strikingly reflected in the emphasis on "metallurgical joinery" which is so uncharacteristic of indigenous African work. (The metalwork of the flourishing tourist industry of Abomey, consisting of a combination of casting and sheet-brass work, is derived from this court art).

The Nupe of Nigeria are famed for their skill in making tinned-brass bowls, water vessels, and coffeepots, the forms and motifs of which strongly evidence Near or Middle Eastern origins some centuries ago. The central Yoruba make fine ritual fans of beaten and incised brass for the cult of the river goddess, Oshun. The Ibibio women of Calabar formerly did excellent repoussé work on imported brass dishes; and certain northern Ibo women wore brass anklets with enormous decorative flanges.

The Marka, a Bambara subtribe, and some other groups in the western Sudan use sheet brass to enhance their dance masks. Finally, a closer approach to a sculptural use of sheet (and strip) brass and copper is made by the Bakota, north of the lower Congo, whose ancestral shrine figures may be regarded as metal sculptures in low relief with wood backing; these highly stylized works have exerted a notable influence on modern artists (II, PL. 101).

There remains to be considered the casting process, by which the metal sculptors of the world have realized most of their finest imaginative conceptions. Casting, in this context, means the lost-wax technique, which was invented early in the European Bronze Age and flourished in every continent except Australia until it was largely superseded by the "sandbox" (bivalve or multivalve) technique of modern industry, which has now revived and developed the lost-wax process for finer work. No other single invention has been of such fundamental importance in the history of art, or, it may be added, in the development of Western industrial civilization, if only because of the great acceleration of the rate of technical progress through quantity production of tools and weapons that this technique made possible in the Bronze Age. Its special value for both industry and art inheres in its great versatility, which enables the founder to produce in metal almost any form which can be fashioned in wax.

The lost-wax process is essentially a method of mechanically translating a wax form into a metal one, during which the work of art may be considered to have passed through three states. In the first, it is a wax form exactly corresponding to that which the artist wishes to produce in metal; at this point, therefore, his creative work is already complete, even to the decoration, if any, of the surface. In all but very small castings the form has normally been modeled on a previously prepared core of clay, with the proportions suitably reduced to allow for the layer of wax. In the second state, the work has become a void: the wax has been enclosed in a clay envelope or investment, then liquefied by heat, and completely removed; the work has in fact ceased to exist, except as a negative impression inside the clay mold, and is recoverable only by a successful pour, since the impression is subsequently destroyed in breaking open the mold. In the third state, the casting is complete within the mold, the liquefied metal having been poured into it to take the form of the void. Now it remains only to remove the investing clay and the metal rods which have replaced the pouring channels and, if necessary, to finish the surface.

Cast metal sculpture in Africa is practically confined to the Niger basin. It may well be as old as the Christian Era, but the earliest known examples are the incomparably modeled, though rather static and expressionless, brass heads and figures of ancient Ife (VII, PLS. 107, 109, 115; see GUINEAN CULTURES), of which 25 major examples have been found. Thought to have been made by the Yoruba about six centuries ago, they

are remarkably naturalistic, although it is not certain that they are actually portraits. It is believed that about A.D. 1400 this style was transmitted to Benin, about 160 miles southeast of Ife, as numerous bronze heads from the ancestral altars of the Bini kings can be arranged in a chronological series dating from the 15th century to 1933, when the last set was cast. In the earliest group the vigorously humanistic treatment of Ife style is still evident, although some features are much more stylized than others; the thin male heads and the best heads of queen mothers (probably of the 16th cent.) show a technical mastery equal to that of the Ife founders (VII, PL. 111). In the middle and still more in the late periods, however, the sensitive humanism was gradually replaced by an increasingly heavy and unimaginative stylization; L. Underwood suggests that, as the tradition of Ife was forgotten, the more schematic form of the clay core came to dominate the outer surface as well as the inner.

The great series of about 800 rectangular plaques dates from the middle period, probably the 17th century (IV, PL. 20; VII, PL. 113). There were at least one or two more centers of bronze casting, not yet identified, in the region of lower Nigeria. The best works of this group, such as the hunter carrying an antelope (Br. Mus.), express a creative dynamism which is absent in those of Ife-Benin tradition, although very evident in Yoruba castings for the Ogboni secret society. Related to this group are the famous bronzes of Jebba and Tada (see GUINEAN CULTURES), including the four largest castings ever found in Africa; with the sole exception of the sitting figure in the Ife style, they may be tentatively attributed to Idah (see SUDANESE CULTURES). The Igbo brasses, remarkable for their virtuosity, also belong to this complex, and may further be linked with the castings of the Tiv and Jukun of the Benue Valley (PL. 156), of the ancient Sao in the Lake Chad region and perhaps of the Cameroons Grasslands, although the latter may be a more recent phenomenon (PL. 523; II, PL. 99).

In Ghana, apart from the charming little brass weights for gold dust (PL. 523; VII, PL. 128) and brass ritual vessels (VII, PL. 127), and much gold jewelry, there are only a few major works of art (VII, PL. 124), such as a gold trophy head (damaged; London, Wallace Coll.) and two bronze heads found in an excavation in the Bron country. Farther west, among the Dan-Ngere tribes in the Ivory Coast and Liberia, the production of excellent brass figures (VII, PL. 121) was an industry of major importance.

METSU, GABRIEL. Dutch painter of genre scenes (b. Leiden, Jan., 1629; buried Amsterdam, Oct. 24, 1667). His father was a Flemish immigrant painter who died young. Little is known of Metsu's early career, not even who his master was. At the age of fourteen he signed a petition, along with other Leiden artists, to establish a painters' guild and became one of its first members when the guild was founded in 1648. In 1654 he was still in Leiden. His presence is recorded in Amsterdam in 1657; he married there on Apr. 12, 1658, and remained there until his death. Little esteemed during his life, Metsu was greatly admired by collectors in the 18th century, and his works were reproduced in engravings and mezzotints.

With Terborch, Van Mieris, De Hooch, and Vermeer, Metsu depicted middle-class subjects in which action is less important than the mood of comfort and contentment. Besides showing people talking, eating, making music, writing, or reading letters, Metsu also painted bakers and blacksmiths, market scenes, portraits, and occasionally even religious, mythological, and allegorical scenes. Like Jan Steen, who was also from Leiden, Metsu stressed the anecdotal element; but in action and sentiment his figures are much more reserved than Steen's boisterous characters. Metsu's seem complacent, even phlegmatic in comparison; they harmonize well with the subdued light and mellow colors he preferred.

Metsu's technique at its best is as supple and accomplished as any found in Dutch genre, but his compositions are apt to be somewhat crowded. He was particularly adept in painting still-life detail in his scenes of kitchens and markets. Occasionally he painted night scenes that show the influence of Rembrandt. Appearing in some of his pictures is a white background — a feature he may have derived (as did Vermeer) from Carel Fabritius. Metsu's career, indeed, strikingly parallels that of Vermeer, who was three years his junior. Both did their finest work in the years just before and after 1660, and in their later works both followed the prevailing tendency toward elegance and sophistication. However, although Metsu's life was five years shorter than Vermeer's, his total output was much larger; more than a hundred of his paintings survive.

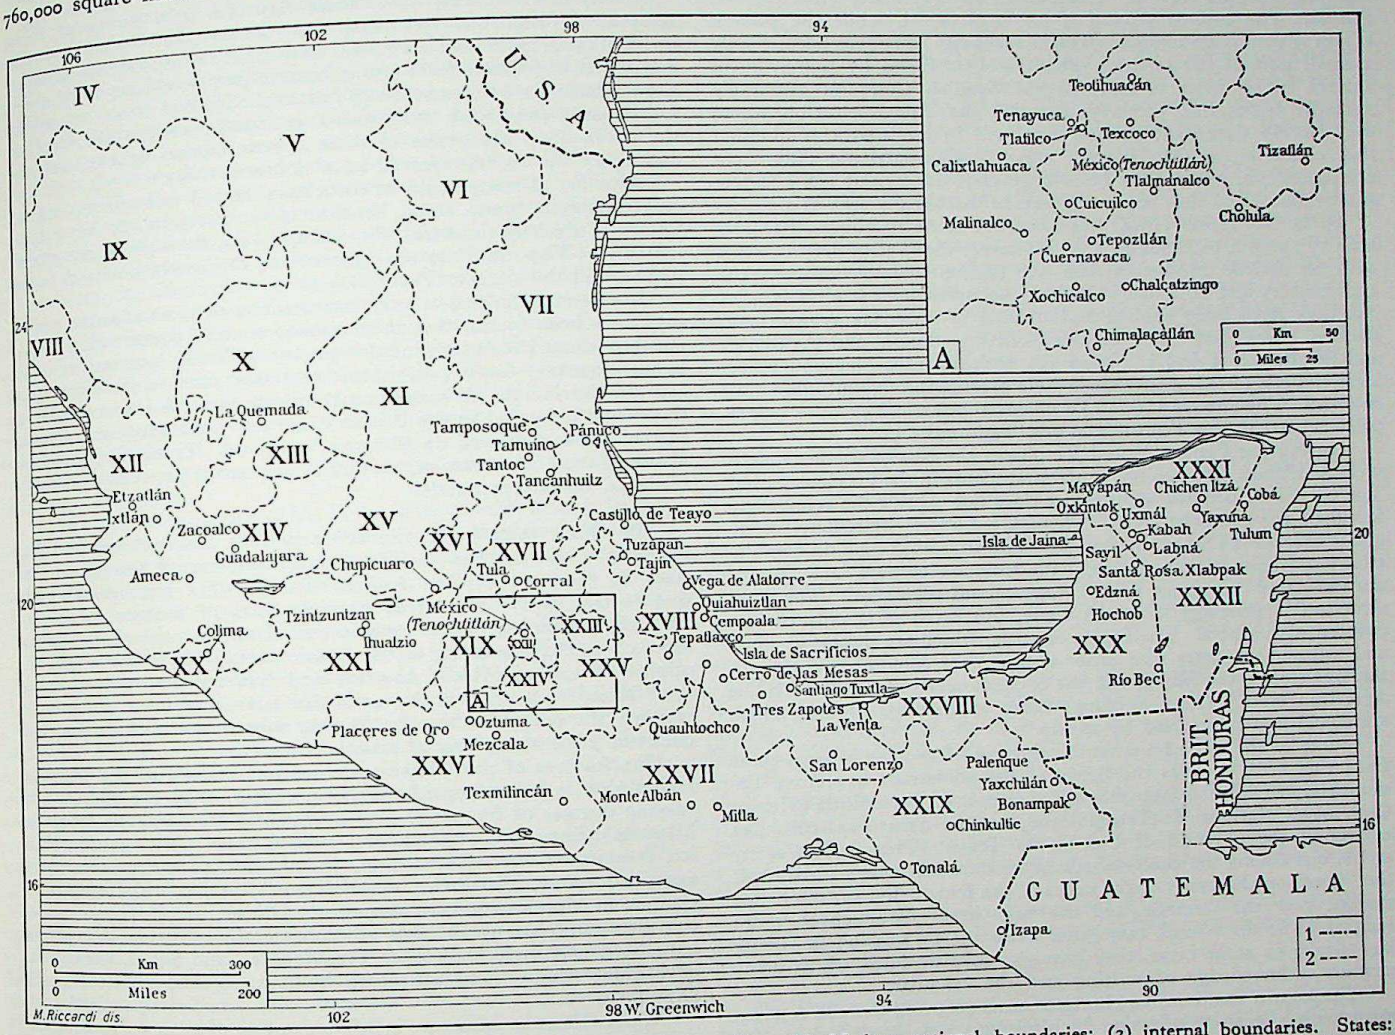
MEXICO. The Federal Republic of Mexico (Estados Unidos Mexicanos) occupies the southernmost part of North America and includes the Isthmus of Tehuantepec, which is sometimes considered part of Central America. These areas, especially to the south and along the coasts, were the seat of some of the most advanced indigenous civilizations that flourished on either of the American continents and certainly the most highly developed that existed in pre-Columbian Central and North America (see AMERICAN CULTURES; MIDDLE AMERICAN PROTOHISTORY). By the time the subjugation of Mexico began with the overthrow of the Aztec empire by Hernán Cortés in 1519, the indigenous civilizations, such as that of the highly refined Mayas, were already extinct, while others, such as that of the Aztecs, were violently destroyed during the conquest. Spanish colonial civilization, superimposed on that of the native peoples, flourished to a remarkable extent, particularly during the baroque period, and influenced the local scene (see SPANISH AND PORTUGUESE ART). The art of modern Mexico has come to exhibit a pronounced national character and has assumed an influential position in the development of international art trends (see AMERICAS: ART SINCE COLUMBUS).

SUMMARY. Pre-Columbian cultures and artistic periods (col. 829): *The sequence of artistic periods in the Huaxtec area; The classic civilization of Veracruz; The Olmec culture; Phases of the Maya civilization; The Zapotec and Mixtec cultures of the Oaxaca area; The Puebla-Tlaxcala area; The Morelos area; The Valley of Mexico from the preclassic to the Aztec period; The Guerrero cultures; The pottery-producing cultures of western Mexico; The preclassic civilizations and*



Tarascan styles of Michoacán; The north central region. Colonial and modern periods (col. 837): *Hispano-Mexican art of the 16th century; Baroque and neoclassic styles of the 17th–19th century; Contemporary art.* Art centers and archaeological sites (col. 843): *Mexico City; Chihuahua; Coahuila; Nuevo León; Zacatecas; San Luis Potosí; Nayarit; Aguascalientes; Jalisco; Guanajuato; Querétaro; Hidalgo; Veracruz; State of México; Colima; Michoacán; Federal District; Tlaxcala; Morelos; Puebla; Guerrero; Oaxaca; Tabasco; Chiapas; Campeche; Yucatán; Quintana Roo.*

PRE-COLUMBIAN CULTURES AND ARTISTIC PERIODS. Of the some 760,000 square miles that constitute the area of the Mexican Republic, more than half — all of the northern and part of the central sections — was inhabited in pre-Columbian times by peoples of an inferior culture, whose artistic contribution is generally insignificant. On the other hand, some of the great indigenous civilizations of the Americas developed in southern Mexico and along the coasts, which with the present territory of Guatemala, El Salvador, British Honduras, and the western part of Honduras (qq.v.) formed a historical unit in which Middle American civilization was born and developed (see MIDDLE AMERICAN PROTOHISTORY). Of that culture area only the part included within the confines of present-day Mexico is dealt with below.

The historical and artistic periods usually recognized by scholars are the following: "preclassic," from the origins to A.D. 50 (broken down into three epochs — the preceramic, the origins of which are still unknown and which extends to 1500 B.C.; the archaic, 1500–500 B.C.; and the formative, 500 B.C.–A.D. 50); "classic," 50–650; and "postclassic," 650–1540 (subdivided into three epochs — the intermediate, 650–900; the Toltec, 900–1200; and the final, 1200–1540).

It is extremely difficult to pursue synoptically and comparatively the unfolding of the different phases within Mexico. In fact, the territory seems to be divided into a series of zones or culture and art areas, which in certain cases are unquestionably interrelated but still possess their own characteristics, as in the case of the similarities and differences occurring among the nations of Europe. Also, in many areas the scantiness of excavation and research makes any documentation fragmentary and our knowledge very incomplete.

For these reasons, it is best to follow the succession of the artistic phases within the individual zones. Naturally, the subdivisions are arbitrary to a certain extent; this must be so, not only because often we do not know the names of the peoples who brought in the individual cultures (thus entailing a certain disparity in the names given to the various areas, which are in some cases ethnic, in others cultural, and in others geographic), but also because there were contacts, exchanges, and overlappings of populations and cultures between areas. Thus, for example, the Maya area can be identified geographically as well as culturally, but this does not change the fact that at the beginning of the postclassic period the Toltecs established themselves in some of its zones and left behind conspicuous artistic evidence of their presence. On the other hand, the differentiation of the cultures of western Mexico is artistic and cultural, inasmuch as we do not know the name of the peoples who created the pottery that characterizes this area. The Oaxaca region is, instead, only a geographic entity, in which the Mixtecs succeeded the Zapotecs. This also happened in the case of the Valley of Mexico, the center of development of the indigenous culture: there the earliest cultural and artistic evidence dates back to the archaic period, but we do not know who was responsible for it. Subsequently, at the outset of the classic period, and perhaps even prior to it, the advanced culture of Teotihuacán developed there, with an extraordinary flourishing of religious architecture; and in the postclassic period the warrior civili-

Principal pre-Columbian centers and archaeological monuments in Mexico. *Key*: (1) Modern national boundaries; (2) internal boundaries. States: (IV) Chihuahua; (V) Coahuila; (VI) Nuevo León; (VII) Tamaulipas; (VIII) Sinaloa; (IX) Durango; (X) Zacatecas; (XI) San Luis Potosí; (XII) Nayarit; (XIII) Aguascalientes; (XIV) Jalisco; (XV) Guanajuato; (XVI) Querétaro (XVII) Hidalgo; (XVIII) Veracruz; (XIX) México; (XX) Colima; (XXI) Michoacán; (XXII) Federal District; (XXIII) Tlaxcala; (XXIV) Morelos; (XXV) Puebla; (XXVI) Guerrero; (XXVII) Oaxaca; (XXVIII) Tabasco; (XXIX) Chiapas; (XXX) Campeche; (XXXI) Yucatán; (XXXII) Quintana Roo.

zations of the Toltecs and, later, the Aztecs flourished in the region until they were destroyed by the Spanish conquistadors.

With all the limitations indicated above, the subdivision into areas and the treatment of the sequence of the artistic periods within the individual zones are made necessary, on the one hand, by the extent of our knowledge and the requirements of exposition and, on the other hand, because the most interesting esthetic features and styles are thus grouped in a rather coherent and orderly manner.

The sequence of artistic periods in the Huaxtec area. Geographically, the Huaxtec (Huastec) area includes the southeast part of Tamaulipas, the eastern part of San Luis Potosí, the northern part of Veracruz, and the adjacent regions of the states of Querétaro, Hidalgo, and Puebla. The eastern section is low and torrid, while the plateau enjoys a temperate climate. The present-day Huaxtecs occupy only a small part of the territory which was inhabited by that tribe in ancient times; even as early as the Spanish Conquest essentially nomadic tribes had partially occupied the Huaxtec region where they left no significant cultural remains. In the artistic production that characterizes the Huaxtec region certain stylistic differences are noticeable, but present knowledge does not permit any accurate subdivisions, and thus it is preferable to discuss the area as a whole.

R. S. MacNeish (1954) has identified some dwellings that date back to the 8th millennium B.C. However, the first pottery cultures with an artistic production are not encountered earlier than the 12th century B.C. It is likely that they occupied almost all this area, but they have been studied and defined in only one typical spot, Pánuco. The first three periods — Pavon, Ponce, and Aguilar — and the Pánuco I and II phases are typically preclassic and reflect local variants of the great archaic style present throughout all Middle America. The Pánuco III and IV phases are classical and are principally related to the Teotihuacán and Tajín cultures.

During the Pánuco V and VI phases the characteristic Huaxtec style flourished; nonetheless, it had precedents in the previous period. The extremely original architecture does not exhibit the refinements found in the southern areas. There are tumuli — circular, rectangular, horseshoe-shaped, in the shape of a truncated cone, in combinations of these various forms, with rounded corners, and in odd shapes — and buildings joined together on platforms. The construction is generally of rough stone, but often it is only of clay covered with stucco The flights of steps, which are double at times and without parapets (the latter appear very late in this region), the side slopes, the facing, and the cornices recall the typical Middle American style. These buildings make up planned groups, which are sometimes intersected by streets.

Some of the most important sculptures of ancient Mexico come from this area, such as the figure of the adolescent boy from Tamuín (X, PL. 49), the magnificent Tzontemec of Tepetzintla (Mexico City, Mus. Nacional de Antropología), and the numerous sculptures encircling the pyramid of Castillo de Teayo. They reflect many styles, but among the characteristic aspects are the cone-shaped caps, the "fans" on the napes of the necks of the female figures, the hands crossed over the stomach, and the large ears. Although they are sculptured in the round, they give more the impression of being bas-reliefs; in some cases, they bear glyphs with dates, which demonstrate a knowledge of writing and the calendar.

The known examples of Huaxtec mural painting include a pavement with a geometric design in black and red, used perhaps for a game, and, above all, those at Tamuín, where there is a frieze, painted in red against a natural background, around a stucco altar in the shape of a truncated cone. It is about 15 ft. long and represents a procession of 12 elaborately decorated and clothed personages; of the Toltec period, it probably belongs to the 11th century of our era.

The ceramic finds, chiefly from the Pánuco VI phase, are of the black-on-white type and exhibit many interesting shapes in a style that is unique in Middle America. In the final two phases beautiful cast windlasses, pipes, and copper objects are often found.

Among the many other products of this region, attention should be called to the splendid pendants of carved shell and the very important little animals in the form of toys with wheels, which are similar to those, also of the Toltec period, already known from Teneneпango (Tenenepanco) and Tres Zapotes, for example. (There is no need to emphasize the theoretical importance of this use of the wheel.)

The Huaxtec area, like much of Middle America, is covered with archaeological ruins.

The classic civilization of Veracruz. The Totonac region in central Veracruz is bounded on the north by the Río Cazones and on the south by the Río Papaloapan, thus including the great coastal plain and the eastern watershed of the cordillera.

From the end of the preclassic archaic period, and particularly during the formative period, there appears in this area a culture rich in clay objects, such as vases with effigies; human figures with fat, bulbous legs; animals; and fruit. Many of these are of considerable artistic merit. Among the finds are standing and seated figures, some of which are rather flattened out, with great broadened faces and wide-open eyes, while others show a commendable realistic style, as seen in examples from Remojadas (X, PL. 25).

In the classic "horizon" painted ceramics representing both men and gods are found. The most notable type is the so-called "smiling figurine," having a face of serene beauty illumined by a smile, an expression very rarely found in pre-Hispanic art. Both the classic and postclassic epochs produced notably fine examples of modeling in clay (e.g., the heads; X, PL. 24).

Partly contemporary with these figurines is a group of stone sculptures of high quality, among them the so-called "yokes" (which bring to mind those used on horses in ancient times), ceremonial axes, and stones in palmate form and in bizarre shapes, almost all of which show admirable workmanship (X, PL. 23). Hooks, either in echelon formation or interlaced, constitute a recurring fretlike motif; between the hooks or at the center of them appear human figures, animals, and other motifs represented in a distinctive style.

Remains of many cities of the classic period exist in the region, and numerous stone steles, sculptures, and bas-reliefs have been found. Especially beautiful, for example, are the ball-game (pelota) markers at Vega de Alatorre, representing the sacrifice of a defeated player, and the stele at Tepatlaxco.

In classic Tajín and in other later centers remains of mural paintings have been found, though in a poor state of preservation. This epoch produced sculpture inferior to that of Tajín, but, on the other hand, some very lovely polychrome ceramics, such as those from the Isla de Sacrificios. A magnificent collection of artifacts found on this island is located in the British Museum, while another is housed in the Museo Regional de Veracruz at Jalapa. Finely worked small alabaster vases are common, as well as numerous personal ornaments made of various materials.

The Olmec culture. In the territory that lies between the Río Papaloapan and the Río Grijalva (composed, except for the mountains in the area of San Andrés Tuxtla, of a hot coastal plain that is frequently inundated) a high level of culture developed from the beginning of the archaic period and continued in certain cases up to the beginning of the classic period. It was perhaps the original culture of Middle America and has commonly been called the "Olmec" culture from the name that later inhabitants gave to the region ("the land of rubber"). During subsequent periods the zone does not present any special artistic interest.

The features of the Olmec style are not limited to the Mexican region that is being considered here; rather, they are found with varying degrees of frequency over a vast area that extends from the Mexican plateau to Guatemala and even farther south. As for Mexico, it must be remembered that, in addition to the centers to be examined below, Tlatilco in the Valley of Mexico and Cerro de la Cantera in Morelos state are also clearly Olmec. In the region under consideration only three sites of considerable artistic importance have been explored: La Venta, Tres Zapotes, and San Lorenzo Tenochtitlán, where there are some monuments and colossal heads (X, PL. 2).

While Olmec architecture is inferior to that of other cultures, their sculpture includes some of the most remarkable art objects of ancient Mexico, such as the famous athlete, or wrestler, from Uxpanapán (X, PL. 3), one of the extremely rare objects of indigenous art that shows concern with the beauty of the human body; the statue at San Martín Pajapán; and the stele at Alvarado. Besides these monumental pieces, the Olmecs produced numerous small sculptures of light-blue jade or of stone in an unequaled style, marked by pear-shaped heads representing artificial cranial deformation, mouths with drooping corners, anthropomorphic "axheads," semihuman and semifeline masks, simple and sexless bodies, and frequent depictions of deformities, such as hunchbacks or monsters with muscles realistically highlighted, which are often naked and devoid of superfluous details; in addition, there are animals, boats, and other forms.

Also characteristic of Olmec art are the representations of the jaguar-man, the local divinity, in which the features of serpents or of birds are very often combined. Monumental sculptures and tiny figurines of hard stone were fashioned in the same style.

Phases of the Maya civilization. The Maya area not only occupies all of southeastern Mexico, beginning at the Río Grijalva, and much of the Chiapas plateau, but also includes all of Guatemala and British Honduras and parts of Honduras and El Salvador. The part of the Maya area that is situated in Mexico can easily be subdivided into subareas, because the same types of artifacts are not found everywhere, and because the salient characteristics of northern Yucatán, for example, are different from those of the Chiapas plateau.

833

The area covers the calcareous plain of Yucatán, which is hot and arid with sparse vegetation; the two large Chiapas mountain ranges; the high, wooded, rainy areas of the Usumacinta basin; and the large forest region of Quintana Roo. The population of the Maya territory is just as varied as its terrain.

Even though monuments of the formative period exist in Yucatán, such as the great pyramid of Yaxuná, and some from the first half of the classic period, most of the artistic manifestations begin in a later period. Starting with the 3d century of our era, the centers with large monuments become more numerous. Various architectural styles can be distinguished in the peninsula. The first is perhaps the one termed "ancient Petén," found in centers such as Oxkintok, which repeats the style of northern Guatemala without any originality (see GUATEMALA; MIDDLE AMERICAN PROTOHISTORY).

More important is the "Puuc" style, characterized by walls faced with stone, barrel vaults, decorated cornices, roundish columns flanking the doors, friezes of rounded moldings, and the very extensive façade decoration of stone mosaics with large masks, serpent motifs, frets, shutters, and huts (X, PLS. 9, 12). Only the upper part is decorated, while the lower part is plain, thus giving an impression of repose. The Puuc cities are generally of imposing dimensions, with large buildings having adequate space between them; the most important of these city sites are Uxmal, Kabah, Sayil, and Labná (X, PLS. 8, 9, 11). They do not spread out around a large plaza, as the central Mexico sites do; although temples are found here, the major buildings are of the civil type. Large, vaulted entranceways with tall arches in the Maya style are frequent. In some cities there are steles bearing long narrative inscriptions. Most probably this style disappeared in the 8th century. Many other Puuc cities, of less importance and still unexplored, also exist. There are others which, even with distinct differences, are comparable to the Puuc style, such as Chichén Viejo. Of the mural painting in the Puuc buildings, which is scarce and of secondary importance, only a few fragments have been preserved.

Other cities, to the south of the Puuc cities, exhibit what is known as the "Chenes" style. Chenes architecture is characterized by an excess of façade decoration, although this feature is not common to all the buildings. Very often the doors are composed of the gaping jaws of the celestial dragon, surrounded by heavy stucco masks. Hochob is perhaps the most characteristic ruin in the Chenes style.

Other cities are similar in some ways to those of the above-mentioned style; the most characteristic is Río Bec. The Río Bec style may be regarded as midway between the Puuc and Chenes styles, since it presents masks with mouths serving as doors, along with *décor* based on Puuc features. The decoration does not, however, cover all the façade, but, unlike that of the Puuc, covers only the lower part of the buildings. Here, too, masks, small mortised columns, and the fret motif are found.

Some stone and rock towers, purely decorative and without any apparent function, are peculiar to Río Bec and some similar sites, such as Xpuhil. Imitating the pyramids, they have false stairways in front, a temple, and even an ornamental *fronton*, all of which create an illusion of size. If this feature of Río Bec architecture is not a particularly happy one, the facing of the buildings is, on the other hand, the most perfect in the entire Maya area; the stones are so painstakingly squared and fitted together that they did not have to be mortared.

The cities of the valley of the Usumacinta and of eastern Chiapas state, such as Palenque (X, PLS. 7, 10, 14–18) and Yaxchilán, belong to the classic period, as do the beautiful clay figurines, both male and female, of the island of Jaina, which are modeled with great mastery and feeling (X, PL. 18). Beginning in the 10th century, with the Toltec invasion of northern Yucatán, the styles of the classic Maya period in that region were followed by a new stylistic period, the "Maya-Toltec," characterized by the fusion of Maya and Toltec features; Chichén Itzá is a splendid example of this style (X, PLS. 34–37).

The plateau region and the Chiapas coast, which are little known at present, show strong Maya influences, but with different features that suggest the possibility of a separate subarea. Among the authentic works of art from this area are the steles at Izapa, the buildings constructed of enormous blocks and the fine sculptures at Chinkultic, the monuments at Tonalá, and numerous objects of various materials that reflect almost all styles, from the Olmec to the Maya and the Toltec.

The Zapotec and Mixtec cultures of the Oaxaca area. In the state of Oaxaca, principally on the Sierra of Ixtlán and in the region of the Isthmus of Tehuantepec, the culture of the Zapotecs of the classic period was followed by the postclassic civilization of the Mixtecs. The area was also inhabited by other ethnic groups whose artistic contribution is of little interest, at least in the present state of our knowledge.

Although the culture of the Zapotecs occupied a very extensive area, there is adequate archaeological data only for the great central Oaxaca Valley, which is about 5,000 ft. above sea level and has a temperate climate and sparse vegetation. Although the principal centers are Monte Albán and Mitla, there are other ruins in the valley that are quite interesting but little known. The most ancient buildings of Monte Albán I date back to the formative period, and their style, like that of contemporary monochrome ceramics with human and animal figures, recalls that of the Olmecs. During the Monte Albán II phase other peoples moved into that city and blended their imported style with that of the preceding period; new styles appeared in the pottery, in the fresco painting (red motifs against an orange background), etc. The Monte Albán III phase belongs to the classic period, by the end of which the city was completely built up. Dating back to this period are the great painted tombs and the clay urns representing divinities, the latter constituting the most typical feature of Zapotec art. The magnificent pectorals and other necklaces of jade recall the style of the Mayas. At the end of the classic period Monte Albán became less important. Artistically, the last phase was decadent and characterized by mass production.

Beginning with the end of the classic period, the Mixtecs introduced a very refined culture into this area. Little is known about their architecture, and they did not make large stone sculptures or mural paintings, but the production of small objects was important. Among the finds are splendid polychrome ceramics with predominantly ritual motifs and all kinds of jewelry, such as necklaces, bracelets, rings, diadems, anklets, and nose rings; these sometimes have moving parts (e.g., skulls with jaws that open and shut). The jewelry, which constitutes the principal Mixtec production, is of gold, silver, or copper and laminated, filigreed, or cast by the cire-perdue process; it may be included among the most perfect and exquisite metalwork of ancient Mexico. The examples from Tomb 7 at Monte Albán belong to this culture.

There also exist wooden objects overlaid with a mosaic of turquoise and jade, such as masks (X, PL. 44), spear throwers, spoon handles, helmets, shields, and ornaments; pectorals of jade and of other rare stones; objects of rock crystal or of polished obsidian, representing skulls, deities, animals, or vases; finely worked bone with glyphs, etc.; and goblets of sculptured and incised alabaster. The majority of these jewels and precious objects have been lost, though they were extremely famous throughout Europe beginning with the 16th century.

Most of the painted books of ancient Mexico that have come down to us were produced by the Mixtecs. The most beautiful codices are the Nuttall (London, Br. Mus.; VII, PL. 259), the Vindobonensis (Vienna, Nationalbibliothek), the Cospianus, and the Bodleian (Oxford, Bodleian Lib.); from nearby — probably Tlaxcala — comes the Codex Borgia (Rome, Vat. Lib.; X, PLS. 54, 56, 64), perhaps the most artistic of all the surviving manuscripts. Here, as in the frescoes, the colors are laid on in flat planes, without perspective, but with a great color sense and refinement in design. Some of the animal figures are striking.

The very refined Mixtec culture had a great influence on later periods and, among other things, was one of the sources drawn upon by 15th-century Aztec art.

The Puebla-Tlaxcala area. This is an area abounding in monuments, few of which have been studied. The great pyramid of Cholula, the largest in ancient Mexico, was built and enlarged over a long period of time. In Tizantlán, one of the villages of Tlaxcala, a temple of a later period has been explored, revealing rather unusual architectural features.

The Morelos area. The art documentation from this region is rather abundant. From earlier times there are the Olmec-style clay objects discovered at Gualupita, a quarter of Cuernavaca, and the contemporaneous bas-reliefs of Chalcatzingo, which are sculptured in natural rock and represent human figures in profile, wearing strange garments and hats and bearing various objects in their hands. Although they are fashioned in low relief, they show the same sensitive modeling found in the sculptures at La Venta. This region also possesses important archaeological centers, such as the ruins of Xochicalco (X, PL. 32).

The Valley of Mexico from the preclassic to the Aztec period. Because of its importance as the center of elaboration of the indigenous culture, this area has been explored more intensively than other regions and is therefore better known.

Tlatilco is the most important of the archaic centers from an esthetic standpoint. There are no architectural remains, but there are many ceramics and figures which are closely related to the Olmec style. Some of the most outstanding finds are vases in the shape of fish, armadillos, and *tlacuaches* (opossums) and large bottles in the

shape of acrobats, doves, and other figures. These vases are often incised with abstract or geometric motifs of hands or animals.

The Olmec-style clay figurines, seated or standing, are particularly interesting, both for the quality of modeling and for their subjects. Images of dancers, acrobats, magicians, and women with two heads and a single body, all painted in several colors and full of life and movement, and also human or animal masks are abundant in the tombs (VI, PL. 53; X, PL. 1).

Cuicuilco has not yielded any important artistic objects, but it contains some of the oldest known buildings in Middle America. The classic period in the valley begins with Teotihuacán, the first great city of pre-Columbian Mexico. Besides the remains of impressive buildings, the wall paintings, and the sculpture, the Teotihuacán culture produced remarkable stone masks with serene human faces of admirable workmanship (X, PL. 39), as well as figurines and other artifacts made of jade and diorite. The pottery, admired for its form and fine texture, is sometimes painted with ritual motifs and sometimes with figures of deities (X, PL. 5).

Tula, the capital of the Toltecs, was located in the northern part of the valley. Although the Tula style has much in common with that of Teotihuacán, it possesses various distinctive features that also recur at Chichén Itzá in the Maya area. Typical of the Toltec style are the atlantes that support the altars or serve as columns (X, PL. 32); columns shaped like serpents, with the head resting on the ground and the tail forming the architrave; decorative bas-reliefs depicting processions of warriors on the walls or benches; rows of jaguars (or tigers) in motion, also in bas-relief, sometimes alternating with eagles or with other motifs; colonnades adjacent to buildings or supporting an access portico to a pyramid; courtyards surrounded by Coatepantli, which are walls decorated with stone serpents in bas-relief and surmounted by battlements (X, PL. 31); large halls around open courtyards; statues of a reclining deity, called "Chac-Mool," with elbows on the ground and knees flexed; ceramics decorated with a glossy paint that gives a glazed effect. The pyramid at Tenayuca, northeast of Mexico City, belongs to the final period.

In Mexico City there are still some remains of the great temple of Tlatelolco, with its stone walls, and that of Tenochtitlán, as well as some sculptured serpents and bas-reliefs.

Sculpture was the most important of all the arts practiced by the Aztecs. Many fine examples of sculptured work in the Aztec style, dating from the middle of the 15th century to the first part of the 16th century, are preserved in the Museo Nacional de Antropologia in Mexico City. Among the most famous are the Aztec Calendar Stone, or Stone of the Sun, an enormous monolith sculptured in bas-relief with the sun and other symbols representing the elements and units of time; Coatlicue, the Earth Mother, realistically fashioned in its details and singularly abstract in its totality, and the statue of Yolotlicue, having the same style and proportions; the Stone of Tizoc (VII, PL. 259), an enormous cylinder sculptured all over, with scenes representing the victories of this emperor around the rim; a large lifelike jaguar with very simple lines, having in its back a circular cavity in which were placed the hearts of sacrificial victims; a porphyry head, with plumes and a human face, representing Quetzalcoatl; the tablet of a temple, bearing the date of dedication; numerous coiled serpents, some of which are abstract in a modern manner; a seated statue of the deity Xochipilli, from Tlalmanalco; the strikingly realistic head of an Eagle Knight (X, PL. 42); and many smaller objects, including a remarkable vase, from Texcoco, of polished obsidian and representing a monkey, a diorite squash, and a carnelian grasshopper.

Among the smaller pieces found in this and other collections, attention should be called to the finely finished objects of rock crystal, such as the skull in the British Museum, animal figures, and vases, as well as articles of alabaster and artistic wood intaglios.

The art of featherwork (q.v.) was highly developed, as is attested by the headdress of Montezuma (Vienna, Mus. für Völkerkunde) and some shields preserved in the ethnological museums in Mexico City, Vienna, Stuttgart, and Madrid. A magnificent Aztec painted manuscript, the Codex Borbonicus, is preserved in the Bibliothèque of the Palais Bourbon in Paris.

Aztec art, original in many respects, has its roots in Toltec and Mixtec art and combines their features to some extent.

The Guerrero cultures. The Guerrero region, potentially very rich, is as yet largely unexplored. A series of subareas apparently exists there, with different styles that have not yet been defined. Along the banks of the Río de las Balsas there are the ruins of many cities, some of them of considerable size. Sculpture, both of a very primitive but expressive type and of a much more advanced type, has been found there. Some of the latter type from Placeres del Oro are reminiscent of the Peruvian Chavín style; others, such as the numerous columns, steles, tablets, and sculptures in the round, are more "Mexican" because of their formal character.

Along the coast there are numerous sites, which can be dated from the formative period up to the Aztec period, where many sculptures, rings for the pelota game, and other objects in a style influenced by the Toltecs have been found. Farther south, in the Ometepec region, there are fine sculptures that reflect the style of Oaxaca. Artifacts of gold and various other materials from Texmilincán attest to a well-developed culture.

In a large area around Mezcala it has been possible to define a style more clearly on the basis of small stone objects: figurines and masks, animals and various other items, such as the customary ornaments, all produced by a technique that seems to have been mechanical and in a rough but vigorous geometric style. Other finds from this region recall both the Olmec style and the classic style of Teotihuacán.

On hills in this area there are numerous fortresses. Some (e.g., Oztuma) have walls and moats that indicate considerable skill in building such defensive works.

The pottery-producing cultures of western Mexico. In the western regions — Nayarit, Colima, and Jalisco — only a few architectural works are known, among which the circular Temple of Ixtlán is noteworthy.

Tombs generally consist of a more or less deep shaft excavated in rock and permitting access to one or more chambers. There is no construction, properly speaking. The best-known tomb found thus far is that of El Arenal near Etzatlán. Near the city of Colima lies the pyramidal monument of Chanal, in the central Mexican style. Ixtepete, an enormous building now being explored, lies near the city of Guadalajara.

While the architecture and sculpture of this vast region are not remarkable, and mural painting seems to have been unknown, the ceramic art developed to an extraordinary degree.

In an ancient period, which is perhaps contemporary with the classic period in the rest of the Middle American area, a large number of clay figures were produced here. Hollow and highly burnished, they are excellently styled and well modeled, showing an extraordinary variety of themes and a naturalism and a mastery of the plastic art that are seldom encountered (X, PLS. 27, 29). Others represent plants, shells, fruit, and frequently animals: parrots, fish, crabs, and the especially well-known little dogs. These last are life-size, in red or brown, with smooth surfaces, and represent examples of a breed that was fattened for use as food (X, PL. 28).

Even the vases are frequently unusual, supported by caryatids or by animals, decorated with human heads, or modeled in strange shapes, such as drums, skulls, and temple bases.

There are also many other smaller solid figurines: musicians (X, PL. 29), acrobats, women grinding corn on metates, sick persons, women giving birth to children, groups of dancers, dignitaries in palanquins borne by four slaves, and many other subjects — realistically depicted or caricatured, comic or abstract — representing human figures, flora and fauna, family or collective life, and popular holidays. In decided contrast to the art of the rest of Mexico, there is no trace of the religious or ceremonial.

The Nayarit figures are coarser, sometimes brutal, if not outright monstrous, in the simplification or in the exaggeration of their features (X, PL. 27). There are numerous large, hollow, naked female figures with enormous feet and very slender arms; individuals so thin that their ribs show; hunchbacks and syphilitics; as well as group subjects. Aside from these figures, which are characteristic of Ixtlán, we find animated scenes representing houses with their inhabitants and animals (X, PL. 26), temples, and pelota games. There are many clay figures of warriors, musicians playing various instruments, dwarfs, women carrying children or vessels, and various persons busy with their daily tasks. All in all, they comprise a lively and often satirical display of the life of these peoples.

Among the outstanding pieces is a parrot made of leaded clay covered with gold leaf, which is now preserved in the American Museum of Natural History in New York.

In Jalisco, the most interesting items are human figurines from the Ameca-Zacoalco region: seated women of hieratic aspect, with large breasts, or warriors holding clubs in their hands, all admirably finished and polished, in an unmistakable style with elongated heads, rounded eyes, and thin, sharp noses. The same general style found in Nayarit and Jalisco also prevails in Colima, where it is generally much more refined.

The regions of Sinaloa and of northern Nayarit do not seem to have been inhabited by sedentary peoples until a very late period, at least. Accordingly, objects of artistic interest appear only shortly before the Toltec period. There are some large polychrome ceramics with ritual or geometric motifs, highly stylized human figures, metal objects, gourds lacquered by a process still used today, and some alabaster vases — all in a Toltec style or in an even later one deriving from Central Mexico.

837

The preclassic civilizations and Tarascan styles of Michoacán. From an archaeological point of view, Michoacán state is notable only for the central part around its lakes and for some sites near the Río Lerma which overlap into nearby Guanajuato state.

The numerous vases and clay figurines found at Chupícuaro (Guanajuato) probably belong to the formative period. Very carefully finished, they are covered with a brilliant red luster and frequently decorated with geometric motifs in black and white. The figurines represent small standing women, with facial features and ornaments created by means of the superposition of minute clay fillets; other larger ones belong to the style of the red ceramics with black and white motifs.

From the classic period there are magnificent spheroidal terracotta pots painted with friezes of figures in various colors, objects of rare stones fashioned in an archaic style (in at least one case with jade eyes), and stone representations of the fire god in a Teotihuacán style. The Chac-Mool figures, with their primitive style and finish, belong to a later date, but they certainly have the same meaning that the Toltec Chac-Mool had.

Architecture is represented chiefly by the so-called "yácatas," ceremonial monuments of unsquared stones accurately fitted over each other but not cemented by mortar. Generally, only the outer surface is faced with stone slabs. The yácatas are long, high, rectangular platforms linked by means of a corridor to a circular building. In some instances the top is so narrow that the possibility of its having supported a temple must be excluded. The most interesting ones are those at Tzintzuntzán, the ancient Tarascan capital, and those at Ihuatzio; they all seem to belong to the final period.

From the final or Tarascan period, properly speaking, there are a great number of metal objects, among them, for example, the remarkable copper mask in the Museo Regional Michoacano, Morelia, and the gold or gold-plated copper jewelry from the excavations at Tzintzuntzán. Besides these and various tools, there are a tortoise-shaped rattle with a small turtle on its back, richly decorated tweezers, bracelets, and some admirably fashioned obsidian ornaments, sometimes encrusted with gold or turquoise. A magnificent sculpture from Ihuatzio, representing a coyote god, has the body of a naked man and the head of the animal. There are also some stone seats in the shape of coyotes. Tarascan ceramics are of excellent quality and include a series of shapes which are not common in the rest of Mexico.

The north central region. In this vast area, which includes the modern states of Zacatecas, Aguascalientes, and San Luis Potosí, there is a series of sites adjacent to the Middle American region of some artistic interest. However, this area is generally far inferior in every respect to the others and presents a series of cultures that are much less developed than those of Middle America proper. The isolated centers of considerable interest include those of La Quemada, Toluquilla, Ranas, and La Magdalena, all of which show a similar type of construction. This region also produced painted ceramics in splendid animal shapes.

Ignacio BERNAL

COLONIAL AND MODERN PERIODS. *Hispano-Mexican art of the 16th century.* The earliest manifestations of Hispano-Mexican art are found in monastery architecture. In fact, the Franciscan and Augustinian monasteries always possessed their own special characteristics; the monastery church generally had a single aisle, with a barrel vault, buttresses, and a polygonal or semicircular apse. One vault, usually a barrel vault built against the upper interior front, supported the choir, forming with its intrados a vestibule in the Spanish style. Since the principal function of a monastery was the catechization of the indigenous peoples, the "patio," a large enclosed atrium facing the church, was especially important. The entire monastery complex was intended to serve a defensive purpose. Also, the building material was suited to the surroundings; in the poorer buildings, ordinary bricks and sun-baked bricks (adobe) were used, while the more important projects were built of stone, sometimes rough-hewn and sometimes squared into matching blocks, and a variety of colored volcanic rock (*tezontle*), as well as precious woods. The originality of this first Mexican architecture reflects the occupation of the builders, who were for the most part monks rather than architects — hence with old-fashioned, still plateresque, tastes — and, also, the use of native workmen who, while possessing an innate decorative sense in keeping with the Aztec tradition, did not know European building methods. The monastic orders, especially the Franciscans, Augustinians, and Dominicans, engaged in a great deal of building activity. Two of the oldest Franciscan buildings are the monasteries at Huejotzingo (1531–70) and Tepeaca (1530), near Puebla; the one at Cholula was built by Toribio de Alcaráz, one of the few well-known architects of the 16th century. Juan de Alameda, a Spanish friar who came to Mexico, perhaps in 1530, deserves the credit for the monasteries at Cálpan (ca. 1550) and Tula (1550), which in the simplicity of their planning, in their plateresque ornamentation, and in the enlarged modules are evidence of the originality of Mexican architecture compared with that of Spain. More generous in proportion and richer in decoration are the Augustinian monasteries at Yuririapúndaro, designed by Pedro del Toro, with roughly plastered, massive walls in sharp contrast with the commonplace decoration of the façade; at Cuitzeo, perhaps built by Fray Juan de Utrera, with an entrance loggia, the church façade on pure Renaissance lines, and a patio with Gothic ribbing inscribing a double row of arches in the plateresque style; at Acolmán (1539), with the appearance of a fortress, softened by the plateresque façade of the church and by the elegant cloister; and at Actopan (1550), the work of Fray Andrés de Mata, perhaps the most imposing, with a Moorish-style keep, two patios, and a sturdy entrance loggia in the Lombard Renaissance style (I, PL. 139). The most remarkable Dominican monasteries are those at Tepoztlán (1559) and Yanhuitlán. In the 16th century and the beginning of the 17th the influence of Juan de Herrera (q.v.), the exponent of Spanish Renaissance purism, is notable; this style is found in the Cathedral of Mérida (second half of 16th cent.), by Juan Miguel de Agüero, and the Cathedral of Puebla (II, PL. 163), erected under the direction of Francisco Becerra. Some of the oldest examples of Mexican civil architecture are the Royal and Pontifical University (now the National University), founded in the mid-16th century, and the Hospital de Jesús, both in Mexico City; the Palacio de Cortés in Cuernavaca (begun ca. 1530, with many restorations); the Palacio de Gobierno at Tlaxcala (extensively remodeled 17th–18th cent.); the Casa de las Monjas and Casa del Adelantado de Montejo, in plateresque style, in Mérida; and the portal of the "Casa del que mató al animal" (House of the One Who Killed the Beast) in Puebla. The less important civil architecture generally followed the Mediterranean custom of locating rooms around a patio, a tradition preserved up to the 19th century.

The most interesting remains of 16th-century painting, exclusively religious in subject and European in style, are the frescoes in white, black, and gray tones found in the monasteries at Acolmán and Actopan; they were painted by skilled artists acquainted with Spanish and Flemish painting of the middle of the century. Among the well-known painters of the 1500s are Rodrigo de Cifuentes and Andrés de Concha. Sculpture has an essentially architectural function and reveals the indigenous taste, which is always closely linked to local tradition. All the 16th-century churches contain examples of this "creole" sculpture (e.g., the open chapel at Tlalmanalco, Mexico state).

Baroque and neoclassic styles of the 17th–19th century. Spanish influence, enriched by frequent direct contacts with Rome, and the indigenous culture evident in the exuberant ornament are essential features of the Mexican baroque period. Building activity continued to be very intense.

The most challenging baroque building is the Cathedral of Mexico City. Begun in the 16th century, perhaps according to plans by Alonso Pérez de Castañeda or by Claudio de Arciniega, who designed the Cathedral of Lima, it was modified in 1615 by Juan Gómez de Mora and was not finished until 1813. The faces, of a volcanic stone (*chiluca*) with a polished surface, exhibit sculptured ornament of some elegance; on the interior, with its immense central nave, the choir is situated opposite the high altar, following a Spanish tradition based on an Arabic compositional concept that does not emphasize perspective. Many churches modeled on the Cathedral were built in Mexico City during the 17th century. Remarkable for their rich ornamentation, especially on the outside, are S. Domingo (XIII, PL. 153), La Profesa, S. Lorenzo, Sta Veracruz, S. Inés, and the Chapel of the Conception, which is in the Cathedral.

Aside from the chromatic variety of the materials (e.g., gray stone for articulated and sculpured elements, red volcanic stone for the smooth surfaces), the baroque churches of this period and later are also distinguished by the predominance of mass over space; they generally have barrel vaults, lunettes, and octagonal cupolas on triangular corbels. This restricted sense of space is probably an inheritance from the pre-Cortés culture, in which the temple was a nonpublic cell isolated from the faithful. Another common feature is the concentration of interior and exterior ornamentation at the points of greatest interest, such as the retable with its paintings and sculptures, the secondary altars, doors, cupolas, and portals. In Puebla, decoration won out over structural clarity; examples are the Rosario Chapel of S. Domingo (XIII, PL. 152) and the churches of S. María Tonantzintla and S. Francisco Acatepec, which are particularly rich because of the use of a variety of materials, such as stucco for the figures and floral motifs, stone of various colors, and *azulejos*, the small polychrome ceramic bricks of Puebla, as well as the wealth

Principal modern centers of artistic interest in Mexico. *Key*: (1) Modern national boundaries; (2) internal boundaries. States: (I) Baja California; (II) Baja California Sur; (III) Sonora; (IV) Chihuahua; (V) Coahuila; (VI) Nuevo León; (VII) Tamaulipas; (VIII) Sinaloa; (IX) Durango; (X) Zacatecas; (XI) San Luis Potosí; (XII) Nayarit; (XIII) Aguascalientes; (XIV) Jalisco; (XV) Guanajuato; (XVI) Querétaro; (XVII) Hidalgo; (XVIII) Veracruz; (XIX) México; (XX) Colima; (XXI) Michoacán; (XXII) Federal District; (XXIII) Tlaxcala; (XXIV) Morelos; (XXV) Puebla; (XXVI) Guerrero; (XXVII) Oaxaca; (XXVIII) Tabasco; (XXIX) Chiapas; (XXX) Campeche; (XXXI) Yucatán; (XXXII) Quintana Roo.

of paintings covering the walls. Similar is S. Mónica at Guadalajara, one of the earliest of the 18th-century churches. The Bishop's Seminary at Guadalajara (1693–1701) is among the better examples of civil architecture of the period; the only concessions to baorque taste are an occasional ornament in the portals and the use of colored stone for the massive columns of the patio. The Tribunal of the Inquisition (now the National School of Medicine) in Mexico City is a severe building, dating from the first half of the 18th century, which has an elegant cloister with late Renaissance columns. In Mexico City there are also many fine houses of Spanish noblemen, such as that of the Condes de Santiago de Calimaya (18th cent.).

The 18th century was particularly fortunate in architecture of the school that may more properly be termed "late baroque" than "Churrigueresque," the term commonly used by art historians. Annexed to the complex of the Cathedral of Mexico City, the Sagrario Metropolitano (1749–68) is the work of Lorenzo Rodríguez, founder of the school of late baroque architecture, who felicitously blended the façade with that of the Cathedral itself (XIII, PL. 152); the Church of SS. Trinidad is also attributed to Rodríguez. The decorated façade of the Church of S. Francisco, also in Mexico City, is a quite restrained example of this style. The Capilla del Pocito (Chapel of the Well; 1779–91) at Guadalupe is a typically late baroque work by Francisco Guerrero y Torres, which has undulating lines and chromatic contrast in the *azulejos* that cover its façade and cupola. In the still beautiful patio of the Monastery of La Merced in Mexico City the decoration, arranged in flat planes, cancels every sense of motion. Other centers of late baroque architecture are Querétaro, with the Monastery of S. Agustín (now the Palacio Federal) and the churches of S. Rosa and S. Clara; Guanajuato, with the churches of S. Francisco, La Compañía (de Jesús), and S. Cayetano (called "La Valenciana"); and Taxco, with the Church of SS. Sebastián y Prisca (known as S. Prisca).

While a touch of provincialism may be noticed in the occasional formal differences found in this group of churches, this cannot be said of the Sanctuary of Our Lady of Ocotlán at Tlaxcala (I, PL. 140), in which the components of the Mexican baroque style — the European influence and the decorativism of the pre-Cortés civilization — are perfectly blended. The unknown architect, who possessed broad learning and was receptive to international tastes, has rendered here a Mexican interpretation of the baroque, particularly in the marked contrast between the red of the bases of the bell towers and the whiteness of the stucco of the façade, which is repeated in the filigreed belfries.

Some remarkable examples of late-baroque civil architecture may be found in several patrician residential buildings of traditional type in Mexico City, such as the house of the Conde de Heras y Soto, the house of the Marquis del Jaral de Berrio (erected by Francisco Guerrero y Torres), and the house of the Condesa del Valle de Orizaba, popularly known as Casa de los Azulejos (House of the Tiles) because of its facing of blue glazed tiles, which was added in 1735. In Puebla, the Palacio de los Herreros and the Casa del Alfeñique (almond-cake house), covered with polychrome tiles and with sculpture, are very original.

In the baroque period the large number of churches, economic prosperity, and the diffusion of the technique of painting on canvas and on copper (which was easier to transport) did not compensate for a certain poverty of expression. European influences are clearly recognizable: first, the predominant contributions of Zurbarán and Ribera; later, the superimposition of the manner of Rubens, which was more in keeping with the opulent tastes of the colony; and, lastly, the more conventional contribution of Murillo. Noteworthy Mexican painters of this period are Baltasar de Echave the Elder (d. ca. 1620), Baltasar de Echave Ibía the Younger (ca. 1583–ca. 1640; cf. I, PL. 144), Alonso Vázquez (d. 1608), Luis and José Juárez

(both, 17th cent.), Miguel Cabrera (1695–1768), and Antonio Pérez de Aguilar (late 18th cent.).

Sculpture, which was always regarded as an architectural complement in church façades and as a decorative feature in retables, remained even more anonymous than the painting. The folk art found in the churches and chapels of the small centers is perhaps more interesting. The oldest sculpture was oriented toward the tragic and realistic Spanish style, either exaggerating it in gestures — at times, to the point of caricature — or confining it to the tritest academicism. Among the most famous sculptors are members of the Cora family from Puebla — José Villegas, Zacarías, and José — who were active up to the early 1800s.

Reaction against the baroque began in 1791 with the arrival of the sculptor and architect Manuel Tolsá (1757–1816), a master from the Academia de S. Carlos in Valencia, who, along with Francisco Eduardo Tresguerras (1759–1833), was the greatest exponent of neoclassicism. Tolsá was responsible for the design of the School of Mining (Colegio de Minería) in Mexico City, which shows great compositional clarity, and for the completion of the Cathedral (1813), with its central cupola and sculptured ornamentation, as well as for numerous works in other centers. Tresguerras was born in Celaya (Guanajuato state), where his most important work, the Church of the Carmen, is located. With a few exceptions, such as the Hospice of Guadalajara, Mexican neoclassicism, which lasted until about 1840, was generally rather uninspired in all its manifestations.

Contemporary art. In the second half of the 19th century, under the influence of European eclecticism, an artistic production without national traits or creative personalities developed in Mexico. In the first part of the 20th century, Italian and French architects and engineers made a considerable contribution to the construction of various public works, which were built in the most diverse styles, ranging from Neo-Gothic to Art Nouveau (e.g., the Palacio de Bellas Artes in Mexico City, by Adamo Boari and Federico Mariscal). Acquaintance with European architecture and with its construction methods (especially the use of reinforced concrete) contributed to the training of that group of Mexican architects and engineers which was responsible for the affirmation of modern Mexican architecture, which is highly original and endowed with remarkable personalities, such as José Villagrán García, Ramón Marcos, Enrique de la Mora, Pedro Ramírez Vázquez, Enrique del Moral, Augusto H. Alvarez, Mario Pani, Carlos Lazo, Raúl Cacho, Guillermo Rossell, and Félix Candela. The theoretician Villagrán García argued against the latest manifestations of eclecticism in the name of purer European rationalism. This latter school was, in turn, reelaborated by the succeeding generation with a sense of imagination at times bordering on exuberance, ready to avail itself of the most diverse materials, ranging from iron to cement to those of local origin. The principal characteristics of contemporary Mex can architecture are summed up in the monumental complex of University City in Mexico City (1949–57), which is comprised of works by an outstanding array of architects, including Mario Pani, Enrique del Moral, Salvador Ortega, Carlos Lazo, Pedro Ramírez Vázquez, Augusto Pérez Palacios, Luis Barragán, Juan O'Gorman, Gustavo Saavedra, and Juan Martínez de Valasco.

With the exception of some popular painters, such as José María Estrada (d. 1873), 19th-century Mexican painting, first identified with neoclassicism and then with realism, affords a rather uninteresting panorama. Only in the revolutionary period, beginning in 1910, did new and original forces come into play, such as those found in the work of the engraver José Guadalupe Posada (1851–1913) and, on a more cultivated artistic level, in that of José Clemente Orozco (q.v.), whose work, along with that of Diego Rivera and the younger David Alfaro Siqueiros and Rufino Tamayo (qq.v.), brought Mexican painting into the mainstream of contemporary world art.

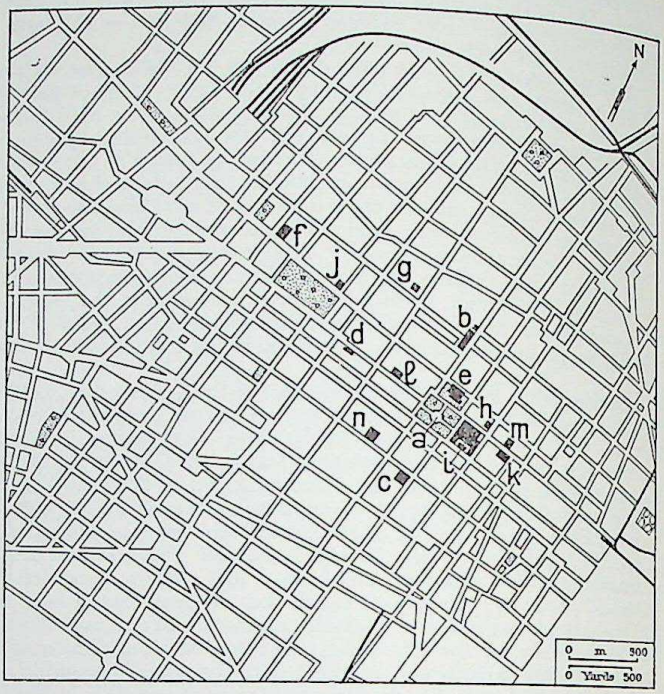
ART CENTERS AND ARCHAEOLOGICAL SITES. The following survey is arranged by states (including the territory of Quintana Roo) and proceeds continuously from the northwest to the southeast. Mexico City will be considered first.

Mexico City (México, D. F.). Capital of the Republic of Mexico and of the Federal District, the city is located on a high plateau, which is about 7,500 ft. above sea level and surrounded by lofty mountains. Founded in about 1325 by the Mexica-Aztec tribe and named Tenochtitlán, it became the capital of the Aztec kingdom. In 1521, Hernán Cortés, after besieging and destroying the Aztec city, founded the new Mexico City on a regular orthogonal plan and furthered its development by draining the nearby swamps and by building new causeways. The major buildings and the Spanish quarter were built around the Plaza Mayor (officially the Plaza de la Constitución; also known as the Zócalo), covering the area of the large Aztec temple at the geographic center of the pre-Cortés city (see FIG. 844).



The imposing Cathedral, which faces the Plaza Mayor on the north, was begun in the second half of the 16th century, probably on the basis of a plan of Alonso Pérez de Castañeda. After an interruption of work, the construction of the Cathedral was resumed in 1615, under the direction of Juan Gómez de Mora (ca. 1580–1648), with a modified plan. The mixed neoclassic and baroque façade has two orders of columns and is decorated with statues and low reliefs. The interior is cruciform with a nave and two side aisles, both of which are flanked by chapels containing some fine examples of Churrigueresque decoration. The Altar de los Reyes, located to the rear of the high altar, is a particularly notable work in the Churrigueresque style. The Sagrario Metropolitano (1749–68), adjoining the Cathedral, is a work of Lorenzo Rodríguez; it has the form of a Greek cross and is elaborately decorated, both inside and out, in a late-baroque manner (XIII, PL. 152).

Other architectural monuments of the colonial period adjacent to the Plaza Mayor are the Palacio Nacional, originally a residence of the viceroys, which was rebuilt in the early 18th century, and the Palacio Municipal, also rebuilt after the early building was almost totally destroyed in 1692, with additions dating from the early 20th century. Among the earliest surviving examples of colonial architecture are the Church of S. Lorenzo (1650); the former Church of S. Agustín (completed 1692), which is now the Biblioteca Nacional; and the Hospital de Jesús (founded 1527), of which only the patio and staircase remain in somewhat their original state.

Examples of baroque civil and religious structures dating from the 17th and 18th centuries are the churches of Sta Veracruz, S. Hipólito, and S. Inés; the National Preparatory School (formerly the Colegio de S. Ildefonso) and "Las Viscaínas" (Colegio de la Paz); the houses of the Condes de Santiago de Calimaya and the Conde de Heras y Soto, as well as the so-called "Casa de los Mascarones" (House of the Masks); and the patio of La Merced, practically all that survives of the original monastery. Other notable examples of colonial baroque are the Church of SS. Trinidad, designed by Lorenzo Rodríguez; the Church of La Profesa; the Church of S. Francisco, once part of a large monastery complex; the Church of S. Domingo, which was rebuilt in the early 18th century (XIII, PL. 153); the National School of Medicine, built in the first half of the 18th century, which once served as the Tribunal of the Inquisition; the "Casa de los Azulejos," so called for its white and blue tile façade; and two former residential structures designed by Francisco Guerrero y Torres, the Palacio de Iturbide and the house of the Condesa San Mateo Valparaiso (now the Banco Nacional de México).

Throughout the 18th century the city was enriched by many new public and private buildings, some of which have been listed above, and, also, by new steps forward in city planning. Under the viceroy Gálvez, existing streets were improved and new streets were built; under the viceroy Revilla Gigedo, the public park (the Alameda) was opened, and new aqueducts, baths, and fountains (XIII, PL. 153) were constructed.

Also dating from this period are the School of Mining, designed by Manuel Tolsá (1757–1816) and the Castle at Chapultepec (begun 1783), which now houses the Museo Nacional de Historia. After

Mexico City, plan of the central zone of colonial settlement. *Key*: (*a*) Plaza Mayor (Plaza de la Constitución; known as the Zócalo); (*b*) S. Domingo and the National School of Medicine; (*c*) Hospital de Jesús and the house of the Condes de Santiago de Calimaya; (*d*) S. Francisco, S. Felipe Neri de Jesús, and the Casa de los Azulejos; (*e*) the Cathedral; (*f*) S. Hipólito; (*g*) S. Lorenzo; (*h*) S. Inés; (*i*) Palacio Nacional; (*j*) Sta Veracruz; (*k*) Escuela Nacional de Bellas Artes (formerly the Academia de S. Carlos); (*l*) Church of La Profesa and Palacio de Iturbide; (*m*) SS. Trinidad; (*n*) Biblioteca Nacional (formerly the Church of S. Agustín).

a period of inactivity, urban development resumed toward the end of the 19th century. A notable early-20th-century structure is the Palacio de Bellas Artes (1904–34), designed in a European eclectic style by Adamo Boari and Federico Mariscal.

Since 1940 a continuous surge of construction activity and development has changed the face of the city proper and its suburbs. In Mexico City the distinctive style of modern Mexican architecture can be seen in the private houses and the commercial and public buildings designed by such prominent architects as Juan O'Gorman, Enrique de la Mora, José Creixell, Enrique Yáñez, Pedro Bustamente, José Arnal, Vladimir Kaspé, Juan Sordo Madaleno, Carlos Lazo, Pedro Romírez Vázquez, Augusto Alvarez, Mario Pani, and Salvador Ortega. University City, about 10 miles from the center of Mexico City, incorporates Indian, Spanish, and modern elements in its numerous buildings, which have attracted international attention (I, PL. 141).

Chihuahua. Chihuahua. Located in the center of a mining region, the city was founded by the Franciscans in about 1705 and

developed with a regular street plan. In the old center there are some remarkable examples of baroque and neoclassic architecture, such as the Cathedral (1717–89), which is dedicated to St. Francis, and the Palacio de Gobierno (1908–09), built around the old tower in which Miguel Hidalgo y Costilla, leader in the fight for Mexican independence, was imprisoned before his execution in 1811. An 18th-century aqueduct still supplies water to the city.

Bibliog. E. C. Creel, El Estado de Chihuahua, Mexico City, 1928.

Coahuila. Saltillo. Founded in 1586, on a gridiron plan, its colonial character is still preserved in part. The late-baroque Cathedral, the Church of S. Esteban, and the magnificent 18th-century parks, along with the more recent Palacio de Gobierno, are notable.

Bibliog. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 115; M. Alessio Robles, Perfiles del Saltillo, 2d ed., Mexico City, 1937.

Nuevo León. Monterrey. Although the city was chartered in 1596, Monterrey presents a predominantly modern aspect, having straight streets and large plazas. Among the oldest monuments are the Cathedral, with its baroque façade and austere interior, which was begun in 1630 but remained unfinished until the beginning of the 19th century, and the Bishop's Palace (El Obispado Viejo) with its domed chapel, dating from 1785. Other prominent buildings in the city are the Palacio Municipal (1853) and the Palacio de Gobierno (1908).

Bibliog. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 118; C. Garza, Nuevo León, in Historia mexicana, I, Mexico City, 1952, pp. 494, 515.

Zacatecas. La Quemada. This well-preserved archaeological site, probably the Aztec city of Chicomoztoc, was already abandoned when it was discovered by the Spaniards in 1535. The buildings are constructed of stone slabs, often held together by a mortar of red clay and corn husks. A paved road leads past a series of small pyramids, beyond which stands a quadrangular building with a central patio surrounded by thick stone columns which may have formed a portico. An unusual pyramid, without tiers or a stairway, which is, perhaps, unique in all Mexico, still rises to a height of about 36 ft.; it is not possible to determine whether it was originally pointed or truncated. On the slopes of the hill on which the city is located there are ruins of great stone walls, which give the appearance of an imposing fortress.

Bibliog. A. Hrdlička, The Region of the Ancient "Chichimecs" with Notes on the Tepecanos and the Ruin of La Quemada, Mexico, AmA, N.S., V, 1903, pp. 385–440.

Zacatecas. Founded in 1546 by Juan de Tolosa in the center of a rich mining and farming region, it was accorded the status of a city in 1585 by Philip II of Spain. Irregular and narrow streets give the city a medieval appearance. Of note are the baroque Cathedral (begun 1612; completed and dedicated 1752; XIII, pl. 154), which has a very richly carved façade and a large, tiled dome; S. Juan de Dios; S. Domingo, known as "La Compañía" (mid-18th cent.); and Nuestra Señora de Guadalupe, which contains paintings by Antonio Torres. There is also an imposing 18th-century aqueduct.

Bibliog. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 87; L. Chávez Orozco, Bibliografía de Zacatecas, Mexico City, 1932; J. R. Benitez, Las catedrales de Oaxaca, Morelia y Zacatecas, Mexico City, 1934; D. Kuri Breña, Zacatecas: Civilizadora del norte, Mexico City, 1944 (2d ed., 1959).

San Luis Potosí. San Luis Potosí. Built by the Spaniards on a regular plan, with straight streets, broad plazas, and public gardens, the city retains a baroque appearance. To that period belong the Cathedral (completed and dedicated 1737), which was built on the site of an earlier church, and the churches of S. Miguelito, S. Agustín, S. Francisco, and Nuestra Señora del Carmen, with its tiled domes and delicately carved façade.

Bibliog. J. Betancourt, San Luis Potosí: Sus plazas y calles, San Luis Potosí, 1921; M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, pp. 87, 116; J. Meade, Guía de San Luis de Potosí, 2d ed., Mexico City, 1946.

Tamuín. This Huaxtec center covers 20 acres, only part of which has been explored. The largest structure is a platform formed of two low rectangular tiers, with stairways and plain balustrades; in front of it there is a much lower platform, extended by an unusual long, narrow corridor with two conical altars, one located in the middle and the other at the end. One of the altars is decorated with murals of red, green, and white, showing a procession of deities. A statue of an adolescent boy (Mexico City, Mus. Nacional de Antr.; X, pl. 49) was found on the larger platform.

Bibliog. G. Kubler, The Art and Architecture of Ancient America; the Mexican, Maya, and Andean Peoples, Harmondsworth, 1962, p. 80 f.

Tancanhuitz. The buildings of this Huaxtec center are distributed symmetrically. The main structure is low and circular, with a maximum diameter of about 40 ft.

Bibliog. G. Kubler, The Art and Architecture of Ancient America: the Mexican, Maya, and Andean Peoples, Harmondsworth, 1962, p. 80.

Tantoc. This site, which is still unexplored, has the largest tumuli in the Huaxtec area. The largest rises to a height of about 230 ft., while another is about 200 ft. high; both appear to be similar in form to the pyramid at Cholula in Puebla state (see below).

Nayarit. Ixtlán. This archaeological center has a circular temple with five access staircases of finely squared stones. On the upper platform, which is paved with stone and surrounded by a parapet with openings in the shape of a Latin cross, there are two altars with small stairways.

Bibliog. E. W. Gifford, Surface Archaeology of Ixtlán del Río, Nayarit, Univ. of Calif. Pub. in Am. Archaeol. and Ethn., XLIII, 1950, pp. 183–301; J. Corona Núñez, El Templo de Quetzalcoatl en Ixtlán, Anales Inst. nacional de antr. e h., 6th ser., IV, 32, 1952, pp. 45–49.

Aguascalientes. Aguascalientes. Founded in 1575, the city later became a missionary center and retains many features from the colonial period. Among the monuments of this period are numerous 18th-century churches, such as the baroque Cathedral and the Church of Nuestra Señora de Guadalupe.

Bibliog. A. R. González, Historia del Estado de Aguascalientes, Mexico City, 1887; M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, pp. 91–110, 135; J. Bernal Sánchez, Apuntes históricos, geográficos y estadísticos del Estado de Aguascalientes, Aguascalientes, 1928.

Jalisco. Guadalajara. Founded in 1531, the city has been the seat of the bishopric of western Mexico since 1549. In the Plaza Mayor are the Cathedral (1571–1618), with its richly decorated façade and interior, and the baroque Palacio de Gobierno (17th cent.). Also notable are the baroque Church of S. Mónica (1720–33), with sculptured foliation on its façade; Nuestra Señora de Guadalupe (XIII, pl. 153), S. Felipe de Jesús, and numerous other churches and monasteries; the neoclassic Hospicio Cabañas; the Guadalajara Museum, housed in an early-18th-century seminary building, which contains valuable paintings, a library, and some archaeological finds; and the Teatro Degollado, an impressive neoclassic edifice dating from the mid-19th century.

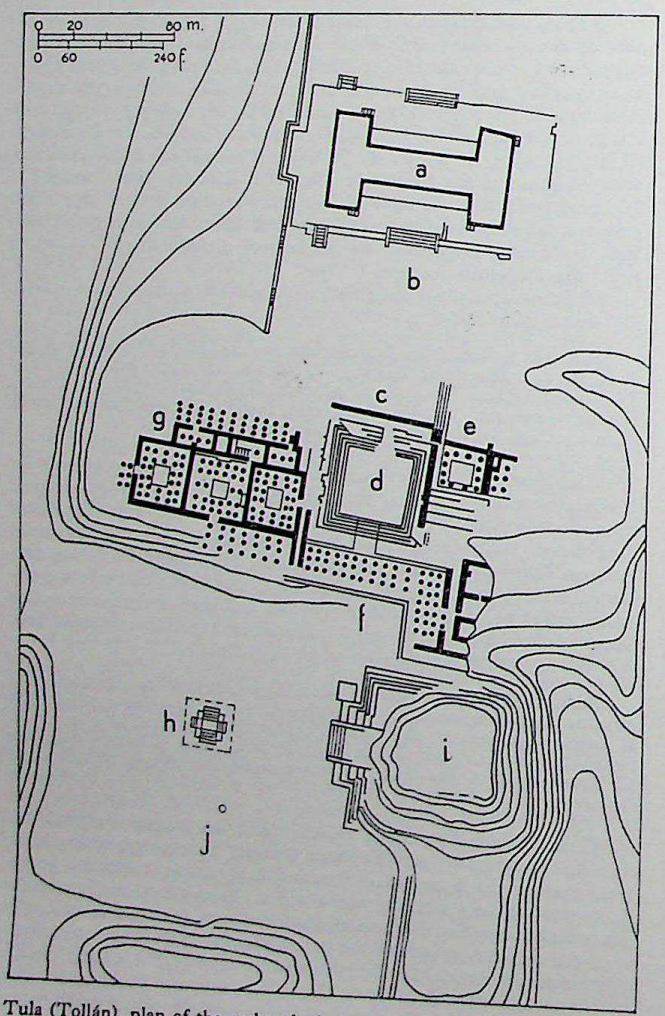
El Ixtepete, a pre-Columbian structure from the classic period, is located near the city.

Bibliog. J. Romo, Guadalajara, Mexico City, 1888; M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, pp. 66–99, 135; J. Cornejo Franco, Gvadalaxara colonial, Guadalajara, 1938; A. Chávez Hayher, Guadalajara de ayer, Guadalajara, 1956; J. Cornejo Franco, Reseña de la Catedral de Guadalajara, Guadalajara, 1960.

Guanajuato. Celaya. Founded in 1570 by 16 Basque families, it contains many works by the architect, sculptor, painter, and poet Francisco Eduardo Tresguerras (1759–1833), who was born and died there. His principal work is the Church of Nuestra Señora del Carmen (1803–07), which has an exceptionally beautiful dome, decorated with green and gold glazed tiles, and in which there are notable sculptures and paintings by the architect. Tresguerras also designed altars for the Church of S. Francisco, in which he is entombed, and the tower of the Church of S. Agustín.

Bibliog. M. Romero de Terreros, El arquitecto Tresguerras, Anales Mus. nacional de arqueol., h. y etn., 4th ser., V, 1927, pp. 326–45; Homenaje al insigne arquitecto D. Francisco Eduardo Tresguerras en el primer centenario de sa muerte, Guanajuato, 1933; F. de la Maza, Dibujos y proyectos de Tresguerras, Anales Inst. de investigaciones estéticas, V, 18, 1950, pp. 27–33.

Guanajuato. This state capital, built on a site occupied before the conquest by the Tarascan people, became a major mining center under the Spaniards. Situated in a narrow mountain gorge, its streets are very winding and narrow. In appearance Guanajuato has retained its colonial characteristics. Important religious structures from the colonial period are the parish church of S. Francisco (1671–96); the Jesuit church, La Campañía (ca. 1747–65), the work of Felipe de Ureña and Fray José de la Cruz; S. Cayetano (dedicated 1788), called "La Valenciana" after the famous silver mine nearby; and S. Diego (founded 1679; rebuilt ca. 1760), which has a fine Churrigueresque façade. Among the other important buildings are the house of the Condes de Rul y de Valenciana, designed by the architect



Francisco Eduardo Tresguerras; the Colegio del Estado, which houses a mineral collection; and the Teatro Juárez. An important historical landmark is the fortresslike Alhóndiga de Granaditas (1798–1808), now a museum, which was built as a public granary and became the scene of a famous massacre in the Mexican war for independence. Also of interest is the Panteón, the public cemetery, with its catacombs.

BIBLIOG. P. González, Algunos puntos y objetos monumentales de Guanajuato, Guanajuato, 1895; M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 87; A. Cortés, Casas históricas de la ciudad de Guanajuato, Guanajuato, 1939.

Querétaro. Querétaro. The city was founded by the Otomi and conquered for Spain in 1531. Almost all of its monuments date from the 18th and 19th centuries, during which it became one of the most important centers in Mexico. The Cathedral (formerly the Church of S. Francisco), dating from the early years of the Spanish occupation, has been modified many times, almost completely in 1727. The baroque churches of S. Clara (founded 1607), S. Rosa (dedicated 1752), and S. Agustín (mid-18th cent.) have highly ornate interiors. Other notable examples of religious architecture are the former monastery of S. Francisco, which now houses a museum; the Capuchin monastery (early 19th cent.); the monastery and Church of La Cruz (founded 1682); the Convent of S. Teresa, or "Teresitas" (1803), a neoclassic work by Tresguerras; and the former monastery of S. Agustín (18th cent.), now the Palacio Federal.

The great aqueduct, about 5 miles long and rising to a maximum height of about 75 ft., was built in the second quarter of the 18th century and brings water to the city's many public and private fountains, among which the Fountain of Neptune (1797; rebuilt 1848) is notable.

Tula (Tollán), plan of the archaeological zone. *Key:* (*a*) Ball Court; (*b*) the small plaza; (*c*) "wall of serpents" (Coatepantli); (*d*) Temple of Tlahuizcalpantecuhtli (or of Quetzalcoatl, or Mound B); (*e*) Building 1; (*f*) colonnaded portico; (*g*) Building 3; (*h*) altar; (*i*) pyramid; (*j*) the central plaza.

Hidalgo. Tula (Tollán). The principal monument of this Toltec site, located west of the modern town of the same name, is the Temple of Tlahuizcalpantecuhtli (or of Quetzalcoatl, or Mound B), a pyramid with five tiers, which is about 33 ft. high (X, PL. 31). The outer walls, faced with thin stone slabs, are carved with alternate rows of eagles devouring human hearts and heads and processions of jaguars. The roof of the temple was supported by four monumental atlantes, about 15 ft. high, and by piers with warrior figures in low relief (X, PL. 32), while the lintel, in keeping with the Toltec style, was supported by two serpents. These sculptures, almost completely preserved to this day, are among the most important documents of Toltec art. The freestanding "wall of serpents" (Coatepantli), with friezes in low relief (X, PL. 31) and crenelation, lies parallel to the north side of the pyramid. The colonnade on the south side is L-shaped, and a bench which runs its entire length is decorated with a procession of warriors carved in low relief and painted in lively colors. On the west side there are remains of large colonnaded chambers with benches around a central impluvium. To the east, remains of a palace can still be seen; a Chac-Mool was found in one of the rooms. There is also a museum with sculptures, ceramics, and other Toltec objects.

Not far from Tula lies the so-called "Corral" building ("the building of the courtyard"), which has a circular center and quadrangular exterior. Some bas-reliefs in the Toltec style were also found here.

Kubler, Chichén-Itzá y Tula, in Estudios de cultura maya, Mexico City, 1961, pp. 47–80.

Veracruz. Castillo de Teayo. This Huaxtec-style pyramid, in a perfect state of preservation, is composed of three almost vertical tiers; a large flight of steps on its west side leads to the upper temple, the walls of which are still standing. Important pieces of sculpture from the surrounding area have been placed around the monument.

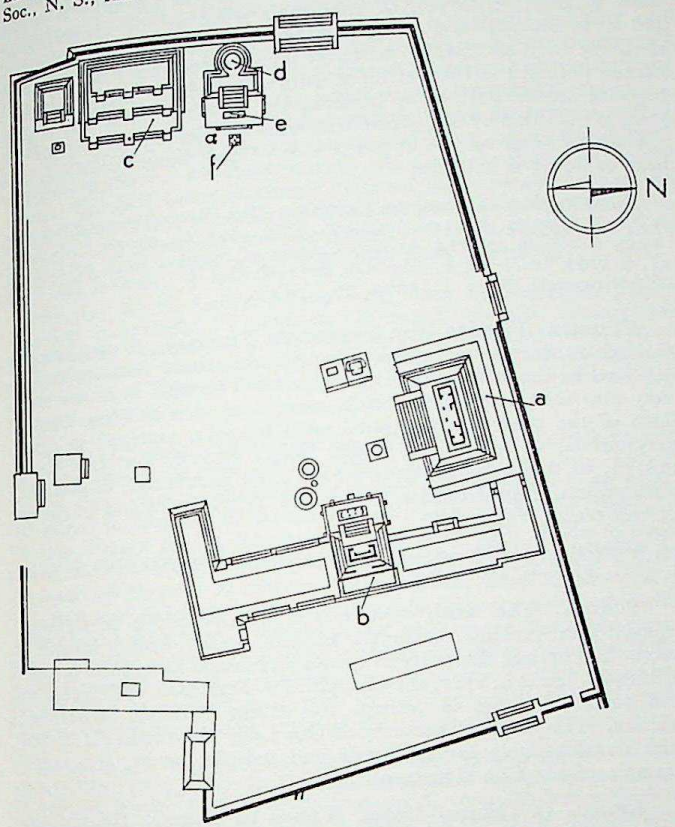
BIBLIOG. J. García Payón, Castillo de Teayo: Noticias sobre su arqueología, Uni-Ver, II, 1950, pp. 155–64.

Cempoala. The Totonac capital at the time of the Conquest, this site includes many important stone monuments, which are grouped within low crenelated walls. All the structures are covered with stucco, which is sometimes painted. The most important groups are the Great Temple, the Temple of the Chimneys, and the Temple of the Wind God (Quetzalcoatl-Ehecatl); the first two are rectangular, while the third rises from a round base (FIG. 849).

BIBLIOG. J. García Payón, Restos de una cultura prehistórica encontrados en la región de Zempoala, Veracruz, Uni-Ver, II, 1950, pp. 90–130; J. García Payón, La Ofrenda del Altar de la Gran Pirámide, Zempoala, El México antiguo, VIII, 1955, pp. 57–65; F. del Paso y Troncoso, Las rovinas de Cempoala y del Templo de Tajín, n. p., n. d.

Cerro de las Mesas. Some remarkable stone steles depicting seated or standing personages, with the heads in profile and the bodies in frontal view in the early classic Maya style, have been found here. Other remains reflect pronounced influences from the central Mexican plateau and the Olmec region.

BIBLIOG. P. Drucker, Ceramic Stratigraphy at Cerro de las Mesas (B. Bur. of Am. Ethn., CXLI), Washington, 1943; P. Drucker, The Cerro de las Mesas Offering of Jade and Other Materials (B. Bur. of Am. Ethn., CLVII), Washington, 1955.



El Tajín. The principal monument of this Totonac center, located just north of Papantla, is a six-level pyramid, rising to a height of about 70 ft. (III, PL. 485). On each of its four sides there are niches which create extraordinary effects of light and shadow and, perhaps, had a wider significance, as the number of niches is thought by some to represent the days of the year. A large flight of steps decorated with fretwork (*xicalcoliuhqui*) leads to the top platform, on which the temple once stood (X, PL. 22). In one of the ball courts there is a bas-relief in the characteristic Totonac style, the central scene of which depicts the sacrifice of the losing player by the winner. Many other sculptured objects are found in the region, such as enormous serpent columns and the bas-reliefs or friezes on various buildings. Some roofs are constructed with a kind of cement so thick and solid that columns are not required to support surfaces as large as 90 sq. yd.

BIBLIOG. E. S. Spinden, The Place of El Tajín in Totonac Archaeology, AmA, XXXV, 1933, pp. 271–87; J. García Payón, La ciudad arqueológica del Tajín, Jalapa, 1951; J. García Payón, Exploraciones en El Tajín, Mexico City, 1955.

849

Pánuco. In the extreme northern end of the Veracruz state, this is an archaeological site of primary importance for our knowledge of Huaxtec art. The architectural remains consist of buildings on platforms with flights of access steps.

Bibliog. G. F. Ekholm, Excavations at Tampico and Panuco in the Huaxteca, APAmM, XXXVIII, 1944, pp. 319–512; R. S. MacNeish, An Early Archaeological Site near Panuco, Vera Cruz, Tr. Am. Philosophical Soc., N. S., XLIV, 1954, pp. 539–641.

Cempoala, plan of the temple enclosure. *Key*: (*a*) the Great Temple; (*b*) Temple of the Chimneys; (*c*) terraced construction; (*d*) Temple of the Wind God (Quetzalcoatl-Ehecatl); (*e*) Temple of Xolotl; (*f*) the fire altar (*from W. Krickeberg, 1956*).

Quauhtochco. At this Totonac center there are remains of a temple atop a pyramid with four tiers, which is reminiscent of the Aztec style, even though it lacks the characteristic double stairway and the two upper temples.

Bibliog. A. Medellín Zenil, Exploraciones en Quauhtochco, Jalapa, 1952.

Quiahuiztlán. This site of a Totonac fortress town contains the well-known types of mausoleum also to be found in other sites of this area. They are small-scale reproductions of a temple — with base, mortuary, chamber for worship, roof, and stairs — and are grouped to form cemeteries in the European style.

Tuzapán. This Totonac center has paved streets, an elaborate drainage system, and pyramids, which have sloping sides but lack the usual projecting cornices.

Veracruz. This port city was founded in 1519 by Hernán Cortés, who named it La Villa Rica de Vera Cruz; the settlement was later abandoned and was resettled in 1599. Today, it is a hybrid city architecturally because of the mixture of the old and the modern. Among the principal monuments are the Church of Nuestra Señora de la Asunción (La Parroquia; dedicated 1734) and the fort on the island of San Juan de Ulúa (begun 1528).

Bibliog. L. E. Villaseñor, El puerto de Veracruz, Mexico City, 1890; J. Ramírez Cabañas, La ciudad de Veracruz en el siglo XVI, Mexico City, 1943; M. B. Trens, Historia de Veracruz, 6 vols., Mexico City, 1947–50.

State of México. Calixtlahuaca. This ancient archaeological site, which is situated about 5 miles from the city of Toluca, covers an area of several square miles. The original inhabitants of the site were probably the Matlatzincas; in 1476, during the reign of Ahuitzotl, it was captured by the Aztecs. The noteworthy Temple of Quetzalcoatl-Ehecatl (X, pl. 38) is circular with four tiers. From a rectangular platform that juts out from the base on the east side a broad stairway with a balustrade ascends to the top of the cylindrical temple. The Temple of Tlaloc (the god of rain) is cruciform, with a semicircular forepart built of small squared stones of red and black *tezontle* (pumice) and decorated with parallel rows of skulls made of the same material (X, pl. 38); the structure may have been a Tzompantli, a repository for the skulls of sacrificial victims. Close to the Temple of Quetzalcoatl-Ehecatl are the remains of a building with many small rooms surrounding a terraced courtyard, which was probably a priestly school (*calmecac*).

Bibliog. J. García Payón, Zona arqueológica de Tecaxic Calixtlahuaca, I, Mexico City, 1936; Calixtlahuaca: Guía oficial, Mexico City, 1960.

Malinalco. This Aztec center, dating from the final period, is extraordinary among pre-Columbian sites for its buildings carved out of living rock. The layout reveals such precise planning as to anticipate even the minute details of the rock-cut statues. The principal temple, cut from a ledge, has a pyramidal base with two steeply sloping tiers. Two statues of seated jaguars, also carved from the rock, flanked the stairway at the front, in the center of which there is a kind of podium. The circular room at the top is entered through an opening outlined by two deeply incised serpent profiles, which are arranged in such a way that the doorway itself represents a serpent's mouth, with the fangs forming a low podium before the threshold. To the right of the opening there is a serpent's head surmounted by a squat figure, of which the top is missing, and to the left a drum on which there once stood the figure of a Jaguar Knight, of which only the feet remain. A bench which extends around the inner wall of the circular chamber is decorated with carvings of a jaguar pelt and eagles with outspread wings. A large eagle with wings half spread, in the center of the chamber, faces toward the entrance. Aside from this building there are others of less importance, one of which was not completed because of the coming of the Spaniards. One of these buildings contains the remains of a wall fresco, which depicts a procession of warriors, with elaborate headdresses, carrying spears and shields in their hands. A large wooden drum from Malinalco, now in the Museo Nacional de Antropología, Mexico City, is carved with dancing figures of eagles and jaguars, symbolizing the warrior knights of the cults of the Eagle and the Jaguar.

Bibliog. H. Larsen, The Monolithic Rock Temple of Malinalco, Mexico, Ethnos, III, 1938, pp. 59–63; J. García Payón, Los monumentos arqueológicos de Malinalco, Mexico City, 1947; J. García Payón, Síntesis de las excavaciones en Malinalco, Rev. mexicana de est. antr., XIV, 1956–57, pp. 161–65.

Tenayuca. The terraced pyramid at Tenayuca, only 6 miles from Mexico City, dates back to about 1200 and shows signs of a number of remodelings and enlargements, evidence of which can be seen in a tunnel which has been excavated through the structure. The double staircase, separated by broad ramps in the Chichimec-Aztec style, covers nearly all of one face of the pyramid and projects about 45 ft. beyond the base (X, pl. 41). Almost nothing remains of the twin temples on the summit, which, in accordance with Aztec practice, were dedicated to the war god, Huitzilopochtli, and the rain god, Tlaloc. A "wall of serpents" (Coatepantli), with sculptured heads and masonry bodies, stretches along the low platform at the base of three sides of the pyramid; traces of painted stucco are still visible on some of the serpents. Remains of wall paintings showing skulls and crossbones are preserved.

Bibliog. R. J. Ceballos Novelo and others, Tenayuca (Dept. de monumentos, Pub.), Mexico City, 1935.

Teotihuacán (San Juan Teotihuacán). Probably the first great city of the indigenous people and of the classic period in the Valley of Mexico, this site is as remarkable for its plan as for its monuments and their decoration. The ceremonial nucleus of the city was built along a central axis, the road called "Avenue of the Dead," which begins on the plaza of the Pyramid of the Moon at the north and extends to the south beyond the Temple of Quetzalcoatl. The road is flanked on both sides with both single structures and building complexes, such as that of the Pyramid of the Sun (X, pl. 6).

This pyramid, at present nearly 220 ft. high, is the largest monument in Teotihuacán and one of the largest in Mexico. It has five sloping tiers and served as the base for a temple which once stood on the upper platform. The structure has lost its stucco facing, but excavation has revealed that the core is adobe covered with stone. An adjacent building of later construction was covered with magnificent stone slabs decorated with carved serpents. On the north,

south, and east sides, the pyramid is surrounded by a platform. On the west side, eight smaller temples, symmetrically positioned in a large plaza, stood between the pyramid and Avenue of the Dead.

The Pyramid of the Moon, a slightly smaller structure than the Pyramid of the Sun, was also placed in a large plaza, which was the northern terminus of the Avenue of the Dead. Near its base was recovered the enormous monolithic statue of the "Water Goddess" (Mexico City, Mus. Nacional de Antr.), probably the best example of the archaic sculptural style of Teotihuacán, in which the human figure is stylized along geometric lines.

The numerous structures which stand at either side of the Avenue of the Dead, though generally in a very poor state of preservation, are well planned and well constructed and have restrained but excellent decoration, all typical features of the Teotihuacán style.

A little farther south is the so-called "Ciudadela" (Citadel), a vast quadrangle enclosed by a series of platforms and temples, at the center of which stands the Temple of Quetzalcoatl, a five-tiered structure with a wide central stairway. Its splendid, rather "baroque" decoration of sculptured stone represents feathered-serpent heads alternating with other heads that probably symbolize the rain god, Tlaloc (X, PL. 6). This is undoubtedly the most impressive detached structure in central Mexico.

All around this ceremonial area there is a vast zone covered with the ruins of palaces, temples, and dwellings. The latter are made up of central quadrangular patios surrounded by rooms; a number of these units could have formed a large palace with numerous chambers, patios, and connecting passages.

The many well-preserved mural paintings found in the area of Teotihuacán (X, PL. 19) may also be seen in reproductions in the Museo Nacional de Antropología, Mexico City, where most of the major finds from the zone are now kept. The local museum houses many objects found in regional excavations.

Villagra Caleti, Teotihuacán: Sus pinturas murales, Anales Inst. nacional de antr. e h., V, 1952, pp. 67–74.

Tepozotlán. The Seminary of S. Martín, founded by the Jesuits in 1582, is a remarkable example of ecclesiastical architecture from the colonial period. Especially notable among the seminary buildings is the church (completed 1762), with its Churrigueresque façade and towers and its sumptuous interior (I, PL. 140), in which there are some fine retables (XIII, PL. 154).

BIBLIOG. M. Toussaint and J. R. Benitez, Iglesias de México, III, Mexico, 1925, pp. 78–95; A. von Wuthenau, Tepotzotlán, Mexico City, 1941.

Colima. Colima. At El Chanal, an archaeological site a short distance from the town, a monument in the central-Mexican style has been reconstructed. It consists of a pyramidal base with a wide flight of stone steps, which are decorated in low relief, with the face of a god as the principal motif.

BIBLIOG. C. O. Sauer, Colima of New Spain in the 16th Century (Ibero-Americana, XXIX), Berkeley, Los Angeles, 1948.

Michoacán. Ihuatzio. At this village, south of Tzintzuntzán (see below), there are some Tarascan yácatas which are attributed to the final period.

Morelia. Founded in 1541 by the viceroy Antonio de Mendoza and given the name Valladolid, the city, now the capital of Michoacán state, was renamed in 1828 for José María Morelos, a hero of the struggle for Mexican independence. The Cathedral (1640–1744), which stands between the Plaza de la Paz and the Jardín de los Mártires, has a plateresque façade, twin towers, and a dome; facing it stands the Palacio de Gobierno (begun 1732; XIII, PL. 153), which was formerly a seminary and now houses the state library (Biblioteca del Estado). Another notable architectural monument of the city is the University of S. Nicolás de Hidalgo (founded ca. 1540). An old aqueduct (1785–89) with 254 arches brings water to the city through terra-cotta pipes.

BIBLIOG. J. R. Benitez, Las catedrales de Oaxaca, Morelia y Zacatecas, Mexico City, 1934; J. R. Benitez, Morelia, Mexico City, 1935; F. Benitez, Morelia, Mexico City, 1948.

Tzintzuntzán. This village, the ancient capital of the Tarascan kingdom, has five interesting yácatas. These ceremonial platforms, which belong perhaps to the final period, are T-shaped with stairs on every side. Tombs containing human remains and objects have been found among the yácatas.

BIBLIOG. D. F. Rubín de la Borbolla, Exploraciones arqueológicas en Michoacán; Tzintzuntzan, Temporada III, Rev. mexicana de est. antr., V, 1941, pp. 5–20.

Federal District (Distrito Federal). Cuicuilco (San Cuicuilco). At this archaeological site in the Valley of Mexico there is a circular monument which probably dates to the formative period. It is thought to be the oldest surviving example of monumental architecture in America. The structure, which was probably a temple base, is massive, having a maximum diameter of approximately 400 ft. at the base and rising in four stages to its present height of about 75 ft. The exterior facing of unhewn volcanic rocks is tightly packed against the interior fill of sand and rubble. Excavations have revealed several periods of construction. Access to the upper platform is provided by a staircase that rises between the terraces on one side and a ramp on the opposite side. Other lesser ruins have also been explored at this site.

BIBLIOG. B. C. Cummings, Cuicuilco: The Oldest Temple Discovered in North America, Art and Archaeol., XVI, 1923, pp. 51–58; B. G. Cummings, Cuicuilco and the Archaic Culture of Mexico, Univ. of Ariz. B., IV, 8, 1933, pp. 1–56; E. Noguera, Excavaciones en Cuicuilco, Int. Cong. of Americanists, Proc., II, 1939, pp. 210–21.

Tlaxcala. Tizatlán (San Esteban de Tizatlán). A very late pre-Columbian temple with quite unusual architectural features has been explored in this village near the town of Tlaxcala. It is one of the very rare sites where fired bricks were used as a building material. Two of the altars are decorated with frescoes, executed in a style very similar to that of the Codex Borgia (Rome, Vat. Lib.; cf. X, PLS. 54, 56, 64), in which there are symbolic motifs and, in particular, a magnificent representation of the god Tezcatlipoca and of the god of the planet Venus.

BIBLIOG. A. Caso, Las ruinas de Tizatlán, Rev. mexicana de est. h., I, 1927, pp. 139–72.

Tlaxcala. This small town was a pre-Columbian center which enjoyed great prestige during the colonial period, mainly because its people had opened their city to Cortés and joined him in the conquest of Mexico. Built in 1521, the Church of S. Francisco, with its beamed and paneled ceiling, is perhaps the oldest Christian structure in Mexico. The famous Sanctuary of Our Lady of Ocotlán (I, PL. 140), with its elaborately carved façade and red-tile towers, is a notable example of the Churrigueresque.

BIBLIOG. D. Camargo Múñoz, Historia de Tlaxcala, Tlaxcala, 1892; J. G. Montes de Oca, Tlaxcala: La ciudad morta, Mem. y Rev. Soc. A. Alzate, XLVII, 1927, pp. 161–205; M. Tousaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 23; G. Kubler, Architects. and Builders in Mexico, 1521–50, Warburg, VII, 1944, pp. 7–19.

Morelos. Cuernavaca. The Pyramid of Teopanzolco, which is about all that remains of the Aztec city, consists of two superimposed structures, the earlier of which was covered by another of similar shape. As is typical of Chichimec and Aztec monuments, two flights of stairs lead to the upper platform, on which there once stood two temples, so that separate access to either one of the gods was possible.

The modern city, now capital of Morelos state, developed in the colonial period; Cortés himself lived there for a time. Among the oldest and most important monuments are the Palacio de Cortés (begun 1530, with many later additions), a massive castellated structure with loggias on its façades, which now contains murals by Diego Rivera; the Cathedral (begun 1529), an excellent example of the austere early Franciscan style of Mexico, with a cruciform interior, low dome, and lofty tower; and the Capilla de la Tercer Orden de S. Francisco, situated in a corner of the Cathedral yard and about as old as the Cathedral itself, which has an elaborately carved baroque façade.

BIBLIOG. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 25; R. J. Ceballos Novello, Guía para visitar las principales ruinas arqueológicas de Morelos, Tepoztlán y Teopanzolco, Mexico City, 1929; F. Gómez de Orozco, El convento Franciscano de Cuernavaca, Mexico City, 1943.

Tepoztlán. On the top of Cerro del Tepozteco, a height overlooking the village of Tepoztlán, there are ruins of a temple of the Aztec period. The sanctuary stands upon a two-level base and consists of a porch with benches along the sides and an inner chamber, in which there is a pedestal for a statue of the deity (most likely the local god Tepoztecatl), which was destroyed in the 16th century. Both the piers at the entrance and the benches are decorated with figures and frets in low relief. A number of glyphs have been found among the ruins; some of them are dated, and one bears the hieroglyph of the Aztec ruler Ahuitzotl.

The interesting Dominican monastery and church in the center of the town date from the 16th century.

853

Toussaint and J. R. Benitez, Iglesias de México, VI, Mexico City, 1927, p. 45 f.; R. Redfield, Tepoztlan, Chicago, 1930; P. C. Gante, Tepoztlán, Mexico City, 1958.

Xochicalco. The very impressive remains of this important Toltec city, which dates from the end of the classic period, occupy the top of a large hill and parts of the surrounding hills. The principal monument that has been explored so far is a pyramid on a quadrangular base, with two sloping tiers, a large entablature, and an upper platform, on which stand the lower walls of a spacious hall that was probably a temple. The most remarkable feature of the monument is the revetment of perfectly fitted squared stones, which are entirely covered with reliefs (X, pl. 32). Large serpents constitute the principal motif; the coils of their bodies enclose seated personages, which are executed in a style reminiscent of the Maya, as well as glyphs and fire symbols. All these motifs were once painted in bright colors. The Ball Court is almost identical in its proportions to the one at Tula. From the court a broad street leads to La Malinche, a mound which has not yet been explored. On a nearby hill there are some ruins of what appears to have been a fortress.

Bibliog. M. H. Saville, Bibliographic Notes on Xochicalco, Indian Notes and Monographs, VI, 1928, pp. 185–207; E. Noguera, Exploraciones en Xochicalco, Cuadernos am., IV, 1945, pp. 119–57; E. Noguera, Cerámica de Xochicalco, El México antiguo, VI, 1947, pp. 273–98; C. A. Burland, In the House of Flowers: Xochicalco and Its Sculptures, Ethnos, XVII, 1952, pp. 119–29.

Puebla. Cholula. This town near Puebla was a flourishing city when the Spaniards captured and finally destroyed it. One can still see the great mass of an ancient pyramid (more than 175 ft. high), the largest in Mexico, on the summit of which stands the Church of Nuestra Señora de los Remedios, which was built in the colonial period and subsequently enlarged. Excavations in the remains of the pyramid, which now resembles a natural hill, have shown that it was built and enlarged over a long period in many different styles. At one point the pyramid was decorated with interesting mural paintings of stylized insects. Among the oldest remaining churches of the colonial period are S. Francisco, in Franciscan Gothic style; the Capilla Real, in *mudéjar* style, with 47 cupolas; and S. Gabriel, in the austere Franciscan Gothic style of the early colonial period.

Bibliog. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 23; E. Noguera, El Altar de los craneos esculpidos de Cholula, Mexico City, 1937; E. Noguera, La cerámica arqueológica de Cholula, Mexico City, 1954; F. de la Maza, La ciudad de Cholula y sus iglesias, Mexico City, 1959.

Puebla. Founded in 1531 by the Franciscan friar Toribio de Benavente, who was known as Father Motolinia, the city was named Puebla de Los Angeles and developed rapidly from the early days of its settlement. In the 17th century it already boasted 60 churches, with glazed tile domes that dominate the city's sky line, as well as a great many palaces. The city, which lies in the center of a vast plain, has continued to expand harmoniously on the basis of its original grid plan. In the center of the city there are still some imposing buildings from the colonial period: the Church of S. Domingo, which contains the famous baroque Rosario Chapel (completed 1690; XIII, pl. 152); the 16th-century Church of S. Francisco; the "Casa del que mató al animal" (House of the One Who Killed the Beast), so called because of the sculpture over its portal; the ornate Casa del Alfeñique (now a museum), with its exterior decoration of white stucco and blue and white azulejos; and the huge Cathedral (consecrated 1649; II, pl. 163), which has delicate sculptural decoration on its façade, a dome covered with green and yellow tiles, and a richly furnished interior.

Interesting examples of 16th-century architecture in the environs of Puebla are the monastery at Cálpan and the fortresslike church adjoining the Franciscan monastery at Huejotzingo (1531–70), which may have been designed by Fray Juan de Alameda. Also located in the vicinity of Puebla are the churches of S. María Tonantzintla, with its notably exuberant interior, and S. Francisco Acatepec, which has a tiled façade that contrasts sharply with the austere massiveness of the structure.

The Academia de Bellas Artes in Puebla houses a gallery of Mexican painting from the colonial period.

Bibliog. A. Martínez, Puebla: Colonial Relicarium of America, Puebla, 1939; J. V. Medel, La capilla del Rosario, Puebla, 1940; J. V. Medel, El Convento de Santa Mónica, 2d ed., Puebla, 1940; M. Toussaint, La catedral y las iglesias de Puebla, Mexico City, 1954.

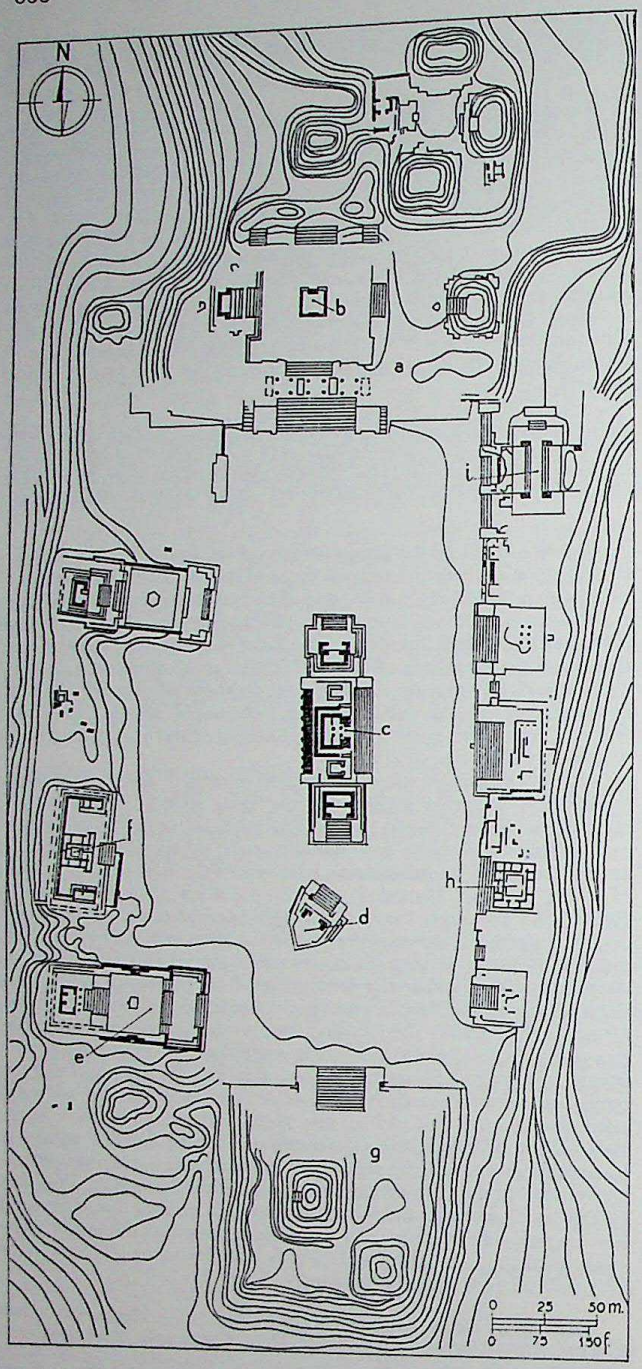
Guerrero. Cerro Oztuma. At this site in the north of the state there is a fortress with interesting walls and moats, which reveal a fairly advanced knowledge of the building of defensive works.

Bibliog. R. H. Lister, Cerro Oztuma, El México antiguo, V, 1941, pp. 209–17; P. Armillas, Oztuma, Rev. mexicana de est. antr. VI, 1942–44, pp. 165–75.

Oaxaca. Mitla. This archaeological center dates from a later period than Monte Albán (see below), from which its artistic style is partly derived. There still remain groups of palaces composed of large rooms; their façades and, in some cases, also the interior walls are decorated with stone mosaics with geometric motifs (X, pl. 47). Each stone is cut so as to fit exactly in its place and thus form part of an over-all design. Along the center of the main hall of one of these palaces there stands a row of enormous monolithic columns that once supported a flat roof. A cruciform tomb built of large blocks of stone admirably fitted together and decorated with the characteristic stone mosaics has been found beneath one of the buildings. Traces of mural paintings in the style of the codices can still be seen.

Bibliog. M. H. Saville, The Cruciform structures of Mitla and Vicinity, New York, 1909, pp. 151–90; A. Caso and D. F. Rubín de la Borbolla, Exploraciones en Mitla, 1934–35 (Inst. Panamericana de Geog. e H., Pub., XXI), Mexico City, 1936; E. C. Parsons, Mitla: Town of the Souls, Chicago, 1936.

Monte Albán. In the formative period the first inhabitants settled on this elevation near the present city of Oaxaca, where they began to build, on an incomparable site, one of the most extraordinary cities of pre-Columbian Mexico (fig. 855). The large stone platforms, which belong to Phase I of the formative period have on their façades large clay panels with reliefs of human figures in motion, the so-called "danzantes" (X, pl. 2); these are reminiscent of the Olmec style, as are almost all the other artistic features of Phase I at Monte Albán. These first settlers also built simple stone tombs and began to urbanize the large central plaza.



During Phase II other peoples who settled on Monte Albán mixed their imported styles with the local style of Phase I. The main plaza was laid out in the form of a huge rectangle with temples and palaces on all sides and another group of temples (Mound H) at the center. The inhabitants built vertical walls of large blocks of stone; those of Mound J were carved with glyphs and various figures. At the same time, the tombs became more spacious and acquired porches, and new pottery styles appeared. The bases and temples of Phase III, which corresponds to the classic period, are decorated with scapular-shaped frets that are repeated indefinitely, thus creating a deliberate monotony that does not mar the overall view of the plaza. The fact that the peripheral walls of the temples on the west side of the plaza were brought forward to achieve perfect symmetry is a sign of great refinement. Some of the large and complex tombs are decorated with frescoes depicting processions of gods and other motifs. At the end of this phase, during which the minor arts reached their maximum development, Monte Albán declined as an active culture, and the cities in the valley attained greater importance with Phase IV, which lasted until the Conquest. Probably in the 14th century, the Mixtecs occupied part of the valley and left, among other things, the magnificent treasure of metal ornaments (Oaxaca, Mus. Regional) which was found by Alfonso Caso in Tomb 7 in the vicinity of Monte Albán.

Bibliog. L. Batres, Exploraciones de Monte Albán, Mexico City, 1902; A. Caso, Las exploraciones en Monte Albán, Temporada 1931–1932 (Inst. Caso, Las exploraciones en Monte Albán, Temporada 1934–1935 (Inst. Panamericano de Geog. y H., Pub., XIX), Mexico City, 1935.

Oaxaca. The city's most remarkable architectural monument is the former monastery of S. Domingo (founded 1575), a massive structure with fortresslike walls and a now badly scarred façade. The baroque interior of the monastery church is one of the richest in Mexico; of special interest is the polychrome stucco tree of Jesse in the choir vault. The Cathedral, which was begun in 1553 and completed about two centuries later, has a plateresque façade with niches in which there are some fine statues of saints and apostles (I, pl. 139). Also architecturally notable are the Church of La Soledad, which has a 17th-century baroque façade, and the 18th-century churches of S. Felipe and S. Agustín.

The Museo Regional de Oaxaca is a repository of finds from the nearby ruins of Monte Albán.

Monte Albán, plan of the archaeological zone. *Key*: (*a*) the north platform; (*b*) sunken court; (*c*) the central complex (Mound H); (*d*) Mound J; (*e*) Group M; (*f*) platform of the "danzantes"; (*g*) the south platform; (*h*) the palace (Mound S); (*i*) Ball Court (*from W. Krickeberg, 1956*).

Yagul. The archaeological zone here consists of a fortress — natural for the most part — at the base of which there was an enormous palace composed of various patios surrounded by rooms, as well as a ball court and several temples and dwellings. Many objects in both the Zapotec and Mixtec styles have been found here.

Bibliog. J. Paddock, The First Three Seasons at Yagul, Mesoamerican Notes, IV, 1955, pp. 25–47; C. Wicke, The Ball Court at Yagul, Oaxaca: A Comparative Study, Mesoamerican Notes, V, 1957, pp. 37–76.

Tabasco. La Venta. This Olmec center is situated on an island surrounded by swamps. A large central patio flanked by basalt columns and encircled by platforms of reddish clay constitutes the main architectural element. From a later date comes a large tomb with stone columns that are, perhaps, representations of tree trunks. The rather numerous structures are built of earth and adobe; here, in contrast to later cities, stone was used as a building material hardly at all, although there are stone mosaic floors with a motif of grotesque jaguar heads. The most striking features of La Venta are the large stone sculptures, among which there are colossal human heads, quadrangular altars decorated on all sides, deformed human figures, steles, and sarcophagi (X, PL. 2). All the stone used in these monumental sculptures was quarried more than 60 miles away.

Bibliog. P. Drucker, La Venta, Tabasco: A Study of Olmec Ceramics and Art (B. Bur. of Am. Ethn., CLIII), Washington, 1952; P. Drucker, R. F. Heizer and R. J. Squier, Excavations at La Venta, 1955 (B. Bur. of Am. Ethn., CLXX), Washington, 1959.

Chiapas. Bonampak. The frescoes found at this classic Maya center near Yaxchilán are generally regarded as the most extraordinary to survive from pre-Columbian times in all America. Three rooms are completely decorated with depictions of religious ceremonies, battles, and sacrifices (IV, PL. 396; X, PL. 20). In these murals — some of which abound in movement, while others are fairly static — hundreds of human figures are represented; there are also many hieroglyphics, and still untranslated inscriptions run along the bottom of certain scenes. The Museo Nacional de Antropología in Mexico City has color copies of the Bonampak frescoes. A fine low relief depicting a human figure in profile is found near the building that contains the murals.

Bibliog. A. Villagra Caleti, Bonampak: La ciudad de los muros pintados, Mexico City, 1949; K. Ruppert, J. E. S. Thompson and T. Proskouriakoff, Bonampak, Chiapas, Mexico (Carnegie Inst., Pub. 602), Washington, 1955; A. T. Arai, La arquitectura de Bonampak, Mexico City, 1960; R. Piña Chan, Bonampak, Mexico City, 1961.

Palenque. One of the most important and best-known Maya sites of the classic period, the city, like most Maya cities, does not appear to have been laid out in accordance with an over-all plan, but there are large architectural complexes. The most important building is the Palace, a vast and approximately rectangular structure whose rooms are grouped around patios (X, PL. 7). From it rises a tower, a unique structure in pre-Columbian America, which is about 50 ft. high and divided into three stories with an interior staircase. The Temple of the Inscriptions, named for the panels with hieroglyphics in low relief that decorate its interior, is even more famous for the large crypt discovered there in 1952. This tomb is a large vaulted chamber, profusely decorated with fine stuccoes and connected with the temple above by a stairway. The body was placed in a magnificent stone sarcophagus with a beautifully decorated monolithic top. Many valuable and interesting objects found in the crypt are now in the Museo Nacional de Antropología, Mexico City (X, PL. 17). The temples of the Sun and the Foliated Cross (X, PL. 7) and that of the Cross are three small jewels with triple entrances and sloping roofs that are decorated with stuccoes and ornamental cresting. Although many other interesting buildings are found here, Palenque is noted not only for its architecture but also for the splendid sculptures, principally of stucco, with which it was richly decorated, and for the stone tablets adorned with figures and glyphs, some of which are the most beautiful and important produced by the Maya culture. Very little remains of the Palenque mural paintings.

Ruz L'Huillier, La pirámide-tumba de Palenque, Cuadernos am., XIII, 1954, pp. 141–59; A. Ruz L'Huillier, Exploraciones arqueológicas en Palenque, 1953, 1954, 1956, Anales Inst. nacional de antr. e h., 6th Ser., X, 1958, pp. 69–299.

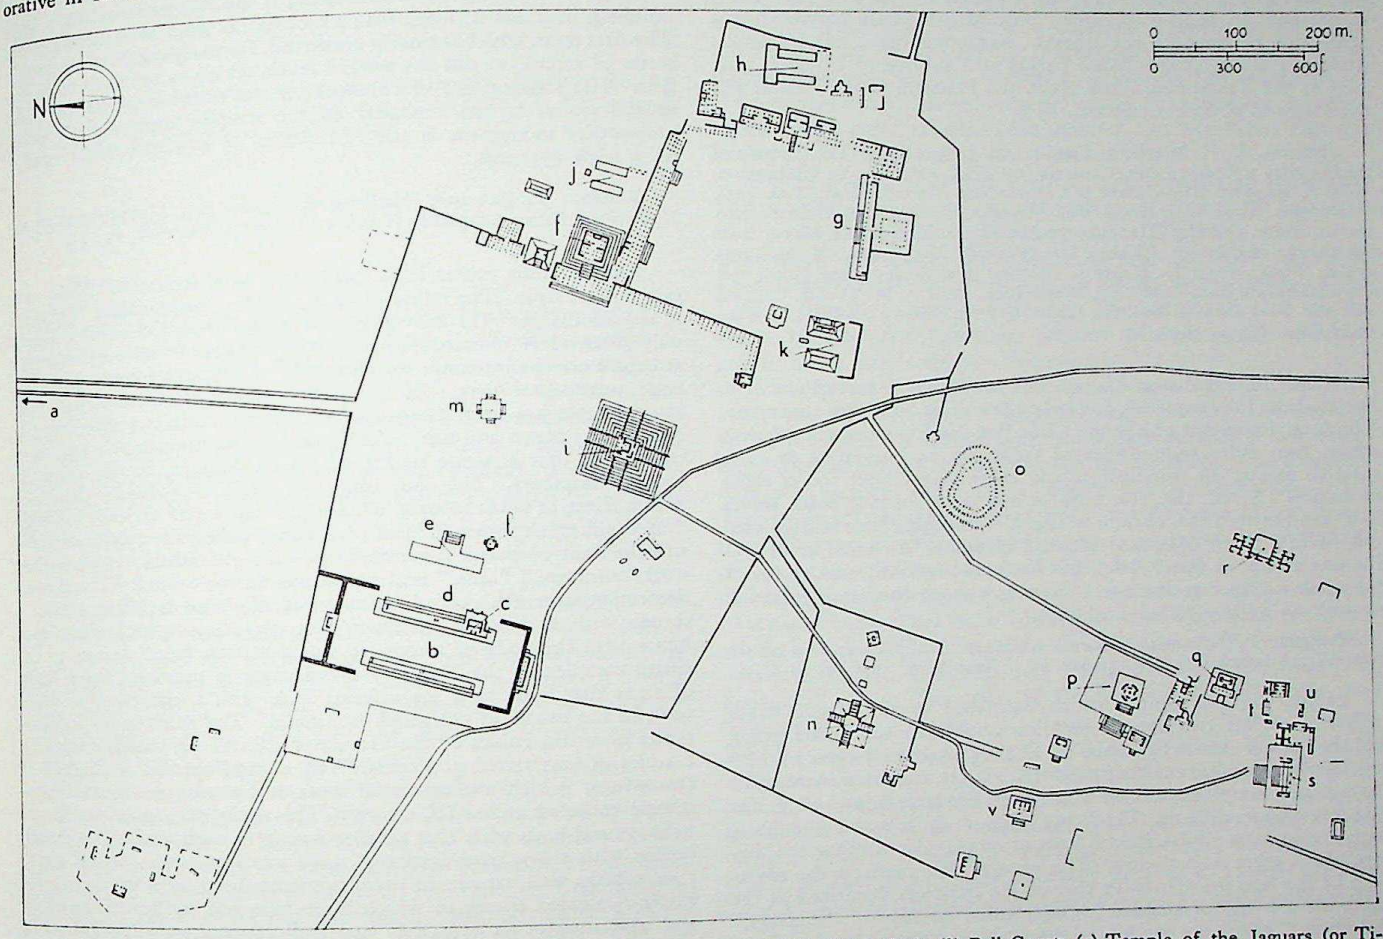
Yaxchilán. Dating back to the classic period, this center on the banks of the Usumacinta has many imposing buildings. Outstanding among them is House K (or Structure 33), which stands on a base and has three entrances. The walls are bare, but the frieze is decorated with human figures seated on thrones, and above it rises a huge ornamental crest, or roof comb, with a large figure in the center. A large number of steles bearing extremely ancient dates have been found, as well as tablets and beautifully sculptured lintels (X, PLS. 15, 16).

Bibliog. S. G. Morley, Report of the Yaxchilan Expedition, Carnegie Inst. of Washington, Yb., XXX, 1931, pp. 132–39.

Campeche. Edzná. This Mayan center has an enormous chambered pyramid in the Puuc style, with five tiers and a flying façade.

Bibliog. A. Ruz L'Huillier, Campeche en la arqueología Maya (Acta anthr., I, 2–3), Mexico City, 1945, pp. 52–61.

Hochob. The most remarkable ruin here is a Chenes-style temple with a single entrance and a façade entirely decorated with a huge mask and flanked by two protruding buttresses, each of which bears



a human figure. At the sides of the main temple there are symmetrical wings, both of which are decorated with masks, the open mouths of which are the entrances.

BIBLIOG. A. Ruz L'Huillier, Campeche en la arqueología Maya (Acta anthr., I, 2–3), Mexico City, 1945, pp. 33–35.

Río Bec. The Río Bec style is intermediate between the Puuc and Chenes styles. There are buildings with large stuccoed masks whose mouths form entrances. Only part of the façade is decorated in accordance with the Puuc style, in contrast with which, however, the decoration occurs on the lower part of the façade, while the upper part remains unadorned. The characteristic towers are purely decorative in function.

on one wall of the east wing there is a representation of the celestial dragon, whose mouth serves as the door, thus recalling the Chenes style. The so-called "Iglesia" has a large flying façade in the Puuc style (i.e., the front wall rises above the level of the roof, thus serving as an ornamental cresting and adding height to the façade). The building called the "Akab-Dzib" (Writing in the Dark), with its unadorned façade, also dates from this period, as it shows no trace of the Toltec style. A particularly fine example of pre-Toltec architecture, because of its perfect proportions, is the Temple of the Three Lintels, which is located at the nearby site of Chichén Viejo (Old Chichén); the lower wall, with three doorways, is smooth, while the upper part has groups of small mortised columns separated by panels of stone latticework and masks at the corners.

In the Maya-Toltec period many new buildings were erected

Chichén Itzá, plan of the central archaeological zone. *Key*: (*a*) the large *cenote* (Well of Sacrifice); (*b*) Ball Court; (*c*) Temple of the Jaguars (or Tigers); (*d*) lower chamber of the Temple of the Jaguars (or Tigers); (*e*) Tzompantli (skull rack); (*f*) Temple of the Warriors and Group of the Thousand Columns; (*g*) the "Market" (Mercado); (*h*) Ball Court; (*i*) Castillo; (*j,k*) ball courts; (*l*) Platform of the Eagles; (*m*) Platform of Venus; (*n*) tomb of the High Priest; (*o*) the Xtoloc *cenote*; (*p*) the Caracol; (*q*) Temple of the Wall Panels; (*r*) Akab-Dzib; (*s*) Casa de las Monjas; (*t*) the "Iglesia"; (*u*) annex to the Casa de las Monjas; (*v*) Red House, or House of the Deer (*from S. G. Morley, 1956*).

Ruz L'Huillier, Campeche en la arqueología Maya (Acta anthr., I, 2–3), Mexico City, 1945, pp. 21–23.

Santa Rosa Xlabpak. The principal building here is an imposing three-story structure, in the Chenes style, with 42 rooms and two staircases.

BIBLIOG. A. Ruz L'Huillier, Campeche en la arqueología Maya (Acta anthr., I, 2–3), Mexico City, 1945, pp. 37–38.

Yucatán. Chichén Itzá. The buildings of this important Maya center date from the classic Maya and the Maya-Toltec periods. The pre-Toltec style of Chichén Itzá is very similar to the Puuc style, although such features as triple entrances, mortised columns, the small stone "huts," serpents in profile, and revetments of cut stone are rare or nonexistent here. One of the principal monuments of the classic Maya period is the Casa de las Monjas (X, PL. 9), which has three recessed tiers and an L-shaped wing decorated with masks; at Chichén Itzá, as the city became the most important center in Yucatán. One of the principal Maya-Toltec buildings is the Castillo (or Temple of Kukulcan), a pyramid about 80 ft. high with nine tiers. The temple on the top platform is entered through a doorway with two columns carved in the form of serpents, with the heads at the base and the tails at the top. A large flight of steps flanked by serpent heads ascends each of the four faces of the pyramid. Inside the Castillo, another earlier but similar structure contains a Chac-Mool figure and a throne shaped like a jaguar, which is painted red and inlaid with jade. Above the throne there was once a turquoise mosaic in the form of a solar disk. The Caracol (X, PL. 34), which seems to have been used as an observatory, is a cylindrical structure which stands on a square platform; the substructure shows elements of the Puuc style, while the present building most certainly belongs to the early Maya-Toltec period. The Temple of the Warriors (X, PL. 35) stands at the center of a vast complex. It is approached through a colonnade, which has pillars sculptured with warrior figures. At the top of the access stairway, before the entrance to the temple, there is a Chac-Mool statue. The three entrances are separated by serpent columns like those found in the Castillo, and the walls are decorated with masks in the early Maya style and with

Toltec motifs (X, PL. 36). The temple proper is divided into an antechamber and a sanctuary, toward the back of which there remains an altar supported by close rows of atlantes. Beneath this temple there survives an older temple, which is supported by sculptured pillars. The Group of the Thousand Columns, which forms a vast plaza at the base of the Temple of the Warriors, and the so-called "Market" (Mercado), situated at the south end of the complex, constitute an ensemble very much like the one at Tula. The main Ball Court (X, PL. 36), located northwest of the Castillo, is important not only architecturally but also because it still has the large stone rings through which the players attempted to pass the ball, as well as benches decorated in low relief with themes relevant to the game and the sacrifice of the loser. At the end of one of the lateral platforms of the Ball Court stands the splendid Temple of the Jaguars (or Tigers; X, PL. 37), which contains murals depicting battle scenes and, in another chamber, polychrome reliefs representing a procession of warriors and priests. Numerous other less important structures of the Maya-Toltec period still survive in Chichén Itzá, such as the Tzompantli (skull rack), the Platform of the Eagles, and the Platform of Venus (see FIG. 857).

Kabah. Located near Uxmal, this Mayan city in the Puuc style has not been fully explored, and only a few of its buildings are known. The most important one is the Codz-Pop (or Palace of the Masks), whose four sides were decorated from top to bottom with close rows of masks; the principal façade alone bears about 300 of these sculptures (X, PL. 12). The nose of one large interior mask serves as a step between two chambers. Another building here is decorated only with a frieze composed of small columns. An arch, similar to the one at Labná (see below), has been restored and now serves as the main entrance to the site. There is also an enormous pyramid, as well as various other buildings.

BIBLIOG. P. Kelemen, Medieval American Art: Masterpieces of the New World before Columbus (1 vol. ed.), New York, 1956, p. 77 f.

Labná. At this center, which flourished in the classic Maya period, there are two notable building complexes: the portal group and the Palace. Above Structure XI of the portal group rises a building, sometimes called the "Mirador" (X, PL. 11), with four rectangular rooms and a simple façade, on which there are large figures of maltha which rest on modillions. The flying façade at the top of this building once had at least six horizontal rows of rectangular perforations, before which there were figures. The gateway that connects the courtyard of the portal group with that of the Palace is decorated at the top with a frieze of stepped zigzags, stone latticework "shutters," and "huts," which are replicas of the adobe and thatch houses of the people. The Palace is a very large building of several stories, which was probably built in several stages without an over-all plan; although it consists of a series of distinct sections, the general effect is harmonious. A large part of the building is profusely decorated with characteristic motifs of the Puuc style.

BIBLIOG. E. H. Thompson, The Chultunes of Labna, Yucatan (Peabody Mus. Mem., I, 3), Cambridge, Mass., 1897.

Mayapán. The city, which belongs entirely to the Maya-Toltec period, was the successor of Chichén Itzá as the administrative and ceremonial center of the Mayas in Yucatán. It is surrounded by a rather low wall, which is over 5 miles long, in which there are nine gates. Many of the buildings had colonnades both in front and in back, which were generally covered by flat roofs, rather than the vaulted roofs of Chichén Itzá. In general, the construction is of poor quality, with hardly any trace of the lovely squared stonework of the preceding periods.

Shook, The Temple of Kukulcan at Mayapán, Carnegie Inst. of Washington, Current Rep., XX, 1954, pp. 89–108; E. M. Shook and W. Irving, Colonnaded Buildings at Mayapán, Carnegie Inst. of Washington, Current Rep., XXII, 1955, pp. 127–67; H. E. D. Pollock, ed., Mayapán, Yucatan, Mexico (Carnegie Inst., Pub. 619), Washington, 1962.

Mérida. The city was founded in 1542 by Francisco de Montejo the Younger on the site of the earlier Maya city of T'Ho. Among its oldest buildings are: the plateresque Casa del Adelantado de Montejo (mid-16th cent.), built for the city's founder; the massive Convento de las Monjas (early 17th cent.); and the Cathedral, which was completed in the late 16th century by the architect Juan Miguel de Agüero.

The local archaeological museum houses relics from the numerous Mayan sites in Yucatán.

BIBLIOG. M. Toussaint and J. R. Benitez, Iglesias de México, IV, Mexico City, 1927, p. 62; J. García Preciat, La catedral de Mérida, AEArt, XI, 1935, pp. 73–93; G. Ferrer de Mendiolea, Nuestra ciudad: Mérida de Yucatán, Mérida, 1938; J. I. Rubio Mañe, La casa de Montejo en Mérida de Yucatán, Mexico City, 1941.

Sayil. A Maya center of the classic period, this site has many monuments, of which the most interesting is the Palace (X, PL. 8), a huge building, over 200 ft. long, with a rectangular plan and three stories. The first floor, which is poorly preserved, formerly contained a double series of rooms, as did the second level, which is set back from the first. The striking use of columns on the exterior of the first and second stories is not repeated on the simpler top level. Another noteworthy monument is the "Mirador," a structure which stands on a high pyramid.

BIBLIOG. P. Kelemen, Medieval American Art: Masterpieces of the New World before Columbus (1 vol. ed.), New York, 1956, p. 74 f.

Uxmal. This center is probably the most important Maya city in the Puuc style. The tallest of its structures, the so-called "Pyramid of the Soothsayer" (El Adivino), was rebuilt or remodeled five times; only parts of it remain. Outstanding elements in its very complex structure are the immense west staircase, the upper temples, and the large ornamental masks of the Maya rain god (Chac-Mool). An inner temple has magnificent low reliefs depicting a personage surrounded by plants and fish. The Nunnery Quadrangle (X, PLS. 8, 9) consists of four separate buildings, which contain, in all, about 90 vaulted chambers. The four inner façades are profusely decorated with a frieze of stone mosaic, with a different motif on each building thus avoiding an impression of monotony; among the motifs are large stretched-out or coiled serpents, large rain-god masks, stone latticework "shutters," "huts," and sculptures in the round. The carved decoration over the central entrance of the west building shows a throne with a splendid "feather" canopy, above which there is a figure with the body of a tortoise and a human face. Access to the entire complex of the Nunnery Quadrangle is provided by a flight of steps that leads to a magnificent arch with a corbeled, or false, vault in the center of the south buildings. The third large building is the beautiful Palace of the Governor (X, PL. 9), which stands on a series of vast tiered platforms. The central section is flanked by two wings, which are separated from it by passages with monumental corbeled arches (X, PL. 9). The main part consists of two wide central halls with four smaller rooms at each end. The façade begins with a low base decorated with small columns, above which rises a plain wall, which, in turn, is surmounted by a vast and profusely decorated frieze, in which large rain-god masks are repeated and combined in an extremely harmonious manner. The House of the Turtles is decorated only with small columns between the cornice and the architrave and with small turtles, which give the structure its name, in full relief on the upper fillet. Close to the Palace of the Governor are the unexcavated ruins of the House of the Doves, on which a high serrated roof comb is still visible.

BIBLIOG. S. G. Morley, A Group of Related Structures at Uxmal, Mexico, AJA, XIV, 1910, pp. 1–18; S. G. Morley, Ancient Temples and Cities of the New World: Uxmal, The City of the Xius, Pan-Am. Union B., XXXII, 1911, pp. 627–42; M. H. Saville, Bibliographic Notes on Uxmal, Yucatan, Indian Notes and Monographs, IX, 1921, pp. 55–131.

Quintana Roo. Cobá. The most important city of the classic Maya period in northeastern Yucatán, the site is famous as the hub of a system of causeways (*sachbeob*). The existing fragments of these roads show that they had an average width of about 15 ft. The most remarkable, and the only one which has been completely surveyed, connected Cobá with Yaxuná, a distance of approximately 62 miles.

BIBLIOG. J. E. S. Thompson, H. E. D. Pollock, and J. Charlot, A Preliminary Study of the Ruins of Coba, Quintana Roo, Mexico (Carnegie Inst., Pub. 424), Washington, 1932; A. Villa Rojos, The Yaxuna-Cobá Causeway, Contributions to Am. Archaeol., II, 1934, pp. 187–209.

Tulum. This Maya city, which is situated on a high cliff at the edge of the Caribbean, has numerous buildings, some of the Maya-Toltec period and others of a later period; on its three landward sides the city is surrounded by a high, thick wall, in which there are five gates. The Castillo, which is the principal building, stands approximately in the center of the walled area; a wide stairway

861

ascends to the upper temple, which is entered between two serpent columns in the Toltec style. The façade is characteristic of the Tulum style, with walls inclined slightly outward toward the top, a narrow unornamented frieze, and niches over the lintel of the portico. The front of Temple V is decorated with a stucco high relief of a descending god above the entrance. The Temple of the Frescoes has large stucco masks on its corners and bears, as its name indicates, the remains of murals depicting gods or priests on both the interior and exterior walls; these frescoes, in which red and blue predominate, are executed in a less realistic style than that of Chichén Itzá. Tulum was probably the first Mexican city sighted by the Spaniards.

MICHELANGELO BUONARROTI (Michelagniolo di Lodovico di Lionardo di Buonarroto Simoni). Sculptor, painter, architect, and poet [b. Caprese (now Caprese Michelangelo, Italy), Mar. 6, 1475; d. Rome, Feb. 18, 1564]. He wrote his name Michelagniolo, or Michelangiolo Buonarroti; he signed only one of his works, the *Pietà* in St. Peter's, with the words MICHAEL ANGELUS BONAROTUS FLORENTIN FACIEBAT. Even during his lifetime he was considered the greatest genius of modern art, the equal or even the superior of the masters of antiquity; contemporaries saw in him the culmination of the development of Italian art from Cimabue on.

A knowledge of Michelangelo's life is important for the understanding of his artistic personality, even though he kept the two far apart: his works of art did not directly mirror his daily life, and he never tried to adapt his manner of living to his artistic ideals. In his art he created a heroic, superior world; in his life he remained the Florentine artist-artisan, leading a sober bourgeois existence.

The following factors in his life seem to be most important for an understanding of the character of his art: his birth in Tuscany; his youth in Florence; and his descent from an old Florentine family. His art is essentially Tuscan, though, from his youth on, he separated himself radically from the fashionable Florentine art trends of the day; but he did this only to reach the deeper roots of the monumental Tuscan tradition. He is a Florentine in his passionate, audacious being, full of pride but restrained by sobriety and severity. In the inner tension of his figures enveloped in seeming calm, in the precise yet musical contours, and in the penetrating, almost scientific intensity with which he grasped the inner structure of plastic forms, although always subordinating them to a total vision of impressive unity, his art is essentially Florentine. Even later, when he expanded his Florentine idiom into a universal language, and in his last works when he fused the individual forms, the Tuscan character remained predominant.

It is important to know that his mother, Francesca di Neri di Miniato del Sera, died when he was six years old, because this may explain the sibylline type of woman depicted in the Virgins of his youth, in which motherly tenderness seems lacking. His father, Lodovico, and his four brothers were unworthy of him. Since the oldest brother, Fra Leonardo, had entered the Dominican order, Michelangelo was regarded as the oldest and, as a consequence, from early youth had to shoulder responsibility for the entire family. Actually he wanted through his art to raise the social level of his line. He worked not so much for his own fame or advancement as for that of the Buonarroti. This goal seems to have been one of the reasons for the astonishing physical endurance which permitted him to create his gigantic works. He succeeded in his admitted aim of raising the family to the upper classes through the marriages of his niece Francesca and his nephew Leonardo to the noble Florentine houses of Guicciardini and Ridolfi.

His strong Florentine sentiments manifested themselves in his youth and maturity in a Florentine patriotism. His political views, his republicanism, he inherited from his Guelph family. (For details of his political views, see Tolnay, 1949, p. 9 ff.) He gave artistic expression to it in his marble *David* (Florence, Acc.) and, later, in his *Brutus* (Florence, Mus. Naz.), both incarnations of the normative moral forces on which, according to Florentine views, the "buon governo" should be based.

His patrons played an important role in his life, often acting as ideal "father," sometimes severe like Julius II, and sometimes kindly like Lorenzo de' Medici and, later, Paul III and Julius III. Although Michelangelo did not allow his patrons to influence the conception of his works, except perhaps in the earliest stages, nevertheless the enormous opportunities afforded by their commissions spurred him on to his extraordinary achievements. He wanted to satisfy his patrons, not by courtly flattery, but by the quality and scale of his works.

Of his friends only two seem to have played an important role in the inspiration of his art and spirit: Tommaso Cavalieri and Vittoria Colonna. The former, a Roman nobleman of extraordinary beauty, moved the sixty-year-old Michelangelo to a more exalted conception of earthly beauty as the image of the "divine idea." Vittoria Colonna, descendant of one of the oldest Italian noble families, became Michelangelo's spiritual guide in his late religious "conversion."

Two spiritual trends of the period, in particular, left their mark on Michelangelo's thought, art works, and poetry: Platonism (and Neoplatonism), in which he found the metaphysical justification of his passion for Cavalieri — the love of corporeal beauty being but a vehicle for the adoration of the "divine idea" shining through it. The Neoplatonic doctrines inspired some of Michelangelo's great works of art and many of his poems. Platonism (and Neoplatonism) probably came to Michelangelo through his early acquaintance with Poliziano, Marsilio Ficino, Pico della Mirandola, and Girolamo Benivieni at the house of Lorenzo de' Medici, and also through the poetry of Dante, Petrarch, and Lorenzo de' Medici, which he knew well. (For discussion of Platonism in Michelangelo, see: Tolnay, *L'Arte*, 4th ser., V, 1934, pp. 5–44; *BArte*, 3d ser., XXIX, 9, 1936, pp. 389–408; and A. Chastel, *Marsile Ficin et l'art*, Geneva, 1954.) Secondly, ideas of the Catholic reform, which touched him in his youth in the preachings of Savonarola, decisively influenced him in later years in the form of Juan de Valdés' doctrine of justification by faith alone, which he may have known through Vittoria Colonna. (On the development of Michelangelo's religious ideas, see Tolnay, 1949, p. 61 ff.)

Autobiographical allusions appear in his work, always indirectly in a generalized, sublimated manner. In spite of their completely objective and ideal aspect, his works are more personal than anything done in Tuscany before him. His pride and righteous anger are embodied in the faces of the *St. Proculus* (Bologna, S. Domenico), the *Moses* (Rome, S. Pietro in Vincoli), the marble *David*, and the *Brutus*; it is his spiritual raptus which is in the prophets and sibyls of the Sistine ceiling. In the God the Father of the same work the limitless, absolute creative force for which he himself yearned can be recognized. The suffering of the corporeal chains expressed in the slaves for the tomb of Pope Julius II (both, Paris, Louvre; PL. 529) and the torpor, melancholy, or anger of the Allegories of the Medici tombs (Florence, S. Lorenzo, New Sacristy), all express Michelangelo's own world of feeling. The spiritualization of the *capitani*, the seated figures of the Medici Chapel, parallels his own yearning as expressed in poems written to Cavalieri. His striving for liberation from earthly bonds found touching embodiment in three compositional drawings of the Resurrection of Christ (PL. 539; Paris, Louvre; Windsor, Royal Lib.; Br. Mus.; cf. Tolnay, 1943–60, III, figs. 144, 145, 146). It is Michelangelo's own "conversion" which is depicted in *The Conversion of St. Paul* (PL. 537) and his own suffering of the human condition which finds expression in the *Crucifixion of St. Peter* (PL. 534).

His works may almost always be regarded as spiritual self-portraits — sometimes conscious and sometimes subconscious. In his *Last Judgment* (PLS. 533, 536) and in the late *Pietà*, or *Deposition* (PL. 526), in the Cathedral of Florence he expressed the autobiographical allusions more directly, but even here he disguised them. In the *Last Judgment* he depicted his own damnation in a self-portrait on the skin held by St. Bartholomew (identified by La Cava, *Il volto di Michelangelo scoperto nel Giudizio Finale*, Bologna, 1925), and in the late *Pietà*, or *Deposition*, the head of Joseph of Arimathea is, according to Vasari, an idealized self-portrait of the artist. In fact, he did this latter work for his own tomb. Since the Hellenistic period the subjective sentiment, the lyric *état d'âme* of an individual, had not been expressed with such intensity in works of art. Nevertheless, the subjectivity of sentiment becomes of universal value in Michelangelo's hands. Michelangelo never speaks in the first person in his works; he does not seem to express individual spiritual experiences or moods but only universal truths in typical general forms. His works demand recognition of their objective validity; but the material of the experiences from which he distills these universally valid truths is deeply personal.

The extraordinary success and fame of Michelangelo during his lifetime had the effect of creating among his contemporaries two contrary images: His friends, admirers, and younger followers made of him a mythical figure, deified him as an artist and as a man, and called him "divino"; others attacked and even defamed him, fabricating an image — which became a cliché, often repeated later — of Michelangelo as an antisocial character, a somber and avaricious man, and a heretic. The incorrectness of this image was definitely revealed, first, in 1863, by the publication of his poems in authentic form and then, in 1875, by the publication of his letters, showing the generosity and nobility of his heart; in popular opinion, however, the legend still lives on.

The first indications of a real "cult of Michelangelo" appear about 1540. The fictional dialogues by Donato Giannotti (ca. 1545), Francisco de Hollanda (1548), and Anton Francesco Doni (1552), in which Michelangelo is one of the protagonists, are early signs. Benedetto Varchi's *Due Lezioni* (1549), with the interpretation of two of Michelangelo's poems, also belongs to this group. Incidentally, Varchi's is the first printed volume on Michelangelo. Then, in 1550, followed the biography by Vasari, partly based on that by the Anonimo Magliabechiano (ca. 1535–40), and, in 1553, that of Condivi; in 1568, Vasari published the second edition of his biography, in which he incorporated facts reported by Condivi and information from other sources. Mention should also be made of Varchi's *Funeral Oration* of 1564, containing another biography, this time a short one (P. Barocchi, *Trattati d'Arte*, Bari, 1960). Vasari's biography of Michelangelo appears at the end of his great work on the lives of Italian artists as the summit of the whole artistic development of Italy from Cimabue on; his is the liveliest and richest contemporary portrait, although Condivi's is the more reliable because it was probably partly written to Michelangelo's dictation. Both Vasari and Condivi cast Michelangelo's personality in a heroic mold, which remained the model for many later biographies until our time. As an artist his works aroused admiration at a very early date, and he was only twenty-nine years old when the first printed appreciative mention of him appeared in Pomponius Gauricus' *De sculptura* in 1504; here his name appears in a list of the best Tuscan sculptors, and it is mentioned that he is "etiam pictor." Vasari praises him as triumphing not only over the great artists of the Renaissance but also over those of antiquity, and even over Nature herself. Michelangelo's spirit is "godlike" (*divino*), says Vasari, and his works are not only the creations of a great genius but the absolute esthetic canon of all art. The opinions of the other contemporaries mentioned above and those of Tommaso Cavalieri and Vittoria Colonna are similar. Thus the highest appreciation of his art he was ever to receive came from contemporary writers and friends.

Equally high in this circle, which was close to him during his lifetime, was the appreciation of Michelangelo as a man. He was even raised by his contemporaries to a social and human esteem that is unique in the history of art. Condivi treats him in his introduction as an equal of the reigning pope, Julius III, and Vittoria Colonna went even further, comparing his goodness with that of the Saviour.

The reaction against this great acclaim began with Paulus Giovius' short biography (ca. 1525), which reflected the reservations of the court of Leo X against Michelangelo's "untamed nature." The attacks on Michelangelo because of the supposed irreligiousness of his works, which, so it was said, contradicted the traditional sacred iconography, began about 1540. The first signal for these attacks was given by the cynical Pietro Aretino, himself completely irreligious. He denounced Michelangelo's *Last Judgment* in a letter of 1545, actually written as a kind of blackmail, with the intention of getting more drawings as gifts from the master. The arguments of this letter — impiety, illicit license in the use of iconography, and the inappropriateness of his treatment to a holy place — were used against him a short time later by priests under the impact of the Counter Reformation. Gilio da Fabriano (*Due dialoghi . . . degli errori de' Pittori . . .*, Camerino, 1564) condemned Michelangelo's *Last Judgment* and the frescoes of the Pauline Chapel for supposed inaccuracies in the representation of Biblical scenes. It is interesting to note that at the same time in more liberal Venice the Inquisitor on the occasion of Paolo Veronese's trial upheld Michelangelo's nude figures in the *Last Judgment* as correct, because on the Last Day humanity appears naked before Christ the Judge.

His artistic style was criticized by Lodovico Dolce (*Dialogo*, 1557), who found his nudes monotonous and contrasted his art with the manifold beauties in the works of Raphael; this comparison was repeated throughout the 17th, 18th, and 19th centuries, especially in academic circles.

Also, from about 1546 on, the boldness of Michelangelo's style in architecture was severely attacked as contradicting the classical rules of Vitruvius. These attacks came from the "setta Sangallesca," namely the followers of Antonio da Sangallo the Younger, who after his death wanted to procure for themselves his great architectural commissions, which the Pope, however, preferred to give to Michelangelo.

During the 17th and 18th centuries Michelangelo's artistic greatness was never doubted, but he was often rejected as a "corrupter of art" (G. P. Bellori, *Le Vite de' pittori, scultori et architetti moderni*, Rome, 1672; R. Fréart de Chambray, *Idée de la perfection de la peinture*, Mans, 1662; A. Félibien, *Entretiens sur les vies et sur les ouvrages des plus excellens peintres anciens et modernes*, Paris, 1666–68; R. de Piles, *Abrégé de la vie des peintres*, Paris, 1699; Anne Claude Philippe, Comte de Caylus, *Nouveaux sujets de peinture et sculpture*, Paris, 1755; J. J. Winckelmann, *Gedanken über die Nachahmung der griechischen Werke in der Malerei und Bildhauerkunst*, Heilbronn, 1755; F. Milizia, *Principi d'architettura Civile*, Finale, 1781; and, in the mid-19th century, even Burckhardt). Michelangelo's passionate, serious, and powerful style would obviously not suit the taste of the Roman and French classicists; on the other hand, Bernini's appreciation of him as an architect ("Michelangelo era grande come scultore e pittore, ma veramente divino come architetto") is noteworthy at this period.

A new positive appreciation of Michelangelo began in about 1770, probably under the impact of the Storm and Stress movement, whose first heralds were Reynolds and Fuseli in England and Goethe in Germany. It was bound up with the new cult of genius. These artists tried to describe the effect of Michelangelo's works on them and to define objectively the features of his "grand style." This trend culminated, during the French romantic movement, in writings by Stendhal (*Histoire de la peinture en Italie*, Paris, 1817) and Delacroix (*Rev. de Paris*, XV, 1830, pp. 41–58, XVI, 1831, p. 165; *Rev. des deux Mondes*, XI, 1837, pp. 337–43). Stendhal's glowing picture of Michelangelo's greatness and Delacroix's image of his solitary and passionate being are based on an inner affinity and are the results of their own experience and of their self-identification with the master. These writings are great examples of the force of creative intuition by which the personality and processes of creation of Michelangelo are evoked. They are

invaluable as the first visions of the totality of his genius, which they see in its unique essence, but as isolated from the world surrounding it.

Almost all the biographies of the second half of the 19th and beginning of the 20th century follow more or less consciously this romantic pattern; but the historical material has been appreciably enlarged since the late 19th century (especially since 1875). The biographies of H. Grimm (1860–63), A. Gotti (1875), J. A. Symonds (1893), C. Justi (1900, 1909), H. Thode (1902–13), and R. Rolland (1907) are much richer in their documentation than the previous writings, but by this very fact the outline of the image of Michelangelo's genius is somewhat weakened and blurred in them, except in Rolland's.

A new phase in the conception of Michelangelo began with the more intense investigation of the relation of his individual personality and the style of his works to the historical context of which they form a part. This new trend appeared first in the detailed monographic treatment of Michelangelo's youthful works by H. Wölfflin (*Die Jugendwerke Michelangelos*, 1891). This was followed by the monographic treatment of his great cyclic works: the tomb of Julius II, by C. Justi (1900); the Sistine ceiling and the *Last Judgment*, by E. Steinmann (1901–05); the Medici Chapel, by A. E. Popp (1922); the Pauline frescoes, by F. Baumgart and B. Biagetti (1936); and the monographs of Tolnay (1943–60) and H. von Einem (1959). They reveal that even a spiritual and artistic giant like Michelangelo is bound to the historical context of his time and that his originality can be grasped more precisely by investigation of the connection of his works with those which may have influenced him.

In earlier writings about him Michelangelo's individual works were not analyzed in themselves but were used as illustrations of his life or "explained" by his life. Often his works were regarded as expressions of his formal virtuosity alone; this is the point of view of Vasari and Condivi, and also of the biographies of the 19th and early 20th centuries. Only at the end of the 19th century — for the first time in H. Wölfflin's monograph of 1891 — were Michelangelo's works of art analyzed in themselves and recognized as embodiments of essential features of his creative personality. But these analyses were confined to the formal structure of the works, and they were not concerned with the spiritual ideas that Michelangelo expressed.

The newest trend is characterized by the view that the formal structure is conceived as the expression of a spiritual *concetto*. The critic tries to grasp in their entirety the spiritual and formal qualities of the work and to distinguish in them the traditional and original features.

It becomes evident that Michelangelo's works are a language of expression into which the artist infused his own individual world of feelings. The theory (Thode) that Michelangelo's style is an expression of "the deep dualism between pagan form and Christian soul" seems to be oversimplified. There is no contradiction between pagan and Christian elements in Michelangelo, since the "soul" expressed in his works is not specifically Christian but generally human. It is the "human condition" against which the soul in his works rebels, and this conflict is appropriately clothed in the timeless style of antiquity.

The historical place of Michelangelo was defined by the French Romantics, who identified themselves with him and saw in him their spiritual ancestor, the master who broke with the Middle Ages and who "heralded a new world" (Michelet), and with whom "modern art actually began" (Delacroix). On the other hand, more recent writers and artists, such as Worringer, Rodin, Simmel, Dvořák, saw in him the last Gothic master. "Il est l'aboutissement de toute la pensée gothique. Il est l'héritier des imagiers du treizième et du quatorzième siècle" (Rodin). Although both of these opinions contain valuable observations, neither seems to grasp the historical problem.

This becomes clearer when Michelangelo is compared with his contemporary Leonardo da Vinci (q.v.). The scattered scientific tendencies in the art of the 14th and 15th centuries were synthesized, broadened, and greatly advanced by Leonardo. What mattered most to him was to penetrate the visible world around him, without religious prejudice, by empiric observation and experience of the phenomena of nature. He pointed out the analogies in these phenomena and speculated with an admirable freedom of spirit about their common causes. With Michelangelo, on the contrary, appeared a man of moral and religious preoccupation, who turned away from the shining beauty of the visible world to concentrate on the interior images of his spirit. He was the forerunner of the coming century, but at the same time his moral preoccupations can be seen to revive those of the Duecento, elevated to the level of Humanistic thought, which embraces Christianity and antiquity alike, and deepen them according to the exigencies of a solitary, virile, and profound soul. Yet Michelangelo expressed also, and most perfectly, the spiritual preoccupations of his own historical moment.

Michelangelo transferred the linear-sculptural rigor of the Tuscans from a "realistic" level to an ideal sphere. His personality dominated the 16th and 17th centuries. His influence reinvigorated the plastic sense of the leading High Renaissance masters, such as Leonardo da Vinci, Raphael, Fra Bartolommeo, Andrea del Sarto, Correggio, Titian, and J. Sansovino. The new decorative concept of the nude in motion, with rhythmic outlines freely arranged in space and no longer bound to earth, as expressed in the Sistine ceiling, freed younger artists from the tyranny of classical canons — from Pontormo to Il Rosso and Parmigianino, and from Benvenuto Cellini to Vincenzo Danti and Giambologna. After 1541, the date of the unveiling of the *Last Judgment*, Europe was pervaded by a taste for "sublime" art and for "gigantic" form in composition and in depicting figures, as seen in the works of Vasari, Salviati, Tibaldi, Allori, Baccio da Montelupo, Montorsoli, and, in northern Europe, Scorel, Heemskerck, F. Floris de Vriendt, and others. Toward the end of the 16th century Michelangelo's plastic-dynamic sense became eclectically mixed with elements derived from Raphael, Correggio, and Titian. This mixture of elements is evident in the work of such artists as the Carraccis, Domenichino, and Guido Reni.

But the message of Michelangelo was assimilated in a more creatively original manner in Venice by Jacopo Tintoretto, who managed to achieve a synthesis of Venetian color with the rigor of Michelangelo's plastic design. In Flanders, the great Pieter Bruegel succeeded in integrating Michelangelo's monumental sculptural sense with his own northern realism. Later, in Rome, Caravaggio accomplished a synthesis of Michelangelo's plastic sensitivity with an interest in naturalistic detail and contrasts of light and shade. The late style of Michelangelo was a guide for the ecstatic visions of El Greco (Dvořák). All the great European masters of the 17th century admired, studied, and borrowed ideas from the art of Michelangelo. Rubens took up the lesson of Michelangelo in nudes that were animated by vital inner currents. Velázquez posed many of his figures after the manner of Michelangelo. Even in Rembrandt and Poussin there are echoes of Michelangelo. Bernini and Pietro da Cortona (the latter most particularly in the vault of the Palazzo Barberini, Rome) introduced ideas and motifs of Michelangelo in their new triumphal and optimistic view of art. Although his influence diminished in the first half of the 18th century (except in architecture), his "sublime" style was revived first in England, in the work of Reynolds, Blake, and Fuseli, and more strongly in the two masters of French romanticism, Géricault and Delacroix. Rodin, Degas, and Cézanne also admired and studied his work. It can be said that every period and every artist have been attracted by some particular aspect of Michelangelo's work and that this is true even today.

The most varied styles — from the classical style of the Renaissance to mannerism, the baroque, and romanticism — can be seen in relation to the art of Michelangelo, which itself goes beyond any category of style. His starting point and the base of his art was the Florentine Renaissance; but Michelangelo employed Renaissance elements in a decidedly personal manner, using them in new combinations and giving them a dynamism previously unknown. He created expressive symbolic images of his own inner tensions. Consequently Michelangelo's message could never be completely transmitted.

The known facts about Michelangelo's earliest period are mostly those reported by Vasari and Condivi. Though he was born in Caprese, where his father was podestà for six months, he was taken as an infant to Settignano, near Florence; therefore, Caprese played no role in his memory.

His father, Lodovico, had inherited a bit of land with a house in Settignano and rented an apartment on Via dei Bentaccordi, in the Sta Croce quarter of Florence. Michelangelo continued to live in this quarter whenever he was in Florence and later bought several building lots and houses there. His father put the boy into the grammar school of a certain Francesco da Urbino, but, according to Varchi (and to Condivi and Vasari), "the boy preferred to go into the churches, and draw from paintings instead of going to the grammar school to study; often he played truant from school to go where he could watch others painting." There is no reason to doubt this anecdote, which reveals the early emergence of his vocation. His father finally acceded to Michelangelo's wish to become an artist and, probably on the advice of Francesco Granacci (cf. G. Fiocco), placed him in the workshop of the brothers Domenico and Davide Ghirlandajo in April, 1488, when Michelangelo was thirteen years old. The father's record of the contract with the Ghirlandajos, for a three-year apprenticeship, is given in Vasari. Thus Michelangelo began as a painter. At that time, the Ghirlandajos were executing the fresco cycle in the choir of S. Maria Novella, and there Michelangelo most likely learned the elements of drawing and, perhaps, of fresco painting. Also, the crosshatching technique in his earliest drawings may derive from that of Domenico Ghirlandajo's drawings, although with Michelangelo the technique became less pictorial and much more precise in modeling. It is likely that the young apprentice was advised to study ancient works, since this was a practice of the Ghirlandajo workshop (cf. Cod. Escurialensis). The relationship between Domenico Ghirlandajo and the young Michelangelo was tense. Michelangelo did not like his master, who seems to have been jealous of the talent of his pupil and "sbigottito" (dismayed) by the new manner in which Michelangelo made his pen drawings in this early period. On the basis of the existing material there seems to have been no direct stylistic influence of Ghirlandajo on the works of the young Michelangelo.

None of the earliest drawings mentioned by Vasari and Condivi are in existence. These were outlines of a pen drawing, representing clothed women, from the Ghirlandajo workshop; a drawing of the scaffolding in S. Maria Novella; a copy of Martin Schongauer's *Temptation of St. Anthony* (such a copy turned up recently in England, a small tempera in the style of Ghirlandajo, for which an attribution to Michelangelo cannot be supported by positive proofs); copies after works of older masters (perhaps Giotto and Masaccio); and a copy of a head after Ghirlandajo. On the other hand, there are five drawings by the young Michelangelo, which are copies of frescoes by Giotto and Masaccio (F. Portheim, *RepfKw*, XII, 1889, pp. 140–58). Whether they were done as early as 1488, while he was with the Ghirlandajos, or a short time later is a question that cannot be resolved. However, Cellini's *Autobiography* tells us that Michelangelo made copies after Masaccio when he was still a boy.

Three theories concerning the initial phase of Michelangelo's formation have been proposed:

1. The theory that as a pupil of the Ghirlandajos he was strongly influenced by his master. This theory, first expressed by Vasari, has been followed by K. Frey (1907), C. E. Gilbert (*GBA*, 6th ser., XXXIV, 1948, pp. 389–404), and G. Marchini (*BM*, XCV, 1953, pp. 320–31), who attributed to the young Michelangelo three figures of the frescoes in S. Maria Novella.

2. The theory that Michelangelo was initiated into art by Francesco Granacci, a close friend who helped the boy, and not by Ghirlandajo, whom he disliked. This opinion was first expressed by Condivi and taken up by G. Fiocco (*RArte*, XII, 2, 1930, pp. 193–209, XIII, 1–2, 4, 1931, pp. 109–31, XXVI, 1950, pp. 149–55; *CrArte*, II, 4, 1937, pp. 172–75; *Le Arti*, IV, 2, 1941–42, pp. 5–10), who supported Condivi by showing for the first time that Granacci was six years older than Michelangelo and therefore able to advise him. Fiocco attributed to the young Michelangelo several paintings of the Virgin, which are very much in the style of Granacci, and tried to demonstrate by this that the latter directly influenced the former. The attribution of these paintings to Michelangelo remains problematical; according to other authors, they are by Granacci himself (R. Longhi, *Le Arti*, IV, 2, 1941–42, p. 136) or by the Master of the Manchester Madonna (F. Zeri, *Paragone*, IV, 43, 1953, pp. 15–27). Longhi (*Paragone*, IX, 101, 1958, pp. 59–64) has published the fragment of a panel of John the Evangelist, which he attributes to the young Michelangelo, although it is in the style of Granacci. Colin Eisler has suggested (in a lecture) the young Michelangelo as the painter of the tondo in the Museum at Budapest, usually attributed to Granacci, which shows St. John the Evangelist on Patmos.

3. A third theory that the boy Michelangelo was a strong personality, essentially independent of both Ghirlandajo and Granacci (cf. Tolnay, 1943–60, I). On the basis of the material still extant, his earliest drawings are seen to be free copies of those great Tuscan masters of the past with whom he felt an affinity, rather than reflections of contemporary Florentine paintings.

He completed his copies of Giottos and Masaccios by direct observation of nature and gave his prototypes an even more monumental effect by a new conception of volume, weight, attitude, and movement of the body and its relation to drapery. Thus Michelangelo seems to have been essentially self-taught, although he must have learned the techniques from his master, Ghirlandajo. His earliest works manifest a highly independent personality and contain the essential features of his later work.

Probably the penchant for sculpture emerged in Michelangelo at this early age, which may partly explain why he left the Ghirlandajo workshop after one year (although the contract was for three). He entered the "school" in the garden of Lorenzo de' Medici, near the Monastery of S. Marco, which contained a rich collection of ancient sculpture, and the overseer of which was Donatello's pupil Bertoldo di Giovanni (A. Chastel, *Studi Vasariani*, Florence, 1952, pp. 159–67). Bertoldo seems to have given Michelangelo his first instruction in sculptural techniques. However, according to M. Lisner (*ZfKw*, XII, 3–4, 1958, pp. 141–56), Michelangelo received his first practical instruction in sculpture from Benedetto da Maiano before he entered the Garden School. All the works done in the Garden School are lost. According to the earliest biographers Michelangelo made small terra-cotta figures after Bertoldo and a marble head of a faun (lost) after an ancient model, which Lorenzo de' Medici admired (cf. Tolnay, 1943–60, I, fig. 253).

After having worked about a year in the Garden School, Michelangelo was invited by Lorenzo de' Medici, who was enchanted with his talent, to live in his palace on Via Larga, where the artist remained until Lorenzo's death in April, 1492. There he met Poliziano, the court poet and Humanist, who probably introduced him to the ideas of Marsilio Ficino's "Platonic Academy." During this time, according to the earliest biographers, the artist executed two small marble reliefs, *Virgin of the Stairs* and *The Battle of the Lapiths and the Centaurs* (PLS. 524, 525). In neither did Michelangelo attempt an exact imitation of ancient prototypes, but he rendered rather free and personal paraphrases instead.

His *Virgin of the Stairs* is a small, flat relief, of extraordinary monumentality in conception; its style may be defined as that of Donatello remodeled after the antique. From Donatello comes the profile of the Virgin's head, the motif of the steps, and the technique of *rilievo schiacciato* (very low relief), but this is ennobled by inspiration drawn from pagan steles, such as the idea of the whole figure and the veil-like clothing. The Virgin seems absorbed in her thoughts about the future Passion of the Child and seems oblivious to her surroundings; this complete solitude will be characteristic of Michelangelo's later figures. The motif of the Child turning his athletic, muscular back to the beholder is also new and derives from the same conception of solitude. The prophetic anticipation of Christ's death in the Child's pose and in the children with the shroud

869

in the background is a device that will be found in the future works of the master. Michelangelo's Virgin is less graceful but more serious, more distant, and more monumental than those of Leonardo, who preceded him in the tendency to ennoble the representation of the Virgin. In the vague modeling (the hands), in the inaccuracies of the perspective (the steps), in the somewhat awkward manner in which the background of the relief is filled with small motifs, the work of the beginner can be recognized. Nevertheless, R. Longhi (*Paragone*, IX, 101, 1958, pp. 59–64) dates the relief after 1492.

The Battle of the Lapiths and the Centaurs is done in *mezzo rilievo* in three parallel planes. It is unfinished, with a zone of rough marble at the top. The relief, which is crowded with nudes in movement, is in contrast to the calm composition of the *Virgin of the Stairs*. It seems as if the young Michelangelo wanted to show that he was master of two idioms: In the *Virgin* he is "classical," in the stillness of the main figure and its closed silhouette, and in the subordination of space to the figure; in the battle scene the swirling mass of the figures, their bodies animated by fluctuating forces from within, anticipates the baroque (Rubens copied this relief in two drawings). The use of these two styles at about the same time is not unlike the methods of contemporary poets who wrote, according to their subject, in either the popular ("volgare") or sublime style. The theme of the relief is the rape of Hippodameia by the centaur Eurytion, as described in Ovid's *Metamorphoses*, but for the young artist this was only a pretext for representing a struggling mass in movement. Although the compositional pattern of the relief is geometric, consisting of two intersecting triangles with two lateral axes, this scheme is almost obscured by a revolving movement around the main figure in the center, an important feature of Michelangelo's later compositions up to the *Last Judgment* and the Pauline frescoes. The movement of the rounded and full athletic bodies is no longer conceived as a mechanical displacement of the limbs (Pollaiuolo) but as the result of an organic unfolding of forces, flowing from within. The technique of the carving seems to be derived, directly or indirectly, from the reliefs of Giovanni Pisano (see VI, PL. 212); the unity of the substance is kept, and even the forms in the foreground are not completely detached from the background. Again Michelangelo fused the ancient inspirations from battle sarcophagi (Tolnay, 1943–60, I) with Tuscan proto-Renaissance traditions. This was not an archaeological interest in antiquity, as with the masters of the second half of the Quattrocento, nor was it a transformation of ancient influences according to a Neo-Gothic pattern, as with Botticelli and Pollaiuolo; it was a direct continuation of the ancient and Tuscan art tradition, which Michelangelo seems to have felt was an uninterrupted stream leading to him. (On Michelangelo's conception of antiquity, see Tolnay, *JhbPreussKSamml*, LIV, 2, 1933, pp. 95–122; Tolnay, 1943–60, I, p. 134; J. Wilde, *Mit. des Kunsthist. Inst. in Florenz*, IV, 1932–34, pp. 41–64; H. von Einem, *Antike und Abendland*, I, 1944, pp. 55–77. See also G. Kleiner, *Die Begegnungen Michelangelos mit der Antike*, Berlin, 1950; A. von Salis, *Antike und Renaissance*, Zurich, 1947; F. Kriegbaum, *MJhb*, III–V, 1952–53, pp. 10–36.)

Both of these earliest works are surprising for the time (ca. 1490–92) and show the sudden bursting forth of Michelangelo's genius; they are full of anticipations of his later works.

After the death of Lorenzo de' Medici, Michelangelo returned to his father's house, where he remained until October, 1494. During this period he seems to have followed, in the Cathedral of Florence, the ardent preachings of the Dominican prior Savonarola (1493–94), which impressed him profoundly and determined his religious conceptions (cf. G. Poggi in *Michelangiolo Buonarroti nel IV Centenario del Giudizio Universale*, Florence, 1942, p. 113 ff.). This was his first contact with the ideas of an inner reform of the Church, which were to play such a great role in his late period, from the *Last Judgment* on. The sources mention two works done during this period, again one with a Christian and the other with a pagan subject.

A smaller-than-life-size wooden crucifix was made for the prior of Sto Spirito, who had given Michelangelo the opportunity to study anatomy by dissecting corpses. This work was rediscovered a few years ago in the cloister of Sto Spirito by M. Lisner (*Kunstchronik*, Jan., 1963, p. 1 ff.). The work has been cleaned of old overpainting, and reveals the original coloring. It is of the quality and shows the manner of modeling of the young Michelangelo. (Some other scholars, however, are doubtful of this attribution.) In this crucifix he seems to have made the attempt to synthesize both expression of suffering and beauty of pose. Michelangelo introduced, probably for the first time in a crucifix, a *contrapposto* between head and legs, thereby conferring an almost classic beauty upon the expressive figure. The importance of this innovation seems to have been immediately recognized by his fellow artists in Florence. A. Parronchi (*Studi Urbinati*, XXXV, 1961, pp. 1–37) attempted to identify as the crucifix of Sto Spirito a crucifix in the Church of S. Rocco in Massa Carrara. However, it is larger than life-size, in contradiction to Condivi, and in the 17th century it was attributed, with more likelihood, to Felice Palma by Filippo Baldinucci. The other work executed during these years was a *Hercules*, larger than life-size (ht., ca. 7 ft., 7 in.). The statue, acquired in 1529 by Francis I, was exhibited at Fontainebleau and has been lost since 1713. An etching by Israël Silvestre of the Jardin de l'Esang at Fontainebleau shows the *Hercules* of Michelangelo, in a rear view, on a pedestal bearing the monogram of Henry IV (cf. Tolnay, 1943–60, I, fig. 152). A pen drawing by Rubens, in the Louvre, shows Michelangelo's *Hercules* in frontal view (identified and published by Tolnay, in *The Art and Thought of Michelangelo*, New York, 1964 and in *GBA*, 6th ser., LXIV, 1964). This first larger-than-life-size nude figure in marble by Michelangelo directly anticipated the marble *David*.

Before Oct. 14, 1494, divining the political trouble that soon led to the fall of the Medici, Michelangelo took flight from Florence. He went first to Venice, where he remained only a short time, and then to Bologna, where he stayed about a year, until the end of 1495, as a guest of Gianfrancesco Aldovrandi. He busied himself there with literary studies, reading the great poets of the vernacular — Dante, Petrarch, and Boccaccio; his own first poems probably date from this time. Michelangelo's artistic activity was limited to the completion of the tomb of St. Dominic (Bologna, S. Domenico), which was unfinished at the death of Niccolò dell'Arca (da Bari) in 1473. Michelangelo had to supply three missing statuettes: an angel (to balance that of Niccolò), a St. Petronius, and a St. Proculus. He had to subordinate his ideas to an already existing structure. These small figures show the influence of Jacopo della Quercia, with whom Michelangelo had a deep artistic affinity. (Cf. Stefano Bottari, *L'Arca di S. Domenico in Bologna*, Bologna, 1964.) Roberto Longhi (*Ampliamenti nell'Officina Ferrarese*, 2d ed., Florence, 1956) sees Ferrarese influences: that of Ercole de' Roberti in the St. Proculus statue and that of Cosimo Tura in the St. Petronius; but, because the Ferrarese style is harder and more angular in the folds, the influence of Della Quercia is more obvious. According to J. Q. van Regteren-Altena (in a verbal communication), the relief of a Virgin of the Annunciation, on the left outside wall of the choir in the Church of S. Petronio, Bologna, may be a work by Michelangelo from this period. The invention is elevated, but the execution is rough and clumsy, and more probably by a pupil and dating from about 1545.

The situation in Florence was consolidated by the formation of the republic of Savonarola; at the end of 1495, Michelangelo returned there. However, he remained in Florence only until June, 1496, probably because he did not get commissions. While there he executed only two statuettes of children, a *S. Giovannino* and a *Sleeping Cupid* (both lost). The *S. Giovannino* has been identified with several statues, but none of the identifications is convincing. (The name Giovannino can be applied to St. John as an infant or as a youth.) There does exist a sketch by Michelangelo of a child (Louvre; cf. Tolnay 1943–60, I, fig. 110) in a *contrapposto* position, with one arm reaching across his breast, a pose reminding us of Leonardo's *Leda*. As A. E. Popp has shown, this motif was copied in the St. John of the so-called "Manchester Madonna" (*The Madonna and Child, St. John and Angels*; London, Nat. Gall.), and it could therefore be a reflection of Michelangelo's lost

statuette. The same motif can be found in several statuettes, of St. John as a boy, from the late 16th and early 17th centuries (cf. Tolnay, 1943–60, I, figs. 163–165). According to W. R. Valentiner (*Kunstchronik*, III, 1950, p. 199), a statuette of St. John as a boy, in the Pierpont Morgan Library, New York, may be identified with Michelangelo's work. This is rather in the style of Silvio Cosini. Longhi (*Paragone*, IX, 101, 1958, pp. 59–64) has tried to identify the figure with a statuette of St. John in S. Giovanni dei Fiorentini, Rome; A. Parronchi (*Studi Urbinati*, 1960, p. 3 ff.), with a statue in the Museo Nazionale, Florence, that is sometimes attributed to Donatello and sometimes to Francesco da Sangallo (H. Kauffmann, *Donatello*, Berlin, 1935); and F. de' Maffei (*Michelangelo's Lost St. John*, New York, 1964) — in a study containing some valuable observations — with a statue which is now a property of the dealer Piero Tozzi. The attempts at reconstruction of the lost *Sleeping Cupid* have not been any more successful. The most likely hypothesis still seems to be the identification of the motif with the cupid in Tintoretto's *Vulcan Surprising Venus and Mars* (Munich, Alte Pin.), or with that in Giulio Romano's *Childhood of Jupiter* (London, Nat. Gall.; Tolnay, 1943–60, I, figs. 167, 168). Both representations revert to an ancient sculpture of which several copies are in existence. W. R. Valentiner (*Comm*, VII, 1956, pp. 236–48) and P. F. Norton (*AB*, XXXIX, 1957, pp. 251–57) trace the history of the statuette in England; the former takes up again the hypothesis of K. Lange, according to which the *Cupid* in the Museo di Antichità, Turin, should be identified with Michelangelo's.

The *Sleeping Cupid* became the external reason for Michelangelo's first sojourn in Rome. The statuette was sold to Cardinal Raffaello Riario by a dealer as an ancient work; however, Riario discovered the forgery, and the figure was returned to Michelangelo. According to Condivi, Michelangelo went to Rome partly because of his anger at this.

From the end of June, 1496, until the spring of 1501, Michelangelo was in Rome for the first time. He was in contact with Cardinal Riario; with the banker Jacopo Galli, who bought his *Bacchus*, and for whom Michelangelo made an *Apollo*, or *Cupid* (lost); and with Jean Bilhères de Lagraulas, the French cardinal for whom he executed the *Pietà* in St. Peter's. It was Galli who became his chief patron during his Roman sojourn, and in whose house he may have lived. He made a cartoon of St. Francis receiving the stigmata (lost) for S. Pietro in Montorio. The fresco in the first chapel to the left in this church, representing the same subject, and attributed to Giovanni de Vecchi, may be a reflection, in its centralized composition, of this lost cartoon by Michelangelo. No contact seems to have existed between the artist and the court of Pope Alexander VI. What probably most attracted Michelangelo in Rome were the ancient works of art which he could study in several large collections of antique sculptures there.

Contemporaries chiefly appreciated the lifelike quality and grace of ancient works, in contrast to the dry and angular manner of the Florentine masters of the 15th century. In Michelangelo's *Bacchus* (Florence, Mus. Naz.) his attempt to follow the ancients in this respect can be observed, but the fruits of his study of the works of antiquity in Rome were to become more visible in the works executed after his return to Florence. The lost Galli *Apollo*, or *Cupid*, was previously identified with the crouching *Cupid* in the Victoria and Albert Museum, London. This figure has been attributed to Vincenzo Danti by F. Kriegbaum (*JhbKhSammlWien*, N.S., III, 1929, pp. 247–57); J. Pope-Hennessy (*BM*, XCVIII, 1956, pp. 403–11) considers it an ancient statue, completed in the 16th century.

Of the two extant works of this first Roman period, one has a pagan, the other a Christian subject. Condivi describes the *Bacchus* (Florence, Mus. Naz.) in a detailed way, declaring that the statue corresponds to the conceptions of the ancient writers. It is actually a pseudoantique statue made by Michelangelo, probably for Jacopo Galli's "antique garden," which would explain why the figure has multiple views (the position of the figure and the form of the base) rather than the usual one main view of his sculpture. A drawing by M. van Heemskerck (X, PL. 207) shows the figure as the most important piece among the ancient fragments and sarcophagi of the Galli garden. In the drawing the right hand is missing; today the figure has a right hand holding a goblet, similar to that in a drawing (no. 133) in the Albertina, Vienna, and some of the old bronze copies: one, by Pietro da Barga, is in the Museo Nazionale, Florence, and another, anonymous, is in the Kunsthistorisches Museum, Vienna (cf. Tolnay 1943–60, I, figs. 171, 172). Therefore it is unlikely that it is a "clumsy modern restoration" (E. Wind, *Pagan Mysteries in the Renaissance*, London, 1958). Although the right hand is less well executed than the other, the old restoration seems to have followed the original design. The main motif, in which at the side of the god there is a satyr stealing the grapes, reverts to antiquity (e.g., *Bacchus*, Rome, Torlonia Coll.). The soft, full forms are also ancient in inspiration, giving the figure the aspect of a hermaphrodite. Nevertheless, Michelangelo does not follow a precise antique model and rejects the stereotyped *contrapposto*. Here the relaxed leg is on the same side as the raised arm, while the hanging arm is on the side of the supporting leg, giving the figure the unstable stance of a drunken man. The sinuous S line of the profile view still seems to derive from the late-Gothic tradition of Della Quercia (cf. Tolnay, 1943–60, I, fig. 22). It is not the joyful leader of the Bacchanalia that Michelangelo represents here, but the inebriated god. The group seems to symbolize the cycle of decline, in Bacchus and the animal mask, and rebirth, in the satyr. The life-giving grapes are related to the death symbol of the mask. The conception approximately corresponds to the description of Bacchus as a "cosmic god" in Boccaccio's *De genealogia deorum*. The hypothesis that connects the figure with the Bacchic mysteries of Plato's Phaedrus (E. Wind, *Pagan Mysteries in the Renaissance*, London, 1958, p. 147 ff.) seems to be rather far-fetched.

The other work executed in Rome, the *Pietà* in St. Peter's (PL. 526), was commissioned in the autumn of 1497, but the contract dates from August, 1498 (Milanesi, 1875, p. 613). It was probably intended for the tomb of Cardinal Jean Bilhères de Lagraulas, who ordered it (H. von Einem, 1959). The Virgin, youthful in feature, looks neither at the beholder nor at Christ, but, bowing her head slightly, supports the body of Christ and makes a gesture of silent acceptance of the divine will with her left hand. The composition of the group reverts to a type created in the 13th century, probably in the north, which was known in Italy in 14th-century Byzantine painting and in 15th-century Italian sculpture and painting. Longhi (*Ampliamenti nell'Officina Ferrarese*, 2d ed., Florence, 1956) indicates a strong Ferrarese influence, especially that of the Pietàs of Ercole de' Roberti, but Roberti's represent the *Compassio Mariae*, while Michelangelo's shows a solitary Mary accepting the will of God. The technique of the work is much closer to the fine taste of the Florentine Quattrocento sculptors working in Rome than to that of ancient art. The relieflike conception of the group corresponds also to the Florentine tradition: the group is relatively flat but gives the effect of more depth. It is carved from a block, originally oval in depth, as can be seen from the base. The surface is carefully polished, and the modeling is extremely delicate. In the folds on the breast a transition between Della Quercia's animated drapery and the sharp Florentine manner can be observed. The model for the folds on the legs has been traced by J. Wilde (*BM*, XCV, 1953, pp. 65–77) to early drawings of Leonardo. In the faces there are also similarities with a nearly contemporary cartoon by Leonardo (PL. 123; London, Nat. Gall.; formerly Royal Acad. of Arts). H. Wölfflin (1891) observed that the gesture of the Virgin's left hand and of her bent head are probably inspired by Leonardo's Christ in his *Last Supper*.

The first great creative period of Michelangelo's youth was marked by his sojourn in republican Florence, probably from the spring of 1501 until the spring of 1505. The young artist was already famous; his glory was established, and his name appeared for the first time in a book. He was republican in feeling and by tradition, and his commissions came from the Florentine republic (the Gonfaloniere Pietro Soderini was his friend), the Opera del Duomo, and the powerful corporation of the Arte della Lana. During this time Michelangelo developed

873

his classic style in the heroic figures of the marble *David* (1501–04; Florence, Acc.), the Bruges *Madonna* (ca. 1501; Church of Notre-Dame); the Doni Tondo (1504; PL. 527), and the cartoon for *The Battle of Cascina* (1504).

At that moment Leonardo was the most popular artist in Florence, where he exhibited in April, 1501, the first great work of his new style, the cartoon for the *St. Anne* (lost). When Michelangelo returned to Florence, about one month later, he could not have remained insensible to the successes of Leonardo's art. In a series of works, mostly of the Virgin or the Holy Family, executed during this period, Michelangelo's reaction to Leonardo's style can be traced. In a drawing now in the Ashmolean Museum, Oxford (cf. Tolnay, 1943–60, I, fig. 81), he paraphrased Leonardo's *St. Anne*, the influence of which can also be seen in the Bruges *Madonna*; in the tondo for Bartolommeo Pitti (Florence, Mus. Naz.); in a drawing of the Holy Family (Louvre); in the tondo for Taddeo Taddei (London, Royal Acad. of Arts); and in the Doni Tondo. If in his bronze *David* for Pierre de Rohan Michelangelo followed that of Donatello, it was because the contract required it.

Without abandoning exactitude and richness of detail, Michelangelo now subordinates them to his vision of the whole. His artistic language becomes more austere and monumental, and the austerity of the form corresponds to that of the spirit. The passive figures of Bologna and Rome are supplanted by a heroic race. They are no longer victims of forces out of their control but seem to be masters of their own fate.

The Bruges *Madonna* was probably begun in the spring of 1501 (Tolnay, 1943–60, I, p. 158; V. Mariani, *BArte*, XXXIX, 1954, pp. 43–50). The precise work in the details of the folds, rich in realistic observation, seems to indicate that the group was begun not long after he finished the *Pietà*. However, the artist seems to have progressed slowly in executing the work, and this may explain why the Child seems to be more developed in treatment than the Virgin. The solemnity of the group is accentuated by the axial pose of the Virgin, by the vertical and symmetrical folds on the breast, by the veil covering her head in an almost architectural manner, and by the regular, classical features of her face, inspired by Leonardo's types. Contrary to the Florentine tradition the Child is not seated on the Virgin's knees, but is standing between her legs, surrounded by the draperies of her mantle, as if protected in a kind of niche. The *contrapposto* pose reverts to antiquity (cf. Tolnay, 1943–60, I, fig. 203). The Child still seems to be within the Virgin's body, about to free himself from the maternal womb. While the Virgin's face reveals both anxiety and yet stoic determination to accept her fate, the face of the Child, by contrast, wears an innocent smile. The idea of representing the Child as if in the womb of the Virgin may have been inspired by the Byzantine Platytera, who was depicted with the Child in her womb, or from later Virgins deriving from this Byzantine type — for example, the Virgin by Donatello on the high altar in S. Antonio, Padua, and the Virgin of Cosimo Tura in the National Gallery, Washington, D.C. A new feature in Michelangelo seems to be the contrast between the stern attitude of the Virgin and the hesitating passive pose of the Child. A rapid pen sketch representing the same motif, but with nude figures, is in the British Museum (cf. Tolnay, 1943–60, I, fig. 10). The sketch may have been made in 1506, at the time when Michelangelo was about to sell the group to the Mouscron (or Moscheroni) in Bruges (Milanesi, 1875, p. 6; Gotti, 1875, II, p. 51). According to other scholars, such as Dussler, it is a preparatory sketch.

The two marble tondos of this period show a departure from detailed refinement in the treatment of forms and reveal a tendency toward a more synthetic, monumental, and massive style. The artist left both tondos unfinished, and this vagueness in the detail serves to heighten the suggestive power of the whole. Michelangelo here transformed Leonardo's ideas in a manner related to Roman antiquity and worked classic motifs directly into his compositions.

The marble tondo made for Bartolommeo Pitti (PL. 525) was probably executed about 1503–04, at the same time that Michelangelo was working on the marble *David*. According to other authors it may have been made even later (H. von Einem, 1959). It still resembles the Bruges *Madonna*, especially in the contrasting expressions of the Virgin and Child — the former serious and aware, the latter infantile and innocent — though the bodily forms are more broadly and massively treated. The type and the expression of the Virgin's head and face recall the face of the *David*. The Virgin, seated on a low stone block, partly envelops the naked child in her cloak with a sudden gesture, as if to protect him. She raises her head and gazes into the distance, as though prepared for foreseen danger. Her prophetic faculties are also given symbolic expression by a cherub on her forehead, which signifies the gift of higher knowledge. The Child leans wearily on one arm, which rests on an open book, probably the Virgin's prayer book. He seems to be unaware of his destiny. His pose is almost exactly that of an ancient mourning genie (e.g., the Phaedra Sarcophagus, Pisa, Camposanto; cf. Tolnay 1943–60, I, fig. 218). The head of the Infant St. John seems to have been inspired by antique heads of youthful satyrs or centaurs. The three heads form a triangle, a compositional pattern reverting to Leonardo (early drawing in Windsor, Royal Colls., 12276R); this compositional pattern assumes great importance in the works of both Michelangelo and Raphael. There is a preparatory sketch for the figure of the Virgin in the Musée Condé, Chantilly (cf. Tolnay, 1943–60, I, fig. 98).

Quattrocento artists treated the tondo as a round window, and for this reason half-length figures appear in them. Michelangelo represents whole figures within the confines of the circle, as Luca Signorelli did before him (*The Holy Family*; Florence, Uffizi). By means of recurring curves in the lower half Michelangelo emphasizes the circular silhouette of the group; thus the form of the tondo becomes its natural limit.

The drawing *St. Anne with the Madonna and Child* in the Louvre (PL. 539) is probably a preparatory design for an unexecuted marble tondo. The theme reverts again to Leonardo, though the position of the Virgin's arms was inspired by one of Giovanni Pisano's sibyls on the pulpit of S. Andrea, Pistoia (Wilde).

The other marble tondo (London, Royal Acad. of Arts), made for Taddeo Taddei, is dated before the Pitti tondo by some scholars. However, the quality of execution and the size, almost twice as large as that of the Pitti tondo, speak for a later date. A few details in the folds over the Virgin's left arm seem to have been reworked by an apprentice. Here the three figures are bound together by one action: St. John, playing with a bird, probably a goldfinch, approaches Jesus, who is frightened and seeks refuge in his mother's lap, while the Virgin wards off St. John with her barely sketched right hand. The movement of Jesus is inspired by a child from the ancient Medea sarcophagus type (W. Horne, Panofsky). Studies for the St. John are preserved on a sheet in the British Museum (cf. Tolnay, 1943–60, I, fig. 109).

The only authentic panel by Michelangelo, *The Holy Family* (Doni Tondo; PL. 527), is also a tondo and may be considered from the point of view of the composition as the culmination of this series of tondos inspired by Leonardo. It seems to have been made on the occasion of the marriage of Agnolo Doni and Maddalena Strozzi, at the end of 1503 or the beginning of 1504 (G. Poggi, *Jahresbericht des Kunsthist. Inst. in Florenz*, 1906–07, p. 10). The hard, somewhat abstract forms are still reminiscent of the Bruges *Madonna*, although the grouping of the figures, describing a spiral, seems to go beyond the two marble tondos; for this reason some scholars (Wilde, for instance) date it about 1506. Here the Virgin is a heroic mother who raises her child onto her shoulder with her bare muscular arms. The three figures seem to be formed from a cylindrical block, and the spectator's eye is invited to follow the curving spiral that rises from the right leg of the Virgin and finishes in the upper ring formed by the arms of Jesus. The motif of a figure standing on the shoulders of another is an age-old symbol of the victory of a new principle over an older one which has prepared the way for it. By birth the Virgin and St. Joseph belong to the Old Testament, but by their relationship to Christ they are of the New. With Jesus placed high on his

mother's shoulder, Michelangelo apparently wished to show that the principle embodied in Christ, while dependent on that of Mary and Joseph, at the same time surpasses it. On the Child's head there is a band, probably signifying victory, as in ancient statues of victorious athletes. In the background of the composition Michelangelo added nude youths of supple beauty, who are seated or leaning against a low wall, describing a hemicycle. Behind them emerges a bare, mountainous landscape. The ephebic figures seem to symbolize the pagan world *ante legem*, as in Signorelli's tondo in the Uffizi, which was the model for Michelangelo's painting; some scholars, such as Wilde, have interpreted them as angels. The little St. John behind the first wall is the link between the pagan and the Judaeo-Christian world. The unfinished apse in the background could be an allusion to an unfinished ancient temple which will provide a foundation for the new Church of Christ; other scholars have interpreted it as an allusion to the choir of the new St. Peter's (1506). The contrast between the holy scene in the foreground and the pagan world in the background seems to have been fashionable at the end of the 15th and in the early 16th century, as is attested by Leonardo's *Adoration of the Magi* (PL. 117) and that of Hieronymus Bosch (Madrid, Prado; II, PL. 318). From the point of view of color the Doni Tondo is perhaps the earliest 16th-century example of the brightening of the palette and of the use of changing colors, devices which were to be followed by the first two generations of mannerists (Pontormo, Il Rosso, Salviati, Vasari).

In his early Virgins, Michelangelo transformed the traditional devotional image into a philosophicoreligious cult image. Made for private devotion, they do not suppose a believer who is kneeling before the Virgin in prayer but a cultivated Florentine citizen who stands before the image in meditation, finding therein philosophical comfort and edification. This Humanistic and religious conception of the early Virgins set the standard for Michelangelo's religious works of the following periods, up to and including the *Medici Virgin* (Florence, S. Lorenzo, New Sacristy).

Michelangelo's other chief preoccupations during this Florentine period were the problems of the draped standing figures and of the standing or moving nudes. The earliest examples of a change in the conception of draped figures are the statuettes on the Piccolomini Altar (Siena, Cathedral), which were commissioned while he was in Rome (Milanesi, 1875, p. 615 ff.), but which he only began to execute in Florence in 1501. The commission from Cardinal Francesco Todeschini-Piccolomini (later Pius III) called for 15 statuettes by Michelangelo to fill empty places on the altar by Andrea Bregno, which was originally intended to be combined with the tomb of the Cardinal. Michelangelo delivered only four of these statuettes, in 1504 — those of St. Peter, St. Paul, St. Pius, and St. Gregory; a fifth, of St. Francis, was made by Pietro Torrigiani. A letter by Michelangelo's father (1510) suggests that Baccio da Montelupo worked on these figures, which were made after drawings of the master. In 1537 the heir of Pius III transferred his right to the hundred ducats that Michelangelo owed from the advance for the work he never did. About sixty years after the commission, in 1561, Michelangelo's conscience was still troubled, and he wrote to his nephew that he had decided to settle this affair. From these documents it can be deduced: that the statuettes were not actually made by him but by Baccio; that Michelangelo only began to carve the statuettes and left the final execution to Baccio; or that Michelangelo made only some of the figures and the rest were done by Baccio. The problem of the authenticity of these statuettes has been a matter of discussion for more than a half century. In 1940 the statuettes were cleaned, and F. Kriegbaum (*JhbPreussKSamml*, LXIII, 1942, p. 97 ff.) attempted to prove that all four figures are by Michelangelo's own hand; but only in SS. Peter and Paul can the hand of the master be recognized, and the two other figures were probably executed by Baccio. The style of SS. Peter and Paul fits well into the beginning of the Florentine period: The folds of Della Quercia, seen in the SS. Petronius and Proculus of the tomb of St. Dominic, have been replaced by hard, linear folds. In the St. Paul the influence of Donatello is obvious; the head of this figure seems to be a kind of idealized self-portrait of the artist. Longhi (*Ampliamenti nell'Officina Ferrarese*, 2d ed., Florence, 1956) attributes the harder idiom of the folds to the influence of Ercole de' Roberti. A drawing of this monument by Giovanni Antonio Dosio shows in the top center niche a naked resurrected Christ (E. Luporini, *CrArte*, 1958, V, pl. 10). The hypothesis that the Bruges *Madonna* was planned by Michelangelo for this niche (W. R. Valentiner, *AQ*, V, 1, 1942, pp. 3–44) seems to be untenable, because, according to the documents, a Christ flanked by figures of St. Thomas and John the Evangelist should have been located in this niche.

The two most important standing nude figures of this period are the bronze *David* and the marble *David*. Although Michelangelo began work on the bronze *David* about a year later than he began his marble *David*, it is closer to the Florentine tradition than the latter. This can be explained by a stipulation in the contract of Aug. 12, 1502 (Milanesi, 1875, p. 624), which says that Michelangelo's figure should be like Donatello's bronze *David* in the courtyard of the Palazzo Vecchio (Palazzo della Signoria). This was the request of Pierre de Rohan, for whom the Signoria ordered the figure. The statue, still unfinished in 1508, was finally completed in 1509 by Benedetto da Rovezzano. It was then sent to France — first to Blois and then to Bury — and has been lost since the mid-17th century; according to Varchi, it was a life-size figure. The most likely hypothesis is that the David sketch in the Louvre (cf. Tolnay 1943–60, I, fig. 93) is a preparatory sketch for this work. A small bronze *David* in the Louvre (formerly Pulszky Coll.) is regarded by several scholars as a preparatory model for this work (cf. W. Boeck, *Mit. des Kunsthist. Inst. in Florenz*, VIII, 1959, pp. 131–38).

About the last version nothing certain can be said. In the engraving of the courtyard of the Château de Bury by J. A. Ducerceau the figure is too tiny (cf. Tolnay, 1943–60, I, fig. 210); but it seems to represent David holding the head of Goliath as a trophy in his raised right hand, while in the left he is holding a sword. It is not impossible that Cellini's *Perseus* (Florence, Loggia della Signoria), in a similar pose, is a reflection of the final version of Michelangelo's lost bronze *David*.

The block from which Michelangelo had to model the marble *David* (VII, PL. 383; Florence, Acc.) had been worked on forty years earlier (1463) by Agostino di Duccio, who left it incomplete. The block belonged to the Opera del Duomo and was originally destined for the decoration of one of the exterior buttresses of the Cathedral (G. Poggi, *Il Duomo di Firenze*, Berlin, 1909). Agostino began a "giant," probably a David, but he abandoned the work. Since that time the authorities of the Cathedral had been trying to find an artist capable of finishing the block. They found this master in September, 1501, in the person of Michelangelo, who between then and April, 1504, succeeded in producing a figure from the block without recourse to other pieces of marble. It cannot be seen from the front that another artist had previously worked on the block. Only the narrow lateral views indicate that the block was not chosen by Michelangelo, who would certainly have selected a thicker one. The virtuosity with which Michelangelo overcame the difficulties that had baffled others for half a century assured him of an enormous success.

The pose of the figure seems to be calm, but it is full of inner tension; this *David* is ready for action. The contrast between the two sides of his body is marked. All the weight reposes on the right leg, and this side is strictly vertical and closed. The other side, with the silhouette broken by the raised arm, is open. This contrast corresponds, as Wilde has observed, to a moral distinction that was established in the Middle Ages: the right side, under divine protection, is assured; the vulnerable left side is exposed to the powers of evil. Michelangelo repeated this differentiation of the two sides later — in his *Moses*, for example.

This *David* differs from the Florentine tradition of the victorious boy and is inspired in its pose by a type of Hercules on ancient sarcophagi (Tolnay, *JhbPreussKSamml*, LIV, 1933, pp. 95–122), known also in the Middle Ages (Nicola Pisano,

877

Fortitude, pulpit of the Baptistery, Pisa). Michelangelo's own early *Hercules* had followed this type and therefore anticipated this *David*. This identification of the *David* with Hercules may have its explanation in Michelangelo's desire to embody in the figure, which he conceived as a political symbol, the two principal civic virtues of the Renaissance, *fortezza* and *ira*. Just as Hercules was the symbol of strength in classical antiquity, so David was considered *manu fortis* during the Middle Ages. It is not surprising that Michelangelo fused the two in a monument designed to embody the civic virtues — all the more because Hercules and David had been honored as patrons of Florence since the end of the 13th century and the beginning of the 15th century, respectively. Vasari testifies that the statue was already considered by contemporaries as a representation of the political ideal of the republic: "Just as he [David] had defended his people and governed with justice, whoever was governing that city [Florence] should defend it bravely and govern it justly." The *David* of Michelangelo had to fulfill a concrete function in the life of republican Florence: to remind Florentine citizens, as they stood in front of the Palazzo Vecchio, of the virtue of courage necessary to defend the republic against its enemies. (For a discussion of the meeting called to decide the location of the statue, see Tolnay, 1943–60, I, p. 152 f.)

From 1508 on, the government of the Florentine republic desired to have erected in front of the Palazzo Vecchio, near the entrance, a second gigantic statue group that would make a pair with the marble *David*. This was also to be executed by Michelangelo and to represent Hercules and Antaeus, since, as Vasari said, David, as well as Hercules, was "an emblem of the Palazzo." The block was ordered in May, 1508, by Pietro Soderini, but in 1525 Clement VII gave the block to Baccio Bandinelli, although the Signoria still wanted to entrust Michelangelo with its execution. At that time, in 1525, Michelangelo may have made his red-chalk sketches for the proposed group (Oxford, Ashmolean Mus.; Br. Mus.; cf. Tolnay, 1943–60, III, figs. 139, 140). After the fall of the Medicis, in August, 1528, the Signoria decided to take the already half-worked block from Bandinelli and to give it again to Michelangelo. According to Vasari, Michelangelo at that moment abandoned the proposed Hercules and Antaeus and decided to make a Samson with two Philistines. To this version probably corresponds the original model in clay in the Casa Buonarroti, Florence (Panofsky, 1939, p. 231 ff.; Tolnay, 1943–60, III, pp. 98 ff., 183 ff.). According to Wilde (*Michelangelo: The Group of Victory*, London, Oxford, 1954), however, this is the model for the counterpart of the *Victory* now in the Palazzo Vecchio, both of which were intended for the tomb of Julius II.

The highest expression of the young Michelangelo's mastery of the nude human body was probably the cartoon (lost) for a mural depicting the Battle of Cascina. In autumn, 1503, when the Signoria originally decided to decorate the large Council Hall of the Palazzo Vecchio with murals representing Florentine victories, they contracted with Leonardo to do this work (May, 1504); he began, in the spring of 1505, a painting representing the Battle of Anghiari, the Florentine victory over the Milanese. After this, Gonfaloniere Pietro Soderini also commissioned Michelangelo to paint a mural in this hall, which was to represent the Florentine victory over the Pisans near Cascina. He began the cartoon in November, 1504, seven months after the contract with Leonardo, whose original commission was possibly reduced in favor of Michelangelo; the cartoon was finished between April and November, 1506 (H. Thode, 1902–13; H. von Einem, 1959). The Council Hall at that time offered scope for large murals only on the longitudinal east wall (the other walls being perforated by too many windows), on which there were originally three areas separated by two windows. The original shape of the hall was reconstructed by J. Wilde (*Warburg*, VII, 1944, pp. 65–81), according to whom the central area was not suitable for painting, but his argument seems questionable. Michelangelo seems to have considered this commission as a competition with Leonardo. There are three sketches by Michelangelo representing cavalry battles (one in the Br. Mus.; two in Oxford, Ashmolean Mus.; cf. Tolnay, 1943–60, I, fig. 106, III, figs. 142, 143). It may be deduced that at the beginning he tried to harmonize his composition with Leonardo's *Battle of Anghiari*; but he seems to have realized he could not compete in this field, so he decided to confine himself to the representation of nudes, at which he was a master. In the last version there appear to have been no horsemen, or, if there were, they must have been in the background (copy, Br. Mus.; cf. Tolnay, 1943–60, I, fig. 234). The central scene consists of Florentine soldiers on the banks of the Arno at a moment when the chief of the Florentine army had given the signal of alarm because of the imminent attack of the enemy.

The lost cartoon can be reconstructed on the basis of a grisaille (Holkham Hall, Norfolk, Earl of Leicester Coll.), which is probably the copy by Bastiano da Sangallo mentioned by Vasari (cf. W. Köhler, *Jhb. der k. k. Zentralkommission*, I, Vienna, 1907, pp. 115–72). The prototypes for Michelangelo's composition were Florentine representations of the battles of nudes, like those by Pollaiuolo and by Verrocchio (lost). Michelangelo's composition is reminiscent of a high relief composed in three planes carved from a trapezoid block. The bodies are modeled in the manner of the marble *David*, but the movements of the figures seem fixed, as if they were frozen in the significant poses of ancient statues. From this point of view his work seems to be inferior to Leonardo's, if a judgment on the basis of the copy is possible. The nudes in the cartoon seem to have been transitions from the unarticulated but dynamically conceived nudes of *The Battle of the Lapiths and the Centaurs* to the synthetic monumentality of the nudes on the Sistine ceiling. Certain features of the composition, which is closed at the left and open at the right, may have been determined by the location of the fresco on the left area of the east wall of the hall (Tolnay, 1943–60, I, p. 217; J. Wilde, *Warburg*, VII, 1944, pp. 65–81). This compendium of poses of nude human bodies became the model to be copied by many of the younger Florentine artists; its influence was still perceptible in the 17th century (in Rubens, for example).

Under the pontificate of Julius II, who had an inner affinity with Michelangelo by virtue of the boldness of his conceptions and his seething temperament (*terribilità*), a new period began for the artist and for Renaissance art in Rome. This great Maecenas gathered around him the best artists of Italy, and his attention was soon attracted by the talent of Michelangelo, who was perhaps pointed out to him by Giuliano da Sangallo, Vatican architect and Michelangelo's friend. In March, 1505, the Pope invited Michelangelo to Rome to execute his funerary monument, which was to surpass the ancient mausoleums. The artist began this work with great enthusiasm, making many designs, of which one was chosen. He spent eight months in Carrara having the necessary marble extracted. In December, 1505, he returned to Rome, awaiting with impatience the arrival of the marble blocks. His workshop was near St. Peter's, behind the small church of S. Caterina.

Meanwhile, the Pope had changed his mind. He was now thinking of having the new St. Peter's erected by Bramante and temporarily abandoned the commission for the mausoleum. It seems that, as a compensation, Julius II wanted to commission Michelangelo to execute the decoration of the ceiling of the Sistine Chapel, a project mentioned as early as May, 1506 (E. Steinmann, 1901–05, II, p. 695). Michelangelo wanted to continue the mausoleum, but he was not received at the papal court when he asked for the necessary money for the monument. Offended, he took flight to Florence on Aug. 17, 1506, the day before the laying of the first stone of the new St. Peter's, designed by Bramante. From Florence he offered the Pope, through Giuliano da Sangallo, an arrangement whereby he would work on the blocks in Florence, but it was rejected.

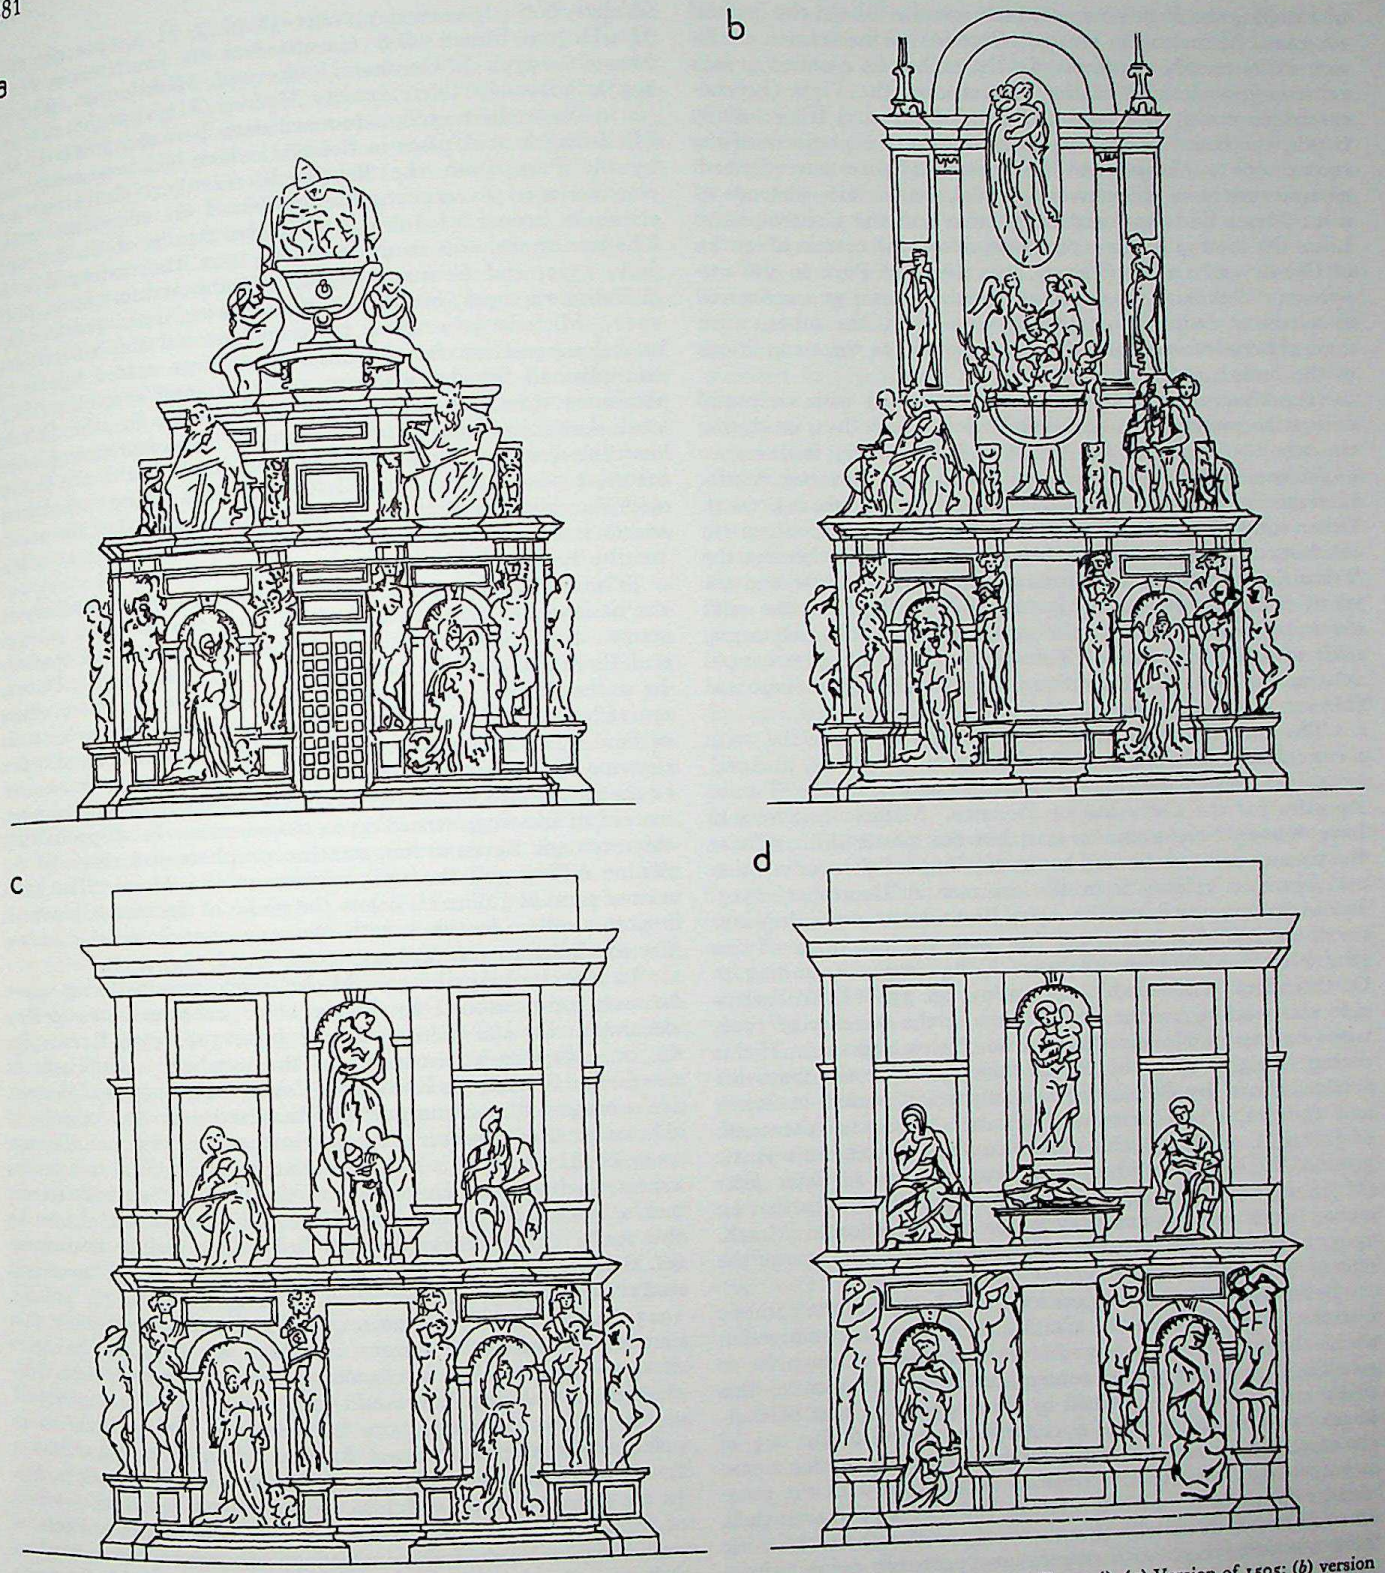
The project for the tomb of Julius II, which occupied Michelangelo's mind for 40 years (1505–45) — and the design of which he changed at least six times — he felt duty bound to complete. He himself said that he was bound (*legato*) to it and that it disturbed his peace of mind. Michelangelo was unable to execute this work, chiefly because of adverse external circumstances. However, it should not be overlooked that with each new reduced design he tried to save the monumental

artistic effect, and possibly to enhance it, in spite of the reduction in the number of figures and in the size of the architectural framework. Only in the last version, part of which was not executed by him, did he give up his struggle. Then it seems that he himself, as a consequence of his religious "conversion" and the resulting change in his spiritual orientation, lost interest in the triumphal monument that he had originally conceived. Now he transformed it into a relatively modest religious monument. The reason for the "lamentable final result" seems to lie not in Michelangelo's own "tragic guilt" (as Justi supposed) but chiefly in the hampering power politics of his patrons, Clement VII and Paul III, who wanted his services reserved for their own commissions, and, in the very last version, in Michelangelo's own new spiritual outlook.

The tomb of Julius II was Michelangelo's first cyclical monumental project. For the first time the artist had to execute not only an assembly of statues and reliefs but also a corresponding architectural framework. He had to conceive a total work of art in which sculptures, reliefs, and architecture would form a kind of symphony. The project was originally planned on a gigantic scale with more than forty larger-than-life-size figures. He promised to finish it within five years.

The 1505 design (FIG. 881) of the monument is not known from primary sources; the reconstructions are based on the descriptions of Condivi and Vasari (1568), on later drawings and contracts, and on monuments probably executed under the influence of the lost project. It was to be a freestanding monument, about 24 ft. wide and 36 ft. deep, consisting of three zones, one above the other. The height of the second and third zones is not known. In the bottom zone there were three bays, separated by four herm-pilasters. In the lateral bays there were niches for statue groups called "Victories." The central bay was probably a door which opened to an oval-shaped *tempietto*, probably domed, in the center of which a sarcophagus for the body of the Pope was planned. In front of the herm-pilasters there were chained male figures, the slaves or prisoners; in the second zone, above the niches, there were four large seated figures, two at the front and two at the back. From this platform the monument rose like a truncated pyramid, at the top of which there was a second sarcophagus (a cenotaph) supported by two allegorical figures, which Condivi referred to as Cybele and Caelus and which Vasari designated as angels.

It is still possible to reconstruct the bottom zone on the basis of drawings in the Kupferstichkabinett, Berlin, and in the Uffizi, which seem to have been made either for the model or copied after it (Tolnay, *MJhb.*, N.S., V, 1928, p. 70; E. Panofsky, *AB*, XIX, 1937, pp. 561–79). C. A. Isermeyer (*Kunstchronik*, VII, 1954, pp. 268–69) gave the measurements for the reconstruction of the lower zone of the monument.



The inconsistencies in the profiles and in the composition between the two zones in these drawings speak for the supposition that the lower zone was conceived for two alternative superstructures. The Uffizi drawing indicates that the central niche was originally wider. The supple proportions of the slave figures recall Michelangelo's style of about 1505, rather than that of 1513, the date of the second model. It may be concluded that the drawings are connected with one of the 1505 design, with the central niche and the top part altered, which he seems to have presented again in 1513 to the Pope's heirs. The articulation of the lateral façades of the freestanding monument is problematical. The most likely supposition is that there were three bays (Panofsky) and not two, as in the 1513 project.

There exist only two attempts at reconstruction of the upper zones (E. Panofsky, *AB*, XIX, 1937, pp. 561–79, and Tolnay, 1951; 1943–60, IV). The height of the second zone of the truncated pyramid is determined by the height of the putti, but the height of the third zone is problematical. Probably it was behind the heads of the seated figures, as in the Berlin drawing, rather than above their heads. The most important differences in the two attempts at reconstruction concern the top zone. Panofsky supposed that the Pope was represented seated on a *sella gestatoria*, which supposedly was supported by two angels. This supposition is based on the erroneous interpretation of the word *bara* (Vasari), which is not a *sella gestatoria*, but a bier or sarcophagus. The reconstruction with a *sella gestatoria* is also unsatisfactory from an esthetic point of view, because the seated figure of the Pope would have risen above the monument without being formally connected with the top platform; finally, the angel behind the Pope cannot be seen, either from the front or from the back. The *bara* is probably a sarcophagus with the recumbent figure of the Pope, as he appears also in the project of 1513 and in the last version. The allegorical figures were to be seated on the right and left of the sarcophagus on the base of the *bara*. One of the projects for Michelangelo's catafalque by Zanobio Lastricati (Milan, Ambrosiana) seems to reflect Michelangelo's freestanding monument for Julius II, as the inscriptions on the sheet state. If the top zone is reconstructed on the basis of this drawing, an esthetically satisfying shape is arrived at, because the sarcophagus with the recumbent statue of the Pope is organically connected by the allegorical figures with the rest of the monument. Also, the silhouette is reminiscent of 15th-century Florentine church façades, such as that of S. Maria Novella. However, Michelangelo's proportions are much more compact, and the bays of the three zones correspond strictly to one another. The idea of substituting figures for volutes appears, before Michelangelo, in Leonardo's sketches for the Trivulzio monument (Windsor, Royal Lib., 12353) and, after Michelangelo, in the monument of Il Bambaja (Agostino Busti) for Lancino Curzio (Milan, Castello Sforzesco). Michelangelo's later designs for the Julius tomb — those of 1516, 1532, and 1542 — were inspired by his own project for the façade of S. Lorenzo.

As for the location of the monument, Michelangelo first seems to have thought of erecting it in the Rossellino choir of the old St. Peter's (Condivi), but Giuliano da Sangallo proposed to erect it in a special, probably central-plan chapel outside St. Peter's (Vasari). Finally, Michelangelo had the idea of locating it in St. Peter's itself, which would then have been rebuilt with a central plan. This seems to have been his own idea, and not that of Julius II, as is usually supposed. Therefore, the idea of a freestanding monument seems to have engendered the idea of the new St. Peter's as a central-plan structure in the tradition of the martyrium. If Vasari's contention that Michelangelo wanted to locate the monument in St. Peter's is correct, then it is likely that the artist planned to put the monument above the "confession" of St. Peter, in the center and below the dome of the projected new church (Tolnay, 1951, p. 94 ff.; H. von Einem, in *Festschrift f. H. Jantzen*, Berlin, 1951, pp. 152–68). The tomb of Julius II may therefore have been intended as a double monument, a memorial to the Apostle Prince as well as to the Pope. However, Michelangelo's monument, if placed below the dome of the new St. Peter's, would have been much too small, and, therefore, it may be supposed that the artist intended to enclose it in a central-plan chapel above the confession. At this place, in 1507, Bramante actually erected a building, the so-called "aedicula," to protect the shrine of St. Peter's tomb. This building was not, as was supposed, a provisional structure, but a chapel which was used by the pope when he came to St. Peter's to say Mass. It is a kind of "Holy Sepulcher" and may have been built there precisely in order to prevent the erection of Michelangelo's central-plan chapel. According to F. Wolff Metternich (*Studies in Western Art*, II, Princeton, 1963, p. 70 ff.), the first project for the tomb of Julius II was intended for the northwest lateral chapel of Bramante's St. Peter's. Metternich accepts the tomb reconstruction of this author.

Shortly before his death Julius II issued a brief (Feb. 19, 1513) in which a Cappella Giulia dedicated to the Nativity of the Holy Virgin is mentioned. (The author's attention was called to this *breve* by Mrs. S. Dijkraaf-Galema.) The Pope wished to be buried in this chapel, which was on the south side of St. Peter's; he seems to have reverted in this instance to the above-mentioned idea of Giuliano da Sangallo. The document does not mention the designer of the tomb that the Pope desired to have executed for the Cappella Giulia in 1513.

881

Compositional designs for the tomb of Julius II, according to reconstructions by C. de Tolnay (drawn by Denise Fossard): (*a*) Version of 1505; (*b*) version of 1513; (*c*) version of 1516; (*d*) version of 1532 (*from C. de Tolnay, 1951*).

Possibly he was no longer thinking of Michelangelo, but it is also possible that by that time he again wanted to have Michelangelo's monument in this chapel and that his heirs, when they recommissioned Michelangelo to make a new design shortly after, were thinking of this location.

The point of departure for the iconographical program for the lower zone of the first project was probably Antonio Pollaiuolo's tomb of Sixtus IV in St. Peter's; here, around the recumbent figure of the dead Pope, are allegorical figures of the Liberal and Plastic Arts and the Virtues (L. D. Ettlinger, *Warburg*, XVI, 1953, pp. 239–74). All of Pollaiuolo's figures are feminine; in Michelangelo's designs they become masculine. It seems, however, that this program was soon superseded by a new one, in which the slaves were no longer personifications of the Arts and Sciences, "which become prisoners of death" through the Pope's death (Condivi), but allegories of the human soul imprisoned in the body, as they appear earlier in Antonio Federighi's holy-water basin in the Cathedral of Siena. Instead

of extolling the Pope's reign, which may have been the original program, Michelangelo created allegories of the human condition in its earthly existence. In the niches he planned groups representing victories of the Virtues over the Vices (Psychomachiae), anticipating the freedom of the soul from earthly bonds, the theme of the second zone. For the platform of the second zone four larger-than-life-size seated figures were planned, representatives of the purely spiritual, intelligible existence of man: Moses and Paul and the Active and the Contemplative Life. On the top of the monument, above the cosmic allegories of Cybele and Caelus (Vasari), was the dead Pope in the empyrean. Therefore the whole of the monument was conceived as a cosmic building, containing, one above the other, three main spheres of existence, which correspond to three conditions of the human soul.

The connection of an architectural structure with sculptural decoration reverts to an ancient tradition, which lived on during the whole of the Middle Ages and in the early Renaissance — for example, in the pulpits of Nicola and Giovanni Pisano. Here, too, the old idea of the hierarchy of the spheres is present. Other influences may have come from Roman sarcophagi (in the bottom zone; Panofsky); from Leonardo's sketches for the Trivulzio monument, where the freestanding structure and the motif of the slaves are anticipated; and, finally, from the *carri dei trionfi*, in which a similar structure and similar elements, such as slaves, are found (Tolnay, 1943–60, IV). A structural relationship with the Holy Sepulcher has also been suspected (H. von Einem, 1959).

The unfinished *St. Matthew* (PL. 529) is connected with a commission from the consuls of the Arte della Lana, in April, 1503, for larger-than-life-size marble statues of the Twelve Apostles for the Cathedral of Florence. Michelangelo was to have delivered one statue a year, but the master did not have the tin e to dedicate himself to the fulfilling of this commission and obtained release from his contract in December, 1505. It can be supposed that in 1503 he at least made drawings for these Apostles, which are lost with the exception of one (Br. Mus.; cf. Tolnay, 1943–60, I, fig. 103). According to O. Ollendorf (*JhbPreussKSamml*, 1895, pp. 359–68), Michelangelo was working on the *St. Matthew* in the summer of 1506, when he was in Florence (letter from Pietro Soderini). If this dating is right, then the *St. Matthew* is separated from the marble *David* by Michelangelo's important period in Rome and Carrara, when he worked on the designs for the tomb of Julius II. Although this chronology seems likely on stylistic grounds, it is contradicted in a letter written 18 years later (Milanesi, 1875, p. 426), in which Michelangelo states that he ceased work on the commission for the Apostles in March, 1505, when he went to Rome, and that by that time one of the figures had been begun.

In any case, the twisted position of the body and the pathetic emotion in the face of the *St. Matthew* give the impression of his being bound by invisible chains, against which he is rebelling. Amazing for a representation of an Apostle, this figure may better be explained by the supposition that Michelangelo was realizing here a conception intended for one of the slave figures for the Julius tomb. The body of this figure is surprisingly massive and large in comparison with the more slender forms of the marble *David*. Influences of Jacopo della Quercia and of Donatello (the motif of the thumb stuck in the belt) are fused here with inspirations probably coming from the *Laocoön* and the so-called "Pasquino" (G. de' Francovich).

The unfinished *St. Matthew* illustrates Michelangelo's method of working in marble. He attacked the front of the block and worked inward in parallel planes; Vasari uses the analogy of water running out of a bathtub. Michelangelo called this method "per forza di levare" (i.e., by means of successively taking away the superfluous marble without adding any marble to the original block). Although unfinished, the figure expresses the whole artistic idea, and finishing it in more detail would probably have lessened, if not destroyed, its dynamic and expressive qualities. For discussion of the problem of the "non finito" in Michelangelo, see Vasari, Condivi, and Bocchi-Cinelli (quoted in Tolnay, 1943–60, I and III); A. Bertini (*L'Arte*, N.S., I, 2, 1930, pp. 121–38; N.S., II, 2, 1931, pp. 172–74); H. von Einem (*Das Unvollendete als künstlerische Form*, Munich, 1959); J. Gantner (*Rodin und Michelangelo*, Vienna, 1953); P. Barocchi (*Arte Antica e Moderna*, III, 1958, pp. 221–35).

In November, 1506, a reconciliation between Julius II and Michelangelo took place in Bologna, which had been recaptured by the Pope from the Bentivoglio family. The artist was commissioned to execute the model of an enormous seated statue in bronze of Julius II for the façade of S. Petronio. The wax model was ready in April, 1507, the casting done in July, 1507, and February, 1508, and the statue put in place in February, 1508; but it had already been destroyed in May, 1511. Michelangelo seems to have regarded this commission as a compensation for the unexecuted large seated figures he had planned for the platform of the pontiff's tomb. About the same time the Pope also commissioned, for the Palazzo degli Anziani, a stucco statue of himself, also seated and larger than life-size, the motif of which was identical with the bronze statue, having a key in the left hand and giving benediction with the raised right hand. It may be supposed that the stucco statue was also made from a small model, perhaps as a test for the bronze figure.

The lost work can be reconstructed only approximately on the basis of old descriptions, which show that it was a prestige statue of the Pope, probably following the type of Antonio and Piero Pollaiuolo's statue of Innocent VIII in St. Peter's. In a few later prestige statues, or drawings for them, there are reflections of the lost work (e.g., Nicolas Cordier's statue of Paul V, in Rimini, Piazza della Fontana; Baccio Bandinelli's drawing of Clement VII, in the Louvre). The violent movement of the raised arm seems to have been a gesture of condemning, instead of blessing, according to the sources. In all probability this dramatic figure anticipates the prophets and sibyls of the Sistine ceiling and the 1515 version of the *Moses*. The large coat of arms of Julius II, below the niche of the statue, has been hypothetically identified with the one that is in the Museo Civico, Bologna (cf. Tolnay, 1943–60, I, fig. 251).

In March or April, 1508, Michelangelo was in Rome, where he was commissioned by Julius II to execute a new ceiling decoration for the Sistine Chapel (PLS. 528, 535; I, PL. 381; II, PL. 291; for a discussion of the symbolic significance of the Sistine Chapel, see E. Battisti, *Comm*, VII, 1957, pp. 96–104). He accepted the commission reluctanctly at the beginning. The original plan preserved in a drawing (Br. Mus.; cf. Tolnay, 1943–60, II, fig. 230) is rather modest, with the Twelve Apostles represented on the pendentives of the low-pitched barrel vault and a system of framed compartments of different shapes in the vault. This system reverts to ancient ceiling decoration (cf. Schulz, *Warburg*, XXV, 1–2, 1962, p. 51 ff.). The second and third drawings (Detroit, Inst. of Art; Br. Mus.; cf. Tolnay, 1943–60, II, figs. 231, 232) reveal the successive simplification and unification of the system, in which the bays and pilasters of the walls are taken into account. After these attempts Michelangelo, realizing they would turn out to be a "cosa povera," seems to have persuaded the Pope to give him permission to paint also the spandrels and lunettes. The Pope gave him a free hand (Milanesi, 1875, p. 427; Maurenbrecher, 1938, p. 69). In the executed work, which he began in May, 1508, the system of framed compartments was fused into a unified architectural trellis; figures exclusively, instead of ornaments, were used as decoration, and figural compositions were planned for the areas inside the frames. Michelangelo secured an independent existence for the ceiling (now separated from the walls by standing putti) by making it appear to float above the chapel. It may be supposed that the 15th-century decoration of the barrel vault by Pier Matteo Serdenti d'Amelia, with a blue sky and golden stars, played a role in Michelangelo's last project; this too was conceived as a "sky" over the chapel.

The Sistine ceiling is the masterwork of Michelangelo's early maturity. The aspirations of his youth converge, clarify themselves, and find a definite place in this monumental work, which unites in a hierarchic system their manifold tendencies. His earlier works now become a repertory for him, from the accumulated treasures of which he draws in his new work.

885

The relationship of the architectural framework and the figures is developed from the first version of the tomb for Julius II. Through a renewed study of natural models and of ancient art (E. Gombrich, *Warburg*, 1937, p. 69) Michelangelo was able to formulate in a more monumental and harmonious way the different categories of figures which he had previously created. He drew further inspiration from the reliefs of Jacopo della Quercia in S. Petronio, Bologna, and in one instance, *The Expulsion*, from Masaccio's fresco on the same theme in the Church of the Carmine, Florence; all these borrowings are assimilated in a new style, characterized by fullness of form and enlivened by rhythmic outlines, which is concrete in details, yet synthetic in its whole.

The new structure of the ceiling decoration may be defined as consisting of three distinct zones, one above the other: the bottom zone of the lunettes and spandrels forms a kind of base; next is the intermediate zone of the prophets, sibyls, and *ignudi* (nude figures) placed in front of the painted attic and stone trellis; and, behind the latter, the highest zone with the "histories," which are seen as if through windows. Within this structure the artist assembled figures belonging to different categories in size and in function, appearing to be of bronze, marble, or flesh, and ranging from architecturally confined to free figures. In the attic zone (the second) he used figures of the most different scales side by side (e.g., the seers and the small putti), while in the upper zone the scale is the same in every scene. The links between these different categories are the *ignudi* (XII, PL. 74), with their ambivalent function as crowning motifs of the thrones of the prophets and the sibyls and, at the same time, framing the stories. All these elements combine to give the effect of a powerful polyphony, dissonant in the second zone and achieving harmony at the top.

The subdivision of the ceiling was inspired by the 15th-century floor decoration of the Sistine Chapel, which was divided, according to liturgical requirements, into a space for the laity, separated by a *cancellata* or screen (moved toward the entry ca. 1573) from the *quadratura* of the cardinals and from the altar space. By projecting the division of the floor and the corresponding arcs of the niches containing frescoed figures of popes on the upper walls (J. Wilde, in *Proc. Br. Acad., 1958*, 1959, p. 61 ff.) onto the curved surface of the vault, Michelangelo created the rhythmically alternating bays on the ceiling. Within this structure the artist distinguished in composition and iconography between those bays which are above the space for the laity and those above the presbytery; above the former he painted stories with many small figures, in which humanity is the prisoner of sin, while above the latter he painted stories with a few large figures, in all of which God appears. It is important to note that the figure of God the Father appears only in the frescoes which are inside and above the presbytery (E. Steinmann, 1901–05, II, p. 220).

Michelangelo took the whole surface of the ceiling as a unity, to which even the pendentives with the prophets and sibyls belong, whereas it was customary to separate the pendentives and to form a border around the vault of the ceiling, including the spandrels. Michelangelo obviously wanted to use a maximum of surface for his frescoes and to unify the curved vault of the ceiling by his decoration.

The pictorial decoration of the vault was not intended as a simple decorative covering of the surface; nor was the decoration intended as merely illusionistic, to be seen from below, which would have nullified the effect of the form of the actual ceiling. It is a plastic-dynamic decoration directly inspired by the mass and surface of the vault and by tension inherent in the very structure of the vault. Michelangelo treated the vault as if it were an enormous block already containing those forces which he expressed in architectural forms, as well as those weights that are personified by the figures. The prophets and sibyls, which are of larger proportions than the *ignudi* above and which, unlike them, have closed outlines, ideally serve to generate the curvature of the vault.

The iconographical program of the earlier versions is not known exactly, except that the Apostles were planned instead of the later prophets and sibyls (PL. 538; I, PL. 381). Nevertheless, it may be supposed that from the beginning the whole of the decoration signified the heavens, following an old tradition of ceiling decoration that reverts to antiquity. The last version may be also considered a new kind of representation of heaven — a sort of Old Testament Olympus peopled by prophets and sibyls, instead of by the Greek gods. Such an interpretation indeed prevailed in several ceiling decorations of the late 16th century, which are actually paraphrases of the Sistine ceiling but represent the mythological Olympus (those of the Zucchis, Giulio Mazzoni, Annibale Carracci, etc.).

The series should be read from the entrance toward the altar, although the chronological sequence of the stories is reversed. In this, Michelangelo was bound by the two already existing cycles in the chapel. The Quattrocento cycles represented in typological order the story of humanity *sub lege* (i.e., the story of Moses) and, facing it, the story of humanity *sub gratia* (i.e., the story of Christ). When Michelangelo decided to decorate his ceiling with histories, there remained no other choice for him but to paint the history of humanity *ante legem* (i.e., Genesis). However, in order to reconcile this tradition with the new demands of the beholder, Michelangelo created a sequence which can be read from the entrance to the altar. He also introduced a new meaning into the historical scenes. The whole ceiling was conceived for the solemn entry of the pope and his entourage into the chapel. The pope could experience, as he proceeded step by step toward the altar, the revelation of the creative power of the highest Being, who, appearing at the beginning in human aspect, takes on a cosmic form. The whole cycle, as seen from the entrance, is thus a gradual theophany in the direction of the altar. It is also a kind of ascension of the human soul to God, *ritorno a Dio*, or *deificatio*.

The histories in the central axis are conceived by the artist as the visions of the prophets and the sibyls, who frame them on the right and left, and the impact of these visions is reflected also in the *ignudi* surrounding them. The figures in the spandrels and lunettes, representing the ancestors of Christ, seem to be excluded from this higher world and unaware of the revelation of God. They seem to be oppressed and to wait aimlessly and without hope, unaware of the coming of the Messiah. The four corner spandrels belong to this same lower sphere; they represent the miraculous deliverance of the chosen people. However, Michelangelo represented the scenes as anonymous events which did not enter into the consciousness of humanity.

In the most recent attempts at interpretation (F. Hartt, *AB*, XXXII, 1950, pp. 115–49, 181–218, XXXIII, 1951, pp. 267–73; E. Wind, *GBA*, LXXVI, 1944, pp. 211–46; H. von Einem, 1959) the tendency has been to discard the above interpretation, although the first two scholars cited here accept this author's theses that the prophets and sibyls are spiritually connected with the histories, which are their visions, and that the spiritual sequence of the series proceeds from the entrance to the altar. Some scholars believe that Michelangelo was inspired by theological writings [according to Hartt, by Vigerio; to Wind, by Sante Pagnini; to H. B. Gutman (*ZfKg*, XVIII, 1955, pp. 74–76), by Nicholas of Lyra; to H. von Einem, by an anonymous theologian] and that the content of the whole plan is not Michelangelo's idea; they hold that he illustrated a program drawn up by theologians, according to which there is a hidden typological meaning in the histories and in the ancestors, so that, in their opinion, the Old Testament scenes represented allude to New Testament scenes not represented. (See E. Wind in *Warburg*, I, 1937–38, pp. 322–30; *Measure*, 1950, p. 411 ff.; and *Renaissance Studies*, London, 1960, p. 312 ff., with woodcut prototypes for four of the medallions on the ceiling from the Malermi Bible of 1490.) But the simplicity of the spiritual idea of the whole, namely the relationship between the finite beings and the infinite Being, as well as the gradual theophany of the latter, does not necessitate the supposition of an erudite program. The typological interpretation of the scenes would seem not to be necessary, because the typological correspondence had already been carried out in the two 15th-century cycles on the chapel walls, and it would have been a pleonasm to repeat this relationship between

the Old and the New Testament. The only exceptions are the prophet Zechariah above the entrance, predicting the entry of Christ into Jerusalem — possibly an allusion to the entry of the pope into the Chapel — and the choice of Jonah, the prophet of the Resurrection of Christ, for depiction above the altar. The histories of the ceiling, however, do not seem to allude to the future coming of Christ (E. Wind, *AB*, XXXIII, 1951, pp. 41–47), but they reveal rather the presence of God. Just as Michelangelo's ceiling is an autonomous work, independent of the rest of the chapel, it may also be regarded as such from a spiritual point of view. Some important observations concerning the structure and chronology of the Sistine ceiling can be found in a paper by J. Wilde, "The Decoration of the Sistine Chapel" (*Proc. Br. Acad., 1958*, 1959, p. 61 ff.).

The preparation of the Sistine ceiling was begun on May 10, 1508, the date of the contract (lost). Until the beginning of January, 1509, the artist probably made sketches and studies and prepared the cartoons, and only then did he begin to paint. By the middle of September, 1509, he had completed the first section; this probably comprised the three stories of Noah, with the accompanying five prophets and sibyls, the corresponding eight *ignudi*, and the spandrels with David and Judith, as well as the first two of the spandrels that were to contain the ancestors of Christ. The second, smaller section was most likely done between the middle of September, 1509, and the end of September, 1510 — the date of Michelangelo's journey to Bologna to obtain the necessary money from the Pope; this section probably included the stories of the original sin and the creation of Eve, as well as Ezekiel and the Cumaean sibyl, with the corresponding four *ignudi* and the two spandrels. The third section was probably executed between January and Aug. 14, 1511, the date of the first unveiling; this section probably included the last four stories, the last five prophets and sibyls, as well as the last eight *ignudi*, four spandrels with the ancestors, and the corner spandrels with the crucifixion of Haman and the bronze serpent. The fourth section — probably executed between October, 1511, and Oct. 31, 1512, the date of the unveiling of the whole ceiling — comprised all of the lunettes. (The cartoons for the first eight lunettes seem, however, to have been executed as early as Jan.–Aug., 1511.) The differences of style, composition, and color among these four sections are clearly visible. The figures in each succeeding section become larger in size and reduced in number, making the compositions more monumental and easier to see from a distance. The outlines, pronounced at the beginning, become less and less important, while the colors become softer and the chiaroscuro richer in its transitions. In the lunettes changing colors are introduced. (For more details concerning the chronology proposed here, see Tolnay, 1943–60, II, p. 105 ff.; a slightly different view is expressed by J. Wilde, *Proc. Br. Acad., 1958*, 1959, p. 61 ff.)

The Sistine ceiling was unveiled on Oct. 31, 1512. The four years during which Michelangelo had labored on this immense work, almost without help, were solitary ones dedicated almost exclusively to his work. (In the same period Raphael executed the Stanza della Segnatura and transformed his own style under the influence of Michelangelo's ceiling.) Now he was anxious to resume work on the tomb of Julius II, though from one of Michelangelo's letters it is evident that Julius II was not anxious to let him continue. However, after the Pope died suddenly in February, 1513, a new contract was drawn up between Michelangelo and the executors of the Pope's will (Cardinal Aginensis and Lorenzo Pucci) on May 6, 1513 (Milanesi, 1875, p. 635 ff.; Maurenbrecher, 1938, p. 296). Although the architectural dimensions were somewhat reduced from the first project, the number of the figures was increased, the time of execution prolonged from five to seven years, and the price raised. Indeed, in later letters (Milanesi, 1875, pp. 428, 489) Michelangelo spoke of an enlargement of the monument. The artist rented a house on the Macello dei Corvi near Trajan's Forum, a house which he later acquired and in which he died. He had all the marble blocks brought there, and he made a contract in July, 1513, with Antonio da Pontassieve to execute the ornamented blocks for the architectural structure. Most of these blocks are still in existence and were used in the lower zone of the final version (Tolnay, 1928).

Michelangelo worked until the spring of 1516 on three figures for the monument and executed the two *Slaves* in the Louvre and the *Moses*. He mentions that he worked on the *Rebellious Slave* in 1513, and he seems to have begun the *Moses* in 1515 (Milanesi, 1875, pp. 115, 391).

The project of 1513 (FIG. 881) can be reconstructed on the basis of the contract and Michelangelo's notes concerning it (Milanesi, 1875, p. 636 f.; Maurenbrecher, 1938, p. 296), the subcontract between Michelangelo and Antonio da Pontassieve (Milanesi, 1875, p. 640), and the drawings in the Kupferstichkabinett, Berlin, and in the Uffizi. No longer a freestanding monument, it was now to be attached to the wall on one side. The *tempietto* in the interior of the lower zone was abandoned. Whereas the lower zone seems to have been essentially identical with that of 1505, except for the figures, the upper zone is completely different. The Pope's sarcophagus stands on the platform surrounded by four figures. In the lateral bays of the platform six larger-than-life-size figures, instead of four, were planned. Behind the sarcophagus rises a very high *cappelletta*, terminating in a semicircular arc, in which Michelangelo intended to place five new figures. It is problematical as to whether the *cappelletta* was meant to be a wall decoration or a projecting structure. Consequently there are different reconstructions (cf. E. Panofsky, *AB*, XIX, 4, 1937, pp. 561–79; Tolnay, 1951, fig. 204). In any case, it is obvious that this project is a compromise between the freestanding monument and the traditional wall tomb, except that Michelangelo introduced in the *cappelletta* the dynamic tension he had already achieved in the painted "trellis" of the Sistine ceiling. The iconographical program also seems to have been a compromise between the original triumphal symbolism of the lower zone and the traditional religious representation of the Virgin and the saints in the upper zone. (The full-length figure of the Virgin floating in a mandorla seems to have influenced Raphael's *Sistine Madonna*.) The drawing in Berlin may revert to 1505 and may have been an alternative version for the monument; this would explain why the figures have the character of Michelangelo's style of circa 1505 and why the architectural measurements and the motifs of the figures do not correspond to the stipulations of the 1513 contract. The differences between the measurements in the contract and in the subcontract are explained by C. A. Isermeyer (*Kunstchronik*, VII, 10, 1954, pp. 268–70) by the difference between the Roman and the Florentine palmo.

Michelangelo made new projects for all the slave figures, six of which exist in sketches on a sheet in the Ashmolean Museum, Oxford (cf. Tolnay, 1943–60, IV, fig. 110); all these sketches are for the corner figures. The sketch for the *Rebellious Slave* can be recognized here; he is clearly defined as a soldier, because he has his armor beside him, which will disappear in the final version. Therefore, the *Rebellious Slave* (Louvre) must be considered a corner figure, in all probability destined to decorate the left front corner. The expression of suffering in the face and the movement seem to have been inspired by the *Laocoön* (O. Ollendorf); possibly Leonardo's St. Sebastian drawing (Hamburg, Kunsthalle) may also have influenced Michelangelo. The *Dying Slave* (PL. 529) is for one of the central pilasters of the front, probably the left one. It is not clear whether it is a dying, sleeping, or awakening figure, but, in any case, the gesture of the right hand suggests he is trying to liberate himself from a nightmare. Both of the *Slaves* are accompanied by small unfinished apes (cf. E. Panofsky, 1939).

The *Moses* (ca. 1515–16) was planned originally for the right corner of the first platform, and the figure is indeed more impressive when seen from below. This gigantic seated marble figure is a further development of the bronze *Julius II* and of the prophets Joel and Daniel; at the same time, the influence of Donatello's seated *St. John the Evangelist* (Florence, Mus. dell'Opera del Duomo; IV, PL. 240) is also obvious. The figure seems to be animated by the righteous anger of a chosen spirit confronted with the baseness of this world. The whole is

889

conceived as a cosmic cataclysm depicted in human form; the passion of his soul seems to unleash the elements of the cosmos, in the flowing beard (water), in the flamelike tongues of hair (fire), and in the cloak spreading like lava over the legs (earth). Perhaps the doctrine of "cosmic man," conceived in the Middle Ages, still lives on, but here the anger is controlled and the whole figure epitomizes the birth, culmination, and death of passion. The *Moses* has always been considered an ideal portrait of the artist, but some scholars (e.g., Grimm) believe it is at the same time an image of Julius II. In his last version of the tomb, Michelangelo moved the figure to the central niche at the bottom zone, indicating that he must have come to consider it the most important piece of the whole monument.

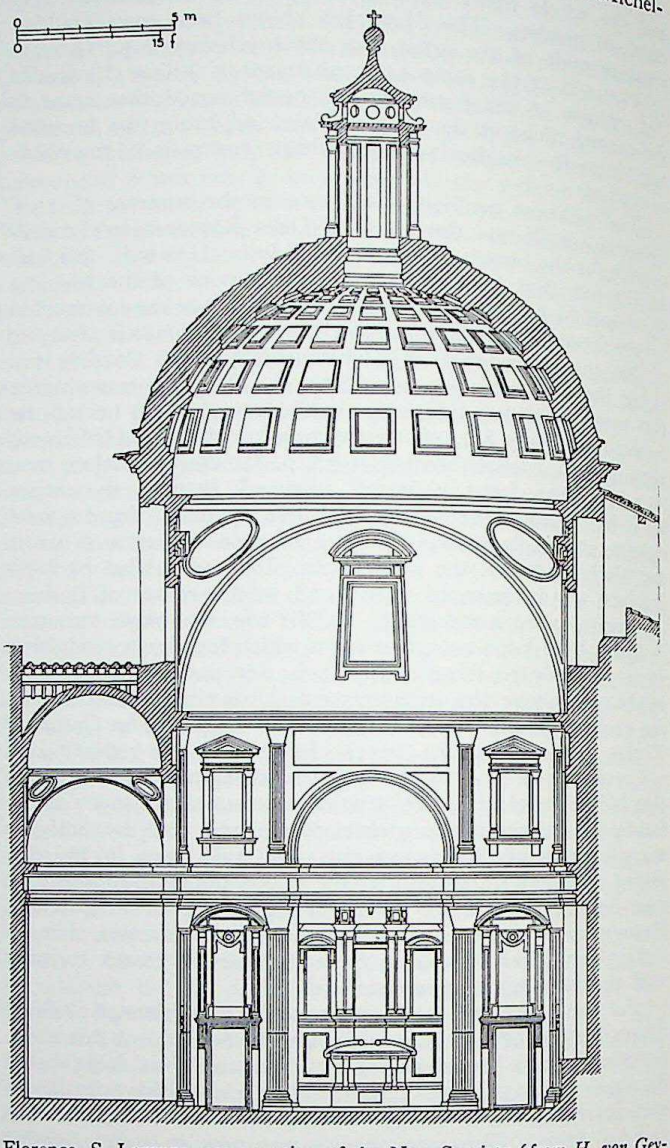
The political conflicts that arose in the summer of 1516 between Leo X and the house of Della Rovere were of consequence for the history of the tomb of Julius II as well. Michelangelo felt that he should enter the service of the reigning Pope, and he himself expressed his wish to have the commission for the façade of S. Lorenzo, the church of the Medicis. In spite of this, in a later letter of Michelangelo's and in Condivi it is stated that the initiative came from the Pope. It was obvious that under such conditions the tomb project would have to be reduced. On July 8, 1516, a new contract was signed (Milanesi, 1875, p. 646; Maurenbrecher, 1938, p. 8). On the bottom zone (FIG. 881) the front remained identical, because the stones for it had already been completed, but the lateral façades were reduced to simple *risvolti*. The upper zone now extends across the whole width of the lower zone. It is articulated by half-columns on ornamented bases, and in the center of it there is a niche called a *tribunetta*. At the top, the whole structure is closed by a large entablature, on which four large candelabra were probably to be placed. It is not certain whether the entablature above the *tribunetta* was horizontal or arched (see the reconstruction by J. Wilde, *Michelangelo: The Group of Victory*, London, Oxford, 1954). In spite of this reduction in the architecture and in the number of figures, it is obvious that Michelangelo tried to save the monumental aspect of the façade by enlarging the architectural forms and by unifying the silhouette of the monument. He tried here, in the two stories of equal width and in the proportional relationship of their heights, to use his ideas for the façade of S. Lorenzo. He suppressed the architrave above the herm-pilasters, thereby making the lower zone even more massive for greater contrast with the very high upper zone.

For the niches of the lower zone he now planned isolated figures instead of groups, and in the central field of this zone, there was to be a bronze relief. Four, instead of six, large seated figures — two at the front and one at each small side (*risvolti*) — were intended for the upper zone, with a bronze relief above each of them. The sarcophagus was now to stand parallel to the façade of the monument, while the statue of the dead Pope was to be held by two figures, in the manner of compositions of the entombment of Christ or of the Pietà. (The author's reconstruction of this part of the tomb is based on an original drawing in the Casa Buonarroti; cf. Tolnay, 1943–60, IV, fig. 122.) Above the Pope there was to be a full-length, standing figure of the Virgin with the Child. When Michelangelo decided to settle again in Florence in 1518, he had the unfinished blocks for the monument sent there. However, he left the finished statues and architectural blocks in Rome. Still his work on the tomb did not go forward, mainly because he spent much of his time between 1516 and 1519 in the marble quarries of Carrara and Seravezza, where he was busy with the excavation of marble for the façade of S. Lorenzo. These years were almost lost from the point of view of creative activity. On Mar. 10, 1520, the Pope annulled the contract for the façade of S. Lorenzo (Milanesi, 1875, p. 581). Michelangelo felt this to be a "very great insult" (*vituperio grandissimo*). In the same year he accepted the commission for the burial chapel of the Medicis in S. Lorenzo, and could not spend time on the Julius tomb. Nevertheless, the contract of 1516 remained in force until 1532.

During the short pontificate of Adrian VI (Jan., 1522–Sept., 1523) the wheel of fortune turned in favor of the Della Roveres. Francesco Maria della Rovere, who in 1516 was deprived of his duchy by Leo X, reinstalled himself in Urbino and, supported by Adrian, requested in April, 1523, that Michelangelo execute the tomb according to the plan of 1516 or repay all the money he had received for it (Milanesi, 1875, p. 421 f.); but, as a consequence of the death of Adrian and the election of Cardinal Giulio de' Medici as Clement VII, the hopes of the Della Roveres receded again, and there was no longer the immediate danger of a lawsuit against Michelangelo. The artist had to continue work on the figures for the Medici Chapel and was unable to concentrate on the tomb of Julius II, from which he wished to be completely liberated (Milanesi, 1875, p. 454). In 1525 there emerged the idea of reducing the monument to a small and modest wall tomb, in the manner of the 15th-century tombs of Paul II (Vatican, Grotte Nuove) and Pius II (Rome, S. Andrea della Valle; cf. Milanesi, 1875, pp. 447, 450). Possibly the design mentioned in October, 1526 (K. Frey, 1899, p. 289), is a project for this greatly reduced monument. In any case, a group of sketches has been identified by the author with this project; these, up till now, have been considered studies for the Medici tomb (Br. Mus.; Florence, Casa Buonarroti; cf. Tolnay, 1943–60, III, p. 77, IV, p. 51 f.). However, this design seems to have been immediately discarded.

In 1527, with the incarceration of Clement VII, Michelangelo stopped work on the Medici monuments and, according to A. E. Popp (1936), resumed work on the Julius tomb. After the victory of the Medicis over the Florentine republic, and after Clement VII's magnanimous pardon for Michelangelo, he tried again to rid himself of the tomb of Julius II. The long drawn-out discussions between the Pope and the Della Rovere heirs finally led to a compromise in April, 1532, and a new contract was drawn up which reverted to that of 1516 (Milanesi, 1875, p. 702 f.), but the monument was reduced by the abandonment of the lateral *risvolti* with their figures. Michelangelo obligated himself by making a new model or drawing; by delivering six figures wrought by himself, which were then in his workshops, either in Florence or in Rome; and by finishing all the architectural blocks. Which six figures were ordered is a matter of conjecture. Probably the question was left open on purpose, to give Michelangelo a free hand in his choice. They were most likely either the *Moses* and the Louvre *Slaves*, along with a Virgin, prophet, and sibyl, or the *Moses*, the four so-called "Boboli Slaves" (or "Prisoners"), and a Victory (Tolnay, 1943–60, IV, p. 53); all the other figures could be executed after his drawings by pupils. Now it was decided that the monument should be erected in S. Pietro in Vincoli, the titular church of Julius II. No models or drawings of this new project exist; there is, however, a drawing for the upper zone by Bastiano da Sangallo which reverts to the 1516 project (Florence, Uffizi; cf. Tolnay, 1943–60, IV, fig. 98).

The dating of the four so-called "Boboli Slaves" (Florence, Acc.; I, PL. 381) is a much-discussed problem. According to some scholars, they were begun in 1516 (J. Wilde and H. von Einem); according to others, in 1519, because four figures for the monument were promised for the summer of that year at the urging of the Pope's heirs (Frey, 1899, p. 135; this is also Justi's opinion). The years 1527–30 have been proposed by A. E. Popp (1936) and 1532–34 by the author (1943–60, IV, p. 51), but each dating presents difficulties. However, stylistically they seem to herald the figures of the *Last Judgment*, and, therefore, the later dates seem more likely. These are actually new enlarged versions of the 1513 figures, two of them being for the front and two for the corners of the tomb façade. They could have been placed on the lower zone of the 1532 version (Tolnay, 1943–60, IV, fig. 206). Another opinion is that of J. Wilde (*Michelangelo: The Group of Victory*, London, Oxford, 1954), according to whom the new architecture for which these figures were intended had been planned by Michelangelo in the mid-1520s — an unlikely hypothesis in view of the fact that in 1525 a reduced monument, similar to those of Paul II and Pius II, had been discussed; the figures must belong rather to an enlarged project, which could have been identical with the new design of 1532. The *Victory* (Florence, Palazzo Vec-



chio) appears also to belong to the 1532 project and seems to have been intended for the left niche of the lower zone of the monument.

During this period (1518–34) Michelangelo executed two independent marble sculptures, a *Christ with the Cross* and an unfinished *Apollo*. *Christ with the Cross* (Rome, S. Maria sopra Minerva) is a second version of a 1514 commission from Metello Vari (Milanesi, 1875, p. 641). Because of a vein in the marble block Michelangelo abandoned the figure in 1516 and later gave it to Vari as a gift. He began a new figure in 1519–20, which he sent in 1521 to Rome, where it was partly reworked and finished by his pupil Pietro Urbano. According to a letter by Vari (Gotti, 1875, I, p. 143), it represents the resurrected Christ, but actually it is a combination of the resurrected Christ and the Man of Sorrows, who holds the instruments of the Passion in his hand. He is represented as victorious over death, an Apollonian nude hero who, instead of showing his suffering, hides it in front of the vulgus. The only feature which is reminiscent of the traditional type of Christ is the bearded face. The *contrapposto* position, with the arm crossing the breast and the head turned in the opposite direction, reminds one of Leonardo's *Leda*. Although the conception seems to be very close to that of ancient statuary, Michelangelo must also have had a concrete religious aim when he made this figure — possibly the idea of erecting the statue of the "true Christ" in the secularized papal city. This is all the more likely since S. Maria sopra Minerva is the Dominican church of Rome, and Michelangelo was a great admirer in his youth of Savonarola.

The other figure is the unfinished *Apollo* (Florence, Mus. Naz.), the history of which is not yet completely clarified. According to Vasari, Michelangelo made, in the autumn of 1530, an Apollo for Baccio Valori, the hated leader of the victorious papal and imperial army and at that time regent of Florence; but in the inventory of the art treasures of Cosimo I de' Medici the figure is described as a David. It may be supposed that this figure, which Michelangelo began (ca. 1525) as a David for the Medici tombs (Popp, 1922), was transformed by him in 1530 into an Apollo. The motif of the figure could be interpreted in both ways. The figure, with its *contrapposto* and the arm crossing the breast, takes up the pose of the *Christ* of S. Maria sopra Minerva, but, since the right leg and the arm across the breast are raised higher, the effect is that of a continuous spiral; it is one of the first *figure serpentinate*. In the sensitive modeling of the surface and in the diffuse distribution of the light and shade, it is one of the master's most harmonious achievements, made in the spirit of the allegories of the Medici tombs. The pose anticipates that of the *Victory*.

The Medici Chapel, or New Sacristy, is situated on the north side of S. Lorenzo (FIG. 892; PLS. 530, 531; IV, PL. 459). In all probability its lower zone dates to the time of Brunelleschi (q.v.). The outside walls of both the second zone and the drum also seem to have been erected before the commission of Michelangelo, under whom — apart from the whole articulation of the interior walls of the chapel — only the cupola and the lantern were executed. However, this dating of the walls (Tolnay, 1943–60, III, p. 27 ff. and p. 124) has been contested (Wilde, *Warburg*, XVIII, 1–2, 1955, pp. 54–66). According to the latter opinion, Michelangelo was the architect of the whole building. The thesis that the chapel was constructed prior to Michelangelo is supported by the observations that the masonry of the exterior on the east and north sides is identical in the lowest zone with that of Brunelleschi's church; that there is no correspondence between the interior design and the exterior (the entablatures are at different levels, the window frames of the drum are higher on the outside than on the inside, etc.); and, finally, that Michelangelo's red-chalk plan of the New Sacristy in the Archivio Buonarroti (identified by Tolnay, *MJhb*, 1928; cf. Tolnay, 1943–60, III, fig. 79) does not yet show the shallow niches, but a chapel with straight walls, the ground plan of which corresponds to that of the Old Sacristy.

Michelangelo deliberately planned the interior of the chapel so as to follow the design of Brunelleschi's Old Sacristy, a fact reported by Vasari. However, it can be seen in the red-chalk drawing that he transferred the articulation of the choir wall, with its three bays, to all four walls and that he disposed the tombs and doors symmetrically. What was still haphazard in Brunelleschi's Old Sacristy here became a system conceived according to the laws of symmetry and correspondence. Michelangelo went even further in this tendency to symmetrical composition in his final version, in which he made further innovations with respect to the Old Sacristy. He inserted shallow niches in the central bays of the lateral walls and of the entrance wall, thereby creating more room for the sculptured tombs, and added an intermediate zone between the lower zone and that of the lunettes, essentially increasing the height of the chapel. The New Sacristy became a slender, relatively small space, high above which is the cupola. A consequence of these innovations was the transformation of the lighting; the Medici Chapel is filled with a diffused light from above, in contrast to the dimly lighted Old Sacristy. Instead of a "Gothic" dome with ribs of the Brunelleschi type, he erected a hemispherical dome with coffers in the style of the Pantheon.

Florence, S. Lorenzo, cross section of the New Sacristy (*from H. von Geymüller, Die Architecktur der Renaissance in Toscana, Munich, 1904*).

The *pietra serena* (gray sandstone) order, completed by plain bands of the same material beside the pilasters, served Michelangelo only as a framework into which he inserted fantastic architectural structures of white marble, which seem to be in conflict with the *pietra serena* order. A rational and an irrational conception of space are here contrasted, as in Roman

and Pompeian wall paintings. The irrational tomb façades are seen as if through openings in the walls; the role of the painted architectural trellis of the Sistine ceiling is taken over here by the *pietra serena* order. The effect would have been enhanced if the wall paintings had been executed as planned. They would probably have had the function of the tomb façades, that is, they would have served as a contrast to the *pietra serena* order in the second and third stories and would perhaps have conferred on the whole space a new meaning.

It seems that Michelangelo had intended to create in the Medici Chapel an abbreviated image of the universe, a kind of cosmic structure with its spheres arranged hierarchically, one above the other. The lowest zone with the tombs stands for the realm of the departed souls; the intermediate zone with the originally planned stories (Popp) was probably intended to represent the terrestrial sphere; and the zones of the lunettes and the light-filled dome, with its partly completed decoration of garlands (later whitewashed), was to have alluded to the celestial spheres. Thus the whole chapel was conceived as a sacred place where men could communicate directly with the transcendent spheres.

[Concerning the sequence of Michelangelo's designs for the tombs, see Tolnay, 1943–60, III, p. 33 ff., and J. Wilde, *Warburg*, XVIII, 1–2, 1955, pp. 54–66. On the history and dating of the tombs and statues, see Köhler, *Kunstgeschichtliche Anzeigan*, IV, 1907, pp. 90–109; Popp, 1922; Tolnay, 1943–60, III, p. 58 ff.; H. W. Frey, *ZfKg*, XIV, 1951, pp. 40–96. The differing opinion of F. Kriegbaum (*Michelangelo Buonarroti*, Berlin, 1940) is followed only by W. Gramberg (*Mit. des Kunsthist. Inst. in Florenz*, VII, 1953–56, pp. 151–60) and is contested by the author (Tolnay, 1943–60, III, p. 131). Concerning the casts in the Accademia di Belle Arti in Perugia, see G. N. Fasola, *Comm*, VI, 1955, pp. 164–72; in the opinion of this author the casts are only copies by Vincenzo Danti.]

The configurations of the sarcophagi, the allegorical figures, and the seated figures in the niches show that here the relationship between sculpture and architecture is newly defined (PL. 530). The architectural structure is no longer a skeleton for the assembly of figures, but the figures now form an autonomous triangle in front of the architecture. The disposition of the figures expresses the meaning that Michelangelo wanted to communicate. Only a few known facts help us to interpret the spiritual content of the chapel. It was intended as a funerary chapel and was dedicated to the resurrection of Christ; therefore, death and resurrection must have played an essential role in the program. Michelangelo himself indicated the program of the tombs on a sheet with an early plan of the tomb of Lorenzo the Magnificent: "Fame holds the epitaphs of the dead; she moves neither forward nor back, because they are dead and their labor is at a standstill." This indicates that Michelangelo meant that with death the Duke reached eternity, but the allusion to the allegorical figure of Fame suggests that his concept is connected with the idea of triumph, perhaps in the sense of the worldly glorification of the Medicis. This seems to have been the point of departure for Michelangelo in the earlier stage of the program. In fact, the paraphrases of the lost projects of Michelangelo (e.g., those in the Louvre) express this worldly glorification in the form of pagan apotheosis: The *capitani* are enthroned and hold scepters; war trophies decorate the structure, which is inspired by the ancient triumphal arch; and at the feet of the *capitani* a semicircle symbolizes the mourning globe.

On another sheet, Michelangelo wrote as follows: "Heaven and Earth [i.e., the two figures planned for the smaller niches to the right and left of the Dukes], Day and Night speak and say: We led the Duke Giuliano to death by one swift current. It is therefore just that he take revenge for this, as he does; and the revenge is this: since we have killed him, so he took our light in dying, and closed our eyes with his closed eyes, so that they no longer shine over the earth. What would he have done with us had he remained alive?" Although the last sentence is obscure and sounds like a play on words, it is clear that Michelangelo wanted to express here the idea of the spiritual triumph of the soul of the dead over the forces of transience symbolized by Day and Night (PLS. 530, 531; XII, PL. 60). Several of his poems express the same idea, and Condivi also interprets the four allegories as expressions of all-devouring time.

The fact that the allegories of Time and the river gods (the latter planned but never executed; original model, Florence, Acc.) were intended to surround the sarcophagi containing the ashes of the dead expresses the ideas of transience and of mourning. The fact that the images of the *capitani* are placed above the level of the allegorical figures and the sarcophagi signifies their spiritual victory over death. The opening at the top of the sarcophagus allows the souls of the dead to ascend to the higher sphere. Thus the transition from an existence determined by matter to an existence in absolute liberty is plastically expressed. Since the glances of both *capitani* are directed toward the statue of the Virgin, it may be said that in the afterlife their souls live in eternal contemplation of the Virgin. The spiritual center of the whole composition is thus the Virgin and Child, with the statues of the two patron saints of the Medicis, SS. Cosmas and Damian. At the entrance to the choir there is an altar, from which the officiant must also face the figure of the Virgin. Thus the relationship of the other walls to the wall of the *Virgin* created a spiritual unity that was completely new in a funerary chapel. Like the first Virgin sculptured by Michelangelo, the *Medici Virgin* is a *madonna lactans*, but the sibylline expression of the early work becomes an expression of maternal love in the latter.

The Medici Chapel was the first funerary chapel to be conceived, artistically and spiritually, as a complete unity in which the tombs were integrated into the architecture of the chapel and the sculpture into the structure of the tombs. Michelangelo's new conception of the funerary chapel as a spiritual and artistic unity inspired numerous 17th- and 18th-century chapels in which the faces of the sculptured figures of the dead on the side walls are turned toward the altar. The Medici Chapel is the first and only funerary chapel of the Renaissance in which pagan and Christian concepts are completely fused. Michelangelo succeeded in achieving a true synthesis, creating an artistic language for the expression of the fundamental truths — pagan as well as Christian — about life, death, and afterlife. The conception that the soul lives after the death of the body, that it is victorious over matter, that its true life begins after its separation from the body, and that this new life consists in the contemplation of supreme truth is identical in ancient philosophy and Christian belief. There is no conflict between Plato's ideas on death and the afterlife and the text of the Requiem; therefore, the objection that the author's interpretation contradicts the doctrines of the Church is hardly valid. Michelangelo seems to have tried to create a new realm of departed souls, a kind of Christian Hades. The Medici Chapel is indeed inspired by the ancient portrayals of Hades, with its four rivers, with the departed souls in ancient armor contemplating the supreme truth instead of praying, and with doors reminding us of the entrance to that realm. The Christian other world is also reflected in the chapel, which was to have centered on the Virgin, the altar, and the fresco depicting the resurrection of Christ, planned but never executed. From the fusion of pagan ideas and Christian doctrines comes Michelangelo's universal language of art. This interpretation was first expressed by this author (*L'Arte*, N.S., V, 1, 1934, pp. 5–44) and, later, by E. Panofsky (1939), who completed it with the doctrine of the temperaments. On the other hand, an interpretation of the Medici Chapel as "an allegory of the princely and papal power of the Medici and their apotheosis" was proposed — on the basis of Vasari, Condivi, and Varchi — by F. Hartt (*Essays in Honor of Georg Swarzenski*, Chicago, 1951, pp. 145–55; *AB*, XXXII, 1951, pp. 115–49, 181–218). Interpretations based on the liturgy of the Requiem are given by H. Brockhaus (*Michelangelo und die Medici-Kapelle*, Leipzig, 1909) and H. von Einem (1959).

Michelangelo's style changes noticeably with the undertaking of the figures for the Medici tombs. The artist now looks at the spectacle of life as if from a distance. He contemplates the universal creative power, of which the individual beings are only the expressions. The forms become more elongated;

melancholy or passive suffering appears on the faces. Michelangelo begins to concentrate on death. It was a fortunate circumstance that the commission for the funerary chapel offered him the occasion to express his philosophy of death.

In May, 1527, Rome was sacked by the imperial army, and Clement VII was imprisoned. In the same month the Medici faction in Florence was forced out and a republican regime was once more instituted. Michelangelo, republican by tradition, put himself at the disposal of the republic and interrupted his work on the Medici Chapel. In 1528 he mourned the death of his favorite brother, Buonarroto. In January, 1529, he was elected to the Nove della Milizia and, in April, became governor general of the fortifications erected against the united armies of the Pope and the Emperor. He was sent (July–Aug., 1529) on a mission to study the celebrated fortifications of Ferrara, where Duke Alfonso d'Este received him with honors and asked him for a work; Michelangelo executed a cartoon for a Leda (ca. 1530; lost, but known through several copies; J. Wilde, in *Fritz Saxl Memorial Essays*, London, 1957, pp. 270–80). Foreseeing the betrayal of the republic by its governor general, Malatesta Baglioni, he took flight from Florence at the end of September, 1529, going to Ferrara and Venice, after which the Florentine republic declared him a rebel. In November, Michelangelo returned to Florence, under siege by the united armies of the Pope and the Emperor, during which he behaved in a courageous manner. Betrayed by Baglioni, the Florentine republic capitulated on Aug. 12, 1530, and Clement VII once more became master of the city. The artist hid in the tower of S. Niccolò (Vasari), but Clement VII soon pardoned him, asking only that he resume his work on the Medici Chapel. From the summer of 1530 until 1534 he was again at work on the figures for the Medici tombs, but the decoration was left unfinished when he departed for Rome in 1534.

Probably in the summer of 1532, in Rome, Michelangelo met for the first time Tommaso Cavalieri, the young nobleman whose beauty was celebrated by his contemporaries. Passion for him rejuvenated Michelangelo, and he wrote love letters and moving love poems inspired by the Platonic doctrine of love (Frey, 1897, nos. XLIII–XLVI, L–LII, LV, LXIV, LXV, LXXVI, LXXIX). As gifts for Cavalieri he executed drawings with mythological subjects, which are at the same time symbols of his love: *Ganymede* (known only through copies: Cambridge, Mass., Fogg Art Mus.; Windsor, Royal Colls.); *Tityus* (Windsor, Royal Colls.); *The Fall of Phaëthon* in three versions (PL. 539; London, Br. Mus.; Venice, Acc.); and *Archers* and *Bacchanal of Children* (both Windsor, Royal Colls., probably copies). This friendship persisted until the death of the artist. From the beginning of this passion Michelangelo no longer wished to live in Florence and decided to stay permanently close to Cavalieri in Rome. His voluntary exile in Rome may have had political motives as well as sentimental ones; the old republican did not want to live in a Florence transformed into a grand duchy of the Medicis. Later, he would feel morally obligated to remain in Rome until the completion of St. Peter's. A return to Florence was, nevertheless, among his projects at the end of his life; in 1554 he expressed the desire to be buried in his native city at the side of his father. Clement VII favored this transfer from Florence to Rome and promised him an important commission in the Vatican, but only two days after Michelangelo's arrival the Pope died (Sept. 26, 1534).

Michelangelo's late style in sculpture and painting was for a long time considered an expression of the tragic debacle of Michelangelo as a man. More recently the opinion has grown that he acquired complete freedom of expression only in his last period and that his late works reflect a reconciliation with destiny and a revelation of divine grace (Dvořák, Tolnay). This last period is characterized chiefly by his religious conversion, as a consequence of which the form, function, and meaning of his works changed. This change occurred in two stages. The works of the first 15 years of the last period, approximately until the death of Vittoria Colonna in 1547, are still conceived in powerful forms which correspond to the ideals of the Italian High Renaissance, although the content and the aim have already changed. In the last decade Michelangelo freed himself from these esthetic norms and developed a completely personal style. Made for the most part, without a commission, for the artist himself, his works of that time may be called subjective confessions. Without regard to the opinions of patrons and without taking into account his own artistic past, he now seemed to follow his inner voice alone. He rejected the fully developed, ideally beautiful natural form of the human body as a vehicle for the expression of his thoughts and tended to express the movement of his soul directly, that is, by disregarding the rational unity and beauty of the human body. In the forms, which now became elongated and fused together, he succeeded in expressing that supreme peace for which he yearned.

During the pontificate of Paul III Farnese (1534–49), a new period of high productivity opened for Michelangelo. Paul III admired and loved the master and raised him to the highest social level. This Farnese pope was a cultivated Humanist and a great patron of the arts, like his Renaissance predecessors; he was also a religious spirit inclined to the inner reform of the Church. He elevated men of high culture and great moral probity to cardinalships (Sadoleto, Contarini, Carafa, etc.). In confirming the institution of the Jesuits (1540) and in establishing a supreme tribunal against heretics (1542), he was the initiator of the Inquisition and of the Counter Reformation, which remained moderate under his pontificate, however. The serious atmosphere of the papal court was reflected also in the works of art executed during his reign.

Taking up an idea of his predecessor, Paul III commissioned Michelangelo to decorate the two end walls of the Sistine Chapel with frescoes, depicting the fall of the rebellious angels on the entrance wall (never executed) and a Last Judgment on the altar wall. Originally Clement VII seems to have thought of putting a representation, of modest dimensions, of the resurrection of Christ on the wall above the old altar, for which several drawings are still extant (PL. 539; Br. Mus.; Windsor, Royal Colls.; Tolnay, 1943–60, V). The motif of the movement of the resurrected Christ, with his Apollonian naked body and beardless face, anticipates the Christ in the *Last Judgment*. Therefore, the gigantic project of the *Last Judgment* seems to have originated from a much more modest project of a Resurrection mentioned in a letter of 1534. A. Perrig (*ZfKg*, XXIII, 1, 1960, pp. 19–41) has attempted to demonstrate that these drawings represent Christ in Limbo, but this is untenable because in them the tomb from which Christ has risen is also shown. Also untenable, it seems to the author, is the hypothesis of M. Hirst (*Warburg*, XXIV, 3–4, 1961, p. 178 ff.), which tries to connect all of Michelangelo's Resurrection drawings with the plans of Sebastiano del Piombo for the altar of the Chigi Chapel in S. Maria della Pace, Rome.

According to the original program for the decoration of the Sistine Chapel, a Last Judgement does not seem to have been planned. Two 15th-century frescoes, the altar by Perugino (also frescoed), and two lunettes painted by Michelangelo himself had to be destroyed to make way for his *Last Judgment*. In the earliest design (Florence, Casa Buonarroti) he kept the old altar (J. Wilde, *Die Grafischen Künste*, I, 1936, pp. 7–11), but the work was finally executed without taking into account the earlier decoration, including his own frescoes. In composition, in the proportions of the figures, and in color, he invented his *Last Judgment* as an independent work (though Sauer and Wilde do not agree with this opinion). The important thing for Michelangelo seems to have been the immediate impact of this work on the beholder, as an actual event taking place, and this may explain why he excluded a frame for it. The work is an expression of the spirit of the inner reform of the Church. The *Last Judgment* is on the west wall (altar wall) of the Sistine Chapel, as was traditional with this scene.

Michelangelo finished the cartoons for the *Last Judgment* in August, 1535. He began the execution of the work with the two top lunettes in the spring of 1536, and the whole work was finished in October, 1541, and unveiled on All Saints' Day (PLS. 533, 536; IV, PL. 179). The development of the idea of the composition can be reconstructed in part on the basis

897

of the few existing drawings. There are published documents by H. Pogatscher, in Steinmann, 1901–05, II, and by G. Mercati, in D. Redig de Campos, *Il Giudizio Universale*, 1944.

The structure of the final composition has been misunderstood since it was described by Vasari and Condivi; they saw in it the traditional horizontal zones, one above the other, but overlooked the dynamic revolving currents that are the most essential innovation in this composition (Tolnay, *AQ*, III, 1940, pp. 125–46). Like Dante's *Divina Commedia*, Michelangelo's *Last Judgment* contains several meanings at once. The most obvious one is its eschatological meaning: the Second Coming of Christ and the Last Judgment. All the figures seem to depend on a single condemning gesture of Christ, and this dramatic unity is one of the chief innovations of the artist. Into the eschatological drama of humanity Michelangelo has also woven his own personal feeling of damnation; his self-portrait appears on the skin held by St. Bartholomew (La Cava, *Michelangelo scoperto nel Giudizio Finale*, Bologna, 1925). Some of his friends (e.g., Vittoria Colonna, Cavalieri) and some of his enemies (e.g., Biagio da Cesena, Aretino) may be depicted.

Beside its eschatological meaning, Michelangelo's *Last Judgment*, seen as a whole, is a cosmic vision, revealing humanity fatally subjugated to the revolving forces of the universe. It is the first artistic representation of a "heliocentric" system (anticipating Copernicus), with the Apollonian Christ as the Sun (*Sol Novus*), around which the constellations revolve, magically attracted and held at a distance at one and the same time (Tolnay, *AQ*, III, 1940, pp. 125–46; H. von Einem, *Kunstchronik*, VIII, 4, 1955, pp. 89–91). However, this cosmic aspect did not interest Michelangelo scientifically — as it would have Leonardo — but only to the extent to which it made the fate of humanity more palpable; it was the moral aspect that fascinated him. However, his contemporaries admired, above all, his unlimited virtuosity in the representation of the nude human body and his mastery in rendering physical movements and psychological expressions (Vasari, Condivi).

Interpretations of the groups and of the single figures of the *Last Judgment* have been proposed by W. Kallab (*Beiträge zur Kg. F. Wickhoff . . .*, 1903, pp. 138–53); E. Steinmann (1901–05); H. Thode (*Michelangelo, Kritische Untersuchungen über seine Werke*, Berlin, 1908–13); D. Redig de Campos (*RendPont Acc*, XIX, 1942–43, pp. 390–405); R. Feldhusen (*Ikonologische Studien zu Michelangelo's J. G.*, unpub. thesis, Hamburg, 1953); and H. von Einem (1959).

During the execution of the *Last Judgment* Michelangelo carved a bust of Brutus (III, PL. 389) for Cardinal Niccolò Ridolfi, another Florentine exile, at the instigation of the artist's friend, the Florentine republican Donato Giannotti. The year of Giannotti's entry into the Cardinal's service, 1539, is the earliest possible date for the bust, the style of which is close to certain heads in the upper zone of the *Last Judgment*. The influence of the ancient busts of Caracalla is obvious (A. E. Brinckmann). In the fibula on the shoulder there is a small relief of a head in profile, which is like those of Brutus on ancient coins (Tolnay, *BM*, LXVII, 1935, pp. 23–29; 1943–60, IV, fig. 92). Michelangelo's conception of Brutus is clearly expressed in the heroic disdain and indignation, obviously for the enemies of liberty, conveyed in the head of the bust. This was Michelangelo's idea, as expressed in Donato Giannotti's *Dialogues* (cf. D. J. Gordon, in *Fritz Saxl Memorial Essays*, London, 1957). At the same time, the *Brutus* is an "ideal portrait" of Michelangelo's own spiritual attitude as he had expressed it earlier in the *St. Proculus*, the *David*, and the *Moses*. The bust was finished by Tiberio Calcagni (Vasari); A. Grünwald (*Florentiner Studien*, Prague, 1914) distinguished Michelangelo's own work from that of his pupil.

During the execution of the *Last Judgment* (in 1536 or, more probably, 1538) Michelangelo became acquainted with Vittoria Colonna, widow of Fernando Francisco de Ávalos, Marqués de Pescara. His friendship with this extraordinary woman, who was so full of religious fervor, inflamed and deepened his own religious faith and led to his conversion (cf. Tolnay, 1949, p. 71 ff.). Vittoria Colonna was acquainted with the ideas of Juan de Valdés and was connected with his circle, which included Bernardino Ochino, Cardinal Reginald Pole, Giulia Gonzaga, and Pietro Carnesecchi. It was probably through Vittoria Colonna that Michelangelo adopted the doctrine of justification by faith alone, as shown by certain of his letters and poems. The conversations between her and the artist in the Church of S. Silvestro a Monte Cavallo (al Quirinale), in 1538, are reflected in the *Dialogues* of the Portuguese painter Francisco de Hollanda. Michelangelo addressed a series of gripping religious poems to her and made for her several drawings (presentation sheets) with religious subjects, including a *Crucifixion* (Br. Mus.); a *Pietà* (Boston, Isabella Stewart Gardner Mus.); and a *Christ with the Samaritan Woman* (lost, but known through copies). A drawing representing the Holy Family, entitled *Il Silenzio* (Duke of Portland's Coll.), may also have been made for Vittoria Colonna (C. Gould, *BM*, XCIII, 1951, pp. 279–82).

After finishing the *Last Judgment* Michelangelo wanted to return to work on the tomb of Julius II, but Paul III refused to allow him the time and charged the master with the decoration of his new private chapel, the Pauline Chapel, which had recently been erected by Antonio da Sangallo the Younger; Michelangelo was to paint frescoes in the central bays of the lateral walls. The first fresco was begun in 1542 and finished in 1545; the second was begun in 1546 and finished probably at the beginning of 1550. (For documents and analyses, see F. Baumgart and B. Biagetti, 1934.) From the style it can be deduced that the *Conversion of St. Paul* (PL. 537), on the left wall, is the first, and the *Crucifixion of St. Peter* (PL. 534) the second. Michelangelo conceived both compositions in relation to the architecture of the chapel, as they are both animated by movements in the direction of the altar. Both frescoes are conceived as personal confessions rather than as representations of historical events. (Cf. M. Dvořák, *Geschichte der Italienischen Kunst im Zeitalter der Renaissance*, II, Munich, 1928; Tolnay, 1951; H. von Einem, *Festschrift K. Bauch*, 1957.)

The *Conversion of St. Paul* derives from a Tuscan type of representation of the 15th century (H. van Dam van Isselt, *BArte*, XXXVII, 1952, pp. 315–19). In the figure of St. Paul, who suddenly seems to see the errors of his whole life in the moment of his blindness, Michelangelo probably expresses the moment of his own "conversion." The groups around him are symmetrically disposed, but within the symmetry each figure is contrasted to the figure opposite; the whole is animated by a revolving movement, beginning with the figure of Christ at the top left, continuing in the curve of St. Paul's body, and going up again to the top right, a device which is a further development of the similar movement in the *Last Judgment*.

In the *Crucifixion of St. Peter* Michelangelo tried to reconcile tradition, according to which St. Peter was at his own request crucified upside down, with the artistic exigencies of clear expression. For this reason he represented St. Peter's cross in a diagonal position at the moment of its erection. The figures in this fresco do not participate directly in the action, seeming, instead, to be involuntary witnesses who have come from various directions. They file past the cross without completely understanding what has happened; only the saint seems to be fully aware of the terrible crime of humanity. (A fragment of the cartoon is preserved in Naples, Mus. di Capodimonte.) The style and composition are a continuation of those of the *Last Judgment*, the monochromatic colorism of which he here transformed into a soft polychromy, indicating a return to the colors of the Sistine ceiling and, perhaps, the inspiration of Venetian painting.

In 1542–45, simultaneously with the first Pauline fresco, Michelangelo hastily finished the tomb of Julius II. He suppressed the slave figures and the Victories; instead of the latter he made two allegorical figures — a Rachel (or Contemplative Life) and a Leah (or Active Life) — thereby transforming the program of the triumphal mausoleum into a purely religious one. Of the figures executed earlier he kept only the *Moses*, which was placed in the lower central bay.

Julius III (1550–55), successor of Paul III, was an ardent admirer of the Jesuits and, at the same time, a hedonist in the manner of the great popes of the Renaissance. During his

pontificate, Michelangelo made Ignatius Loyola an offer to make the plans and model for the Gesù (1554), the mother church of the Jesuits, out of devotion alone. He also made the designs for the completion of the Cortile del Belvedere in the Vatican, which served for the great festivals of the papal court. He also executed for himself the *Deposition* (PL. 526), which he wanted to have erected on his tomb in S. Maria Maggiore (Vasari). This group, begun before 1550, was abandoned in 1555 (H. von Einem, *JhbPreussKSamml*, LXI, 2–3, 1940, pp. 77–99) and, in the mid-17th century, transferred from Rome to Florence. The figure of Mary Magdalene had been reworked by Tiberio Calcagni. This work reverts to a traditional type of Pietà, an example of which is that of Fra Filippo Lippi in the Musée Henry, Cherbourg. The body of Christ is being supported vertically from under the arms by the Virgin and Mary Magdalene, while Joseph of Arimathea, behind Christ, dominates the group. The disposition of the four figures is about the same as that in the *Pietà* Michelangelo drew for Vittoria Colonna, but without the rigid and abstract symmetry of this earlier composition. In the *Deposition* the group is full of life and suppleness, with the figures drawn closer together, forming an elongated cone. According to Vasari, Joseph of Arimathea is an idealized portrait of the artist himself.

Under Paul IV Carafa (1555–59) nothing remained of the Humanist spirit of the papal courts of the past. This pope perfected the Inquisition and infused it with an inflexible rigor in the persecution of those whom the church considered heretics. A dry and prudish spirit reigned over the art of this period. During this pontificate Michelangelo himself was denounced as a heretic — a "Lutheran" — and the figures of the *Last Judgment* were partly repainted by Daniele da Volterra with loincloths to hide their nudity. Michelangelo probably executed at this time the second version of the *Rondanini Pietà*.

A reaction against the severe regime of the Carafa pope set in under Pius IV (1559–65). The new pope surrounded himself with a brilliant court and alarmed the population by his secular behavior. Nevertheless, he consolidated the Counter Reformation by reconvening the Council of Trent (1560–63) and by approving the Index Librorum Prohibitorum. He also gave the aged Michelangelo important architectural commissions (see below).

The *Rondanini Pietà* (PL. 532) is mentioned in the second edition of Vasari (1568), who tells us that, after having mutilated and abandoned the *Deposition* now in the Cathedral of Florence, the artist once again took up a marble in which he had already begun a Pietà. This first version probably dates from 1552–53 (F. Baumgart, *JhbPreussKSamml*, LVI, 1, 1935, pp. 44–56; D. Frey in *H. Kauffmann Festschrift*, 1956, pp. 208–32), and to it belongs the detached right arm of Christ and the still visible fragment of the Virgin's head (Tolnay, *BM*, LXIV, 1934, pp. 146–57). From this period come the three sketches on a sheet in the Ashmolean Museum, Oxford, that permit the reconstruction of the first version, which was inspired by a type of Trinity (cf. Tolnay, 1943–60, V, figs. 365–369). The second version was begun in 1555, and to it probably belong the polished legs of Christ, which are more elongated in proportion than the fragmentary arm of the first version. According to Daniele da Volterra (G. Daelli, 1865, no. 34), Michelangelo was reworking this group again only six days before his death. He seems to have destroyed the upper body of the Christ of the earlier versions, in order to carve it now from the body of the Virgin, and to have changed the position of the latter's head so that it faces forward, as does the head of Christ. Now the Virgin, instead of supporting the body of Christ, is leaning on it, and the two bodies seem to be fused together. The forms of these bodies appear deprived of all physical beauty; their silhouettes are angular, and their surfaces (except for those parts that belong to the first and second versions) are roughhewn. He used this device to obtain a diffused light and to attenuate the contrast of light and shade.

The late religious drawings of Michelangelo are a new attempt to evoke directly Christ's suffering; they have about them the intimate character of prayer. The series representing the Crucifixion with the Virgin and St. John, which Michelangelo originally drew as designs for a larger-than-life-size marble group (cf. Tolnay, 1943–60, IV, fig. 174), shows the sacrifice of Christ and its effect on the human soul and conscience (IV, PL. 276; London, Br. Mus.; Oxford, Ashmolean Mus.; London, Seilern Coll.; Louvre; Windsor, Royal Colls.; Rome, Vatican Lib.). In the Virgin and St. John are revealed the mourning, guilt, and remorse of humanity in confrontation with Christ's sacrifice. Michelangelo obviously tried to incarnate his own sentiments of guilt and remorse in relation to Christ's sacrifice, a bold innovation in place of the traditionally more objective conception. At the end of the series, however, the Virgin and St. John lean against the Cross as if to seek its protection (Br. Mus.; cf. Tolnay, 1943–60, V, fig. 231). Other subjects treated in his late drawings are the Expulsion of the Money-changers from the Temple (probably an allusion to the purification of the Church), Christ on the Mount of Olives, and the Annunciation (cf. Tolnay, 1943–60, V, figs. 208, 235–247). Perhaps the latest of the surviving drawings is a *Virgin and Child* (Br. Mus.) in which the Madonna is standing, while the Child is embracing her. There remain none of the attributes of the Virgin found in traditional representations; her clothes have become a transparent veil, and the theme is completely humanized into a moving expression of love. (For further discussion of the technique and dating of the late religious drawings, see Tolnay, *RepfKw*, XLVIII, 1927, pp. 157–205; R. Wittkower, *BM*, LXXVIII, 1941, pp. 159–60; J. Wilde, 1953; L. Dussler, 1959; Tolnay, 1943–60, V, p. 72 ff.)

Michelangelo died in Rome on Feb. 18, 1564, in the presence of Cavalieri, Daniele da Volterra, and two doctors. On February 19, his body lay in state in SS. Apostoli. In accordance with Michelangelo's wishes, his body was taken to Florence by his nephew Leonardo; this was done secretly, because the Romans wished to keep the body. On March 12, he lay in state in Sta Croce, the church of his quarter of Florence. On July 14, 1564, the funeral took place in S. Lorenzo; the membership of the Accademia (except for Cosimo I de' Medici and B. Cellini) was present. A description of the funeral can be found in the contemporary book *Esequie del divino Michelagnolo* (1564; see also *The Divine Michelangelo*, a facsimile ed., with trans. by R. and M. Wittkower, London, 1964). Of the funeral orations, those of B. Varchi, L. Salviati, and G. M. Tarsia were published in separate pamphlets in 1564. The tomb in Sta Croce was erected according to a design by Vasari, with the collaboration of the best of the younger sculptors; none of the master's own sculptures was integrated into it.

MICHELANGELO THE ARCHITECT. Michelangelo's approach to architecture was that of a sculptor; he associated buildings with living things. Instead of the traditional mathematical conception of architecture, his was essentially organic and consequently dynamic. He used the architectural members created originally for the "mathematical" conception, but he had to modify them to suit his own. Even in his lifetime his departure from the traditional Vitruvian canons was often decried as purely arbitrary, though it appears completely coherent and logical if one understands the new dynamic functions with which he was investing his architecture. In Michelangelo's works columns and pilasters, entablatures and architraves, walls and empty spaces are formed as if animated. Sometimes the tensions which he wants to express are so strong that they seem to break the traditional architectural unities (e.g., broken segments and tympanums); sometimes several designs of the same architectural *concetto* are juxtaposed, creating a new unity and amplifying the effect. Thus his architectural forms often evoke an actual emotional response in the beholder. Moreover, many of his architectural works symbolize an idea-content which determines, to a certain degree, the treatment of the forms.

According to Michelangelo, the character of architecture is organic and anthropomorphous: "It is certain that the parts of a building correspond to the parts of the [human] body" (Milanesi, 1875, p. 554); the same idea was also expressed by Vitruvius (*De architettura*, III, ch. 1), but in a different sense (cf. Tolnay, 1949, p. 95).

901

Scholarly research on Michelangelo as architect began with the great work of H. von Geymüller (1904) and gained new vigor in the work of D. Frey (1920). Special problems have been treated in articles by Tolnay (from 1927 on), R. Wittkower (1933, 1934), and H. Siebenhüner (from 1952 on). A recent monograph is J. S. Ackerman's *The Architecture of Michelangelo* (London, 1961).

From 1505, the date of his first project for the tomb of Julius II, Michelangelo designed architectural and figural ensembles in which the relationship between the sculpture and the architectural framework was newly determined. The geometrical lines of the architectural structure and the organic forms of the figures are combined into a whole. Such a compositional system is further developed in the Sistine ceiling, in which the painted architectural members are treated as dynamic entities. The figures do not always respect the lines of the painted architectural trellis: the *ignudi* overlap them. Nevertheless, the figures seem bound to their places and do not yet unite into an autonomous whole in front of the architecture. This was finally realized in the Medici tombs, where the figures together comprise an autonomous composition and the architecture serves as background. There results a juxtaposition of two contrary systems, the figural and the architectural, which play simultaneously one against the other, resulting in the effect of a kind of polyphony. In these three works Michelangelo subordinated the architectural to the sculptural forms. Vasari notes that the master fitted the architecture to the figures, rather than the figures to the architecture.

The marble exterior of the Chapel of Leo X in Castel Sant'Angelo, erected in 1514, is a work attributed to Michelangelo as early as the mid-16th century (drawing by Bastiano da Sangallo, Lille, Mus. des Beaux-Arts). That it is an early work becomes evident from the placement of the two window openings to the right and left of the central axis, an early Renaissance arrangement. In this case, however, the windows have broad proportions and horizontal, rather than arched, frames.

More original is the design of the *finestre inginocchiate* which Michelangelo made (ca. 1517) for the ground floor of the Palazzo Medici. The original drawing (Florence, Casa Buonarroti, 101) gives a more authentic idea of his intentions than the actual windows, in which the inner window frames are of a Quattrocento type, probably to conform to the style of the façade. In the drawing the inner frame seems to be subjugated by the outer frame, and the whole seems to suggest a conflict of forces.

At about the same time Michelangelo made his first sketches for the ground plan of the Palazzo Altopascio. A sketch in the Casa Buonarroti is on the back of a letter dated 1518. However, the drawings for the same project in the Casa Buonarroti (117A, 118A) should be dated later. This palace was intended for the Cavalieri dell'Altopascio and was actually to be the hospital of this confraternity, rather than a private palace.

His first designs for a major architectural work were those for the façade of S. Lorenzo (I, PL. 406), the parish and family church of the Medicis, a design which he entered in the competition of 1515 (Vasari). After the initial difficulties of getting the commission, Michelangelo began the work with enthusiasm, declaring in a letter: "I will do the most beautiful work that has ever been done in Italy." He executed at least three designs and four models. On the basis of the last model a contract was drawn up in January, 1518, but was annulled by the Pope two years later, before the execution could begin. For the rest of his life Michelangelo felt this to be a serious insult.

Several sketches and one wooden model are still in existence (Florence, Casa Buonarroti). A series of block sketches with measurements for the façade have been identified by this author (cf. Tolnay, 1943–60, IV, figs. 145–166), on the basis of which J. S. Ackerman has reconstructed the façade, concluding that it must have corresponded to the model. The authenticity of the wooden model in the Casa Buonarroti is proved by a still-preserved base (previously unnoticed) for one of the seated figures in the mezzanine on the narrow right flank of the façade. The sketches show that Michelangelo was inspired by the façade projects of his elderly friend Giuliano da Sangallo, whose designs (Florence, Uffizi) derived from the traditional Tuscan type of basilican church façades. Though Michelangelo's first projects have the same silhouette as Sangallo's drawings, he transforms the tectonic structure, which consists of three superimposed zones, into one conflict-filled, dynamically animated mass. He accentuates more strongly than Sangallo the central and the lateral parts, thereby creating a tension in the horizontal and in the vertical. The last design by Michelangelo, in which the whole façade is three stories high, is also inspired by a drawing of Giuliano da Sangallo's. Michelangelo first inserted a double mezzanine between the lower and upper stories, so that the weight of the mass was augmented. On the other hand, the continuing lines of the columns and *lesene*, which seem to play the role of buttresses or ribs, gave greater coherence to the orders. Michelangelo transformed the static and distinct forms of Sangallo into a united body, held together by a trellis of architectural members and heightened by the unity of the statuary program, which was to have included the most outstanding saints of Italy and the patron saints of the Medicis. The artist himself summed up the program in a letter, when he said that the façade would be "architecturally and sculpturally the mirror of all Italy." The aim of this program extended beyond the glorification of the Medici family and of Florence, and claimed to be universal by including the saints of papal Rome. (For further details on the façade, see Tolnay, *GBA*, 6th ser., XI, 1934, pp. 24–42; Ackerman, 1961.)

Clement VII, successor of Leo X, had an even greater appreciation of Michelangelo's art. Two of his main Florentine works were executed during this pontificate: the New Sacristy, or Medici Chapel, in S. Lorenzo, and the Biblioteca Laurenziana. During this period he developed his personal architectural language, based on the bichromatic architectural style of 15th-century Florence; in its hard and finely chiseled profiles the Florentine love for precision is recognized. However, Michelangelo's forms express a conflict between an inner energy and a passive outerframe which imprisons it, as the body imprisons the soul in the Louvre *Slaves*.

The first negotiations about the plans for a new library to house the manuscripts and books of the Medicis seem to go back to the autumn of 1523. The idea of locating the library within the cloisters of S. Lorenzo perpetuates the tradition of the Middle Ages. In the history of Renaissance architecture, the Biblioteca Laurenziana is the first library to be conceived in accordance with its secular purposes, rather than with the canonic forms of religious architecture. The execution began in the summer of 1524 and was suspended about two years later, once more to be resumed in 1530 and suspended in 1534. In 1550 the idea of finishing it was again put forward, but only ten years later was the staircase (PL. 540) from the vestibule to the reading room actually executed by Ammanati (q.v.). (For further details on the history of the library, see Tolnay, *MJhb*, N.S., V, 1928; R. Wittkower, *AB*, XVI, 2, 1934, pp. 123–218; Tolnay, *GBA*, 6th ser., XIV, 1935, pp. 95–105; and Ackerman, 1961.)

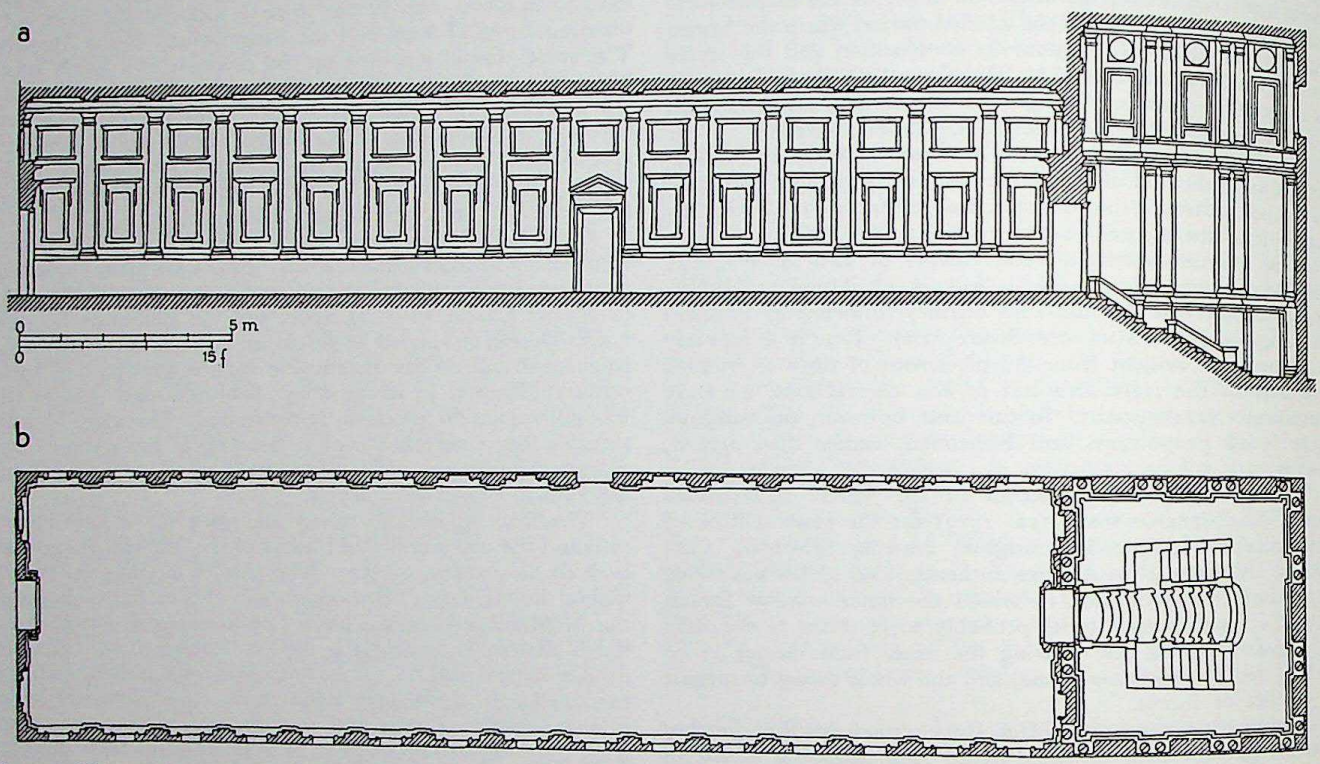
Michelangelo conceived the vestibule (*ricetto*) as a "preludium" to the reading room, a kind of transition between the outer world and the library itself (FIG. 903). It is a small but very high room with a curious order of encased *pietra serena* (gray sandstone) columns and a dim filtered light that penetrates from above (I, PLS. 381, 418). The visitor entering this room was meant to be separated suddenly from the noises of everyday life and enclosed in a solemn and higher sphere, preparing him for the spiritual work to be done in the library.

The original plan of the stairs was different, calling for a double flight against the lateral walls. This arrangement is seen in sketches preserved in the Archivio Buonarroti, in the Casa Buonarroti (89A), and in Haarlem, Teylers Museum (A33v), and also in a drawing in the Casa Buonarroti, showing the structure of one of the lateral walls. An early project for the library room (Casa Buonarroti, 42A) shows a wall structure similar to that of the vestibule.

The individual architectural forms of the vestibule are not explicable by normal standards. The stairway, instead

of leading upward, seems to flow downward like a cascade of lava; the recessed columns do not appear to support any weight, but seem to pull vertically in both directions against the mass of the wall, and the resulting downward pressure is symbolized in the volutes. The motif of the "imprisoned" columns may have been inspired by ancient Roman buildings, such as one of the tombs on the Via Appia, which Giuliano da Sangallo drew in his sketchbook, now in the Vatican Library (Cod. Barb. lat. 4424, fol. 70v). But even here the recessed column still has its supporting function. It was Michelangelo who gave this motif the new meaning of tension.

Between the columns there are ten *pietra serena* tabernacle-niches with hard profiles, as if cast from metal. Because there is a base in each of them, it should be supposed that they were intended for a series of larger-than-life-size statues. Nothing is known of the program of the statues, but it seems likely that a series of *uomini illustri* was intended (i.e., a kind of pantheon of the greatest poets and philosophers of antiquity and of Italy since Dante).



This vestibule is the earliest enclosed space with a free-standing staircase in its center, and it became the model for the many monumental stairways in halls of the 17th and 18th centuries. The doorway at the top of the stairs opens into an extremely long and relatively low rectangular room, the reading room. Here the traditional three naves are abolished. A residuum of this motif of church architecture is retained, however, in the articulation of the wooden ceiling and in the floor. A sketch for the ceiling by Michelangelo has been identified by this author (Oxford, Ashmolean Mus.; cf. Tolnay, *CrArte*, N.S., II, 1954–55, pp. 237–49). The order of the pilasters comprises a kind of "metallic trellis," which is completed by the beams of the ceiling and the corresponding lines on the floor, forming a kind of "cage." The forms of the pilasters and of the windows are of utmost simplicity. Everything is done to give the room a serious aspect, propitious to the concentration of the user. Bright but diffused lighting is assured by the many windows on both longitudinal walls. Michelangelo's use of such contrasting effects in the vestibule and the reading room was obviously not a simple play of imagination. He wanted to express thus, in the last versions, the different functions of the two rooms.

Originally the master planned a secret library of triangular shape at the end of the reading room. Two ground-plan sketches for this room are still preserved. They show that its architecture was to resemble that of the vestibule, with its six recessed columns and nine niches for larger-than-life-size statues. The light would have come from a dome and from the oculi of the attic. The concept of the room as a kind of sacrarium brings to mind the apse of a church.

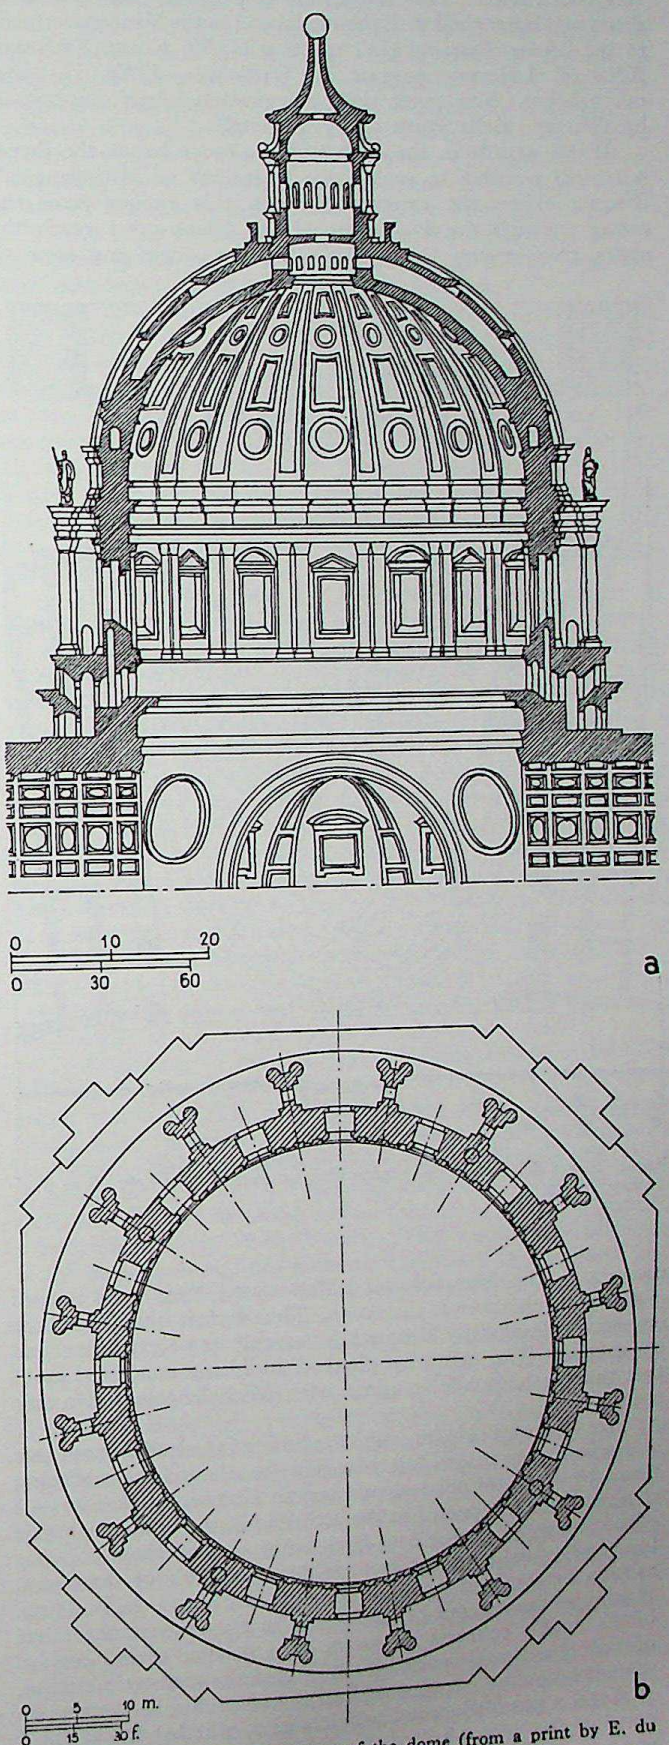
Aside from the Biblioteca Laurenziana, Clement VII wanted from Michelangelo a ciborium design for the main altar of S. Lorenzo in October, 1525. Actually this was to have been a stone canopy placed above the altar and supported by four antique columns; the ground plan is in the Casa Buonarroti, and a sketch of the whole project is preserved in the Archivio Buonarroti (identified by Tolnay, *MJhb*, N.S., V, 1928, pp. 377–476). This project was abandoned.

About 1531–32, Michelangelo designed a tribune for the Medici reliquaries on the inner side of the façade of S. Lorenzo, just above the entrance portal. Several drawings for it are still in existence. This is a delicate balcony of white marble with a rhythmically articulated balustrade. An enormous marble coat of arms of the Medicis in the central axis below the reliquary tribune seems to function as a kind of supporting console; it has the form of a stylized bucranium, and its unusual design should also be attributed to Michelangelo. The three doors of the tribune are small and framed, with utmost simplicity, in white marble. A balcony for the exterior façade was planned but never executed. The entrance door of *pietra serena* leading to this reliquary tribune from the second-floor loggia of the cloister of S. Lorenzo has herm-pilasters and anticipates the tabernacle doors of the Palazzo dei Conservatori on the Capitol in Rome.

At the beginning of 1529, the republican government of Florence, fearing that Clement VII might try to regain power there, decided to complete the fortifications of the city. Michelangelo was nominated Governatore Generale e Procuratore delle Fortificazioni della Città. Still preserved in the Casa Buonarroti are 23 drawings for this task (XII, PL. 87; cf. Tolnay, *AB*, XXII, 1940, pp. 227–37; 1951). In them Michelangelo reveals himself as a bold innovator of fortification designs.

Florence, Biblioteca Laurenziana. (*a*) Longitudinal section; (*b*) plan (*from I monumenti italiani raccolti a cura della R. Accademia di Italia, Rome, 1934*).

905

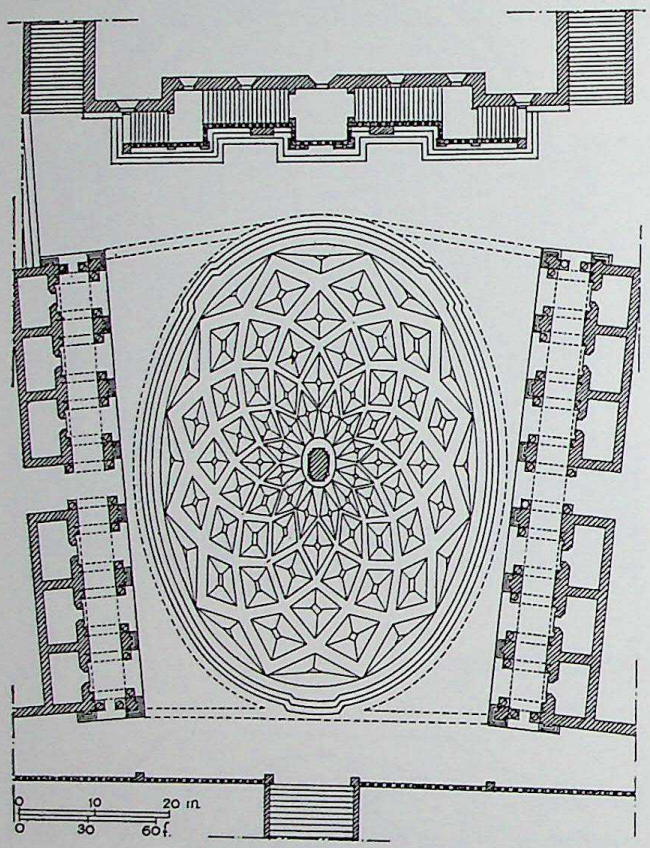


Instead of the traditional geometric (square or triangular) bastions, he gave them zoomorphic shapes, reminiscent of cross sections of crustacea with long antennae and *orecchioni*. These fantastic and beautiful projects were, at the same time, highly practical, having been designed in accord with the recent development of heavy artillery. The curved shapes of the fortifications would prevent the enemy from approaching the city gates and would also allow an active artillery defense from within. The drawings reveal that Michelangelo busied himself with fortification plans for all the city gates, and not only that of S. Miniato as Vasari reports. These drawings are probably not studies for permanent fortifications in masonry and stone; their fantastic forms suggest, rather, that they were intended as temporary structures of packed earth (Vasari). During the siege, there was no time to build them in a more durable material. Their influence on future fortifications was considerable, however; Vauban, the greatest 17th-century engineer of fortifications, was influenced by them.

Michelangelo's most intensive activity as an architect began in his old age; not until he was seventy-one years old did he turn definitely to architecture. This switch was made, first of all, for practical reasons: Since the carrying out of architectural works lay in the hands of other artists and artisans, the aged Michelangelo could confine himself to making drawings for the projects and to directing their execution. He may also have had the reason that the abstract language of architecture corresponded to the inclination toward reasoning and synthesis of his old age (D. Frey, 1920).

With the pontificate of Paul III a new period of high productivity opened for the aged master. The Farnese pope was a great admirer of Michelangelo and appreciated fully his capacities as an architect. He commissioned him for the largest and most significant architectural tasks existing at that time in Europe — the reconstruction of the religious and civic centers of the Eternal City, St. Peter's and the Capitol (FIGS. 906, 907). Both these projects gave a new aspect to the physiognomy of Rome. Finished after the death of the artist, their style is quite distinct from that of Michelangelo's Florentine works. They are characterized by the simplification of lines and masses, by the rejection of the bichromatic style, and by the use of colossal orders executed in travertine, which appear for the first time in Michelangelo's architecture.

In September, 1546, shortly after the death of Antonio da Sangallo the Younger, Paul III appointed Michelangelo to direct the work on St. Peter's. At first he was reluctant to accept, but, when he finally agreed, he began to execute the designs with fervor and later even considered the carrying out of this commission as a kind of religious mission. He directed this undertaking for 17 years, during which the work advanced more than it had in the preceding 40 years. Successive changes in the building plan had been made by his predecessors: Bramante's central-geometrical plan was superseded by Raphael's longitudinal plan, and a compromise between these two plans was followed by Antonio da Sangallo the Younger. Michelangelo rejected the latter's project, with its towers of many shapes, its diverse orders of columns, its atrium, and its ambulatory, which took the light from the interior. Grandeur, simplicity, and majesty were lacking in the project of his immediate predecessor, and Michelangelo resolutely returned to Bramante's conception, which he thought to be superior because it was "clear, straightforward, luminous, and isolated from the Vatican Palace all around" (Milanesi, 1875, p. 535 f.). He gave the plan an even greater clarity by shortening the arms of the Greek cross, by suppressing the corner towers of Bramante (q.v.), and by reducing the size of the four spaces in the diagonal axes; thus the main dome became more dominant (FIG. 906). To consolidate the building he had to reinforce both the four innermost pillars, which support the dome, and the walls. To give a greater unity to the composition of the building he added to its outer walls the same order of colossal pilasters his predecessors had already planned for the interior and placed them in a rhythmic alternance.



Michelangelo made four models for this work. The first was a small clay model of the whole building (Sept.–Nov., 1546), perhaps recorded in a drawing attributed to E. du Pérac (Feltrinelli Coll.; formerly Dyson Perrins Coll.). On the basis of this model a larger wooden model of the whole building was made in 1546–47. This second model is probably the one

Rome, St. Peter's. (*a*) Cross section of the dome (from a print by E. du Pérac); (*b*) cross section of the drum (*from A. Schiavo, 1954*).

that appears in a painting by Passignano (Florence, Casa Buonarroti). In July, 1557, he made a clay model of the drum and the dome. Finally, between November, 1558, and November, 1561, a larger wooden model of the drum and the dome was constructed. This last model is probably identical in its drum and inner shell with the model still in the Vatican, formerly in the Museo Petriano (IV, PL. 193; cf. W. Körte, *JhbPreussKSamml*, LII, pp. 90–112; R. Wittkower, *ZfKg*, II, 1933, pp. 348–70). The outer shell was reworked later, supposedly by Giacomo della Porta or by Vanvitelli.

If one stands in the center of the space below the dome, it is still possible to realize the intentions of Michelangelo's design. When the expanding forces that radiate from the center through the four arms of the Greek cross reach the apses, they reverse themselves along the arches and seem to

Rome, Piazza del Campidoglio, plan after an engraving of 1567 (*from C. de Tolnay, 1951*).

contract in the four colossal pillars; from there they ascend along the pendentives to the dome. The whole is like a grandiose organism animated by alternating movements of expansion and contraction. The centrally planned building, conceived until that time as immobile, became with Michelangelo a dynamic space.

From the west side (PL. 541) the body of the building appears as one enormous mass. Michelangelo accentuated the ascending forces by means of colossal pilasters in alternating rhythm — a rhythm which is repeated in the attic and in the double columns of the drum. The dome does not seem to rest on these columns but seems, rather, to rise from within the circle of the drum, as from a crater, and appears to be hovering above the building. Finally, at the summit of the cupola in the lantern, the motif of the double columns reappears on a smaller scale. Instead of the Renaissance principle of grouping geometric bodies, there is here the successive sublimation of one unified organism. It is still a much-discussed problem as to whether the elevated curve of the outer shell of the dome as we see it today really corresponds to the intentions of Michelangelo (cf. D. Frey, H. R. Alker, E. Panofsky, L. Beltrami, Tolnay, W. Körte, R. Wittkower, J. Coolidge, D. Gioseffi, J. Ackerman). The fact is that all the original drawings by Michelangelo (Lille, Mus. des Beaux-Arts; Haarlem, Teylers Mus.; Oxford, Ashmolean Mus.) show an elevated profile in the outer shell; on the other hand, this outer shell is shown in the engravings by Étienne du Pérac as a hemisphere. The late Oxford sketch of the lantern (1557–61), with a small section of the top of the dome, still shows several dome profiles and reveals that Michelangelo had not yet definitely decided which to use. Probably Michelangelo's last version was intended to be higher than the hemispherical dome of Du Pérac, but somewhat lower than the version seen in his earlier drawings in Haarlem and Lille (ca. 1546). In any case, the inspiration for the elevated outline of the dome came from Brunelleschi's dome of Florence Cathedral.

Michelangelo's façade design for St. Peter's was not followed. The project seems to have developed in his mind from a portico similar to that of the Pantheon, with six columns carrying a pediment (cf. sketch, Cod. Vaticanus 3211, fol. 92, identified by Tolnay, *RepfKw*, XLVIII, 1927, 157–205; Feltrinelli Coll.; formerly Dyson Perrins Coll.), to a more monumental portico with ten columns rhythmically grouped and a protruding central part with four columns in front of the ten (cf. Du Pérac's ground plan of 1569 and reconstructions based on it by H. R. Alker, V. Mariani, and J. Coolidge).

Perhaps Michelangelo's whole building implied a symbolism of the universe. According to tradition, the dome indicated the heavenly sphere, and it was this idea that Michelangelo expressed plastically in the hovering form of the dome and in the decoration he planned for the interior. The lower part of the building is conceived as a symbol of the earth, with its four apses corresponding to the four cardinal points. This "universal" meaning was appropriate to the double function of St. Peter's as martyrium of St. Peter and mother church of Christianity.

For further details about St. Peter's, see also the works by D. Frey; H. R. Alker; A. E. Brinckmann; E. Panofsky; L. Beltrami (*La Cupola Vaticana*, Vatican, 1929); Tolnay (*JhbPreussKSamml*, LI, 1930, pp. 1–48, LIII, 1932, pp. 231–53); G. Giovannoni (*Saggi sull'architettura del Rinascimento*, 2d ed., Milan, 1935); W. Körte (*ZfKg*, N.S., I, 1932, pp. 161–62); R. Wittkower, (*ZfKg*, N.S., II, 1933, pp. 348–70); J. Coolidge (*Marsyas*, II, 1942, pp. 63–123); G. Marchini (*BArte*, XLI, 1956, pp. 313–17); Ackerman (1961).

The other large commission that Paul III gave to Michelangelo was for the monumental rebuilding of the Capitol. During antiquity and the Middle Ages, the Capitol was associated with a universal idea; it was the center of the political life of Rome, the place from which the city and the imperium (i.e., the world) were governed. The idea of its importance remained always alive and seems to have inspired Michelangelo's designs.

When he received the commission from Paul III, the square of the Capitol lacked artistic unity; only on the west side did it have architectural links with the city below it. Michelangelo's idea was to transform this irregular agglomerate into an ensemble of three symmetrically disposed buildings which would frame a closed, oval piazza (FIG. 907). By means of a flight of steps, the *cordonata*, he joined this piazza at its central axis to the city below. Anyone ascending this majestic approach from the formerly small, cramped streets of the city found at the top a solemn and ordered world. Since 1538 the equestrian statue of Marcus Aurelius had stood on a temporary rectangular base in the center of the piazza. When Michelangelo decided to give the piazza an oval plan, he designed a new oval base for the statue (X, PL. 148). The oval in the center of the trapezoid area formed by the three buildings and by the balustrade on the fourth side produces the effect of two spaces, one inside the other. While the oval, decorated by a star ornament, symbolizes the centrifugal forces, centripetal forces seem to act on the buildings — another instance of the conflict between the expanding forces and the limits that contain them. The first project for the whole piazza seems to date from about 1546 (Tolnay, 1951; Ackerman, 1961), and not from 1561–63

as has been proposed by H. Siebenhüner (*It. Forsch.*, 3d ser., I, Munich, 1954). The oval is convex, probably meant to be the idealized shape of the Capitoline hill, the top of which suggests a pole of the earth. The globe may signify the earth, or perhaps the celestial globe, in which case Michelangelo would be reverting to an old tradition of symbolizing the celestial sphere, well known in ancient floor mosaics. The idea of Rome as *caput mundi* seems also to have guided him in his choice of ancient statues to decorate the piazza. The ensemble would thus illustrate the idea of Rome as eternal and universal. This meaning of the Capitol was first indicated by this author (*JhbPreussKSamml*, LI, 1930, pp. 1–48, LIII, 1932, pp. 231–53) and was later taken over by F. Saxl (*Lectures*, London, 1957, pp. 200–14). On the other hand, H. Sedlmayr (*JhbPreussKSamml*, LII, 1931, pp. 176–81) rejected any symbolic interpretation of the Capitol on a purely formalistic basis.

The only palace on the Capitoline hill dating from Michelangelo's lifetime is the Palazzo dei Conservatori (PL. 542), on which construction began in 1563. Sketches for it have been identified by the author (Oxford, Ashmolean Mus.; Tolnay, *BM*, XCVIII, 1956, pp. 379–80). It has in the lower story a portico with columns that support a second story with aedicula windows; this is surmounted by a large cornice reminiscent of that of St. Peter's. A colossal order of *lesene* and pilasters binds together the mass of the building. Under the pressure of such a gigantic yoke the columns of the portico seem to be pushed apart and the Ionic capitals seem to curl forcefully. Projects for the stairway of the Palazzo dei Senatori are on a sheet in the Casa Buonarroti (cf. Tolnay, 1943–60, III, fig. 125); this type of double staircase with two opposite flights of steps is anticipated in sketches by Leonardo (e.g., Ms. B., fol. 15b). Documents concerning the history of the Capitol in Michelangelo's time were discovered and published by this author (*JhbPreussKSamml*, LIII, 1932, pp. 231–53) and republished, with other documents, by P. Pecchiai (*Il Campidoglio nel Cinquecento*, Rome, 1950).

Mention should be made here of the Cathedral of Padua, the choir of which was designed by Michelangelo, according to documents in the archives. Originally, the entire building was designed by Jacopo Sansovino, but in January, 1551, the Cathedral chapter chose the drawing and model of the choir made by Michelangelo, which was then executed with the assistance of Andrea della Valle. The building was begun in May, 1552, and almost finished by about 1570; the first Mass was held there in 1582 (cf. *Due Lettere sopra la fabbrica della Cattedrale di Padova*, Padua, 1794, published anonymously, the author of which is Canonicus F. S. Dondi Orologio).

The colossal order of Corinthian pilasters is in the style of those of the palaces on the Capitol and of St. Peter's, but executed with less care. The forms of the windows in the choir and the transept remind us of Brunelleschi's in Sto Spirito, Florence. The whole building is impressive in its monumentality. However, its ground plan, with two transepts, is north Italian in origin and may revert to the design of Jacopo Sansovino. (Concerning the choir of the Cathedral of Padua, see the author's article in *Festschrift Herbert von Einem*, 1964/65.)

The building of the Palazzo Farnese was begun almost thirty years before Paul III appointed Michelangelo to complete it, in the autumn of 1546. Its architect was originally Antonio da Sangallo the Younger, who made his first designs for Cardinal Alessandro Farnese from 1517 on. He enlarged the first project after the election of the Cardinal to the papacy in 1534. (For the early history, see F. de Navenne, *Le Palais Farnèse et les Farnèse*, Paris, 1914; also, recent research has been done by W. Lotz. For further details of the history of Palazzo Farnese, see Tolnay, *JhbPreussKSamml*, LI, 1930, pp. 1–48; 1951; also H. Siebenhüner, *Wallraf-Richartz-Jhb.*, XIV, 1952, pp. 144–64; Ackerman, 1961.)

The following parts were executed in accordance with Michelangelo's plans:

1. On the façade, above the main portal, the great window with four green-marble columns and the Farnese coat of arms (XII, PL. 56). Sangallo had already planned a central window with freestanding and applied columns, the drawing of which is in Munich (identified by Tolnay, *JhbPreussKSamml*, LI, 1930, pp. 1–48). Michelangelo transformed Sangallo's arches into a horizontal lintel and added a pair of marble columns behind the outer ones. He gave the window greater depth and crowned it with a monumental coat of arms.

2. The monumental cornice at the top of the façade, of which Michelangelo first made a wooden model in the spring of 1547, and parts of which he finished in July of the same year (F. de Navenne). This cornice was bitterly criticized by followers of Antonio da Sangallo the Younger, whose opinion was expressed in a letter that S. Meller (*JhbPreussKSamml*, XX, 1909, pp. 1–8) attributed to Battista da Sangallo, which is known through a copy made later by Michelangelo.

3. According to Vasari, he enlarged the *sala grande* in the left corner of the façade, a room which is two stories high, the wall decoration of which was never finished.

4. He also made the design for the *ricetto* (vestibule) in front of the *sala grande*, which has a flattened barrel vault in the form of a half oval (Tolnay, 1951, PL. 243). Vasari expressly emphasizes the novelty of this innovation, which had an enormous success, especially in French architecture of the 17th and 18th centuries; it made possible the insertion of a mezzanine for servants' quarters above. This flattened barrel vault is reminiscent of the flattened oval arches of the bridge of Sta Trinita in Florence, which reverts to a design of Michelangelo, according to a 1560 letter of Vasari's (F. Kriegbaum, *RArte*, XXIII, 1941, pp. 137–44).

5. The travertine frieze on the upper story of the courtyard reverts also to Michelangelo, according to Vasari.

6. Inside the courtyard Michelangelo designed a new upper story. The piano nobile, a remodeling of Sangallo's with open arches, has windows that can hardly be attributed to Michelangelo on stylistic grounds. The authentic form of the courtyard is preserved in the engraving published by Antoine Lafréry in 1560, which probably reverts to the model. The engraving by P. Ferrerio — dated 1545, but published in 1650 — shows the piano nobile of the courtyard at the back of the façade with all the arcades open; this is, therefore, an independent engraving, probably reverting to the model or to an earlier drawing after it. The uppermost story of the courtyard is treated by Michelangelo as a heavy attic, in contrast to the Vitruvian tradition, according to which each upper story should be lighter than the one below it. The windows of the upper story (Oxford, Ashmolean Mus., 333) formulate again, and more forcefully, the motif of the subjugation of the inner frame by an outer frame.

7. According to the Lafréry engraving, Michelangelo left open three arches at the back of the courtyard and five outer arches facing the Tiber — a transparent loggia rather than a closed wing (Sangallo). He probably intended this loggia to be a kind of belvedere looking out on the garden, in the center of which he meant to put the just-discovered "Farnese Bull" (XII, PL. 121) as a fountain, and on the axis of which he planned a bridge across the Tiber (Vasari). This would have been one of the early examples of landscape composed as a prospect and would have shown how Michelangelo tried to combine the building with the environment.

During the pontificate of Julius III, Michelangelo offered, in 1554, to execute for Ignatius Loyola, out of devotion alone, the plans and model for the Church of the Gesù; also, the artist made plans, in 1552, to finish the Cortile del Belvedere, the scene of the great feasts of the papal court. The plan for the Gesù, perhaps preserved in a drawing in the Uffizi which was discovered by A. E. Popp (*MJhb*, N.S., IV, 1927, pp. 389–477), shows a longitudinal church consisting of a very large nave, thought to be barrel-vaulted, with four chapels on each side and a choir. This plan — perhaps inspired by that of L. B. Alberti for S. Andrea in Mantua — became the model for Vignola, who 14 years later actually began the construction of the Gesù.

Concerning Michelangelo's projects for the Cortile del Belvedere, see J. S. Ackerman, *The Cortile of the Belvedere*, Vatican, 1954. Vasari, says that Michelangelo replaced Bramante's circular flight of steps in front of the exedra by straight steps (II, PL. 346), similar to those he designed for the Palazzo Senatorio on

the Capitol. (The balustrades of the exedra steps were rebuilt in the 18th cent.) A ground plan made after Michelangelo's steps is in the Scholz Scrapbook in the Metropolitan Museum, New York (No. 49.92.72). It seems more likely, however, that Michelangelo's idea of transforming the composition of this courtyard embraced more than these steps. Although the general disposition of the terraces with three flights of steps already existed in Peruzzi's project (Windsor, Royal Lib.), each flight was nevertheless treated as an entity in itself, and it seems likely that it was Michelangelo's idea to unify the three flights by identical balustrades ornamented by spheres (drawing, now Feltrinelli Coll.; formerly Dyson Perrins Coll.). In the mid-16th century the Cortile was called "Teatro di Palazzo" or "Teatro Vaticano." The stage for the representations was the lower courtyard, and the terraces and steps served as the auditorium. The most impressive view was from the Vatican Palace, facing the large exedra, and Michelangelo's steps served to crown the whole composition.

The idea of the foundation of a national church of the Florentines in Rome, S. Giovanni dei Fiorentini, dated back to the pontificate of Julius II, but it was only under Julius III that this idea was revived and the commission for it given to Michelangelo. In 1559 the Florentines of Rome asked him for a drawing and a model. Several extant drawings for this church show a central-plan building with what seems to be a baptismal font in the center. Since the church was to be dedicated to John the Baptist, Michelangelo seems to have conceived it as a baptismal church. The earliest sketches show that he followed a plan by Antonio da Sangallo (Florence, Uffizi), but in later designs he freed himself from this geometric scheme, arriving at a dynamic plan that is a more concentrated version of St. Peter's. A drawing by G. A. Dosio, representing the lost model, has been discovered by C. L. Ragghianti and published by E. Luporini (*CrArte*, XXIV, 1957, p. 458).

The chronology of the three drawings for the ground plan (K. Frey, 1909–11, 296, 295, 294) was established by A. E. Popp. D. Frey identified a drawing in the Casa Buonarroti (36A) as belonging to S. Giovanni dei Fiorentini. Another drawing on the verso of Frey 295 was identified by the author in 1932. There were probably two models: One with segmented entablatures was copied in the prints by J. Lemercier (1607) and V. Régnard (1684); another with triangular entablatures was copied by Dosio. Also, the interior articulation of the dome is slightly different in Dosio's drawing than it is in the other two prints.

The pontificate of Pius IV was characterized by a secular tendency. During this period, the last of Michelangelo's life, the artist developed his last architectural style. He now created a style no longer characterized by the conflict between dynamic space and walls, but by the dematerialization of walls and by the fluctuation of space. These tendencies in his last architectural designs correspond to those in his latest sculptures and drawings.

When Pius IV gave the Baths of Diocletian to the Carthusians for conversion into a church and monastery in 1561, Michelangelo was charged with the designs for this work. He transformed the tepidarium into the Church of S. Maria degli Angeli, which was redecorated in the mid-18th century by Vanvitelli. The most important information about Michelangelo's transformation of the baths into a church comes from a contemporary chronicle published by P. Pasquinelli (cf. *Roma*, III, 1925, pp. 349–56, 395–407), which was used by this author (*JhbPreussKSamml*, LI, 1930, pp. 1–48), who also published a view of the interior of the church as it appeared in 1703, about forty years before Vanvitelli's redecoration. H. Siebenhüner (*MJhb*, 3d ser., VI, 1955, pp. 179–206) adopted these conclusions. The old views show that the artist tried to conserve the ancient character of the enormous hall by keeping the eight colossal columns and reconstructing the primitive vaults. The latter seem to swell like sails and to be held back by the columns. They express perhaps the ancient concept of the "celestial tent" or the "heavenly canopy" mentioned in the Old Testament (Isaiah 40:22). The effect of the mass of the walls was eliminated by leaving large open rooms, transformed into chapels, on the sides of the main room.

Michelangelo's last architectural work, the Sforza Chapel in S. Maria Maggiore, was actually executed by a pupil, Tiberio Calcagni — a fact that is quite visible in the dry profiles and ornaments. The ground plan, which is Michelangelo's, has a surprising originality, however. Its effect is based on the contrast between the plastic pillars with columns and the development of the rounded walls. The pillars are placed diagonally so that the dimensions of the space cannot be controlled. Again the vault suggests the "heavenly tent." Michelangelo also designed a small façade, or entrance, for the Sforza Chapel, which was destroyed in 1748. An 18th-century drawing, made before its destruction, is in Paris, Bibliothèque Nationale, Cabinet des Estampes (identified and published by Tolnay, in *Urbanisme et Architecture, Mélanges Lavedan*, Paris, 1954, pp. 361–62). The idea of this little façade is a further development of that of the Chapel of Leo X in Castel Sant'Angelo.

Pius IV also asked Michelangelo to redesign the gates of Rome, and Vasari states that the artist made numerous drawings for them, but only Porta Pia was built, from 1561 on (PL. 542). The present upper story is a 19th-century addition. The original design is preserved in a 1568 engraving by B. Faleti (cf. Tolnay, *JhbPreussKSamml*, LI, 1930, p. 44). In the center of the yellowish-pink, crenelated brick wall rises an enormous travertine portal; its curious forms suggest ascending forces in the lateral pilasters and in the broken segment, which is subjugated by a triangular tympanum. The portal seems to symbolize the tragic splitting asunder of vital forces, and the whole city gate becomes a kind of *memento mori*. It is obviously composed to be seen in the perspective of the long straight road leading to it, which Pius IV had built. An unpublished drawing of the 16th century (Paris, École des Beaux-Arts) seems to indicate that the upper floor of Porta Pia was not finished at that time. There are also two unpublished drawings after Porta Pia in the Scholz Scrapbook, in the Metropolitan Museum, New York (No./49.92.56r and v). The development of Michelangelo's idea can be followed through the drawings (Florence, Casa Buonarroti; one in Haarlem, Teylers Mus.; one in Windsor, Royal Lib.); also, an earlier version can be seen on a medallion of Pius IV, the design of which is in the Casa Buonarroti (106A.r.).

The probable scenographic inspiration of the composition can be seen in a Vatican fresco in which there is a view of Via Pia, at the end of which emerges Porta Pia (cf. E. B. MacDougall, *JSAH*, XXIX, 1960, pp. 97–108).

MICHELANGELO THE POET. During his lifetime Michelangelo's poetry was known only to the small circle of his friends. Although Luigi del Riccio and D. Giannotti planned to publish the poems, they were actually printed the first time, in revised form, by Michelangelo's grandnephew in 1623. The poems were rediscovered during the romantic period, between 1820 and 1850, from which time date the first translations in French and in German (1826). The first appreciation of his poems as intimate confessions appeared anonymously, in 1833, under the title *Essai sur Michel-Ange considéré comme poète*, the author of which was Lambruschini (cf. E. Dörken, 1936, p. 80 ff.).

Since the middle of the 19th century the essence of Michelangelo the man has often been defined entirely on the basis of his poems (Quinet, Michelet, Romain Rolland, etc.). This is one of the reasons why the late period of Michelangelo has been seen only as a kind of spiritual debacle. The publication of the poems in their authentic form by C. Guasti (1863) and by K. Frey (1897) was of great importance. A recent critical edition of these poems by E. N. Girardi (1960) also contains a new chronology. The essential analyses of his poetry are those of Friedrich Gundelfinger (Gundolf), Georg Simmel, Thomas Mann, and Benedetto Croce. (See also N. A. Robb, *Neoplatonism of the Italian Renaissance*, London, 1935, p. 239 ff.)

Michelangelo was not a poet by profession, and he did not reach in his poems the perfection he achieved in the plastic works of his youth and maturity. Nevertheless, even in his lifetime, he was known as a poet. Proofs of this are his portrait as poet in Raphael's *Parnassus* (I, PL. 307; identified by Tolnay, in *Friedrich Gerke Festschrift*, Baden-Baden, 1961, pp. 167–72)

and the first published book about him, Varchi's *Due Lezioni* (1549), which had as its subject two of his poems.

It can be said that Michelangelo applied sculptural methods to his poetic creations, because they seem to be carved with effort from the rough matter of the language. In his poems the Tuscan language has a forcefulness reminiscent of Dante and is distinguishable from the sweet melodious language of contemporaneous Tuscan poets. As in his plastic works of art, he omitted external descriptive details, such as landscape, and only the intensity of his sentiments was allowed to manifest itself. This subjective immediacy and intensity raised Michelangelo's poetry above its models (Petrarch, Poliziano, Lorenzo de' Medici), probably making it the earliest purely lyrical expression in European literature.

The themes of his poems are love, art, and faith. The inspiration came directly from personal experience, but, especially in his youth, he expressed himself in the conventional metaphors of the Petrarchists. Later, the influence of Dante became more important, and at the end he arrived at a poignant personal language. In the poems of his youth his eroticism was not yet sublimated; in his maturity he expressed the tragic fatefulness of love, in his verses written to Cavalieri, and spiritualized his passion for physical beauty, in which he saw the way to the Divine Idea. Then came the poems to Vittoria Colonna, which were written as expressions of an almost religious adoration of this beloved woman. Finally, in his late, religious poems he expressed his doubts about the sincerity of his own faith, imploring the divine mercy to justify himself and invoking directly God the Saviour. The succesive spiritualization of the objects of his love is similar to that of Dante and Petrarch, but with the difference that with Michelangelo the objects change at each level — the "beautiful and cruel lady" (*donna bella e crudele*), Cavalieri, Vittoria Colonna, God. His way to catharsis was not an ascent free of struggle but a continuous conflict between his sensuality and his spiritual yearning.

MICHELOZZO (Michelozzo di Bartolommeo, sometimes known as Michelozzo Michelozzi). Italian bronze caster, sculptor, and architect (b. Florence, 1396; buried in S. Marco, Florence, Oct. 7, 1472). First mentioned as a bronze caster at the Florentine mint in 1410, Michelozzo worked from 1417 to 1424 as assistant in Ghiberti's studio, employed on the north Baptistery doors and the statue of St. Matthew for Orsanmichele (Florence). From 1425 on, Michelozzo shared a workshop with Donatello, and they collaborated on various works until 1438. The two artists are mentioned together for the marble tabernacle for the statue of St. Louis of Toulouse (Orsanmichele), the reliefs for the Siena Baptistery font, and for the exterior pulpit of the Cathedral of Prato. In these works Michelozzo's share is generally considered to have been confined to the casting and the architectural parts, probably on Donatello's designs. On the other hand, in the two important tombs they executed together — that of the antipope John XXIII (Baldassare Coscia) and the Brancacci monument — it is difficult to establish the extent of Michelozzo's participation in the designs. The Coscia monument (XII, PL. 16) is important as the prototype of the Renaissance tomb. Here, and in the Brancacci tomb (Naples, Sant'Angelo a Nilo), the new classicizing spirit is introduced into a form that is still Gothic, while the reliefs and statues of the dismantled tomb of Bartolomeo Aragazzi (III, PL. 391; London, Vict. and Alb.) illustrate the transformation to the completely classical style that was to be a lasting influence on later Renaissance tombs.

Beginning in 1417, and for thirty years thereafter, Michelozzo received frequent commissions from Cosimo de' Medici, whom he accompanied in the latter's exile in Venice in 1433–34 and for whom he rebuilt the Medici villas around Florence: Careggi, Castello di Trebbio, and Cafaggiolo (VIII, PL. 191). In this last, Michelozzo made a decorative feature of the fortress character of the building and introduced windows and details typical of the rather austere style of the Florentine Renaissance.

Michelozzo's earliest religious architecture is believed to have been the rebuilding of the Monastery of S. Francesco in Mugello (also known as Bosco ai Frati); the sacristy of Sta Trinita in Florence has also been attributed to him. In the 1430s Michelozzo redesigned the façade of the Church of S. Agostino in Montepulciano (VIII, PL. 191), which is Renaissance

in form but has Gothic traits in its niches and the architectural frame of the lunette. In Florence he modified and extended the Monastery of S. Marco, also for Cosimo, and won the commission for the Medici (Riccardi) Palace (XII, PL. 4). These works, perhaps Michelozzo's most famous, characterize his mature style, which was strongly influenced by Brunelleschi. The architecture of S. Marco (cloisters, refectory, cells), however, is reminiscent of the architectural forms found in the predella panels of Fra Angelico. The library, in particular, recalls Angelico's delicate white structures, and its linear rhythms and volumetric clarity are far from the typical concentration of Brunelleschi. S. Marco was to become the model for many later monastic buildings in Tuscany, and the Medici Palace, with its combination of grandiosity, elegance, and technical accomplishment, remained the standard palace design for the new ruling class.

For almost forty years Michelozzo was employed on the rebuilding of SS. Annunziata (Florence). Although it was largely transformed in the 17th century and later, the plan has remained intact, as have also the Chiostrino dei Voti, the sacristy, and the shrine of the Annunciation. Several works in and around Florence have been attributed to Michelozzo as designer, if not actually carried out by him, such as the Convent of S. Maria Maddalena in Pian di Mugnone (I, PL. 388), which illustrates the characteristic simplicity and sobriety of his style. His other principal Florentine works are the Chapel of the Novitiate in Sta Croce, the shrine of the Crucifix in S. Miniato al Monte, and the silver statue of St. John the Baptist for the Baptistery (Florence, Mus. dell'Opera del Duomo). Michelozzo succeeded Brunelleschi as *capomastro* of the Cathedral of Florence in 1446, but in the last years of his life most of his work was done outside Florence.

In Milan, the Portinari Chapel in S. Eustorgio (XII, PL. 3) and the Medici bank are traditionally attributed to him, although of the latter only the portal is now accepted as his (XII, PL. 3). In Pistoia he designed S. Maria delle Grazie, a plan strongly influenced by Brunelleschi, and in 1462 he is recorded in Ragusa (now Dubrovnik, Yugoslavia), where he was commissioned to rebuild the Palace of the Rectors, which had been damaged by fire.

Sculpturally Michelozzo's style is transitional from Gothic to Renaissance via an interpretation of classic art that sometimes verges on academism. His earliest sculptures are reminiscent of Ghiberti, with traces of the great sculptors of the 14th century. The Aragazzi monument is perhaps his most individual work and is characterized by a somewhat severe classicism, with the accent on strong forms rather than on refinement of detail. Psychologically he is far less subtle than Donatello, but his works have a strength and character of their own.

As an architect, Michelozzo is much more important, for he extended the influence of the Renaissance style and helped spread the new Humanist principles enunciated by Brunelleschi and Leon Battista Alberti (qq.v.). Although Michelozzo seems scholastic by comparison and his interpretation is characterized by a closer adherence to medieval tradition, especially in his religious works, he nevertheless contributed to the diffusion of these principles by applying them practically and creating a simple, economical, and functional style.

Marco CHIARINI

MICRONESIA. Constituting one of the four principal divisions of Oceania, Micronesia comprises an estimated 2,500 islands with a combined land area of less than 1,500 square miles. The insular fragments are almost lost in the vast reaches of the western Pacific Ocean.

Major geographic subdivisions include the volcanic Marianas, which extend north from Guam toward Japan; the west–east-oriented Carolines, with their numerous low-lying atolls, dominated by the high islands of the Palaus, Yap, Truk, Ponape, and Kusaie; and the widespread Marshall and Gilbert groups, the latter astride the equator and both of them constituted entirely of coral atolls.

SUMMARY. General characteristics (col. 916). Mariana Islands (col. 916). Caroline Islands (col. 916). Marshall Islands (col. 917). Gilbert Islands (col. 918).

GENERAL CHARACTERISTICS. At least eleven subcultural areas are recognized within Micronesia's bounds. Distinctions among them in art, religion, language, social organization, and technology have their roots in the prehistoric origins of island immigrants. The several cultures have undergone centuries of adaptation to local differences of habitat. Other modifications have resulted in historic times from the varied influences of customs introduced by Europeans and from other sources outside the islands.

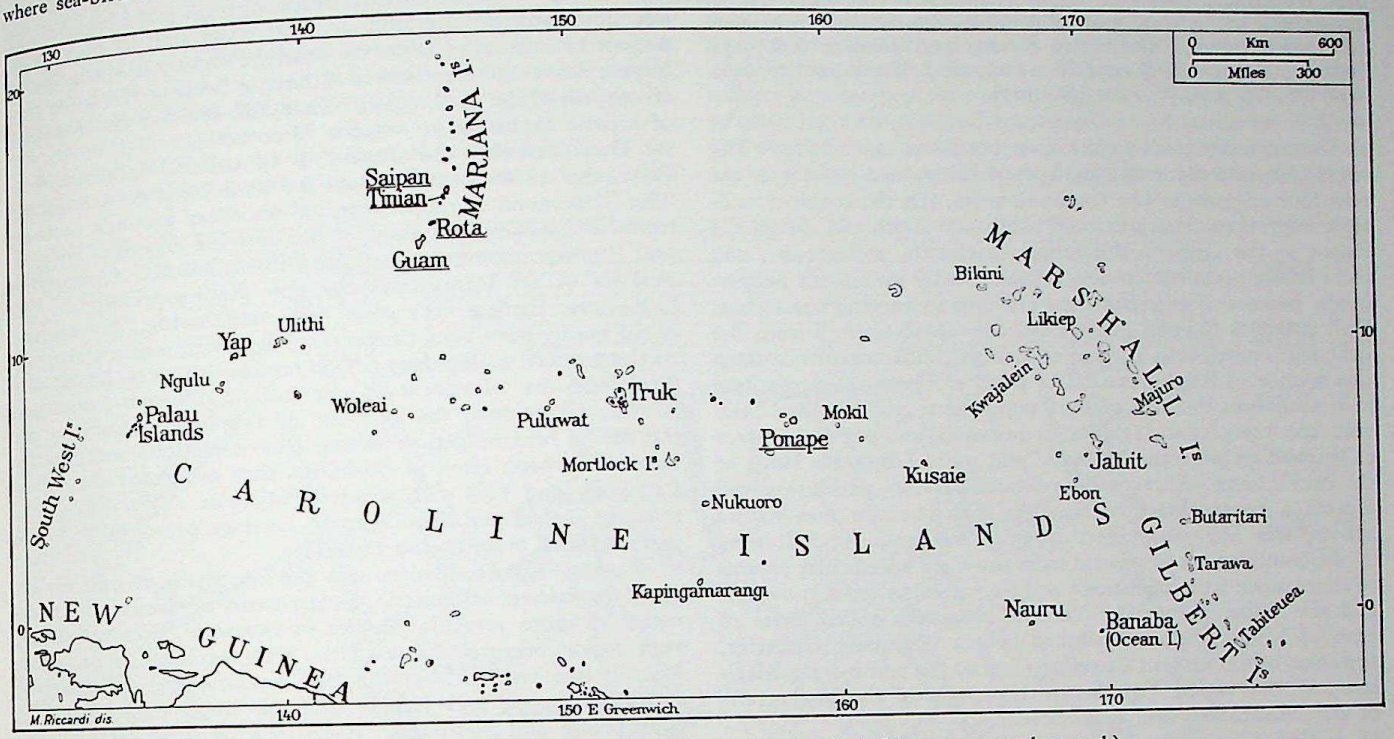
The islands lie wholly within the tropics, a condition which obviates any serious anxiety about clothing and shelter. The high islands provide a fair range of resources for craft work, including basaltic lavas and a wider variety of woods and fibers than is usually present on the atolls. The latter are composed almost entirely of coral limestone. In both environments some combination of gardening and fishing is the basis of economic life.

In aboriginal times possibly 150,000 people lived in the area. New diseases brought in by Europeans contributed to an alarming decline in population for many years. In the 20th century the death rate was curbed, and a continuing high birth rate resulted in rapid expansion; by mid-century there were more than 100,000 Micronesians. Non-Micronesians were few, except on Guam, where a transient population supported various military facilities. Island communities rarely number more than a few hundred individuals. While the high islands are only sparsely settled, density of population in the more crowded atolls rises to 1,000 persons per square mile.

The older technology manifested a quite direct dependence on the immediate environment. While interisland trading augmented the resources to a degree, most artifacts were fashioned from locally available materials. In social intercourse the bonds of kinship and community played a predominant role and provided the framework for economic and political organization. Micronesians viewed the supernatural as an idealized extension of their earthly existence. Ancestral ghosts advised them on demand, and high gods and unnamed nature spirits were placated in simple ritual.

Marked changes in Micronesian living followed the introduction of European institutions. Time-honored crafts and skills gave way under the pressure of trade imports and the copra industry. Social patterns suffered less, except in port towns and adjacent areas. Although Protestant and Catholic mission practice displaced the formal aspect of island religions, many beliefs of old survived with remarkable vigor and blended with the new.

MARIANA ISLANDS. Ancient Chamorro stonework is known from a wide range of ground stone implements and from the capped uprights, foundations of communal *latte* houses, which have been uncovered in ruins on Guam, Saipan, Tinian, and Rota (see MICRONESIAN CULTURES, *Prehistoric sites*). Associated pottery remains date back to 1500 B.C. and suggest an affinity with older Philippine ceramics. Descendants of the ancient Chamorros long ago abandoned the traditional island crafts, and several centuries of Spanish rule served to create a Hispaniolized colonial culture. Such handiwork as is now produced — some wood carving and shell-ornamented accessories — is primarily for the tourist market. On Saipan a well-established Carolinian colony is responsible for the principal manufacture of mats and other trade items of fiber.



CAROLINE ISLANDS. The Palau Islands (Western Carolines) unquestionably produced the virtuosos of Micronesia, artisans who worked in wood, stone, tortoise shell, and clay. Skilled carpenters constructed magnificent meetinghouses, on the beams and gables of which were carved and painted lively scenes depicting favorite legends (PL. 543). Finely finished bowls and boxes sparkled with mother-of-pearl inlay (PL. 548). Stone monoliths featured a stylized human face suggestive of Sepik River wood art found in New Guinea (q.v.). Dishes and ornaments cut and pressed from tortoise shell showed better control of technique than did the plain ware and modeled lamps of clay (PL. 546). Modern production is limited mainly to "story-boards," on which the decorative storytelling art of the meetinghouse is capsuled in a dimension designed to attract the tourist.

Yap's position, geographically, and esthetically as well, is intermediate to the Palaus, the Marianas, and the atolls lying to the east. The art reflects much of the old Palauan and Chamorro work in stone,

wood, and clay. The men's house, raised on a stone foundation and with timbers decorated in a style reminiscent of Palauan, derives additional appeal from artfully arranged sennit lashings and decorative reed wall panels. In tattooing, loom weaving, and canoe design, Yap has more in common with the low islands, since these were crafts in which Palauans (and possibly Chamorros) were less adept. The arts of the Yap region, including the atolls, have survived in modern times as a result of the islands' relative isolation.

A marine flavor pervaded the traditional arts of the Truk Islands, where sea-bird forms and designs symbolizing fish were carved on

GILBERT ISLANDS. In the Gilbert Islands, Ocean Island (Banaba), and Nauru the proficiency achieved in fiber crafts resembled that of the Marshallese, though tattooing and mat decoration showed generally less development. On Nauru, however, plaited fiber aprons of intricate design, suggesting an affinity with Marshallese clothing mats, were worn by pregnant women (PL. 548). The checkerwork basketry was not unlike that of western Polynesia. World-famous are the ancient inventions of sennit-corded armor and shark-toothed weapons, which, in later years, became elaborated to the point of inutility.

Micronesia, diffusion of indigenous arts. (Centers of archaeological interest are underscored.)

dance sticks, hair combs, outrigger parts, and canoe-house timbers. A similar style appeared in tattooing and weaving. The Trukese, to an unusual extent, loaded themselves with heavy earrings and necklaces cut from marine and coconut shells. Although the art of Truk cannot compare as a whole with that of Yap or the Palaus, Micronesia's only masks (PL. 545) came from atolls in the vicinity; versions of these dance masks are now mass-produced as souvenirs in the Mortlock (Nomoi) Islands.

The peoples of Ponape (formerly Ascension) and Kusaie surpassed all other Micronesians in the weaving of complexly designed girdles from banana fiber. The geometric motifs of these loomed fabrics appeared also in the carving on their dance paddles, in tattooing, and in the sennit wrappings of outrigger parts. Ancient settlements at Nan Matol on Ponape and at Lele on Kusaie (FIG. 921), which had walled structures and planned waterways constructed from massive lengths of columnar basalt, now lie in ruin. The modern arts of the eastern Carolinians are limited in general to the plaiting of admirable hats and baskets from processed coconut leaf, a 20th-century cottage industry.

As for the two outlying islands, god figures (PL. 547), lacking in anatomical detail yet striking in their formal simplicity, were conspicuous among Nukuoro's generally unpretentious artifacts. Attractive saddle stools served as coconut graters; in recent times the type has been introduced into Kapingamarangi (PL. 544), where such graters are now made in miniature as souvenirs. On both atolls loom-woven fabrics of hibiscus fiber and plaited pandanus-leaf mats were of notable quality, although their artistic appeal depended solely on technique.

MARSHALL ISLANDS. Here weaving found a substitute in handwork utilizing fine pandanus leaf, particularly for dress mats with decorative borders reminiscent of Ponapean loom work. As in tattooing, the mat designs had to do with the sea, fish and bird life, and navigation cues (cf. III, PL. 499). Flowers and shells provided the basis for a refined personal adornment. In modern times traders have encouraged handicrafts utilizing processed coconut leaf in forms quite foreign to aboriginal practice.

MICRONESIAN CULTURES. The term Micronesia (q.v.) while basically geographic in meaning, serves also as a designation for the various Oceanic cultures and societies that are not otherwise identified as Polynesian, Melanesian, or Indonesian.

The arts and crafts of Micronesia depend fundamentally upon a few traits that are almost universal throughout the area and probably date from the period of earliest Micronesian settlement. Characteristic forms include tattoo patterns, plaited mats and baskets, ornaments of shell, plain wooden bowls, and the functional design of outrigger canoes. To this heritage were added introductions from Indonesia and Melanesia which, however, had not diffused into all or even most of Micronesia before the arrival of Europeans altered the course of developments. In this category we find loom weaving, as practiced in most of the Carolines, pottery and megalithic constructions in the Palaus, Yap, and the Marianas, and representations in wood of human and bird forms in the western and central Carolines. Elaboration of many of these crafts developed as local innovations; examples are the stylized wood art of the Nukuoro-Mortlock-Truk region, the woven belts and stone structures of Ponape and Kusaie, the dress mats of Nauru and the Marshalls, and the style of communal buildings in the Palaus, Yap, and the Gilberts. In general, the more typical Micronesian arts func-

tioned in the Carolines from Yap to Truk; marginal areas marked by idiosyncratic practices were the Palaus, the Marianas, and the several island groups from Ponape eastward. The aboriginal crafts continued until the 20th century but have now almost disappeared. Trade handicrafts, utilizing local wood and fiber resources, have in part replaced them, but these reflect a general lowering of quality.

SUMMARY. General considerations and cultural affinities (col. 919). Prehistoric sites (col. 920). Architecture (col. 921). Three-dimensional art in wood (col. 923). Three-dimensional art in stone and shell (col. 924). Decorative carving and painting (col. 925). Pottery (col. 925). Shell ornaments (col. 926). Tattooing (col. 926). Weaving (col. 928). Plaiting (col. 929).

GENERAL CONSIDERATIONS AND CULTURAL AFFINITIES. The small and scattered land fragments of Micronesia have, over the past four or perhaps five thousand years, felt the tread of multiple migrations from west and south and southeast. From the Palaus to the Gilberts differences in climate, topography, and soil fertility provoked endless experiment by immigrant peoples in the process of adapting their customs to varying conditions. Vast stretches of open sea isolated one island or atoll from the next and contributed further to cultural differentiation within the bounds of Micronesia. The relatively poor resources held to a minimum the size of local populations and provided little economic basis for such elaboration of social and political custom as marked societies in the larger and more hospitable lands of the Pacific basin. Micronesian religious practice, which revolved around a personalized relationship with ancestor and nature spirits, was likewise subject to only moderate formalization.

Micronesian art in general lacks the more spectacular aspects of that known from Melanesia and Polynesia, or from Indonesia and the Asian mainland. Yet the esthetic manifestations of each of Micronesia's subcultures bear a distinctive character, apparent in the ancient Chamorro arts of the north-lying Marianas, in the varied Carolinian styles, and in the atoll crafts of the Marshallese and Gilbertese.

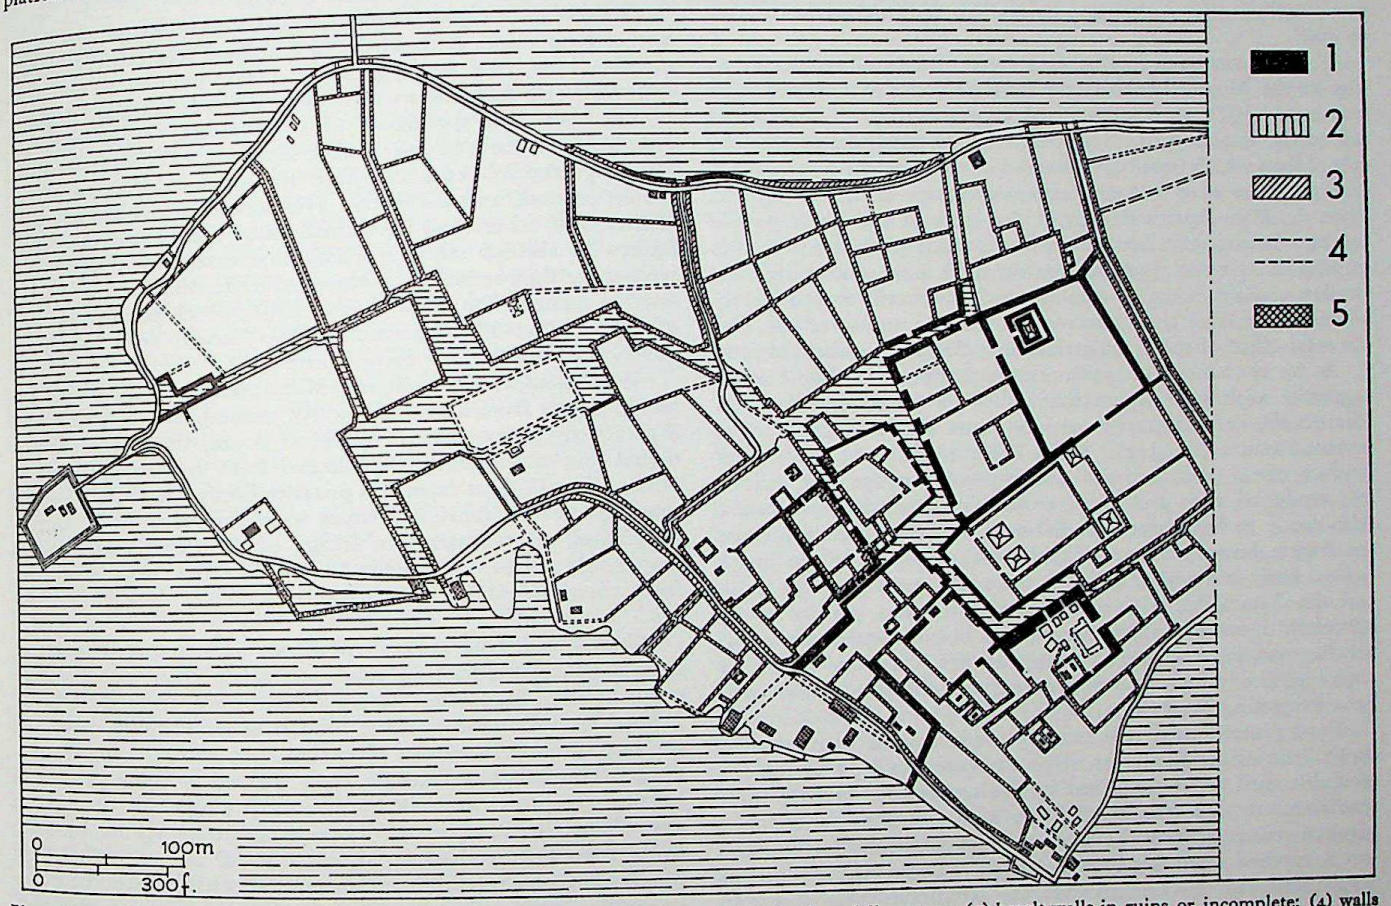
Within Micronesia the most widely distributed art forms, and undoubtedly the oldest, were geometric and nonrepresentational. In the creation of personal ornaments artists revealed their fascination with number and rhythm as they manipulated the size, shape, and color of shell beads and disks. Tattooing designs, derived basically from the diagonal check and twill of plaited mats and baskets, showed a similar preoccupation, and the same array of triangles, chevrons, diamonds, and zigzags appeared in Carolinian carved and painted wood surfaces. Almost the only organic forms realistically represented in tattooing and wood decoration were sharks and porpoises.

Loom weaving has been well documented as an introduction from Indonesia. The decorative motifs in most Carolinian textiles bore an obvious relationship to local plaiting designs, despite the differences encountered in technique. Micronesians found it easy to integrate weaving with their existing art traditions. Wood sculpture, for which evidence points to Melanesia as the source, proved more difficult to master. Essential to the art as it emerged in the Carolines west of Ponape was the representation of human and bird forms in more or less realistic fashion. The absence of sculptured sharks and porpoises and the dearth of surface decoration on sculptured bowls, prow ornaments, and human images suggest the need to distinguish two separate traditions in Micronesian woodworking. The one, suggested as earlier, dealt solely with geometric decoration of wood surfaces (e.g., house beams and canoe hulls). The other, introduced later, was associated with undecorated three-dimensional forms. Only in the Palaus did artists manage successfully to combine the two traditions, notably in the shell ornamentation on wooden utensils and the storytelling scenes carved and painted on meetinghouse gables.

The types of communal houses found in the Palaus, Yap, and the Marianas, while strongly reminiscent of Indonesia and Melanesia, may well have developed locally from a dwelling plan widespread in Micronesia. However, the unusual mastery of carpentry techniques by Palauans was without Micronesian precedent. Ceramics and massive stonework were restricted to the same three groups in western Micronesia (Ponapean stone structures were not in this tradition) and were probably diffused from Indonesia.

The role played by Yap in the evolution of Micronesian art poses an ethnographic problem. In practices common in both Yap and the atolls to the east, for example, weaving, tattooing, and shell decoration, the Yapese frequently took second place. In crafts shared with Palauans and Chamorros, they failed to measure up to the standards of those groups but showed a skill not possessed by the atoll peoples. Although in many ways subject to influences from the nearby Palaus and Marianas, the Yapese leave the impression of having been at the same time an outpost of the atoll region. Thus Yap stood at the crossroads of artistic exchange in western Micronesia.

There remains the possibility of cultural influence from Polynesia. In the context of art the evidence is not convincing. The Micronesian groups accepted on other grounds as being most "Polynesian" are those of the outlying islands of Nukuoro and Kapingamarangi and of the Gilbert Islands. Comparative analysis of art forms indicates that Kapingamarangians and Gilbertese, sharing very little with neighboring Micronesians, could hardly have been carriers of Polynesian media and motifs to the western archipelago. Nukuoro tended to be linked with Truk and the Mortlocks as a result of diffusion from those islands, rather than the reverse. A simplified naturalism and the use of ornamentation issuing from technique and function have often been cited as traditions that associated the central Carolines (and Fiji) with western Polynesia. This resemblance must be interpreted as a common heritage preserved in locally variant forms from earlier times.



Ponape, Kusaie, Nauru, and the Marshalls, marginally situated in eastern Micronesia, lacked many of the artistic refinements of more versatile peoples to westward. Yet within this very region occurred some of the truly exciting inventions in Micronesian art, such as the belt weaving and the tattooing styles in Ponape and Kusaie and the dress mats plaited by Marshallese and Nauruans. Every one of these local innovations can be traced back to the generalized Micronesian art of old, which provided a foundation more directly for the later achievements of the west-central Carolinians.

PREHISTORIC SITES. Double rows of stone columns with hemispherical capstones indicate the location of many ancient Chamorro villages on Tinian, Saipan, Guam, and Rota. These *latte*, as they are known locally, were the roughly cut foundations for large structures of wood and thatch, used as the men's house, the chief's domicile, or as dwellings for an extensive family. The capped uprights, quarried from coral limestone with basalt adzes, stood as high as 16 ft. and covered an area of up to 60 × 15 ft. *Latte* sites were inhabited from the mid-9th century until the 16th-century occupation of the Marianas by the Spanish. Hans G. Hornbostel in the 1920s reported several hundred *latte* locations on the four islands. Most prominent were ruins at Taga, on the southwest coast of Tinian, and at Agingan, similarly situated on Saipan, with 18 and 12 house units respectively. Subsequent colonization by Japanese as well as military activity during World War II resulted in extensive deterioration or destruction of *latte* sites. At the present time the best-preserved include the House of Taga, central and only surviving unit of the Taga group; the Blue site, a mile to the south, excavated in 1950 by Alexander Spoehr; the Gongna Cove group at the north end of Tumon Bay, on Guam, restored in 1946 by Douglas Osborne; the As Nieves quarry, with several unfinished shafts and caps, in eastern Rota; and the Laulau site on Magicienne Bay, on Saipan.

A quite different megalithic tradition is preserved in the jungle-covered ruins of Nan Matol off the eastern shore of Ponape. Here on the reef legendary builders from northern Ponape created more than fifty artificial islets. In an 11-sq.-mi. area, protected by a stone breakwater, walled enclosures were erected from natural blocks of columnar basalt, rafted from the northern part of the island, and built up to heights of 40 ft. in a cribwork filled with coral limestone. The basalt and coral

components, all carefully assembled in a kind of dry masonry, show little or no evidence of cutting or shaping. These structures and an associated network of canals served as the seat of a dynastic line that ruled the Ponapeans for many generations until overthrown, with aid from Kusaiens, prior to European discovery. Nan Towas, the outstanding ruin, consists of two high-walled rectangles, one within the other, in the center of which is a capacious vault said to have held the remains of the last ruling chief. Surveys of the ruins were undertaken by Johannes Kubary, F. W. Christian, and Paul Hambruch around the turn of the present century. A similar though less elaborate project was executed in prehistoric times at Lele on the eastern coast of Kusaie, 250 mi. east of Ponape, where reef and sand provided a foundation for an extensive layout of walled courts and canals (FIG. 921).

Dwellings of Ponapeans and Kusaiens are still built on low platforms walled and paved with basalt and coral rock. Elsewhere in Micronesia house platforms and stone-paved yards and roads exist only in the Palaus, Yap, and a few neighboring atolls. Palauans, utilizing andesite boulders, extended this type of construction to piers, drains, causeways, and fresh-water bathing pools.

Plan of the ancient settlement at Lele, Caroline Islands. *Key*: (1) Basalt walls; (2) walls of coral limestone; (3) basalt walls in ruins or incomplete; (4) walls of coral limestone in ruins or incomplete; (5) dwellings (from *G. Thilenius, IV, 1919*).

ARCHITECTURE. Despite regional differences in design, Micronesian housing was basically rectangular in ground plan, with corner posts supporting tie beams and plates on which rested a light, large, and well-constructed saddle roof. Gable ends commonly extended far beyond the floor area and provided additional working space. Pandanus leaf and coconut and other palm leaves were converted into roof thatch. Space under the low-hanging eaves frequently remained clear, although, when necessary, the exposed sides were protected by matting from rain and wind. Wood planking or panels made of reeds served for more permanent enclosure. The types of flooring varied from bare earth to sturdily built platforms of planks or poles.

One widespread solution for ridgepole support depended on the erection of a king post above each tie beam. In the Marshalls, the Gilberts, and Nauru these beams, bridged by numerous slender poles, formed a floor for secluded sleeping quarters just under the roof. In dwellings of many eastern Carolinians only the crossed rafters of the roof carried the ridgepole. Palauans, at the other end of the Carolines, achieved an unusual strength of construction by utilizing their consummate skill in carpentry. The lofty gabled ends of their 50-ft.-long meeting houses (*bai*, PL. 543) represented a composition of carefully hewn planks fitted horizontally behind framing batten boards. The entire roof frame was firmly mortised to wall and corner posts.

The *falu*, or men's house, on Yap, as still constructed today, reflects another principle of roof support. Seven unhewn logs, selected for their superlative dimensions and symmetry of form, are planted deep in the ground along the center line of an elevated platform and rise grandly to meet the ridgepole 30 ft. above. The natural beauty of these timbers, lashed to untrimmed beams and rafters with sennit plaited in artistic patterns, compares favorably with the sophisticated woodworking of the neighboring Palauans. A companion feature of Yapese housing is the hexagonal floor plan resulting from a triangular extension of roof and walls at each end. The same architectural characteristics, although of more modest proportions, distinguish the larger shelters of atoll communities to the south and east, where Yapese influence has penetrated. Building design in this part of Micronesia is possibly related to a need for withstanding the gale winds and typhoons that annually visit the region.

Only superficially similar to the *falu* is the spectacular *maneaba*, or council house, of the Gilbert atolls. This is simply a huge gabled roof of pandanus thatch held up by several rows of coconut-log columns, those under the ridgepole mounting upward to 50 ft. The ground covered by one such public building on Butaritari (Makin) was reported to be 114×250 ft. All timbers in the structure are made secure with sennit lash-

ings. Eaves reach nearly to the ground and the space beneath is left open to lagoon breezes.

THREE-DIMENSIONAL ART IN WOOD. Early European visitors to the Marianas commented favorably on the wood art of the natives but made only very general references to objects produced (e.g., bowls, spears, field implements, and images). Specific statements about the sculptural ability of these people (the Chamorros) must be omitted in a discussion of regional specialties, since the local crafts did not long survive Spanish rule.

The most extensive and, therefore, most typical three-dimensional work in wood was produced in the area from the Palaus to Nukuoro. The artifacts — human images, canoe ornaments, and variously shaped boxes, bowls, and dishes — were not large and were painted sparingly, if at all, in white and black. Artisans preferred the wood of breadfruit trees with its medium-coarse grain, which could easily be shaped with shell-bladed adzes. Representation was limited to human and sea-bird models almost exclusively. Adherence to realism diminished from west to east.

Canoe ornaments in this area were of several types. From Yap to the Mortlocks, bow and stern pieces of sail canoes were terminated by a conventionalized representation of the forked tail of the frigate bird. The endpieces of small canoe models, cult objects which possibly preserved a more ancient form of decoration, terminated in a crescent-moon shape with tips pointed upward. *Aten* figures decorated the ends of the Truk paddle canoes. Bound with sennit cord atop each peaked prow, this carving in its upper portion represented a pair of affronted sea swallows, their beaks in contact and their tails raised pertly behind. The birds are not recognizable to the untutored eye, and the total effect of the symmetrical *aten* design is quite abstract.

As for containers (PL. 548), artisans in Palau and Yap created a greater variety of forms than is to be found elsewhere in Micronesia, in addition to unique four- and six-legged trays, or small tables (PL. 544). From Palau to Puluwat a common artifact was a plain but well-proportioned storage box, lidded and equipped with a cord for suspension from a house beam. Also made to hang were small bowls or dishes that represent the frigate bird by means of realistic duplication of the bird's beaked head and forked tail. In the same region, and in Truk and the Mortlocks, a deep elliptical bowl was part of every household inventory. Rim decorations at both ends, serving as handles and carved in exceedingly stylized fashion, reputedly portrayed the human face with a long straight nose surmounted by a projecting forehead.

Food graters, as a rule crudely made from a bent branch, evoke little esthetic interest. One exception existed in the remarkable bird form conceived by Nukuorans for grating their ripe coconut. Its two sturdy legs and foot-high saddle seat blended gracefully with the outstretched neck of the bird; at the top a toothed shell blade was lashed. Today the people of Kapingamarangi have taken over the Nukuoran form and ably manufacture scores of the product both for trade and for their own use (PL. 544).

The best of Micronesian sculpture depicted the human body. Figures of both sexes, full-length and freestanding, rarely more than a foot or two in height, served as ritual artifacts in the Palaus and Yap. These images are carved in lifelike proportions, with a minimum of detail, and have a moderately rough surface on which adz marks still show. Yapese also incorporated such representations into house posts and window hooks. Tobi, the atoll nearest New Guinea, has become famous in modern times as the source of small squatting male figures, carved in brown hardwood, polished, and fitted with large staring eyes of inlaid mother-of-pearl.

From Yap to Puluwat, where atoll navigators undertook long and dangerous voyages at sea, the sculptured human form appeared as a doll-like fetish to be brandished by canoe captains in the face of oncoming storm clouds. The wooden image was all but obscured by coconut leaflets, knotted about the arms and waist, which enhanced the magical effect. The arms hung straight at the sides; the head was carved simply, with long straight nose, eyes that were usually mere slits, overhanging brow, and small mouth. The hair and beard were painted black, and a woody stump with several projecting spines from a sting ray substituted for the lower limbs. Alternatively, some weather fetishes had two nearly complete torsos, joined at the back and Janus-headed.

Stylistically the famed Mortlock masks and the *tino* images of Nukuoro may well have developed, along with the fetish figure, from a single Caroline Islands tradition. The same basic design of the face in the fetishes was apparent on the slightly convex plane of the heavy Mortlock dance mask (PL. 545). Dominating the 2-ft.-high mask was a T formed by the long straight nose and black-painted eyebrows, both in strong relief, the latter being reminiscent of the wings of a frigate bird in flight. Eyes were frequently omitted, and a small pouting mouth was drawn in black on the lime-coated surface of the mask. Essentially the same facial representation also characterized the normally proportioned head carved as part of the king post on the front gable of men's canoe houses.

Nukuoran sculptors designed their *tino* images (PL. 547) with a long trunk, arms at the sides, short legs tapering into a circular base, and an egg-shaped head, pointed at the chin but otherwise featureless or virtually so. The unrelieved planes of the body lent the figure an anonymous, timeless quality. Life-sized variants of the smaller images (ca. 15 to 20 in.) had faintly perceptible ears and nose and carried a pattern of tattooing on neck and shoulders. Nukuorans lacked the seafaring tradition of other atoll Carolinians and maintained their god-figures in shrines ashore. These fine examples of stylization were more than matched by the abstract forms of a few weather fetishes made in the atolls west of Truk, which consisted simply of a knob "head" connected by two "arms" to a base from which the familiar ray spines protruded.

Wood sculpture in eastern Micronesia scarcely merits the name. Apart from a few distinctive canoe-prow ornaments and a pleasingly proportioned hourglass drum, there were undecorated but nonetheless well-shaped food servers and mixing bowls. The Gilbert Islanders produced only the latter. Equally impoverished in aboriginal times were the residents of Kapingamarangi, on the southern fringe of the Carolines, although (as already noted) they later borrowed a few woodcraft ideas from their neighbors on Nukuoro.

THREE-DIMENSIONAL ART IN STONE AND SHELL. Human or animal representations in materials other than wood seldom occur in aboriginal Micronesian art and never in modern times. From Yap are reported three human heads roughly carved on the face of coral limestone blocks and set into building foundations. The ruins on Kusaie have yielded a human figure in basalt. Sculptures from Palau are more numerous but exhibit only slightly better quality. These andesite monoliths, standing from 2 to 7 ft. aboveground, are carved as conventionalized human heads, sometimes in association with realistic lizard or crocodile forms. They stand near the corners of house platforms or at ceremonial centers in the villages and symbolize spiritual beings. They feature large eyes and, often, prominent noses, but further generalization is not possible because of stylistic differences and indistinctness of details. One quite skillful representation of a life-size human face is preserved in shell material from the giant *Tridacna* clam.

The famed money wheels of Yap are flat-sided disks of aragonite which measure up to 12 ft. in diameter and have center holes by which they can be transported on carrying poles. These fine white limestone pieces were quarried in the Palau Islands, laboriously shaped with stone tools, and rafted across several hundred miles of ocean to the Yap villages. There they still line roadways and lean against clubhouse platforms — repositories of value in the native system of exchange.

Other principal stone artifacts are those used for mashing taro and breadfruit. In the Marianas, Kusaie, and Ponape they were pecked and ground from hard basalt. A more easily worked coral limestone sufficed in the rest of the islands, and in some places wood was substituted. Ancient Chamorro and Marshallese pounders have rather stubby cylindrical forms. Elsewhere these implements bear some resemblance to the Truk

925

type, which is truly a work of art. Stylistically related to Polynesian poi pounders, the Truk artifact averages about 6 in. in height and is beautifully proportioned. Its bell shape is enhanced by a shallow hemispherical base and a flaring ringed top, on the flat surface of which are carved one or more peaked projections in a symmetrical design. Regional variants possess straighter sides and flatter bases and are unornamented.

Techniques for shaping stone worked equally well for processing the thick, heavy shell of the giant *Tridacna* clams. Everywhere in the islands this material was preferred for making adzes, chisels, and gouges. Adz blades, originally lashed with sennit to bent wooden handles, appear in triangular, trapezoidal, and quadrangular forms. In western Micronesia, principally on Guam, archaeologists have also recovered tools made of basalt, although these are limited in number. From *Tridacna* shell, Marshall Islanders once fashioned smoothly finished beaters, employed in preparing pandanus leaf for dress mats. Still in use and greatly valued as family heirlooms, these unique artifacts possess a translucent quality and pleasantly curving outline that imparts a genuine artistic merit.

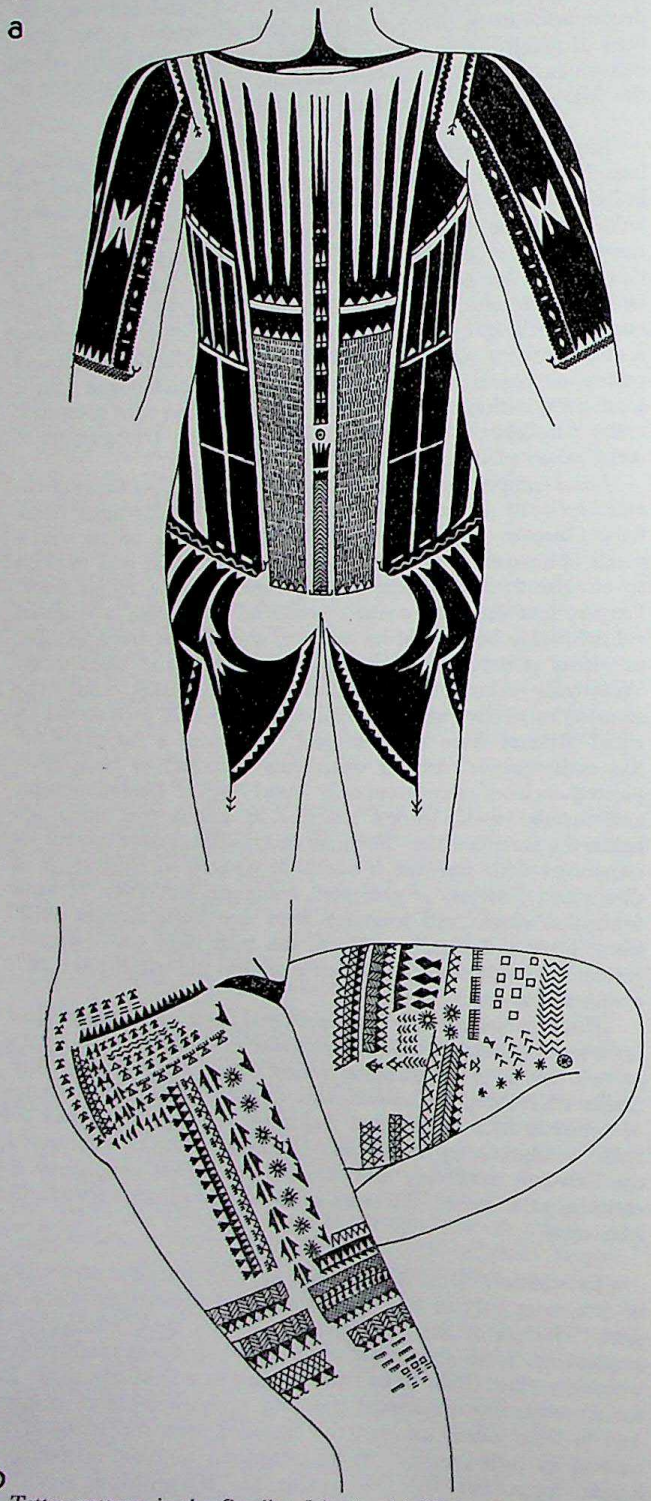
Decorative carving and painting. Micronesians employed several techniques for decorating the surface of wood constructions and artifacts. In the Marianas and Carolines, particularly from the Palaus to Truk, some manner of painting was practiced. Colors were usually black with white or red, or all three, and in a few islands also yellow; they were applied with brushes of coconut-husk fiber. The resulting decoration, most frequently seen on house posts, beams (pl. 543), rafters, and canoe hulls, had a rough and untutored character that betrayed a relative lack of skill with the medium. In most of these same islands artists at times combined painting with a cutting away of thin sections of surface wood — a technique which was not true low relief but was nonetheless an effective means of emphasizing certain parts of a design. In the Palaus such excised portions on smaller articles were inlaid with mother-of-pearl instead of being painted with a contrasting color.

The people of Yap and of the atolls as far east as Puluwat used sharp mussel shells to incise delicate linear designs on bamboo tobacco containers. On other wood artifacts incising appeared only sporadically — on dance sticks in Truk, on paddles in Ponape, and on the warping benches of Kusaien weavers. White lime was generally rubbed in to heighten the effect of line decoration. House posts carved in relief (pl. 544) are to be found on Yap. Islanders east and southeast of the Carolines paid almost no attention to the potentialities of ornamental carving and painting of wood surfaces; however, they used a patterned covering of tightly plaited pandanus-leaf fiber to enhance, for example, their dance sticks.

Geometric motifs dominated Micronesian wood art. Straight lines appeared in a multitude of combinations with triangles, diamonds, and zigzags, which, in each region, bore a strong resemblance to local patterns of tattooing and weaving. Curved lines were rare, and attempts to represent nature were limited almost entirely to fish forms. To the above statements one important exception must be noted: Natives of the Palau Islands developed the practice, unique in the artistic traditions of Oceania, of embellishing the planked gable ends and squared roof timbers of their grand meetinghouses. In addition to using the familiar geometric signs of other Carolinians, they created complex storytelling scenes dominated by conventionalized human figures, which, in the company of fishes, birds, and reptiles, frolicked in settings replete with trees, houses, canoes, and sea waves. These panels (pl. 543) were executed in the cutaway technique described above and were further enlivened by painting in four colors.

Pottery. The only Micronesians to be credited with a knowledge of ceramics are Palauans, Yapese, and pre-Spanish Chamorros. Women of Yap and the Palaus continued to make cooking pots well into the 20th century. Their wares, hemispherical in form and with incurved rims, were coarse and friable. Surfaces lacked decoration and were undistinguished by slip or glaze. The method of manufacture combined coiling and molding, the coils being smoothed out with paddle and stone. Palauans also made curious oil lamps (pl. 546), the rims of which are surmounted by crudely modeled figures of seated women, often shown nursing their babes. The antiquity of pottery in the western Carolines is not known beyond the fact that it predated European contact. Extensive excavations have been conducted in the Palaus by Douglas Osborne and on Yap by E. W. Gifford.

Chamorro pottery styles have been studied by Laura Thompson and Alexander Spoehr from shard collections made in Guam, Saipan, and Tinian. The craft did not survive the Spanish conquest of the Marianas in the 17th century. The *latte* builders produced an abundance of undecorated ware of varying quality and color. Vessel forms and technique cannot be reconstructed with any certainty. Some shards of the same period show fine incised lines, cord marks, and other surface decoration. In earlier cultural levels there occurs a distinctive ware of much better quality, thin, hard, and red-slipped, which is associated with the earliest remains of human occupancy in the Marianas (mid-2d millennium B.C.).



Shell ornaments. Shell necklaces, ear pendants, girdles, bracelets, and finger rings, used in varying degree, enhanced the individual's appearance throughout Micronesia. Truk Islanders held first place in personal adornment, and they strongly influenced others all the way from the Mortlocks to Yap. In this region the principal materials consisted of white *Conus* and *Trochus* and orange-red *Spondylus* marine shells, black coconut shell, and the beautifully patterned shell of sea tortoises. Esthetic effects were largely achieved by skillfully combining numerous pieces of contrasting color, size, and shape into a total composition. The artisans' preoccupation with geometric order parallels their play with number in the arrangement of wefts when plaiting mats and baskets.

Basic components of design included disks, $^1/_4$–1 in. in diameter, each of which was roughed out as a flat-sided blank from *Conus* or coconut shell, drilled through the center with a small hole, strung with others on a sennit cord, and reduced to circular form and unit size by rubbing on a rough stone. Larger, less carefully shaped beads of *Spondylus*, a material valued highly because of its scarcity, were interspersed in some necklaces at patterned intervals among white and black disks. Wide belts or girdles consisted of multiple strands, numbering as many as twelve; wood or shell connectors held each strand an equal distance from the next and maintained a flat plane for the entire piece. Among ornaments intended to hang from pierced earlobes were commonly found rings of *Conus*, coconut, and tortoise shell, looped together in chains that often fell below the shoulder line. Earrings and necklaces were sometimes elaborated with pendant triangles of *Spondylus*, large rings of *Conus* and *Trochus*, or elongated immature coconuts. Stylized fishhooks, rings, and triangles were cut from tortoise shell; from Truk and certain atolls to the west have come curious pendants of this material, which resemble the wheel parts of a clock mechanism.

Micronesians east of Truk employed fewer and simpler shell ornaments. Disks of central-Carolinian appearance were strung more often in a longitudinal series rather than face to face. Shells of *Natica*, *Melampus*, and *Cypraea*, attached to strips of hibiscus bast or braided pandanus leaf, were favored for belts, headbands, and necklaces. At the other end of Micronesia, the Palauans used very few personal ornaments and, from archaeological evidence, the same appears to have been true in the Marianas.

Tattooing. Most Micronesian peoples practiced some form of tattooing; only in the Marianas was it apparently quite absent. Masters of the craft employed a toothed, adzlike bone implement, held above the skin and briskly tapped with a wooden mallet. Soot mixed with water provided coloring. Patients ordinarily underwent the first operation before puberty and in later years extended the tattooed area according to the custom in each locality. Women tended to limit tattooing to hands, arms, and legs; on males the bluish-black markings were frequently applied to the torso as well.

Style varied from island to island. The most complete body design, still extant among older adult males, originated in Ulithi and Yap and was common throughout the western Caroline atolls as far as Woleai and Tobi. Two sets of rays rising above the nipples dominated a vertical composition of dark rectangles which extended to the groin; the back was covered with a symmetrical pattern of curving dark fields that joined along the backbone and terminated on the buttocks. Women in these islands, together with those in the atolls eastward to Truk, displayed a quite different style of tattooing; the decoration, concentrated on the thighs, consisted of an unframed arrangement of fishes, crosses, triangles, and chevrons, set off by bands of crosshatching or rows of parallel diagonals. Men in the eastern part of this area were tattooed much like the women. (See FIG. 927.)

Tattoo patterns in the Caroline Islands. (*a*) Ulithi; (*b*) Lamotrek.

The Palauans manifested a third style. Hands, arms, and legs of both sexes (though of women, more than men) were tattooed. Long stripes made up of crosses, chevrons, zigzags, or other symbols, repeated infinitely between confining lines, typically covered the lower limbs.

Among eastern Micronesians a distinctive decoration existed in each linguistic region. In the Gilberts, where tattooing was not important, one common design represented the fronds of a coconut tree. Women in the Marshall Islands favored a pattern of barbed lines and zigzag connectives across the shoulders, and tattooed their limbs with a comb design and further use of zigzag lines. The men extended these motifs to the entire chest and back, and even to the face, where it was a mark of chiefly status. Perhaps the most complex tattooing in all Micronesia existed in Ponape, in the decoration of women's hips, waists, and thighs. Apparently of indigenous origin, this artistry recalls the Ponapean virtuosity in loom weaving, the patterns in both media being remarkably alike.

Micronesian tattooing is essentially geometric and nonrepresentational. The principal motifs are triangles, chevrons, crosses, straight or zigzag lines, and rows of short lines in vertical, diagonal, or crosshatched patterns. Most of the motifs had names, nevertheless, relating them to fish, shellfish, birds, heavenly bodies, and canoes — things that were valued highly by the islanders. The only truly realistic portrayals are those of sharks and porpoises. The spacing of design elements varied widely from the random and discrete to the creation of an integrated composition adapted to the body area being decorated. Curvilinear elements are exceedingly rare and occur mainly as outlines of the dark areas noted in back tattooing among the males of Ulithi, Yap, and Woleai.

WEAVING. Carolinians, with the exception of Palauans and a few atoll communities near Truk, wove quality textiles on simple backstrap looms. Fabrics fashioned from the split fibers of banana stalks were usually worn by men as loincloths; those made from inner bark fiber of the hibiscus tree were favored by women as sarongs. Loom width, which determined cloth width, ranged from 1 to 2 ft. in the central and western Carolines; the length of the finished product was ordinarily three to five times as much. Black, rust, red, and yellow plant dyes were used to alter the light natural color of bast fiber. In some of the atolls where weaving has survived, commercial dyes in blue, purple, red, and green have been substituted.

The ring method of warping was practiced in preparing the loom. Weavers knotted the warp threads end to end and wound them in a continuous spiral around the two beams. The warp-face weaves lent themselves admirably to longitudinal stripe decoration. Color, width, and number of stripes, as preferred according to local custom, were controlled by preplanned knotting of appropriate fibers during production of the warp spiral. Although seven was a favorite number, from one to eight stripes might appear. Wide stripes, combined with narrow ones, were often distinguished by introducing color-contrasting warps to break up the monotone. In striped fabrics, the wefts remained undyed and were incorporated in a plain weave (under one, over one). Ratio of warps to wefts averaged about 60 to 25 per square inch.

Most Carolinians also decorated their cloth by adding dyed wefts of hibiscus in one to a dozen patterned bands across the stripes at both ends of the material. In some places the only decoration was of this type. The extra wefts, commonly paired with the basic undyed wefts, were floated across the warps by using additional heddles or were laid in with pattern sticks, while the undyed wefts were combined with the warps in plain weave. The resulting decoration appeared on the surface of the cloth as rows of geometric forms, including triangles, diamonds, chevrons, and crosses, with a complementary design on the opposite side of the cloth. Many of the design elements were similar to those employed in local tattooing and, in like manner, were named for features valued in the island environment.

The atolls from Ulithi to Satawal formed a fairly homogeneous area in regard to weaving process and design. Ulithians had taught their craft to women on Yap, but Yapese men,

constructing a very long loom, also wove a special cloth that was a form of native money. Certain innovations and less conformity to a common style characterized the east-central Carolines, dominated by Truk and including the two Polynesian outliers. Fabrics were shorter and wider; stripes were broader and close together, and the internal design was more complex. Kapingamarangi weavers attempted no decoration at all in their loom cloth.

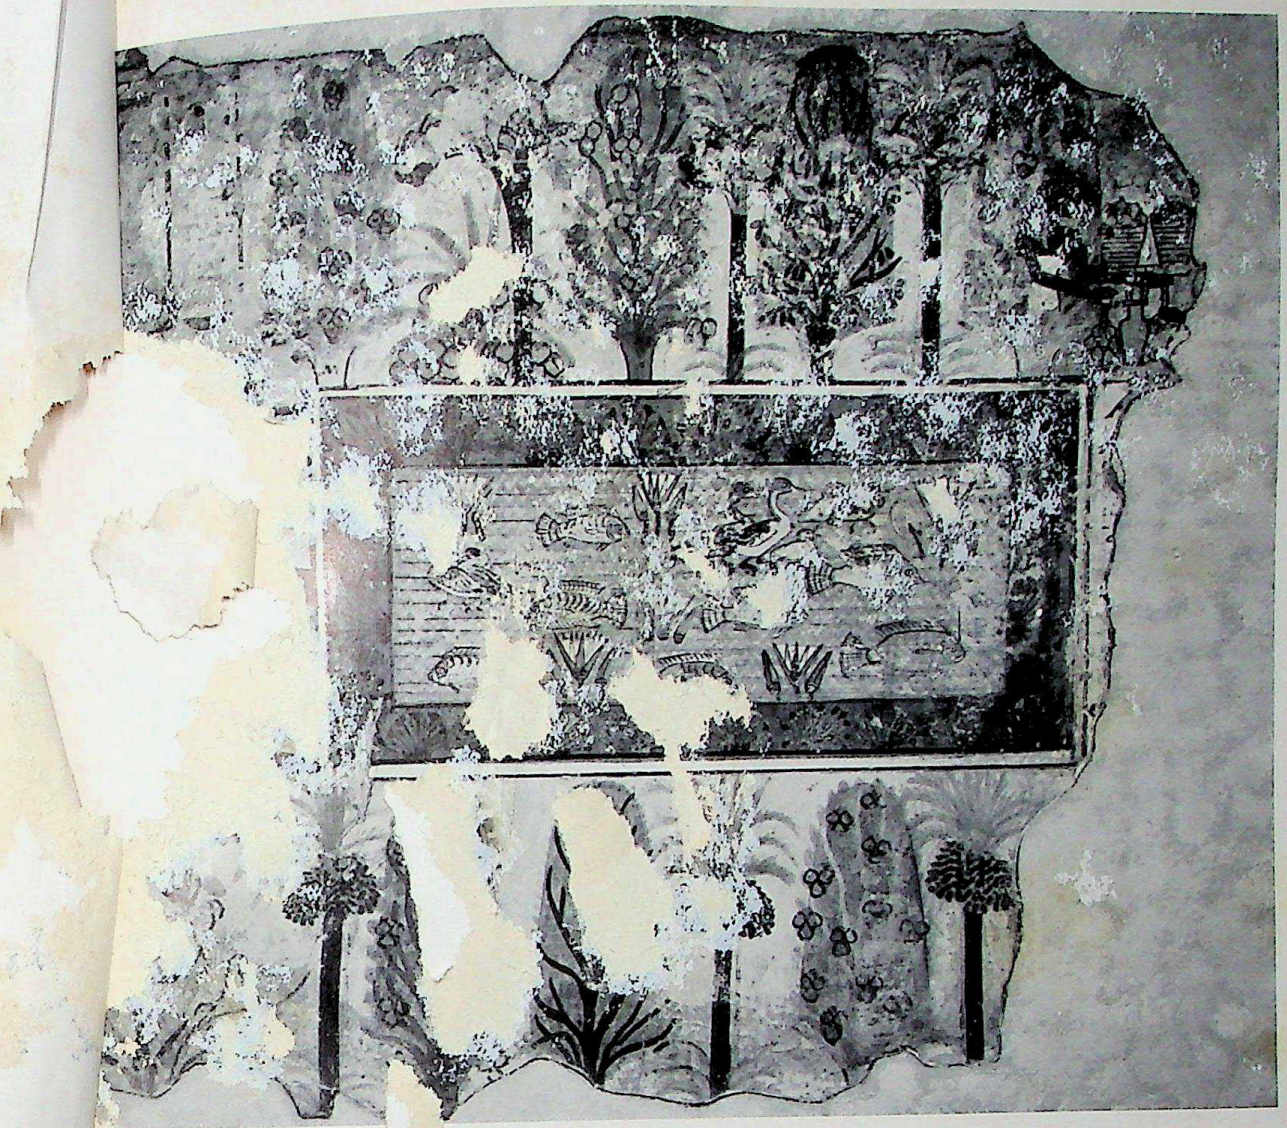
Among Carolinian weavers, Kusaiens and Ponapeans must be accounted superlative. They produced belts no more than 6 or 7 in. wide from banana fibers so fine that 87 warps per inch have been counted. Kusaiens, especially, achieved ingenious patterns of varicolored warp striping with each stripe only a few threads wide. The effect of transverse bands of decoration was obtained by the careful knotting-in of different colored warps, some only an inch or two long, when the loom was first set up. Weft threads played only a very small role in Kusaien design and served mainly as binder for the warps. Ponapeans not only handled warp knotting with skill but elaborated the ornamental use of extra wefts (brocading) far beyond that achieved elsewhere in the Carolines. Furthermore, they incorporated hundreds of small beads and disks of white, black, and orange shell as part of the brocading process, to produce a surface encrustation that is an integral part of the textile. The remarkable accomplishments of Ponapean and Kusaien weavers represent the masterly conclusion of a few basic Micronesian techniques, namely, ring warping, warp-face weave, and knotted warps.

PLAITING. Micronesians of both sexes continue to manifest their traditional skill in fashioning field baskets and coarse mats from freshly cut coconut leaves. The leaflets, still attached to a split frond, are crossed diagonally to right and left in plain check design.

Most island women in former times knew, although few do nowadays, how to prepare pandanus leaves for making a variety of bags, pouches, baskets, sleeping mats, floor mats, and certain dress items. The green leaves had first to be rid of their thorny edges and midribs. After drying in the sun or over hot coals they were rolled up and softened by repeated blows with wood or shell beaters. Finally the broad leaves were slit lengthwise to desired plaiting widths. Plaiters employed the same diagonal check as in coconut-leaf work but usually doubled the wefts for durability.

Twilled plaiting, less common than check, characterized both pandanus and coconut-leaf products among many Micronesians. The variations from a simple under-one, over-one technique offered infinite possibilities for surface design without recourse to colored wefts. Palauans excelled at twilled work of this kind. Throughout the atolls of eastern Micronesia the decoration of mats and other twilled or checked artifacts was achieved by manipulating light and dark strips of pandanus leaf; the contrasting colors resulted from differences in leaf maturity before processing. In Kusaie, Nauru, and the Marshalls, island artisans produced more sharply defined patterns by laying in strips of black-dyed hibiscus bast on selected pandanus wefts.

Nauruans made mats of a unique type, about 15 in. square, which were traditionally worn by pregnant women (PL. 548); the plaited designs bore a marked resemblance to the warp-face weaving in Kusaien belts. The Nauruan plaiting was distinctive in that wefts ran parallel to the sides, rather than diagonally. Most pieces were executed in plain check with double wefts, though a few mats included some twill. The natural hue of pandanus contrasted nicely with the black, red, or brown of dyed hibiscus fiber. In Carolinian loomed fabrics, vertical wefts were variously arranged in color and number after the manner of warps, while horizontal wefts usually alternated in color. This technique yielded patterns in which unbroken vertical lines and short horizontal dashes predominated. When both horizontal and vertical wefts were ordered in complex rhythms of number and color, practically limitless innovation in rectilinear design was possible.



The finest mat work in Micronesia came from the Marshalls. Women's dress mats, a pair worn front and back covering the body from waist to ankles (PL. 548), bore a superficial likeness to Nauruan pregnancy mats. Double wefts paralleled the edges of the square mats just as on Nauru, and both types had ornamental borders. Marshallese mats, however, were twice as large, with wefts eight to an inch instead of four. They featured the borders rather than the centers, which remained in plain check of brown pandanus. The borders consisted of from three to seven decorative bands in parallel, each plaited intricately in pandanus, black- or yellow-dyed hibiscus, and a dark-brown fiber from the sun-dried inner bark of a creeping beach vine. Unlike the Nauruans, who preferred rectilinear design, the Marshallese stressed diamonds, lozenges, triangles, and chevrons in developing band decoration. This play with diagonal line produced patterns remarkably similar to those in the brocaded transverse bands of finely woven Ponapean belts. The plaiting in both the Marshalls and Nauru suggests a unique attempt to duplicate selected features of eastern-Carolinian loom weaving without adopting the loom itself.

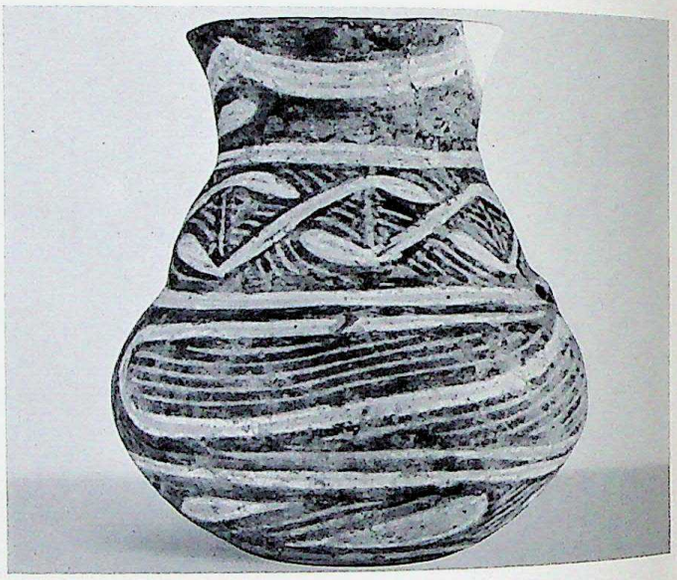
Ht., 13 in. *Below, left*: Face from a double herm, from Roquepertuse. Ht., 8¼ in. Both, Marseilles, Musée Archéologique. *Right*: Male head, from Entremont. Ht., 11 in. Aix-en-Provence, Musée Granet.

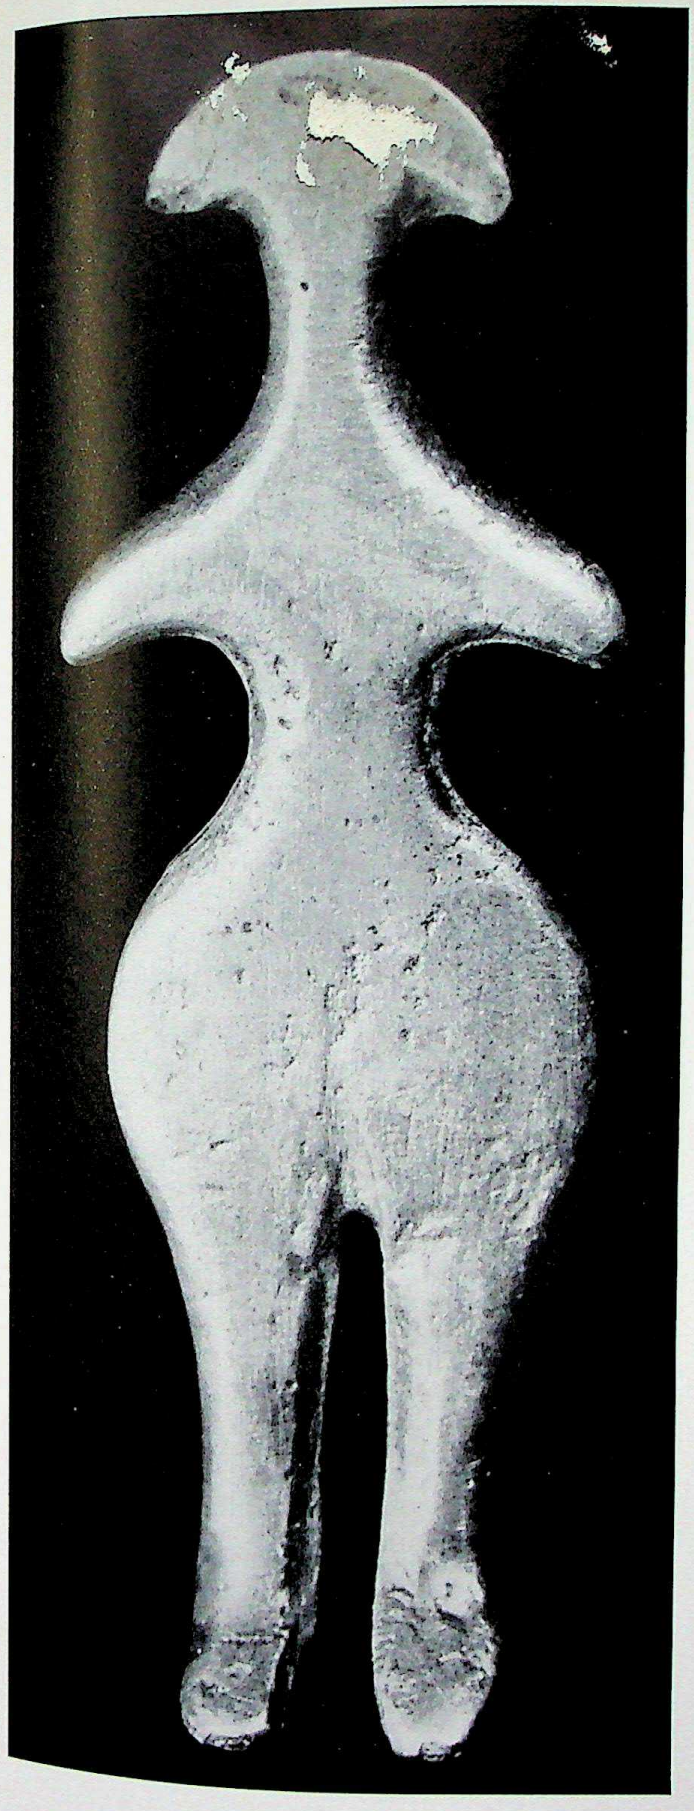
Pl. 412. Statues of warrior-heroes and pillar porch with *têtes coupées*, from Roquepertuse, Bouches-du-Rhône, France, 3d–2d cent. B.C. (reconstruction). Marseilles, Musée Archéologique.

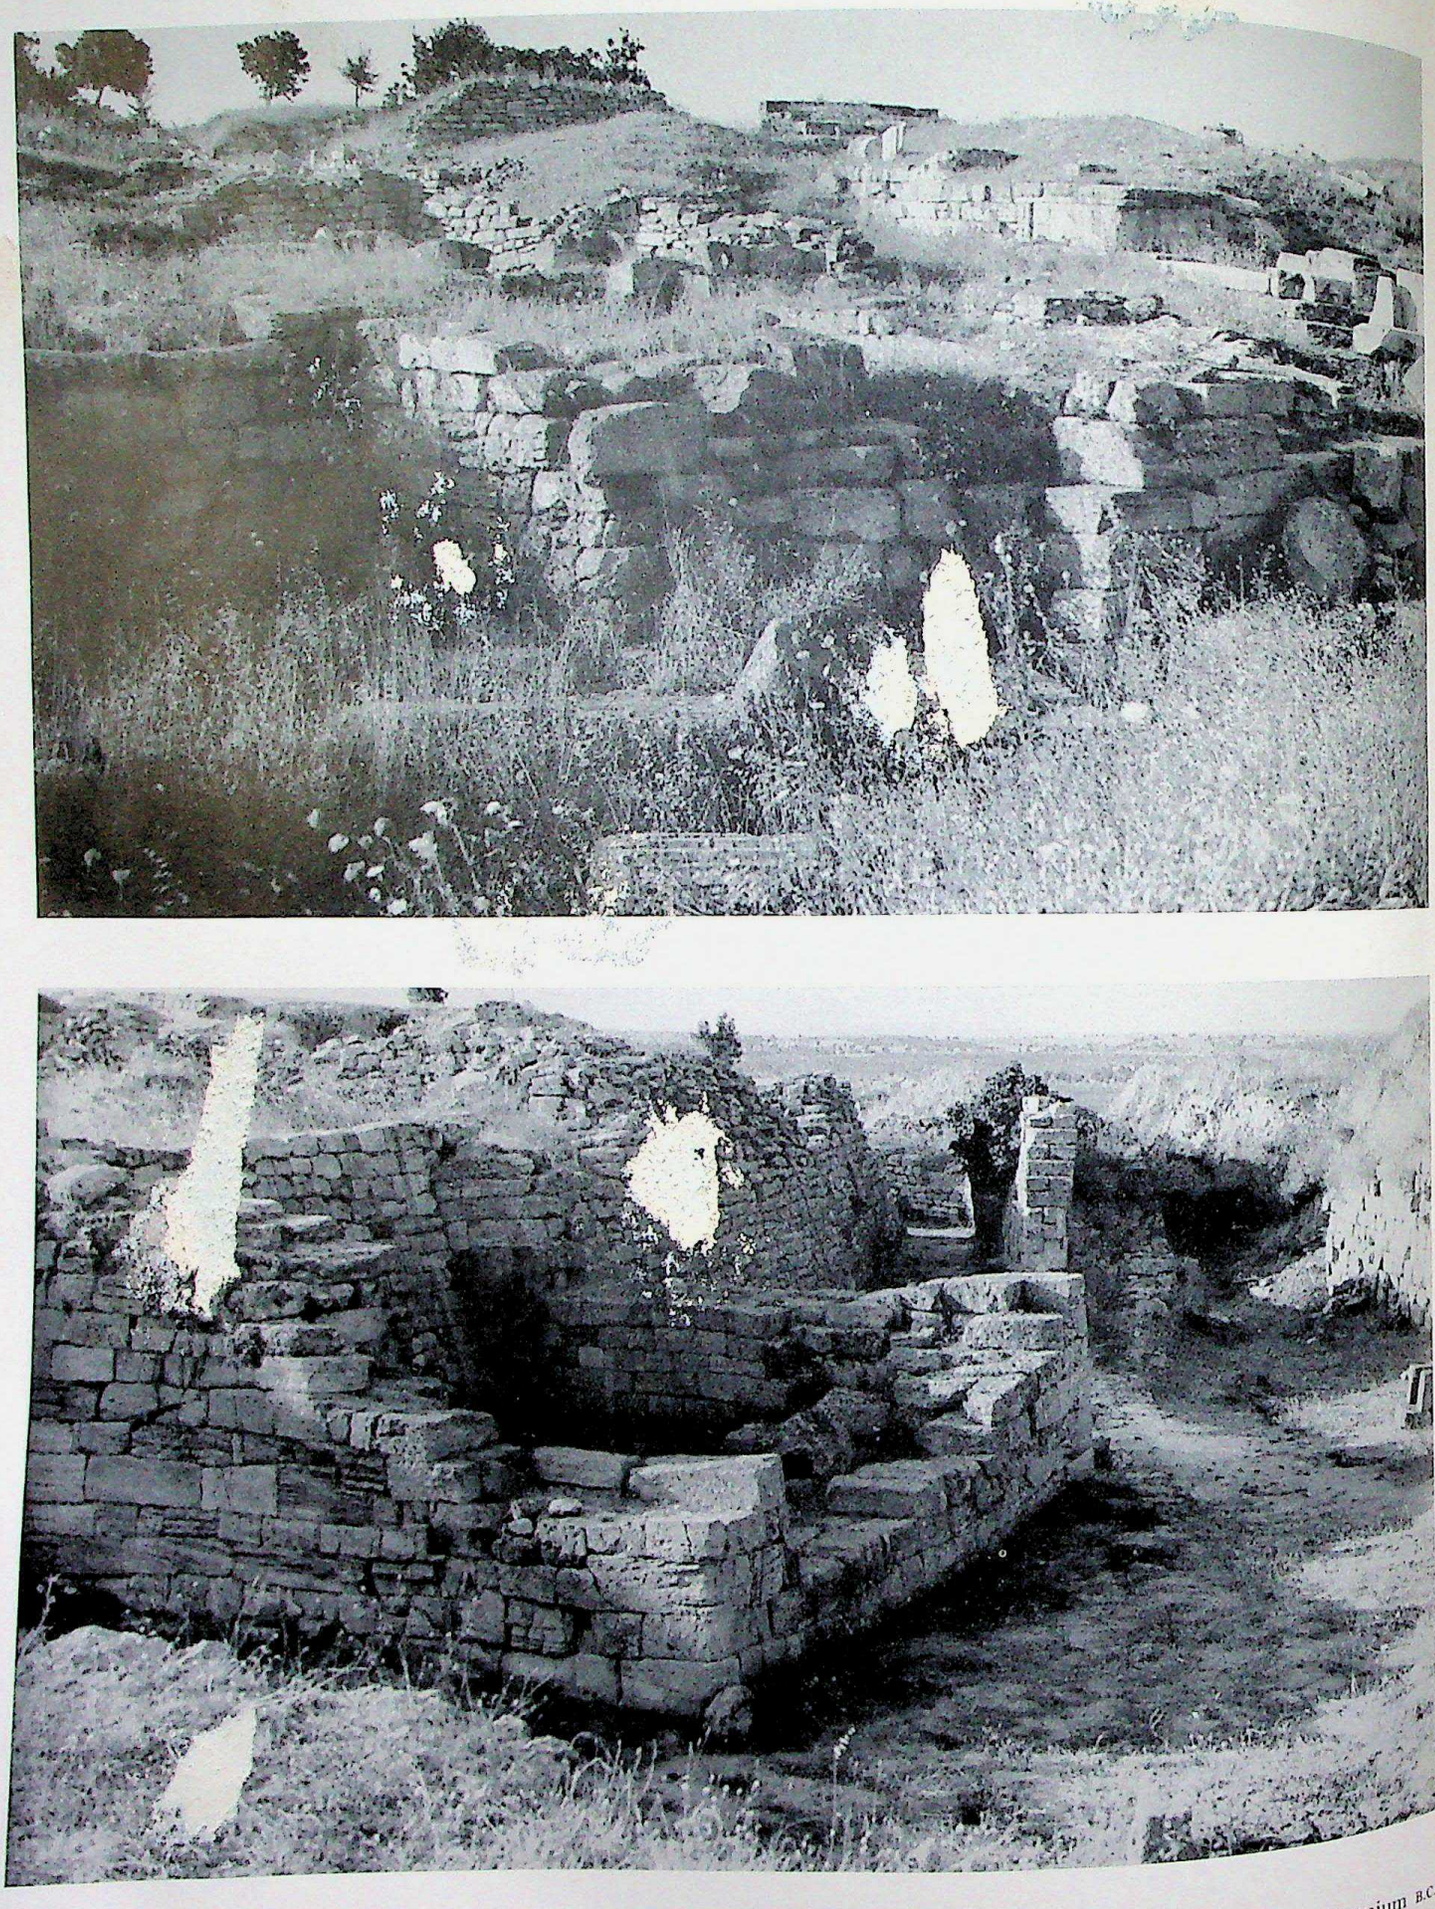
Pl. 413. Dwellings, 7th–4th millennium B.C. *Above*: Jericho, remains of a house. *Below*: Khirokitia, Cyprus, remains of a tholos.

Pl. 414. Human skull with face modeled in clay and shell eyes, Jericho, 5th millennium B.C. Amman, Jordan, Museum.

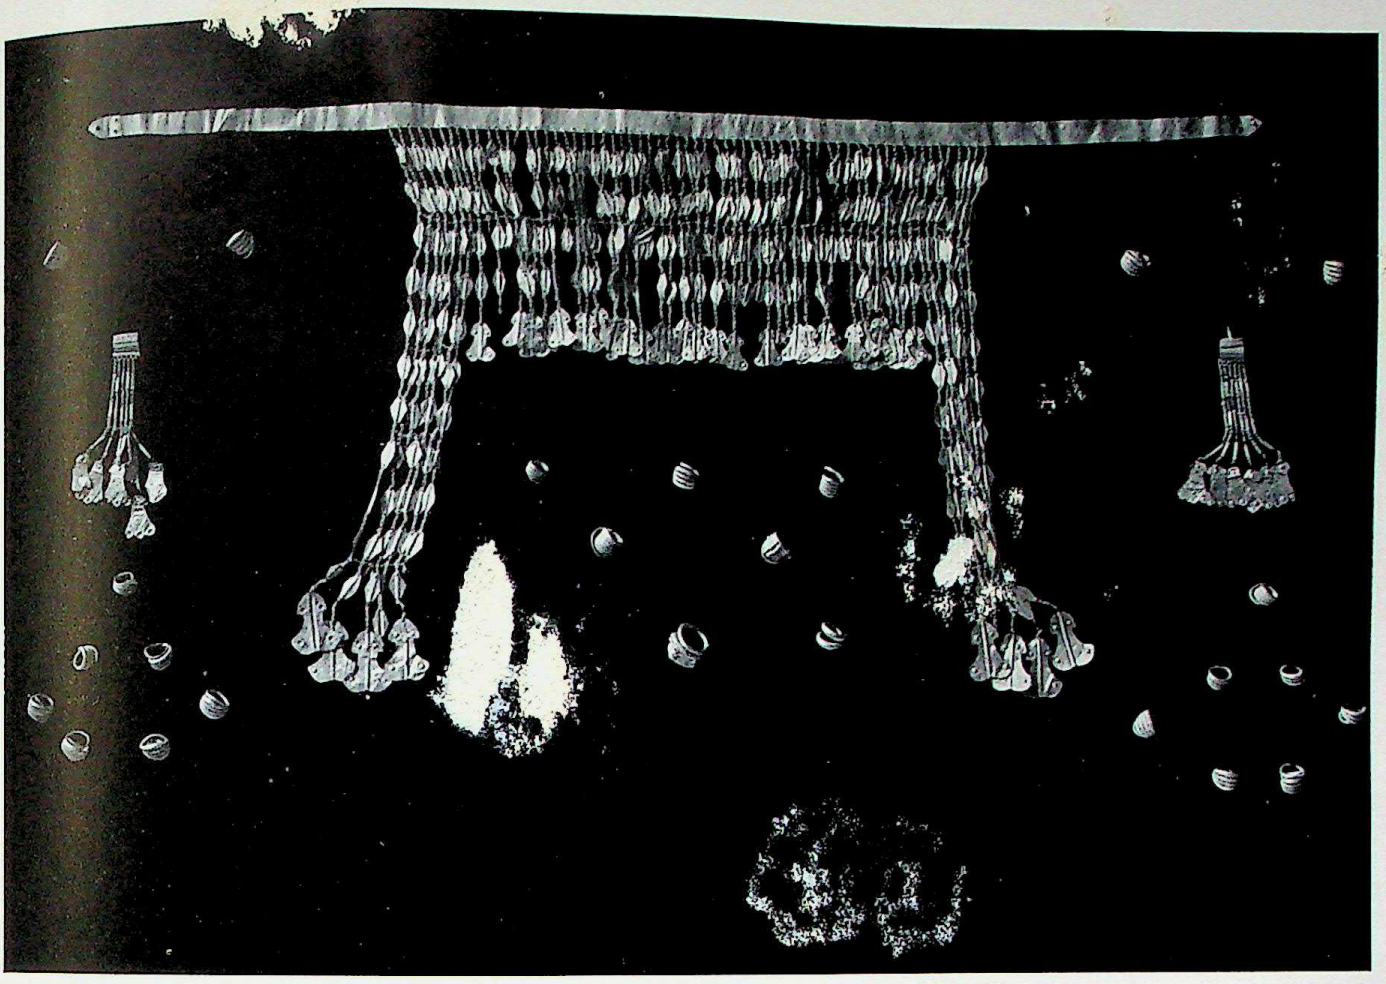


Pl. 415. Figurines, 4th millennium B.C. *Left*: From Mamariyya, Egypt. Painted pottery, ht., 11½ in. New York, Brooklyn Museum. *Right*: Al-'Ubaid culture, Ur. Clay with bitumen wig, ht., 6½ in. London, British Museum.



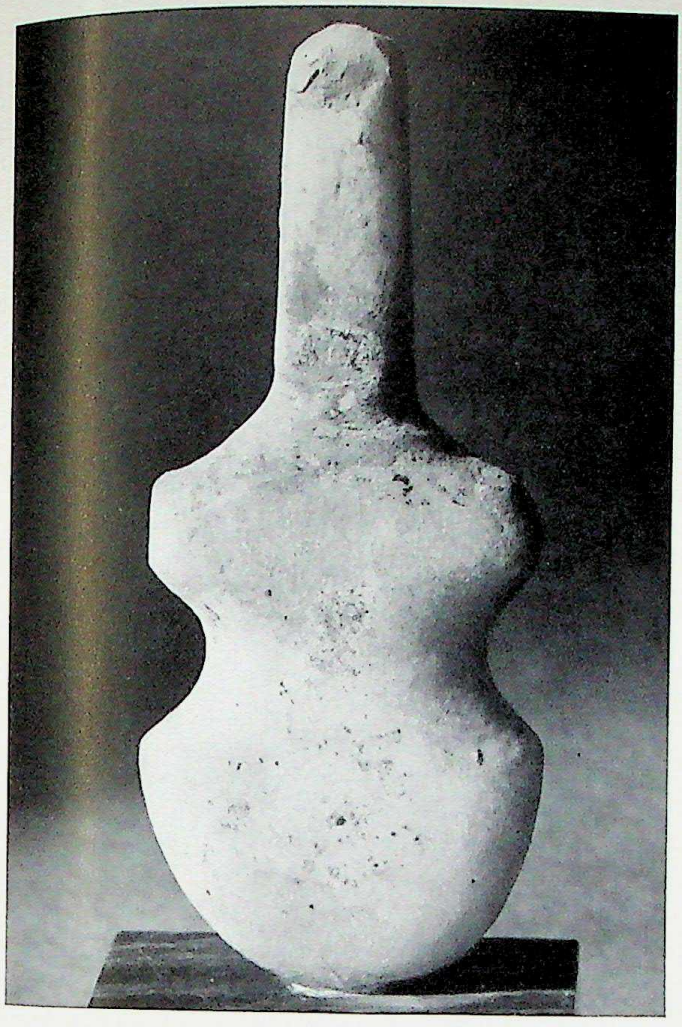


Pl. 416. Painted and incised pottery. *Left, above*: From Hacılar, Turkey, 4th millennium B.C. Ankara, Archaeological Museum. *Center*: From Tell Halaf, Syria, early 4th millennium B.C. *Below*: From Jamdat Naṣr, Iraq, early 3d millennium B.C. Paris, Louvre. *Right, above*: From Lerne, Greece, Sesklo culture, late 4th–early 3d millennium B.C. Athens, National Museum. *Center*: From Traian-Dealul Fintinilor, Romania, Cucuteni culture, second half of 3d millennium B.C. Bucharest, Archaeological Museum. *Below*: From Vukovar, Yugoslavia, Vučedol culture, late 3d–early 2d millennium B.C. Zagreb, Archaeological Museum.



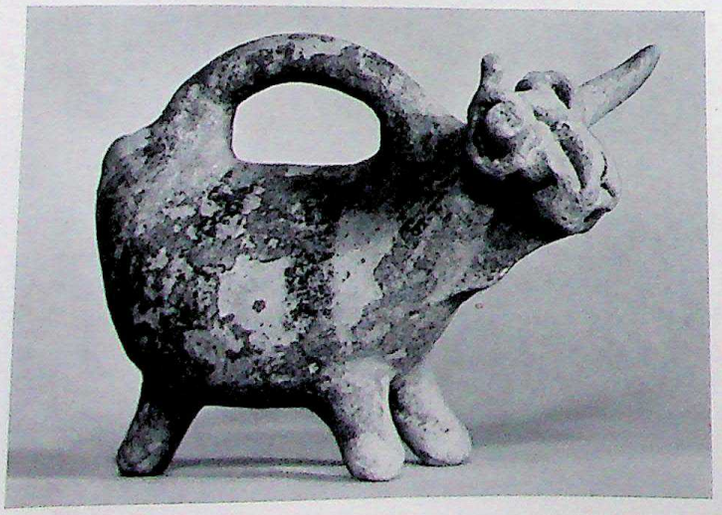
Pl. 417. Anatolian statuettes, second half of 3d millennium B.C. Ankara, Archaeological Museum. *Left*: From Alaca Hüyük. Electrum, ht., 2 3/4 in. *Right*: From Horoztepe. Bronze, ht., 8 1/2 in.

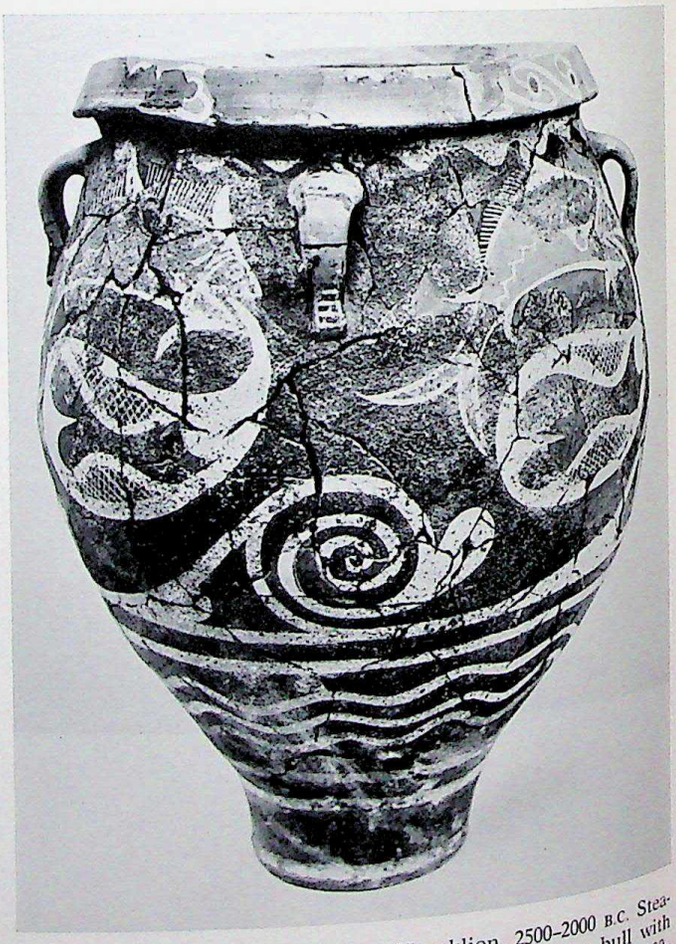
Pl. 4a. Troy (mod. Hissarlik), Turkey. *Above*: View of the city from the southwest with city walls of Troy II, 3d millennium B.C., and Troy VI, 2d millennium B.C. *Below*: View of the tower and east wall of the citadel from the southeast, Troy VI.



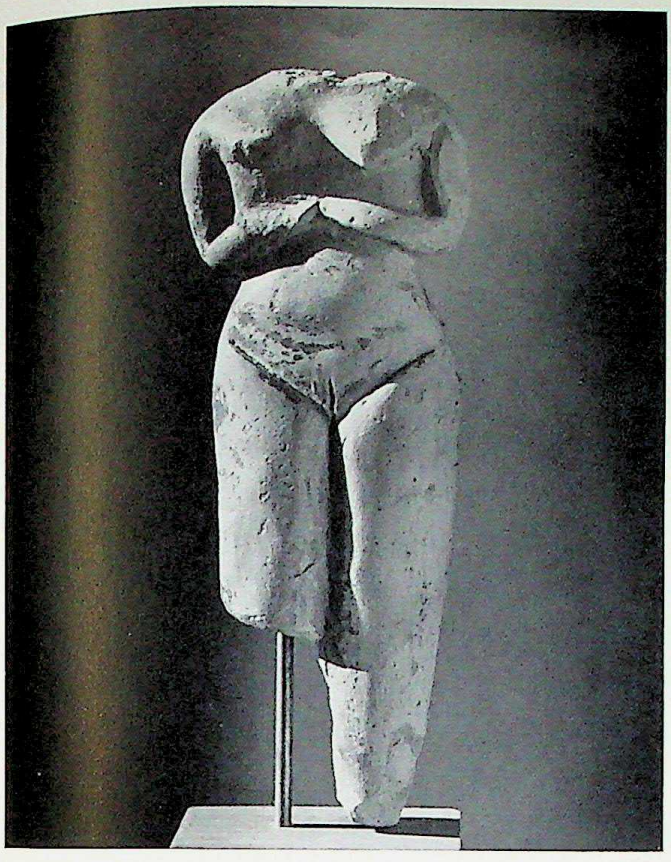
Pl. 419. Trojan culture, 3d millennium B.C. *Above*: Diadem, ear pendants, and curl spirals, from the "treasure of Priam," Troy II. Gold, max. l., 21 1/4 in. Formerly, Berlin, Museum für Völkerkunde. *Below, left*: Sculptured stele, Troy I. Limestone, ca. 39 3/8 in. *Right*: Two-handled cup (*depas amphikypellon*), Troy III. Ht., 11 3/4 in. (Partially restored.) Rome, Museo Pigorini.

Pl. 420. Lyre player, Keros, Cyclades, ca. 2000 B.C. Marble, ht., 8 7/8 in. Athens, National Museum.

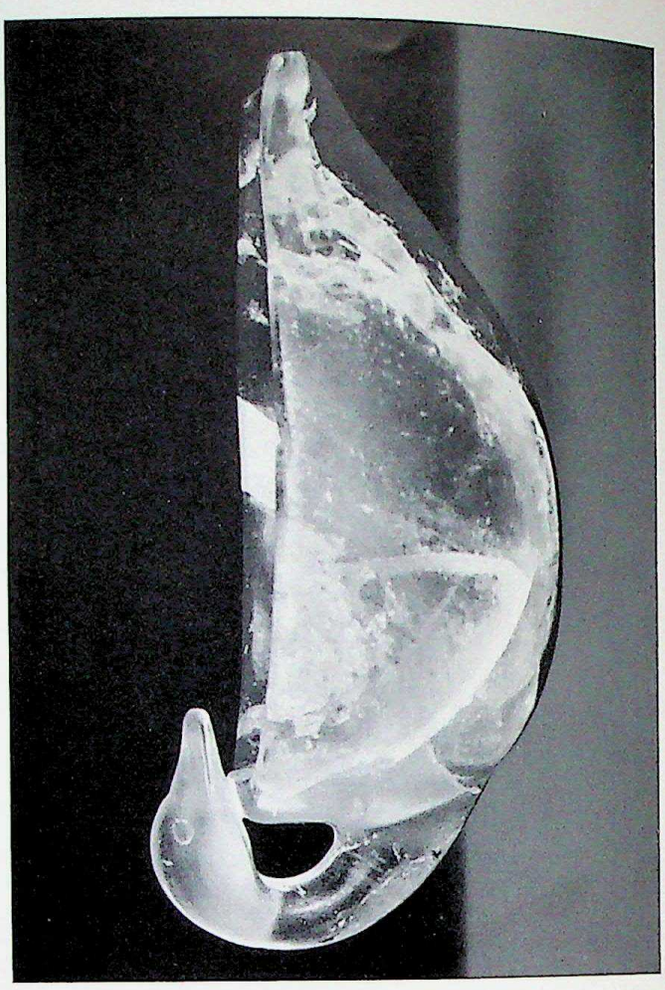


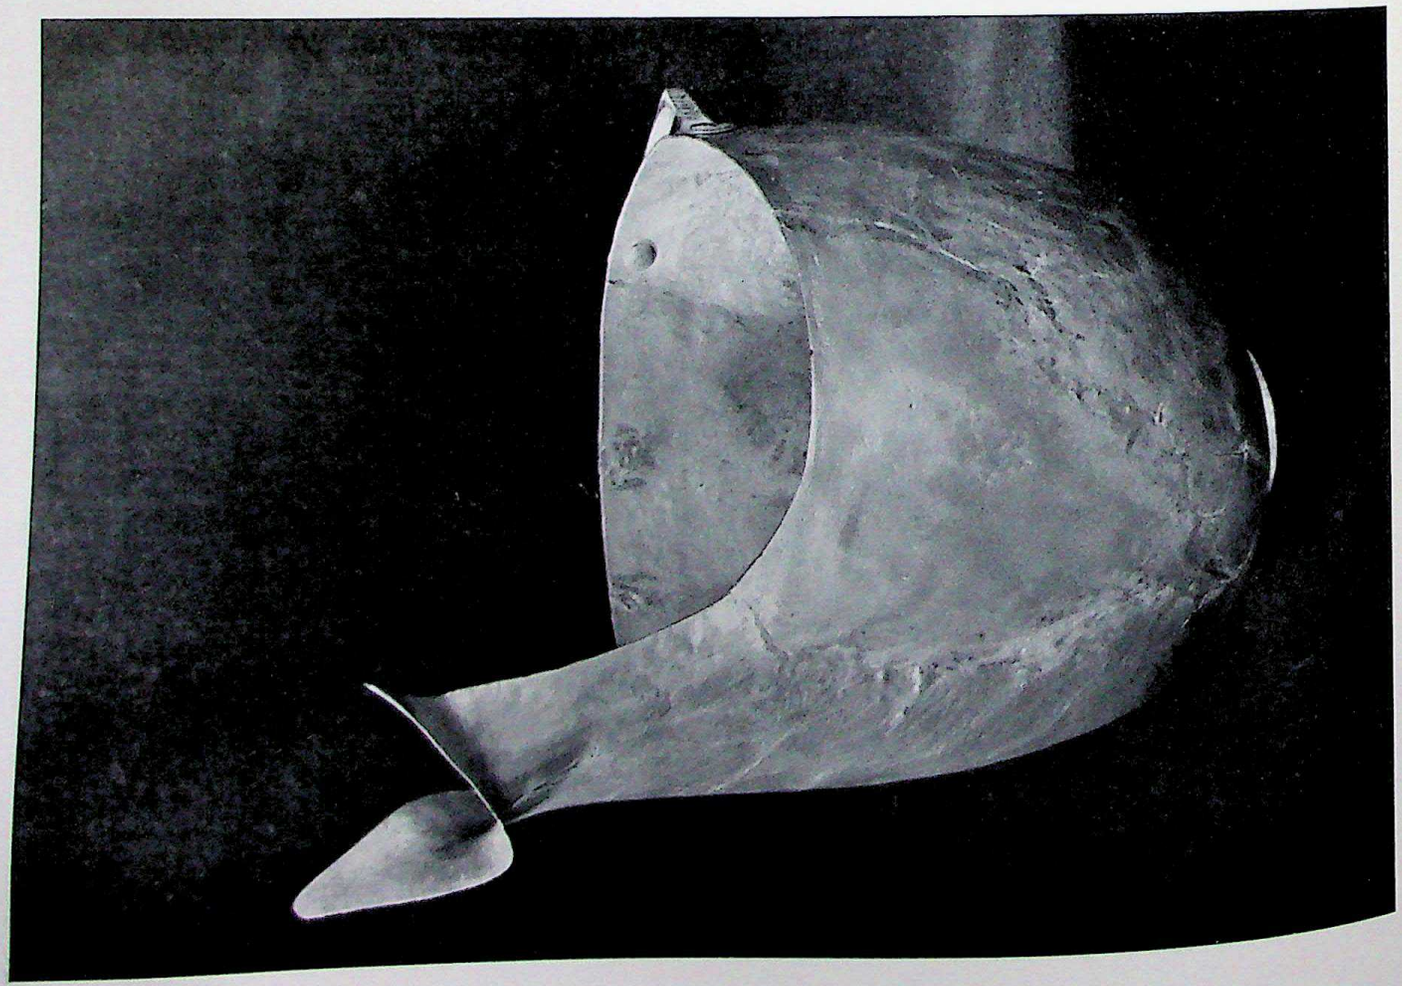


Pl. 421. Cycladic culture. *Above, left*: Violin-shaped idol, Paros, second half of 3d millennium B.C. Marble, ht., ca. 4 in. Paris, Louvre. *Right*: Idol, Naxos, second half of 3d millennium B.C. Marble, ht., 3 1/2 in. Oxford, Ashmolean Museum. *Below, left*: "Pan-shaped" vessel, Syros, ca. 2000 B.C. Terra cotta, diam., 11 3/4 in. Paris, Louvre. *Right*: Painted pitcher, Lerne, Greece, 1700–1400 B.C. Ht., 12 1/8 in. Athens, National Museum.

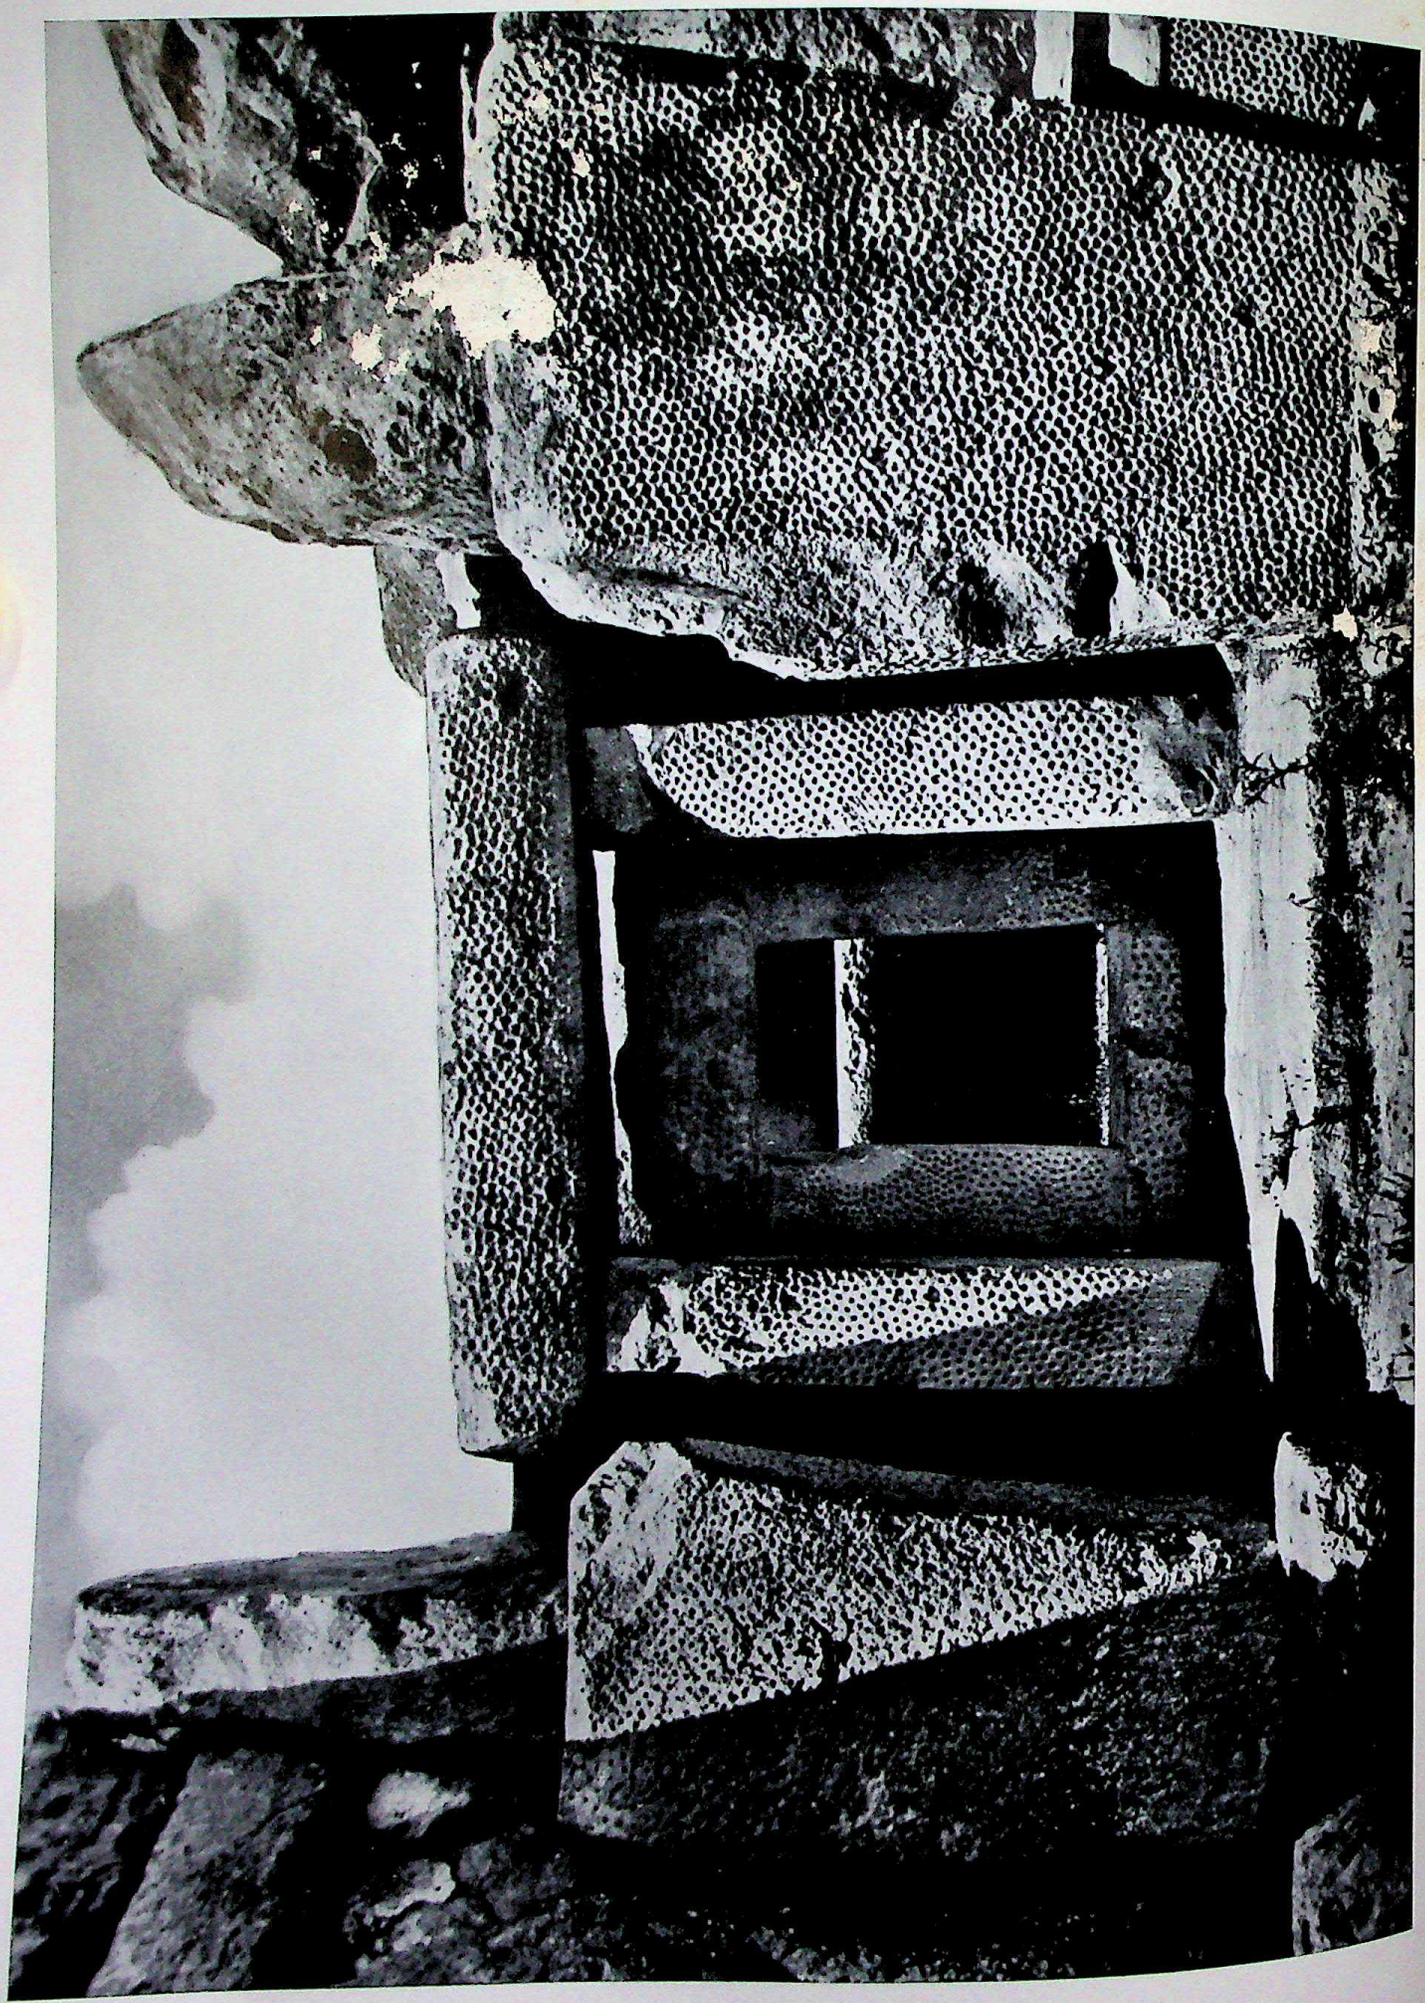


Pl. 422. Cretan culture. Heraklion, Archaeological Museum. *Above*: Twin idols of Cycladic type, Tekes, Heraklion, 2500–2000 B.C. Steatite, ht., 2 in. *Left, center*: Teapot vase in Vasiliki style, 2300–2000 B.C. Ht., 7 1/2 in. *Below*: Askos in the form of a bull with acrobats between the horns, Koumasa, 2300–2000 B.C. Terra cotta, l., 8 1/8 in. *Right*: Pithos in Kamares style, Phaistos, 1800–1700 B.C. Ht., ca. 19 3/4 in.

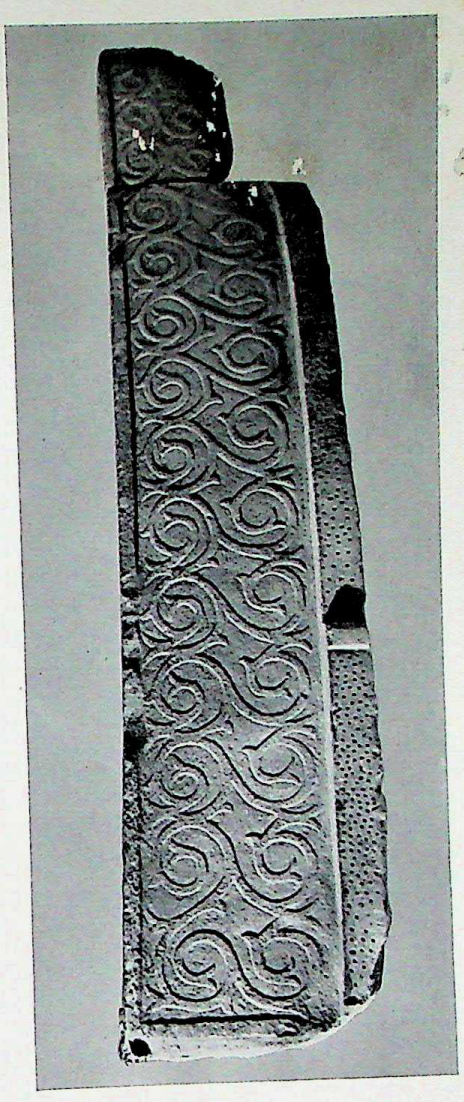




Pl. 423. *Above, left*: Statuette, Sesklo culture, Lerne, Greece, early 3d millennium B.C. Terra cotta, ht., 7 1/8 in. Corinth, Archaeological Museum. *Right*: Female figurine, Lerne, second half of 3d millennium B.C. Terra cotta, ht., 4 1/8 in. *Below*: Fragment of wall painting with flying fish, Phylakopi, Melos, second half of 3d millennium B.C. Ht., 9 1/8 in. (After a water-color reproduction.) Last two, Athens, National Museum.



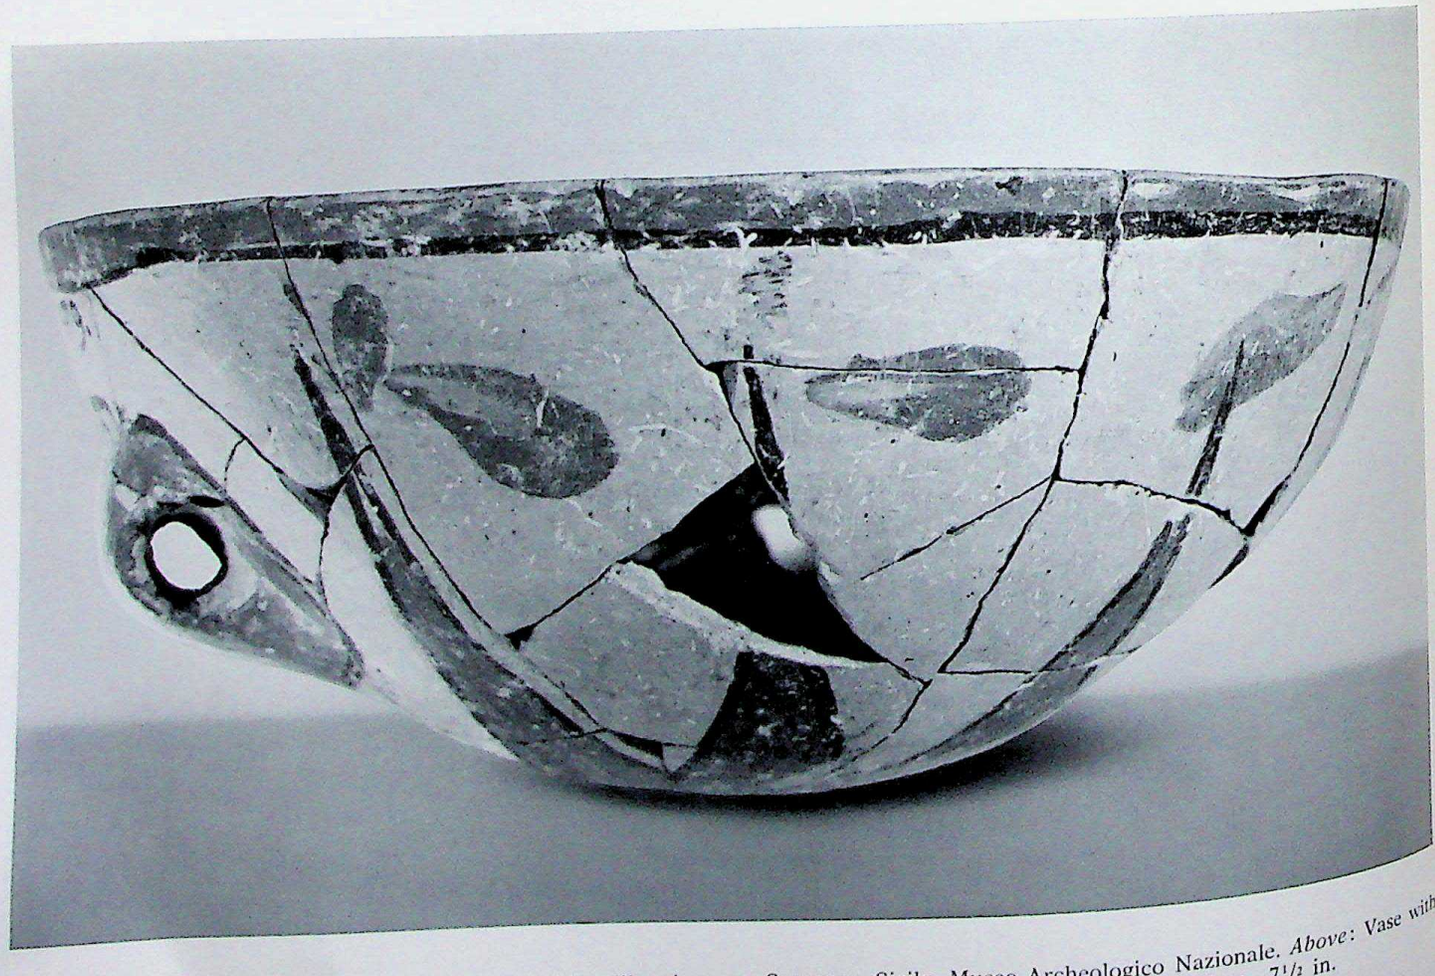
Pl. 424. Helladic culture. *Left:* "Sauceboat," Mycenae, ca. 2500–1950 B.C. Gold, ht., 8⅜ in. Paris, Louvre. *Right, above:* Matt-painted cup, Lerne, ca. *1950–1700* B.C. Ht., 4⅞ in. *Below:* Toilet vase in the shape of a duck, Mycenae, 1600–1500 B.C. Rock crystal. Last two, Athens, National Museum.



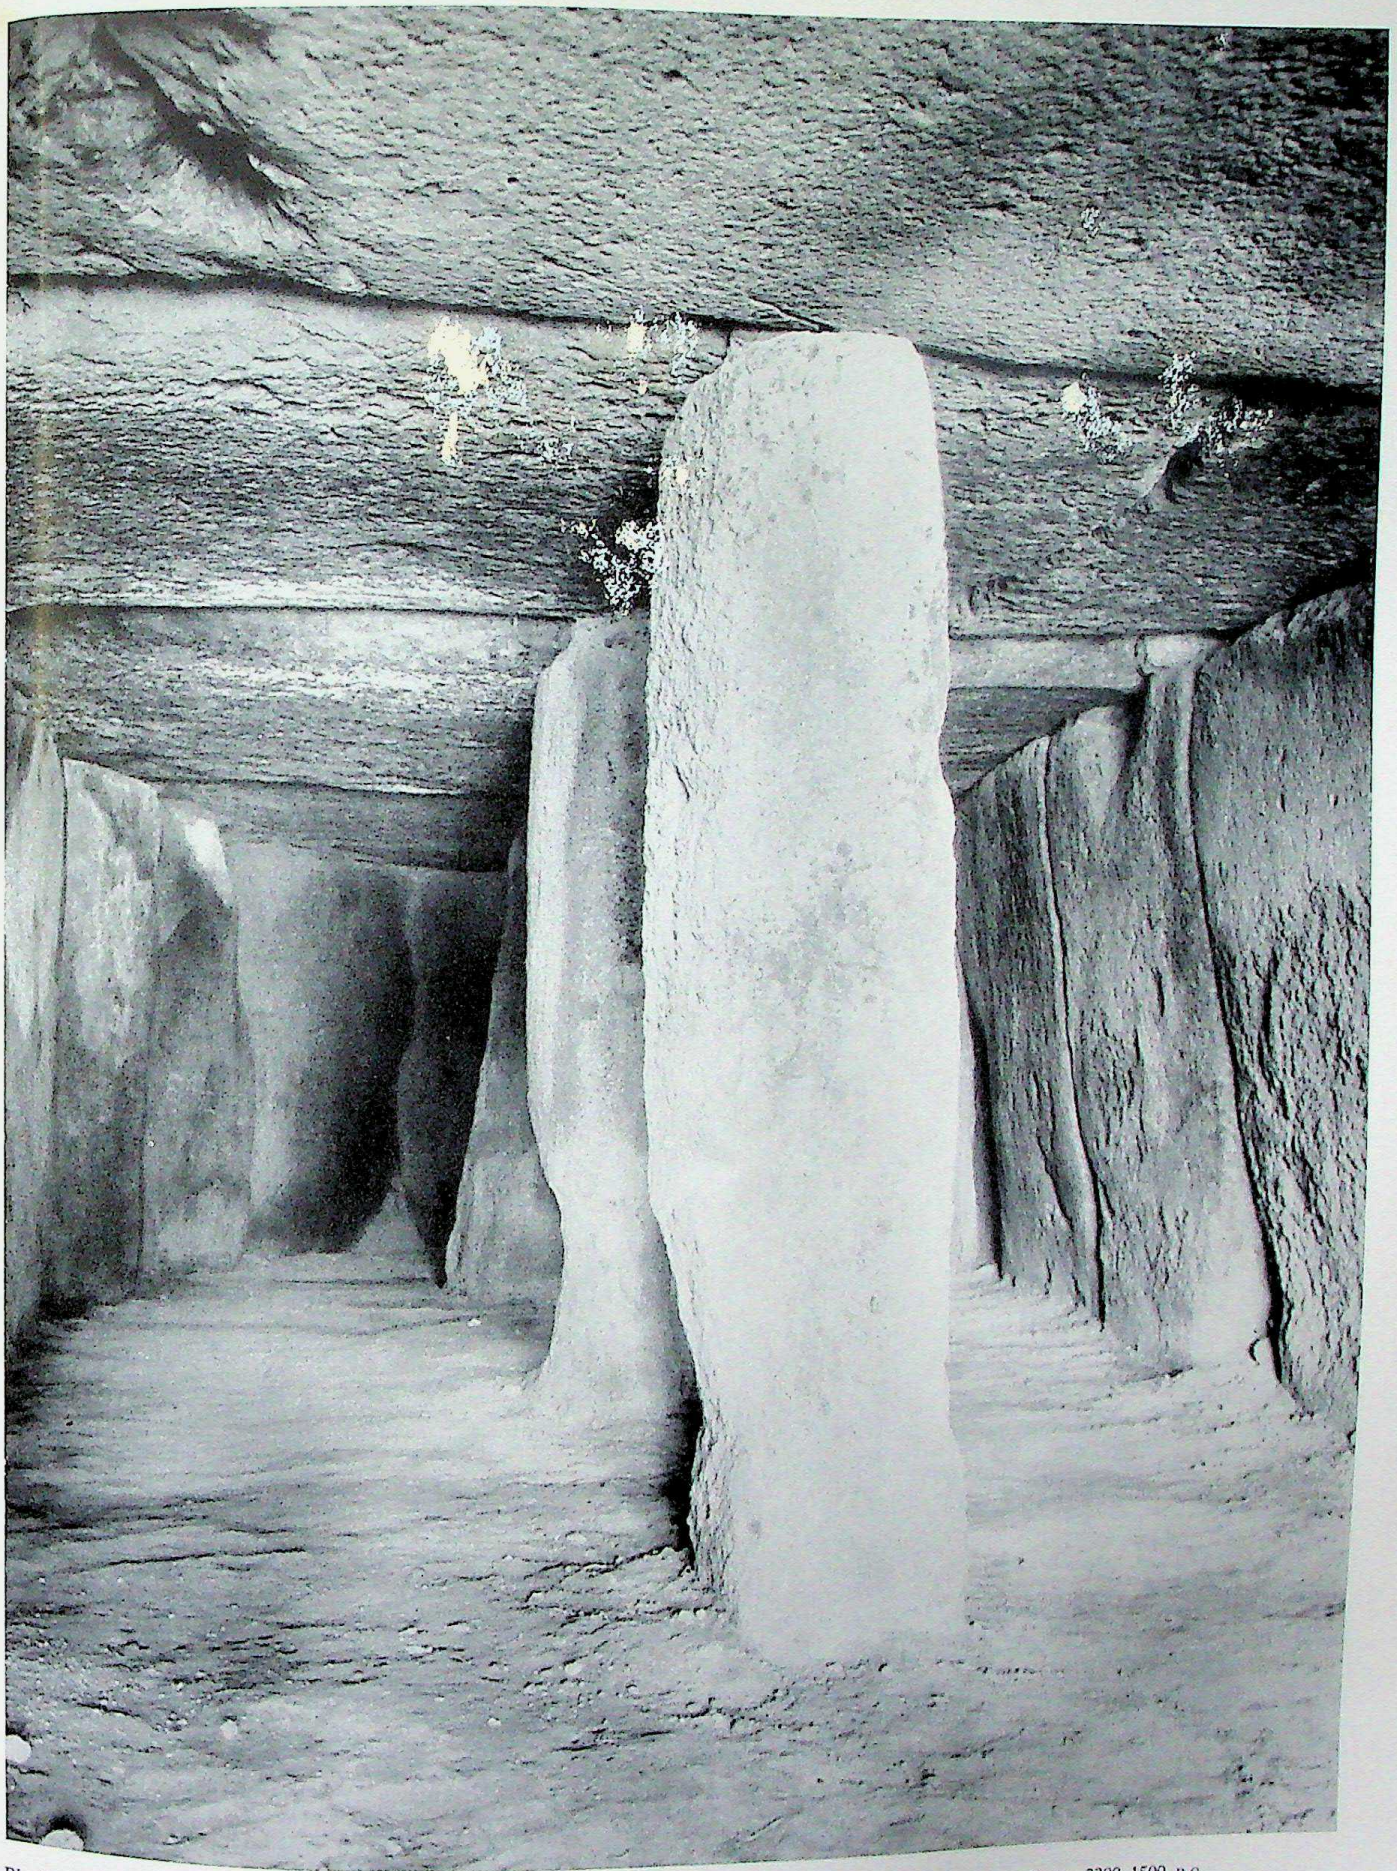
Pl. 425. Mycenae, royal tomb circle from the northeast, 1600–1500 B.C.

Pl. 426. Malta, Mnaidra, entrance of a megalithic "temple," second half of 3d millennium B.C.

Pl. 426. Malta, Mnaidra, entrance of a megalithic "temple," second half of 3d millennium B.C.



Pl. 427. Maltese culture, second half of 3d millennium B.C. Valletta, Museum. *Above*: Architectural relief with animals, Hal Tarxien. Limestone. *Below, left*: Idol, from the hypogeum of Hal Saflieni. Limestone. *Center*: Architectural relief with spiral decoration, Hal Tarxien. Limestone. *Right*: Architectural element with spiral decoration, Bugibba, St. Paul's Bay. Limestone.

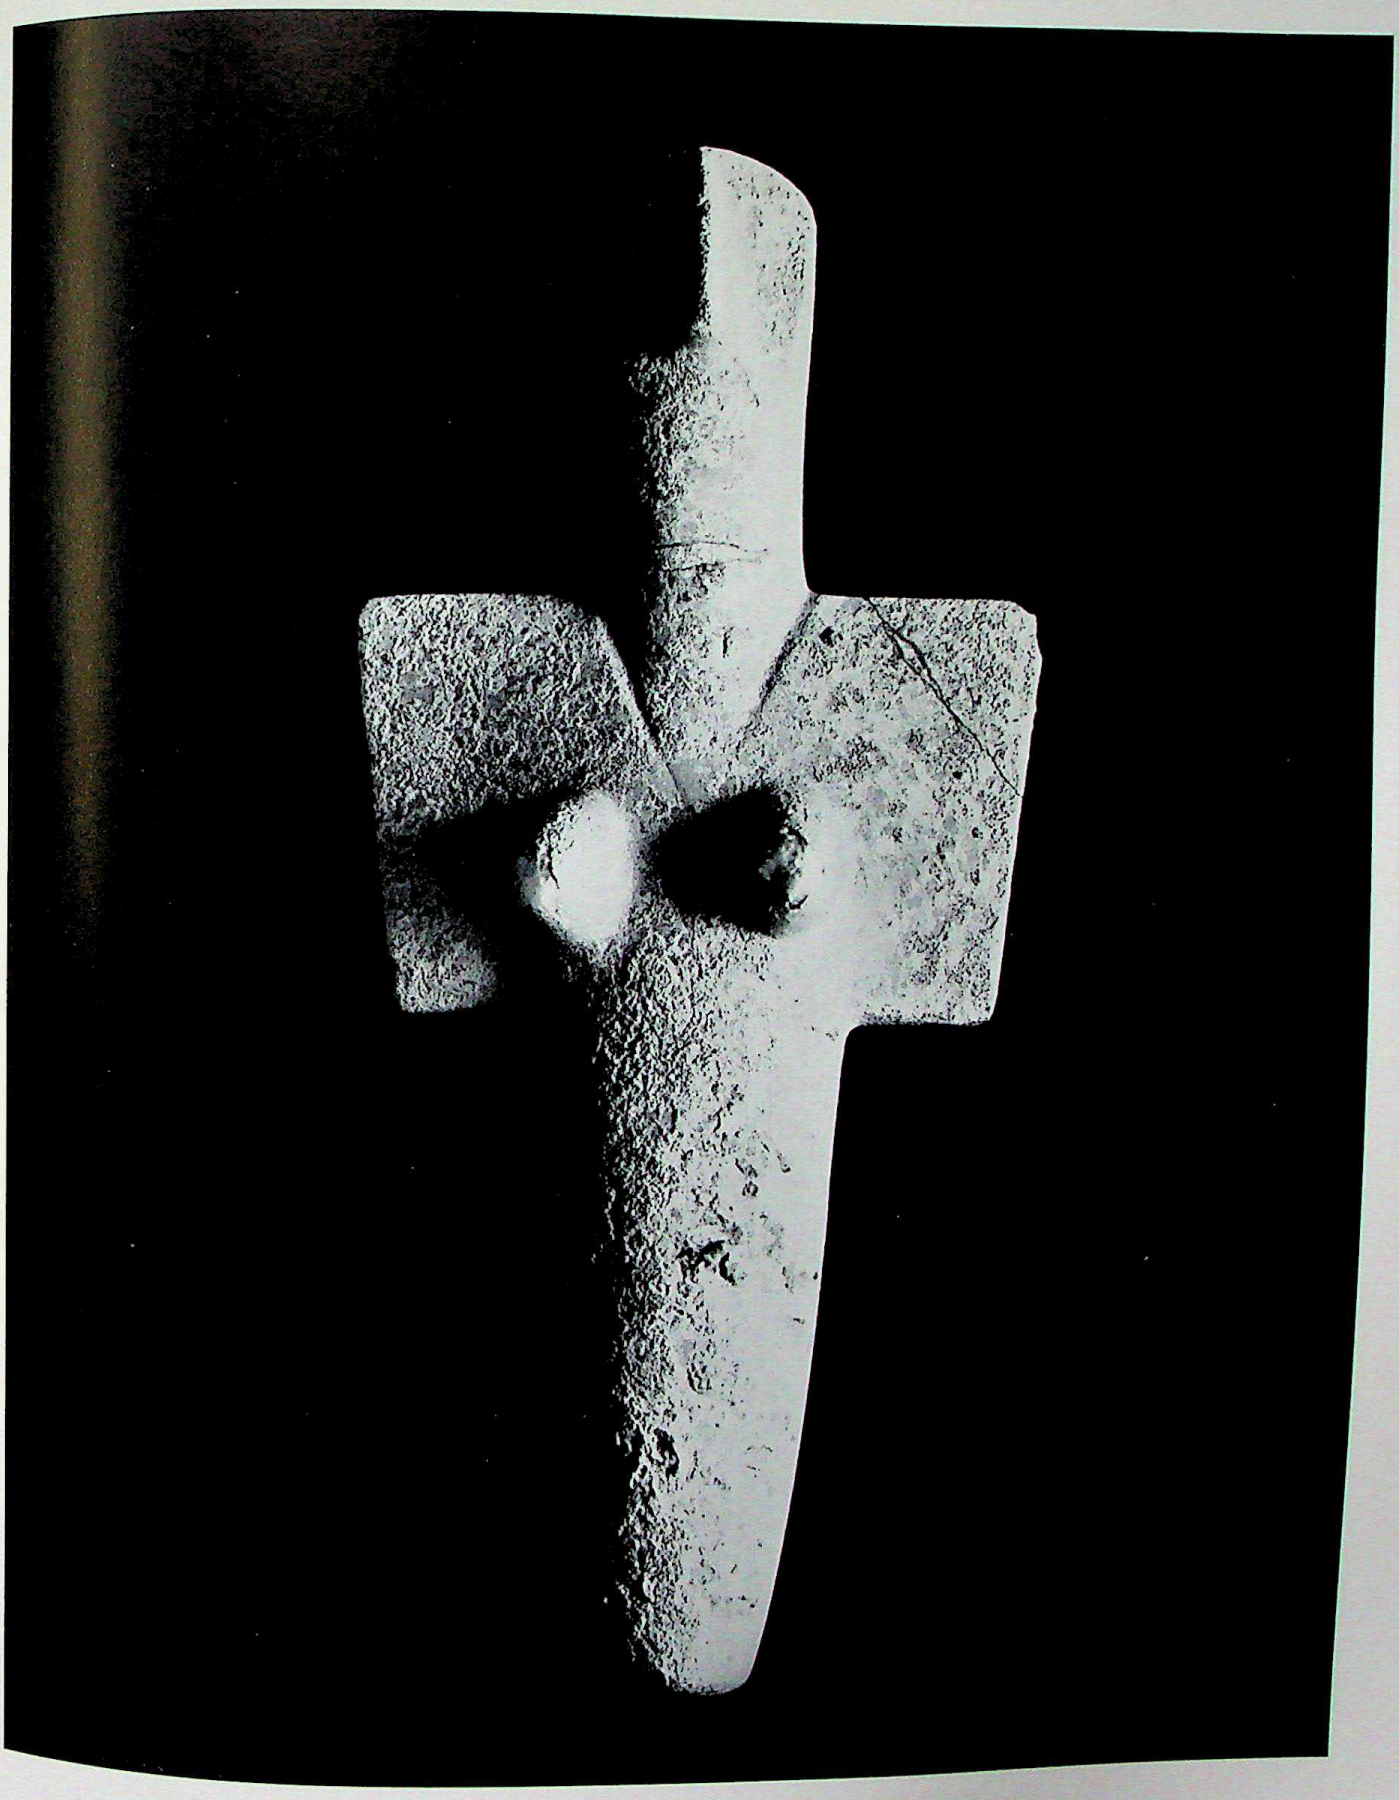


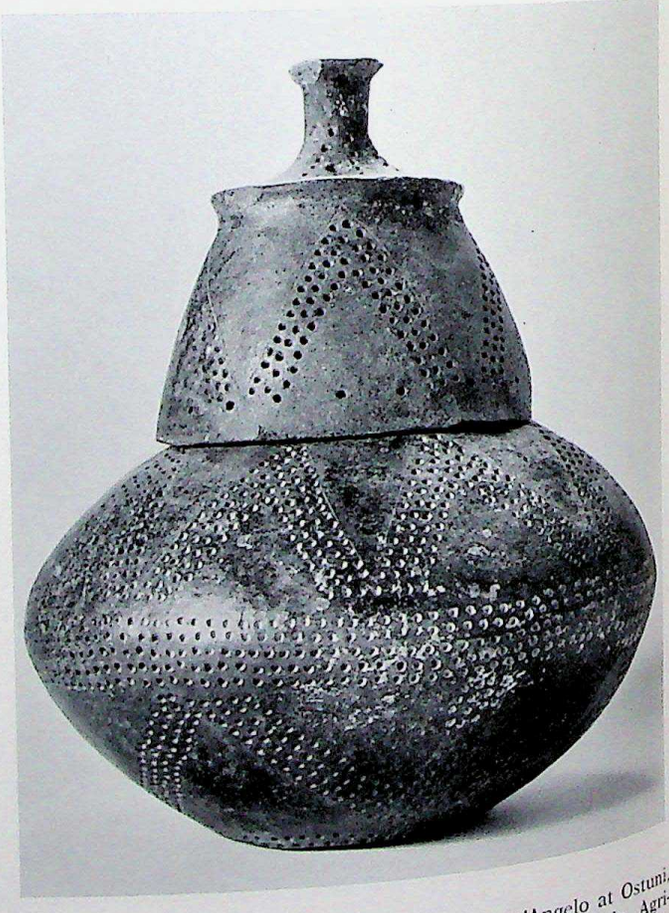
Pl. 428. Pottery in Stentinello style, Sicily, mid-4th millennium B.C. Syracuse, Sicily, Museo Archeologico Nazionale. *Above*: Vase with impressed decoration, Naxos, near Messina. Diam., 8½ in. *Below*: Painted cup, Megara Hyblaea. Diam., 7½ in.

Pl. 429. Painted pottery, Serra d'Alto, near Matera, Italy, 3d millennium B.C. Matera, Museo Nazionale. *Above*: Ht., 4 3/8 in. *Below*: Ht., 6 3/8 in.

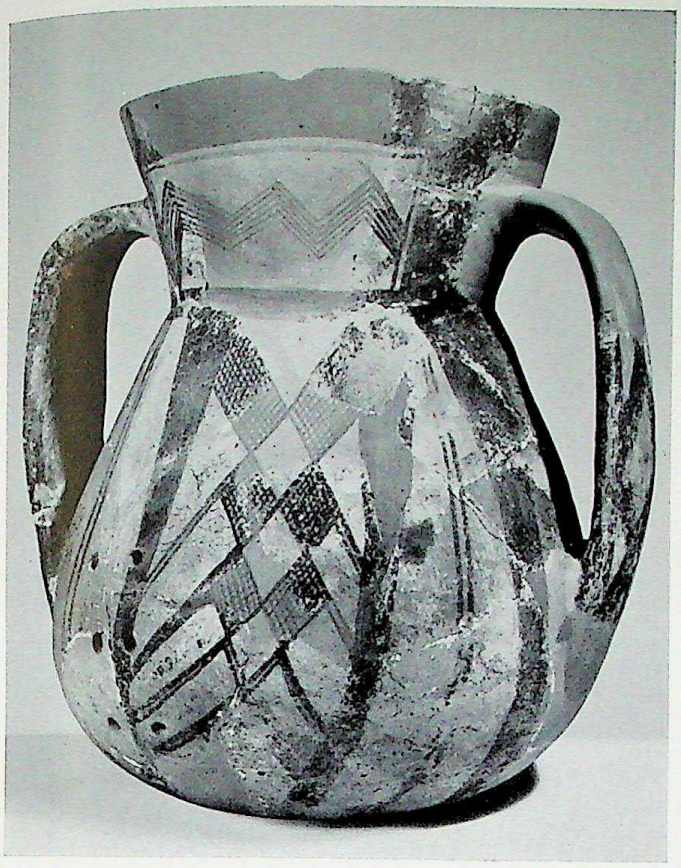
Pl. 430. "Fruit stand," Vallelunga, near Caltanissetta, Sicily, ca. 1700–1400 B.C. Syracuse, Sicily, Museo Archeologico Nazionale.

Pl. 431. Antequera, near Málaga, Spain, megalithic sepulcher known as Cueva de Menga, interior gallery, 2200–1500 B.C.

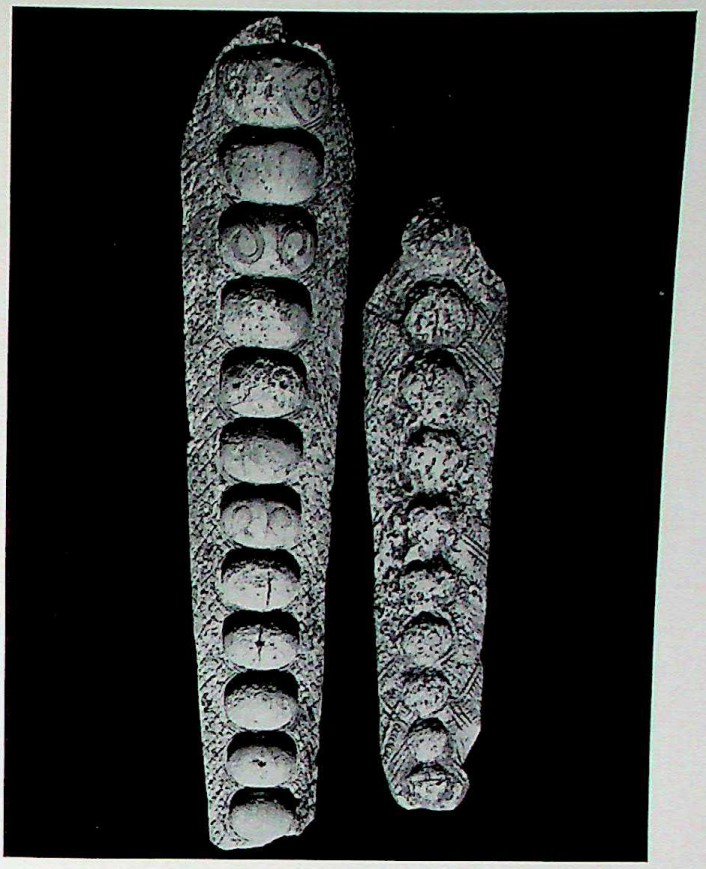


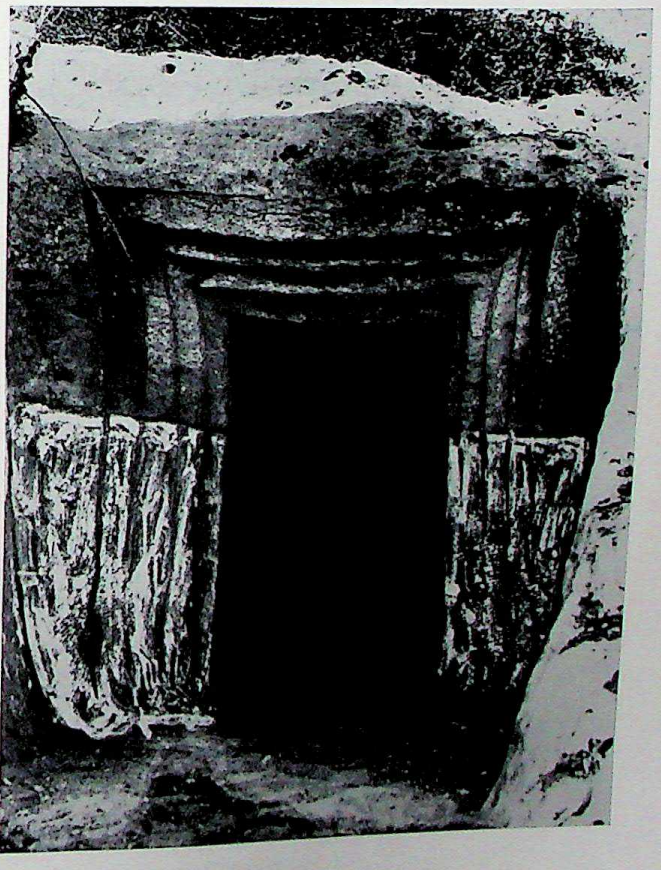


Pl. 432. Iberian Peninsula and Sardinia. *Above, left*: Idol with schematized human figure, from a megalithic tomb in Estremadura, second half of 3d millennium B.C. Alabaster, ht., 7⅞ in. *Right*: Two views of a bowl, from Los Millares, near Almería, Spain, late 3d–early 2d millennium B.C. Both, Madrid, Museo Arqueológico Nacional. *Below, left*: Bell beaker, from Brichs, Spain, late 3d–early 2d millennium B.C. Solsona, Spain, Museo Diocesano. *Right*: Tripod, from the cave of S. Bartolomeo at Capo Sant'Elia, near Cagliari, Sardinia, late 3d–early 2d millennium B.C. Ht., ca. 4 in. Rome, Museo Pigorini.

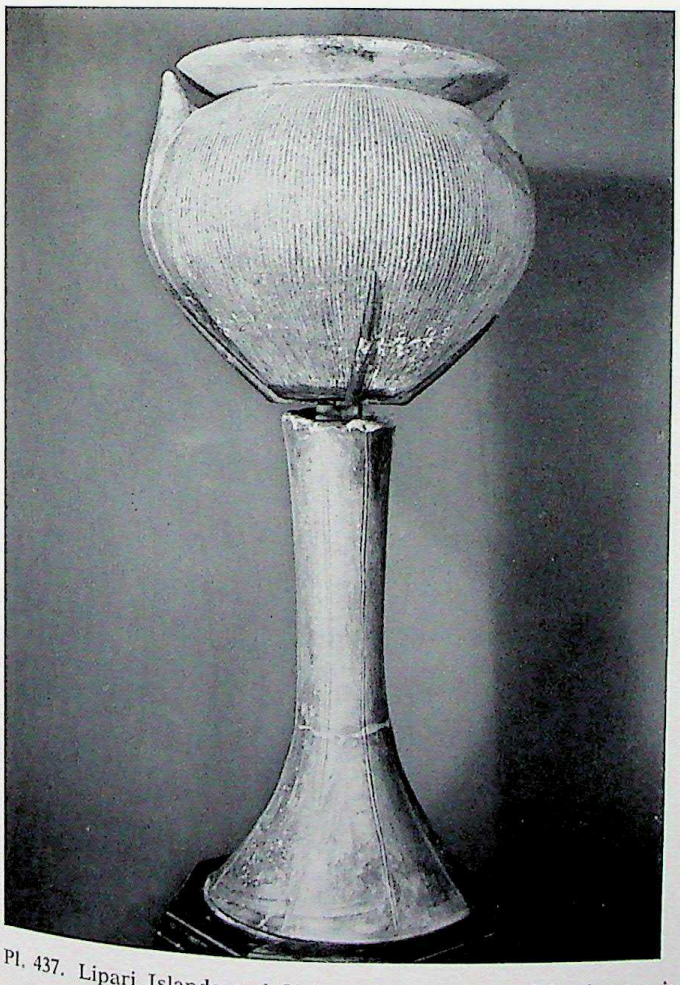


Pl. 433. Schematic female statuette, Senorbì, near Cagliari, Sardinia, early 3d millennium B.C. Limestone, ht., ca. 17 in. Cagliari, Museo Archeologico Nazionale.



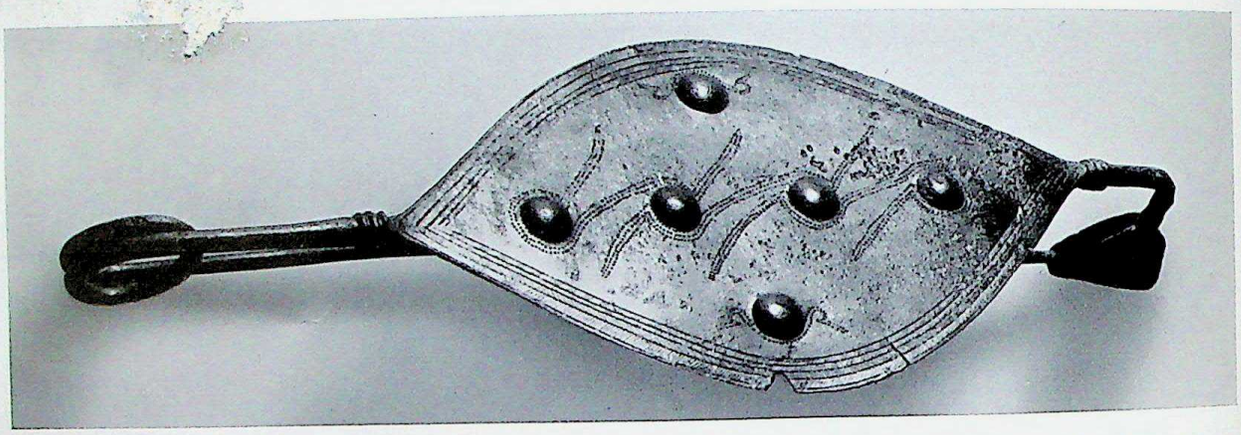


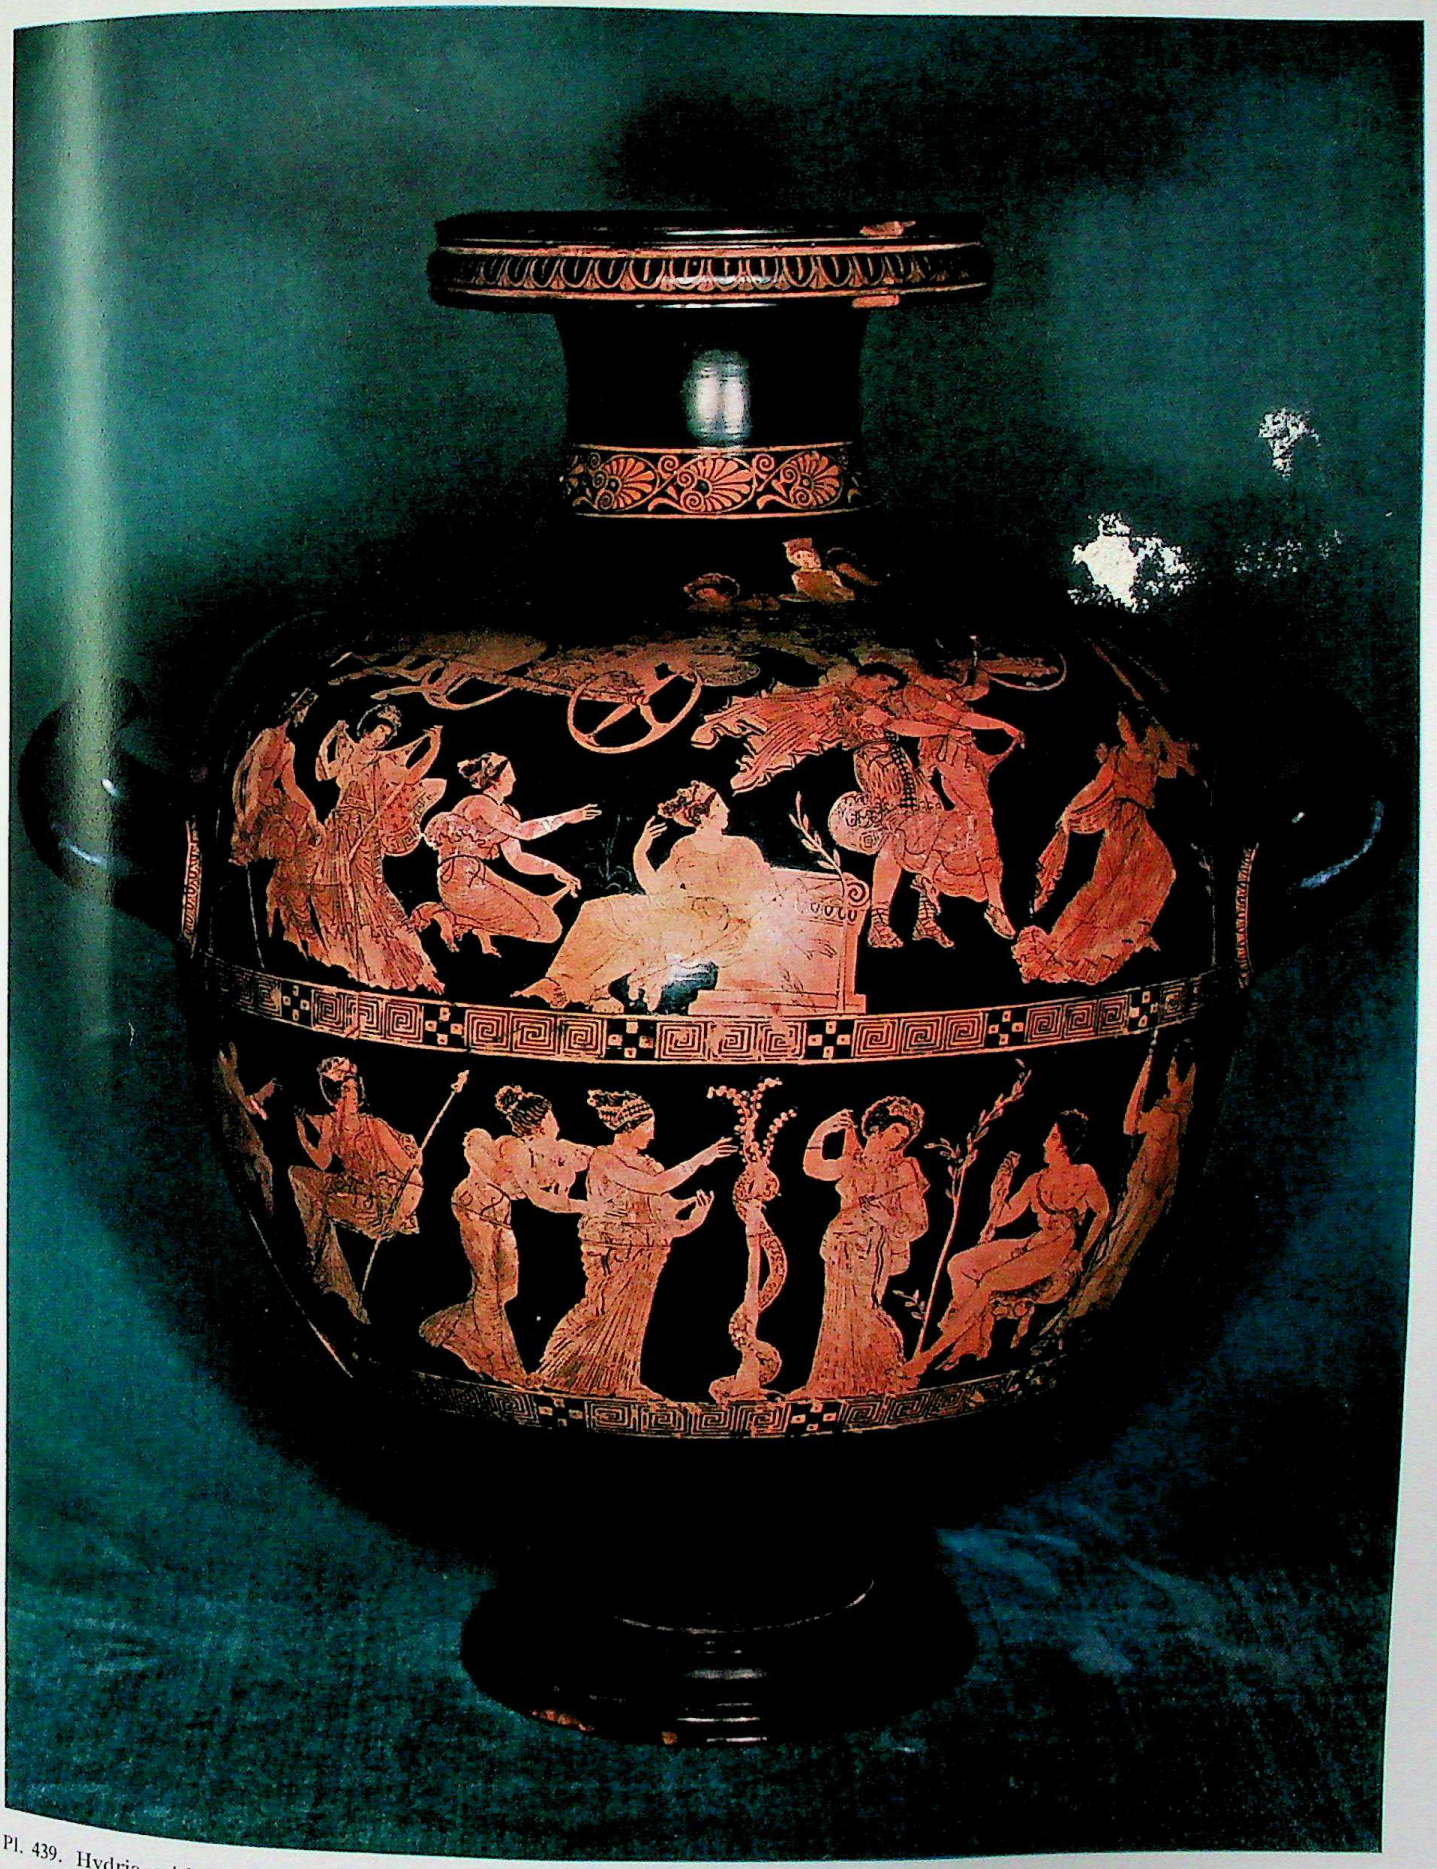
Pl. 434. Pottery, Italy. *Above*: Fragment of a bowl with impressed and sgraffito decoration, from the grotto of Sant'Angelo at Ostuni, near Brindisi, late 3d millennium B.C. Taranto, Museo Nazionale. *Below, left*: Vase painted in Serraferlicchio style, Agrigento, late 3d millennium B.C. (?). Ht., 9 1/2 in. Agrigento, Museo Civico Archeologico. *Right*: Vessel, Mirabella Eclano, near Avellino, first half of 2d millennium B.C. Ht., 8 5/8 in. Mirabella Eclano, Antiquario.



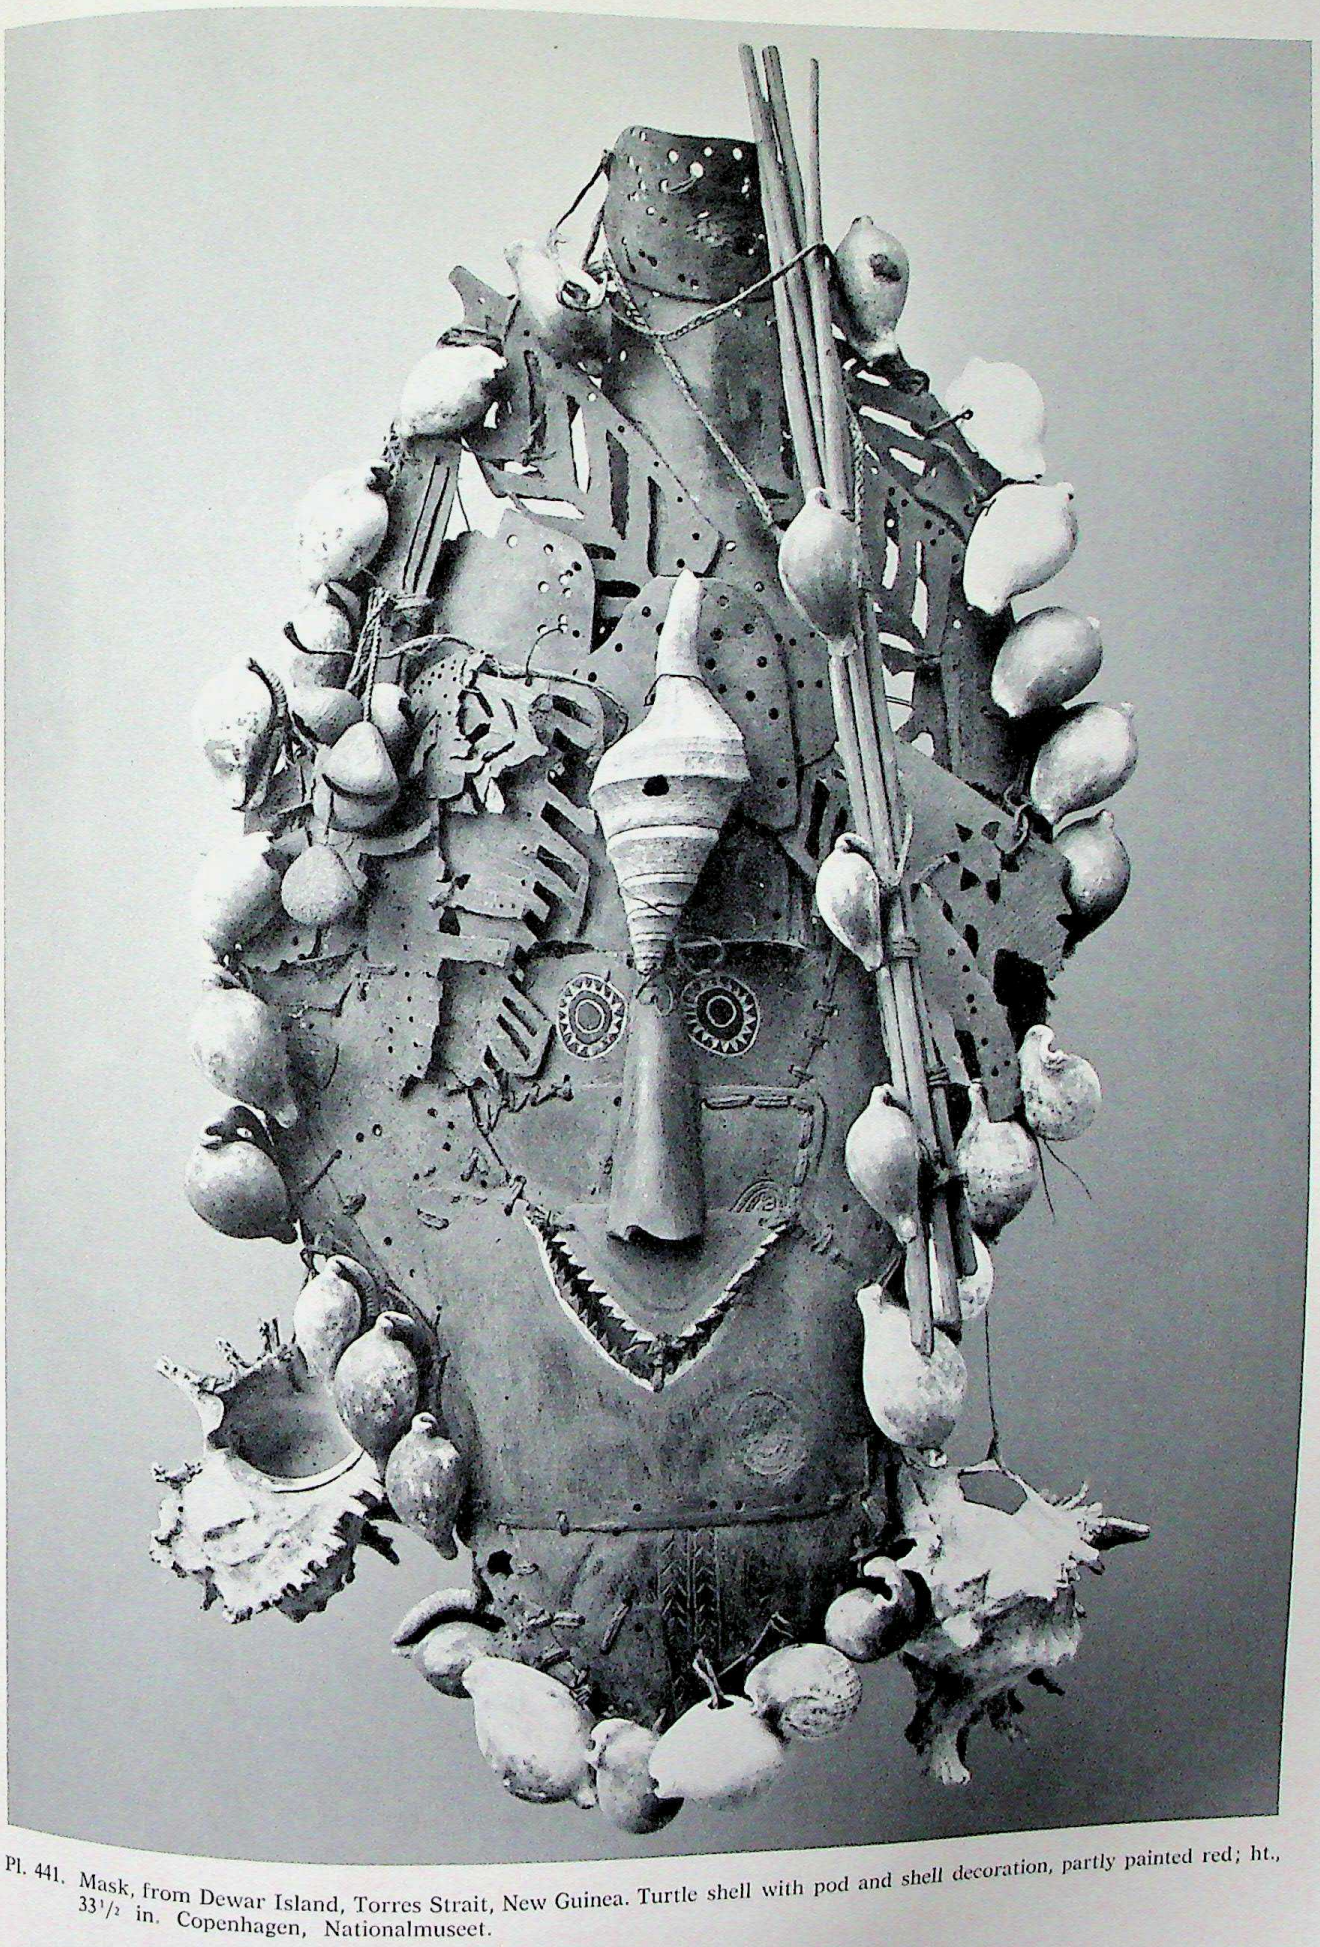
Pl. 435. Sicily. *Above, left*: Painted vase in Castelluccio style, Monte Tabuto, near Comiso, 1800–1400 B.C. Ht., 13 1/8 in. *Right*: Bossed bone objects, Castelluccio, near Noto, ca. 1800–1400 B.C. Ht. of longer, 6 1/2 in. *Below, left*: Carved door slab from a rock-cut tomb, Castelluccio, ca. 1800–1400 B.C. Limestone, ht., 39 1/8 in. All three, Syracuse, Sicily, Museo Archeologico Nazionale. *Right*: Cassibile, near Syracuse, entrance of a rock-cut tomb, ca. 1000–850 B.C.

Pl. 436. Spain. *Above*: Pottery, El Argar culture, El Oficio, 1500–1000 B.C. Barcelona, Museo Arqueológico. *Below*: Funerary stele, Solana de Cabañas, Logrosán, 1000–800 B.C. Stone. Madrid, Museo Arqueológico Nacional.





Pl. 437. Lipari Islands and Sicily. *Above*: Panarea Island, remains of a village, ca. 2000–1300 B.C. *Below, left*: High-footed vase of monochrome red ware, from Pantalica, 1200–1000 B.C. Ht., 42½ in. Syracuse, Sicily, Museo Archeologico Nazionale. *Right*: Pitcher, Ausonian II culture, Lipari, ca. 1150–850 B.C. Ht., 13 in. Lipari, Museo Eoliano.

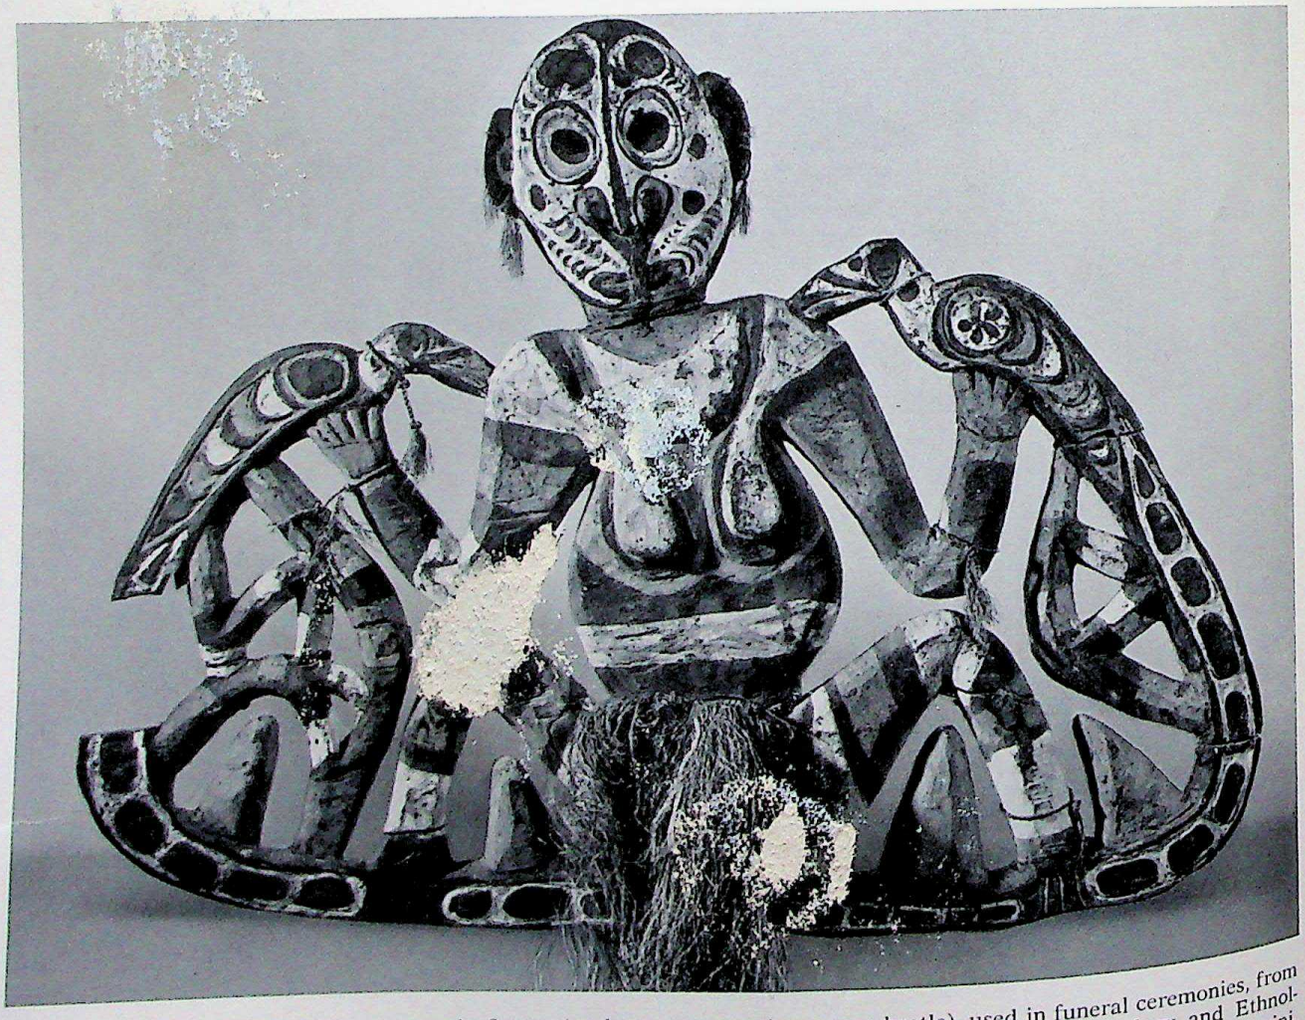


Pl. 438. Central Italy. *Above*: Vase in Appennine style, Belverde, near Chiusi, second half of 2d millennium B.C. Ht., $2^{3}/_{8}$ in. Perugia, Italy, Musei Civici. *Center and below*: Coste del Marano, near Tolfa, early 1st millennium B.C. Bronze. Rome, Museo Pigorini. *Center*: Fibula. L., $10^{7}/_{8}$ in. *Below*: Bowl. Diam., $5^{7}/_{8}$ in.

Pl. 439. Hydria, with the rape of the daughters of Leukippos, Herakles in the Garden of the Hesperides, and Athenian heroes, ca. 420–400 B.C. Ht., 20½ in. London, British Museum.

Pl. 440. Phaon and nymph, detail of calyx-crater, 420–400 B.C. Full ht., ca. 15 3/4 in. Palermo, Sicily, Museo Nazionale Archeologico.

Pl. 441. Mask, from Dewar Island, Torres Strait, New Guinea. Turtle shell with pod and shell decoration, partly painted red; ht., 33½ in. Copenhagen, Nationalmuseet.

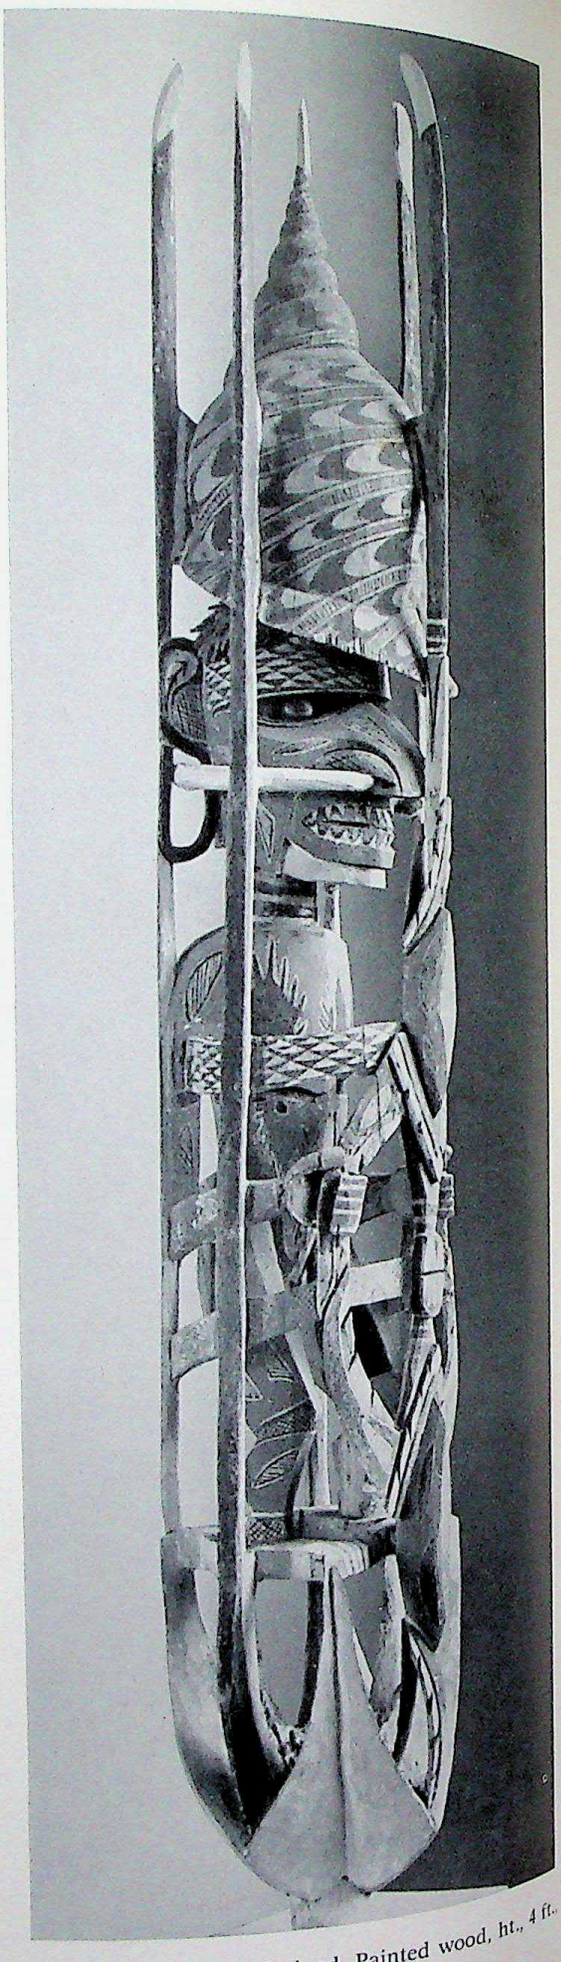


Pl. 442. *Above, left*: Mask, from Sepik River area, New Guinea. Rattan, human hair, palm leaf strips; ht., 29 7/8 in. Basel, Museum für Völkerkunde. *Right*: Ceremonial mask, from Torres Strait Islands, New Guinea. Painted wood, red cloth, artificial hair; ht., 18 1/2 in. London, British Museum. *Below, left*: Winged mask, New Ireland. Painted wood, ht., 25 5/8 in. *Right*: Baining mask, New Britain. Painted tapa. Last two, Hamburg, Museum für Völkerkunde.

Pl. 443. *Left*: Dance mask, from New Hebrides. Wood with boar tusks. *Right*: Ceremonial mask, from New Caledonia. Wood (wig and beard of human hair). Both, Hamburg, Museum für Völkerkunde.

Pl. 444. *Above, left*: Tshuosh openwork figure (perhaps representing a sago beetle), used in funeral ceremonies, from Sepik River area, New Guinea. Wood. Cambridge, England, University Museum of Archaeology and Ethnology. *Center*: Shield with anthropomorphic reliefs, from New Guinea. Wood, l., 48 7/8 in. Rome, Museo Pigorini. *Right*: Panel with stylized human figure, from New Guinea. Wood. *Below*: Human figure with birds, from Sepik River area. Last two, Rome, Lateran Museums.

Pl. 445. *Left*: Fertility charm, from Torres Strait area, New Guinea. Wood, ht., 10 1/4 in. London, British Museum. *Right*: Image of a divinity, from Kaniet Islands. Wood, ht., 31 7/8 in. Bremen, Übersee-Museum.

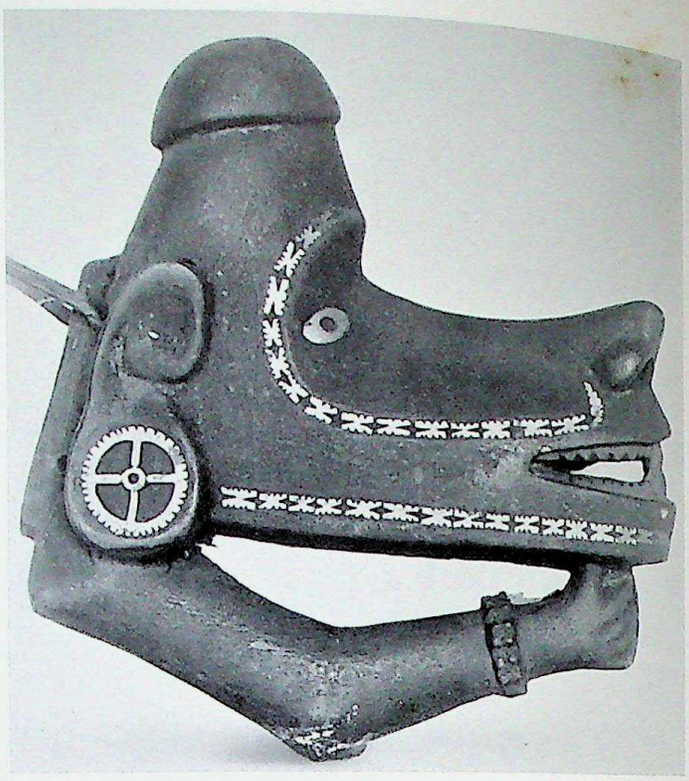


Pl. 446. *Left*: Ancestor figure with characteristic Admiralty Islands hairdress. Wood, ht., 4 ft., 6 7/8 in. *Right*: Dorsal war ornament, from Admiralty Islands. Wood and sea-eagle feathers, l., 20 7/8 in. Both, Bremen, Übersee-Museum.

Pl. 447. *Malanggan* sculpture, from New Ireland. Painted wood. Hamburg, Museum für Völkerkunde.

Pl. 448. *Left*: *Uli* sculpture, from New Ireland. Painted wood. *Right*: *Malanggan* sculpture, from New Ireland. Painted wood, ht., 4 ft. 5 in. Both, Hamburg, Museum für Völkerkunde.

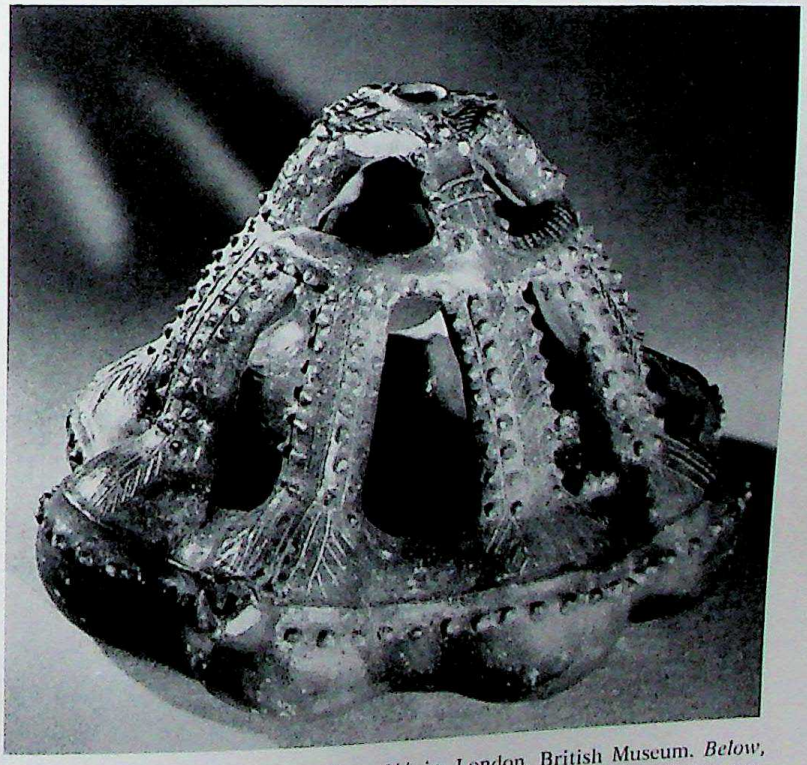
Pl. 449. Sulka ceremonial mask, from Gazelle Peninsula, New Britain. Reed pith on bamboo frame, with leaf fringe; ht., 24 in. London, British Museum.



Pl. 450. Feather mosaic, from a ghost house, Middle Sepik area, New Guinea. Rome, Lateran Museums.

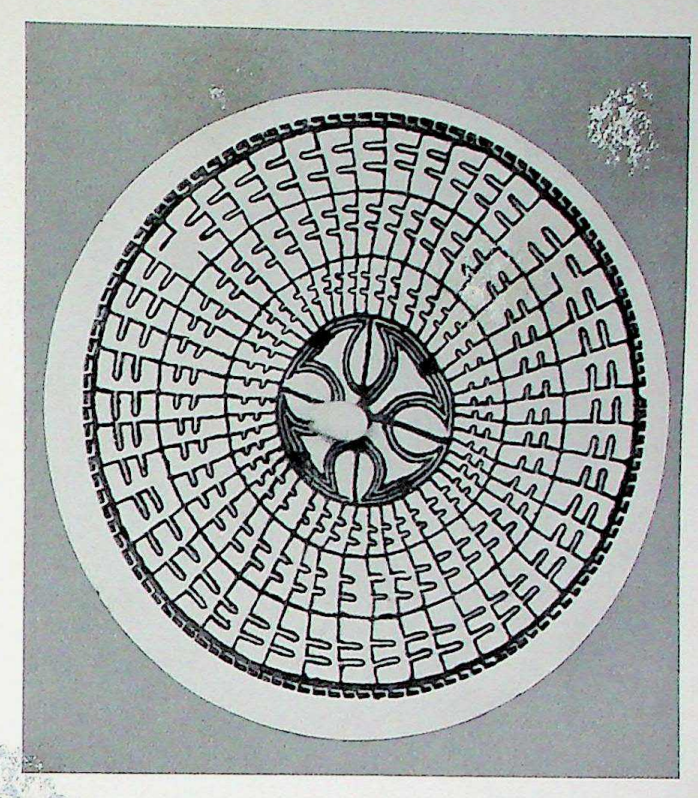
Pl. 451. *Left*: Female figure, from Solomon Islands. Wood, ht., 3 ft., 10 3/4 in. Bremen, Übersee-Museum. *Right*: Achin ancestor figure, from New Hebrides. Wood, 8 ft., 6 3/8 in. Basel, Museum für Völkerkunde.

Pl. 452. *Above, left*: Food bowl, from Solomon Islands. Wood, with pearl-shell inlay; ht., 9 in. London, British Museum. *Right*: Marovo prow ornament from a war canoe, New Georgia, Solomon Islands. Wood with mother-of-pearl inlay, ht., $6^{7}/_{8}$ in. Basel, Museum für Völkerkunde. *Below*: Food bowl, with openwork ornamentation, from Admiralty Islands. Wood. Hamburg, Museum für Völkerkunde.

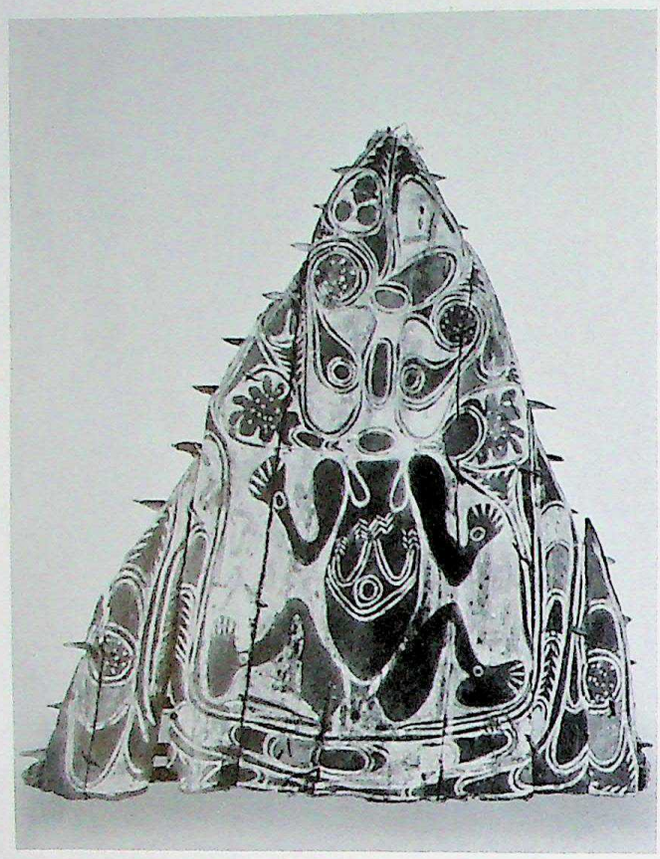


Pl. 453. Jar for storing sago, from Sepik River area, New Guinea. Painted clay, ht., 27½ in. Basel, Museum für Völkerkunde.

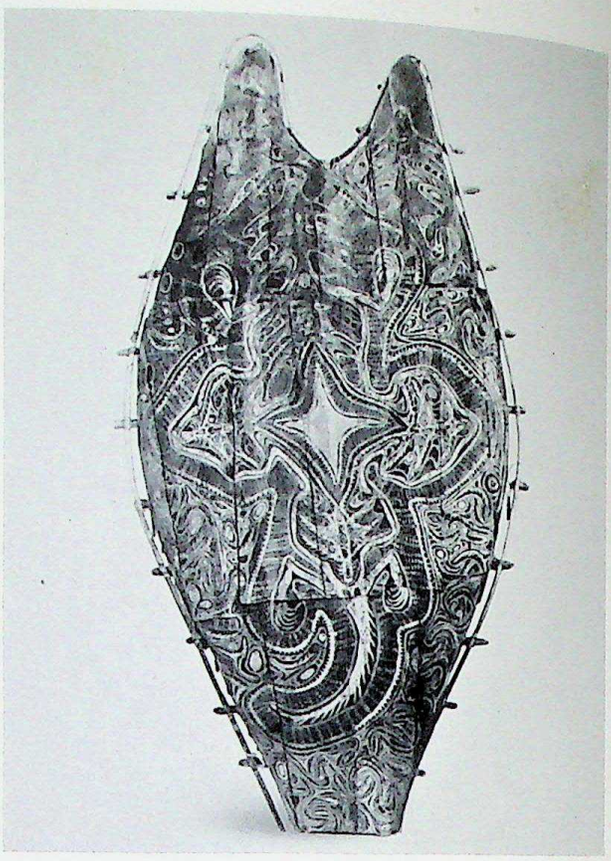
Pl. 454. Painting from a ghost house, south Maprik area, New Guinea. Palm-leaf sections on bamboo frame, 52 × 25¼ in. Basel, Museum für Völkerkunde.

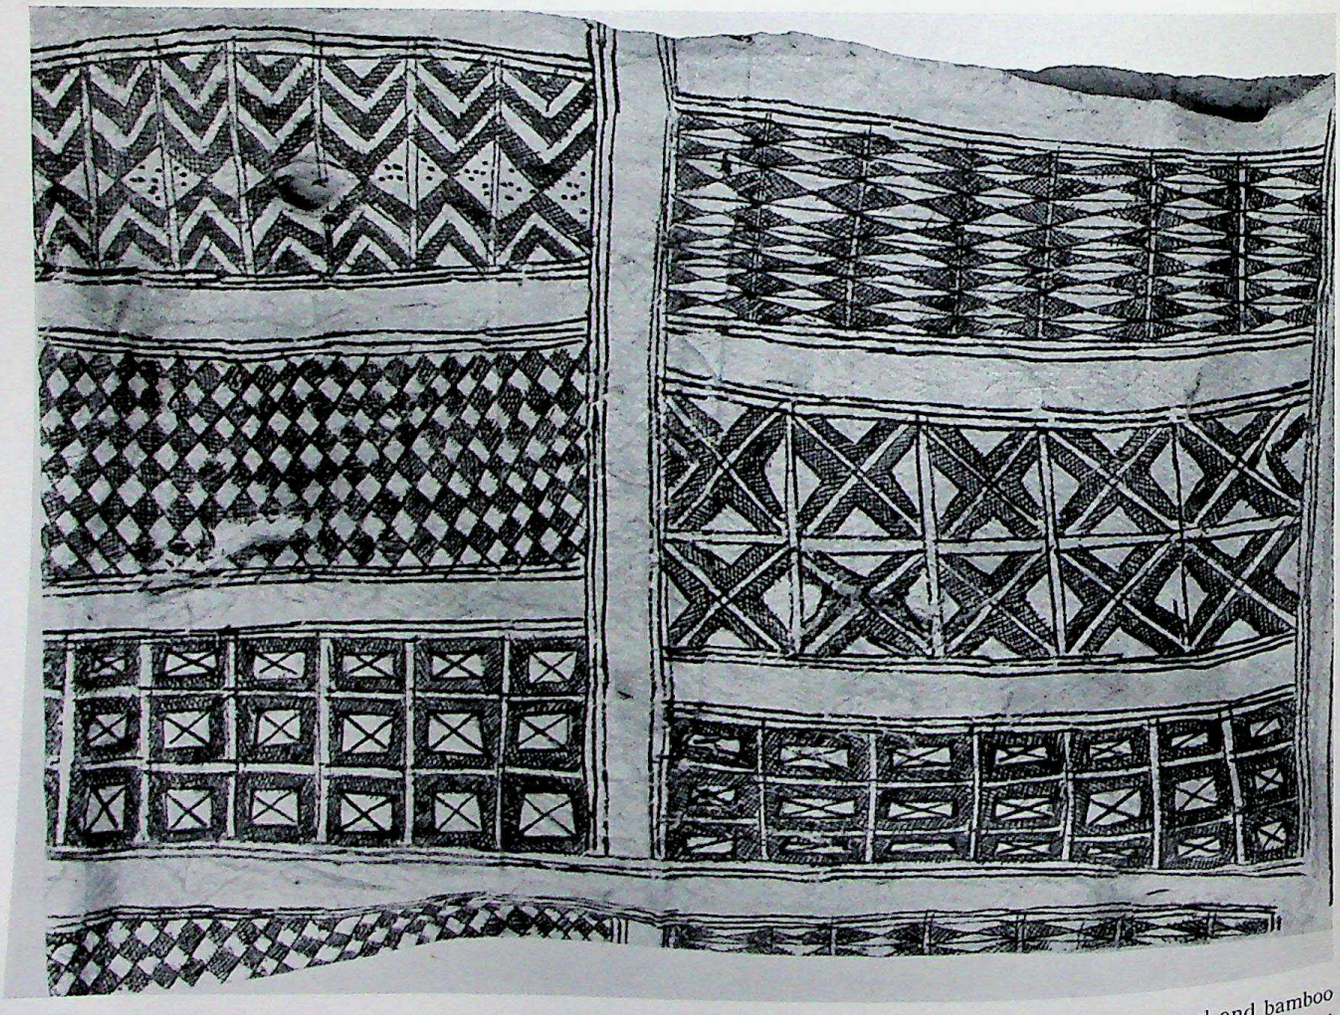


Pl. 455. *Above*: Bowl, from Sepik River area, New Guinea. Clay, incised and painted, diam., 9 1/4 in. London, British Museum. *Below, left*: Gable ornament, from Sepik River area. Painted clay, ht., 12 3/4 in. Salem, Mass., Peabody Museum. *Right*: Water container, from Fiji Islands. Clay with vegetable varnish, ht., 7 1/8 in. Paris, Musée de l'Homme.

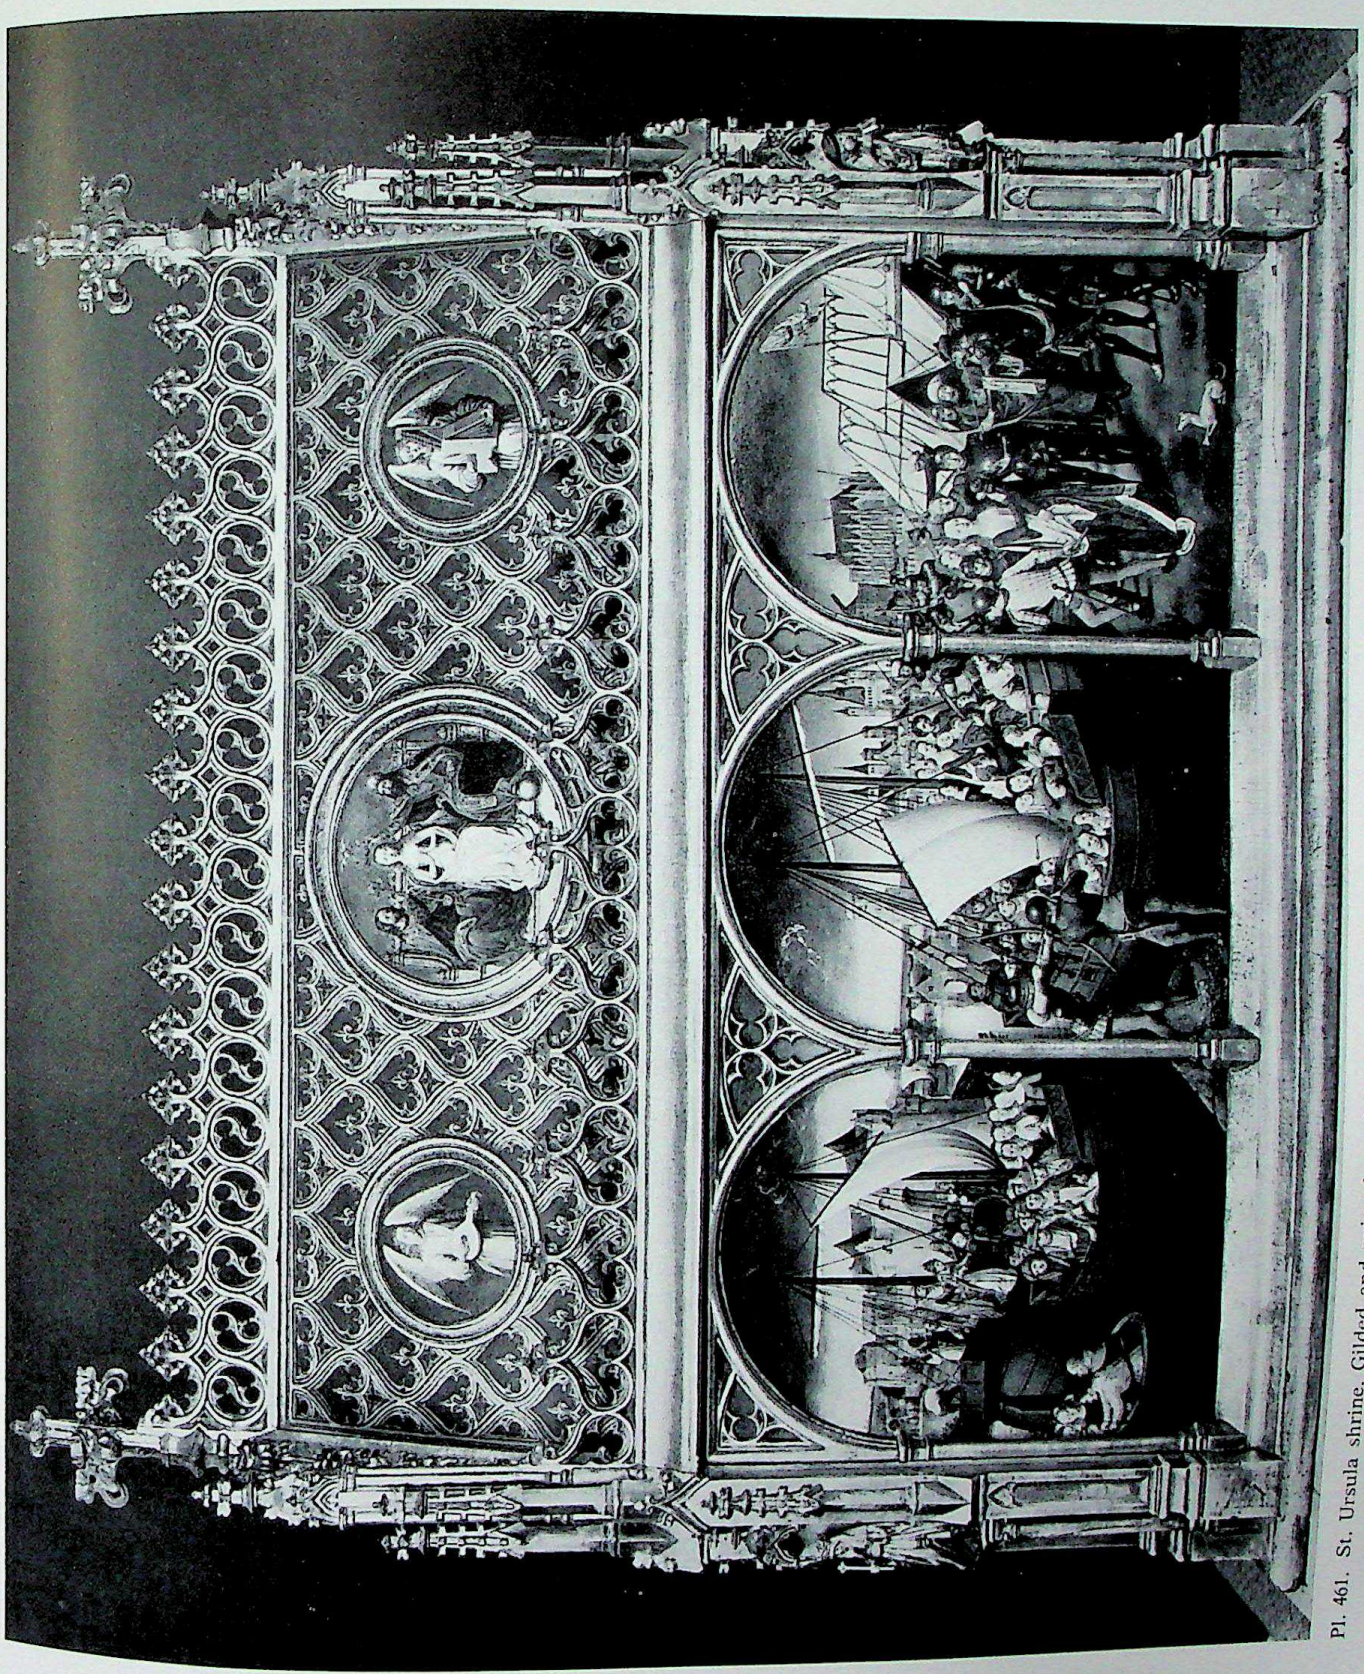


Pl. 456. Handles of betel-lime spatulas, from Luf Island. Wood. Hamburg, Museum für Völkerkunde.

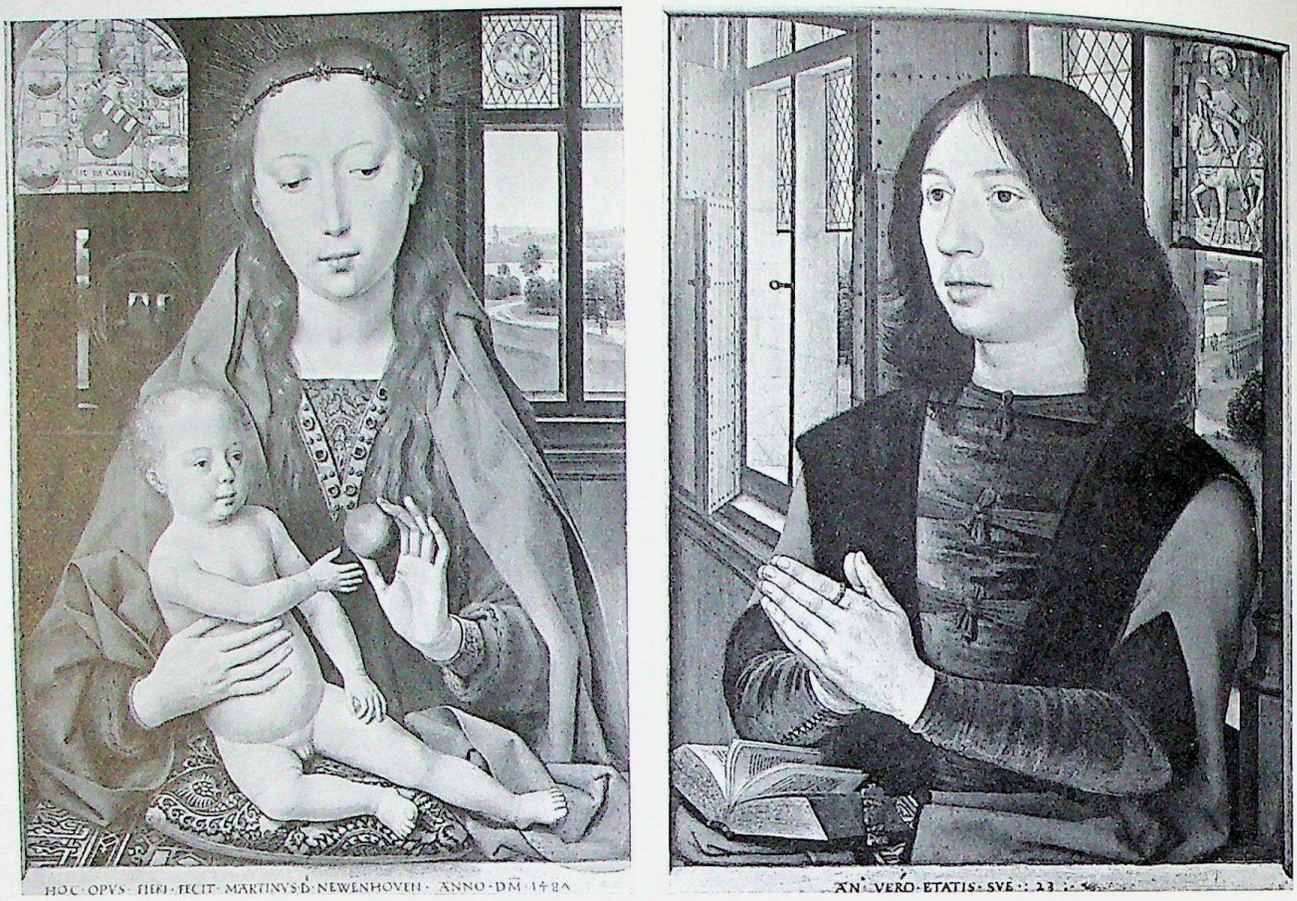




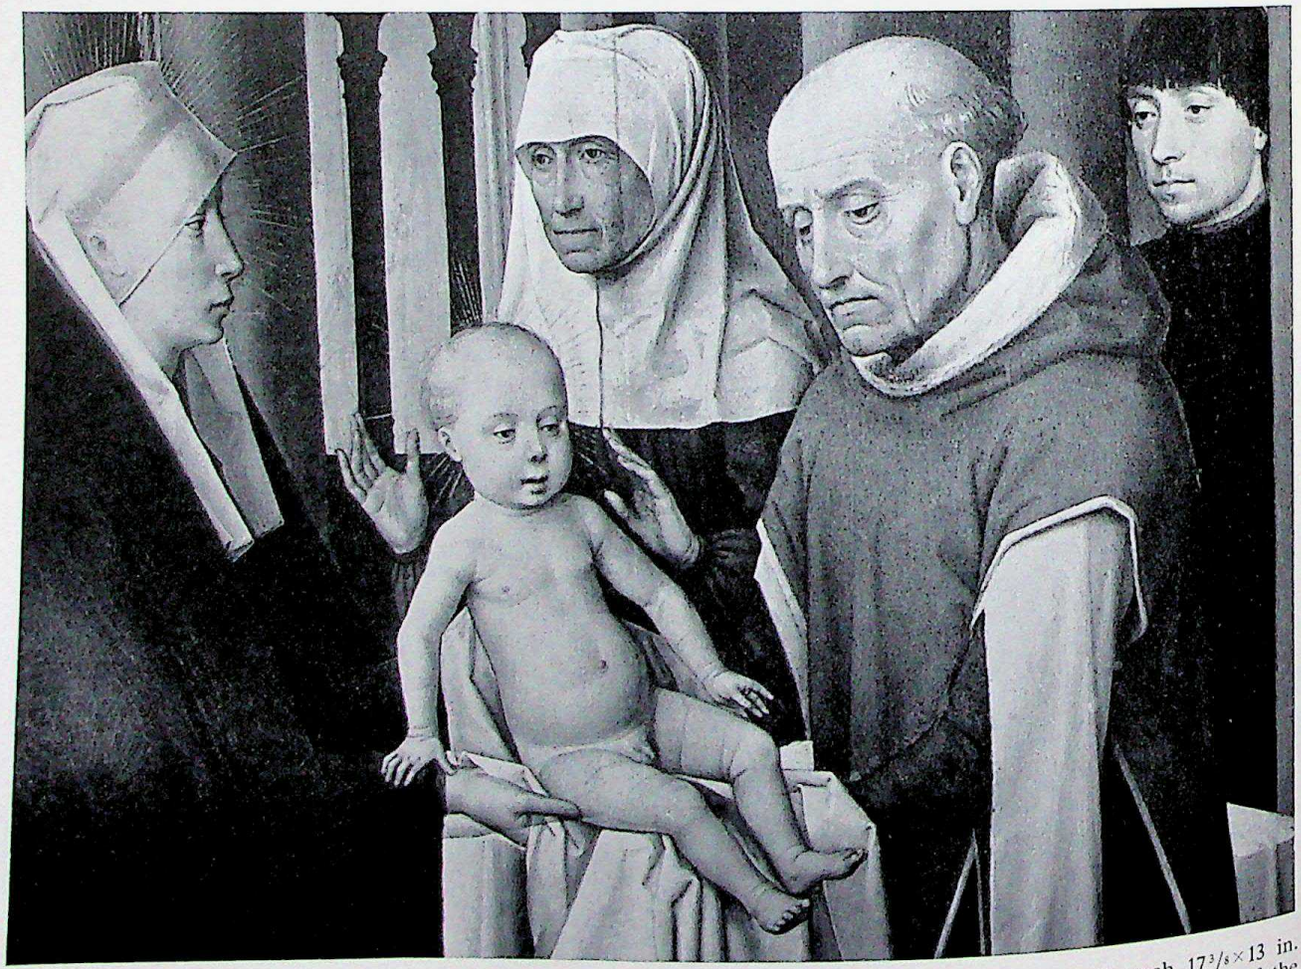
Pl. 457. *Above*: Two pectoral ornaments (*kapkap*). *Left*: From Admiralty Islands. Turtle shell, diam., 4 7/8 in. Bremen, Übersee-Museum. *Right*: From Solomon Islands. Tridacna and turtle shell. Rome, Museo Pigorini. *Below*: Neckrest, from Sepik River area, New Guinea. Wood. Formerly, Rome, Museo Pigorini.



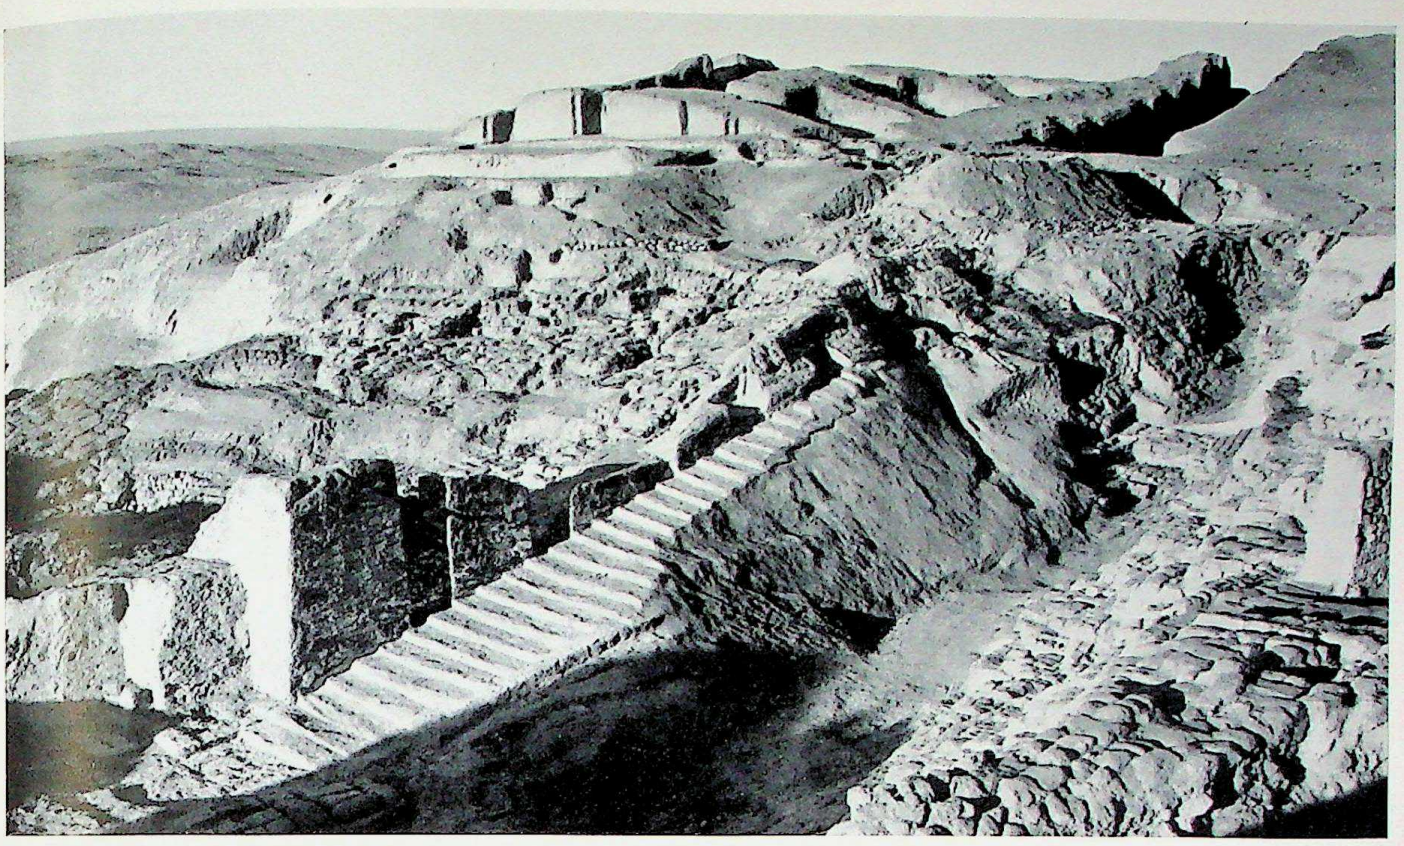
Pl. 458. *Above*: Paintings from ceremonial houses, Sepik River area, New Guinea. Palm-leaf sections on wood and bamboo frames; 3 ft., 4 1/2 in. × 3 ft., 2 5/8 in. and 9 ft., 10 in. × 5 ft., 3 in. Basel, Museum für Völkerkunde. *Below*: Tapa with geometric motifs, from Fiji Islands. Florence, Museo Nazionale di Antropologia e Etnologia.



Pl. 459. Portrait of a man. Panel, 11 3/4 × 8 5/8 in. The Hague, Mauritshuis.



Pl. 460. Virgin and Child with Saints and Donors, from the Donne Triptych. Panel, 28×27 in. *London, National Gallery.*



Pl. 461. St. Ursula shrine. Gilded and painted wood, ht., ca. 31½ in. Bruges, Musée Memling.

Pl. 462. *Above*: Diptych with the Virgin and Child and the donor Martin van Nieuwenhove. Panel, each $17^{3}/_{8} \times 13$ in. Bruges, Musée Memling. *Below*: The Presentation, detail of triptych with the Nativity, the Adoration of the Magi, and the Presentation. Panel; full size of wing, $37^{3}/_{8} \times 24^{3}/_{4}$ in. Madrid, Prado.

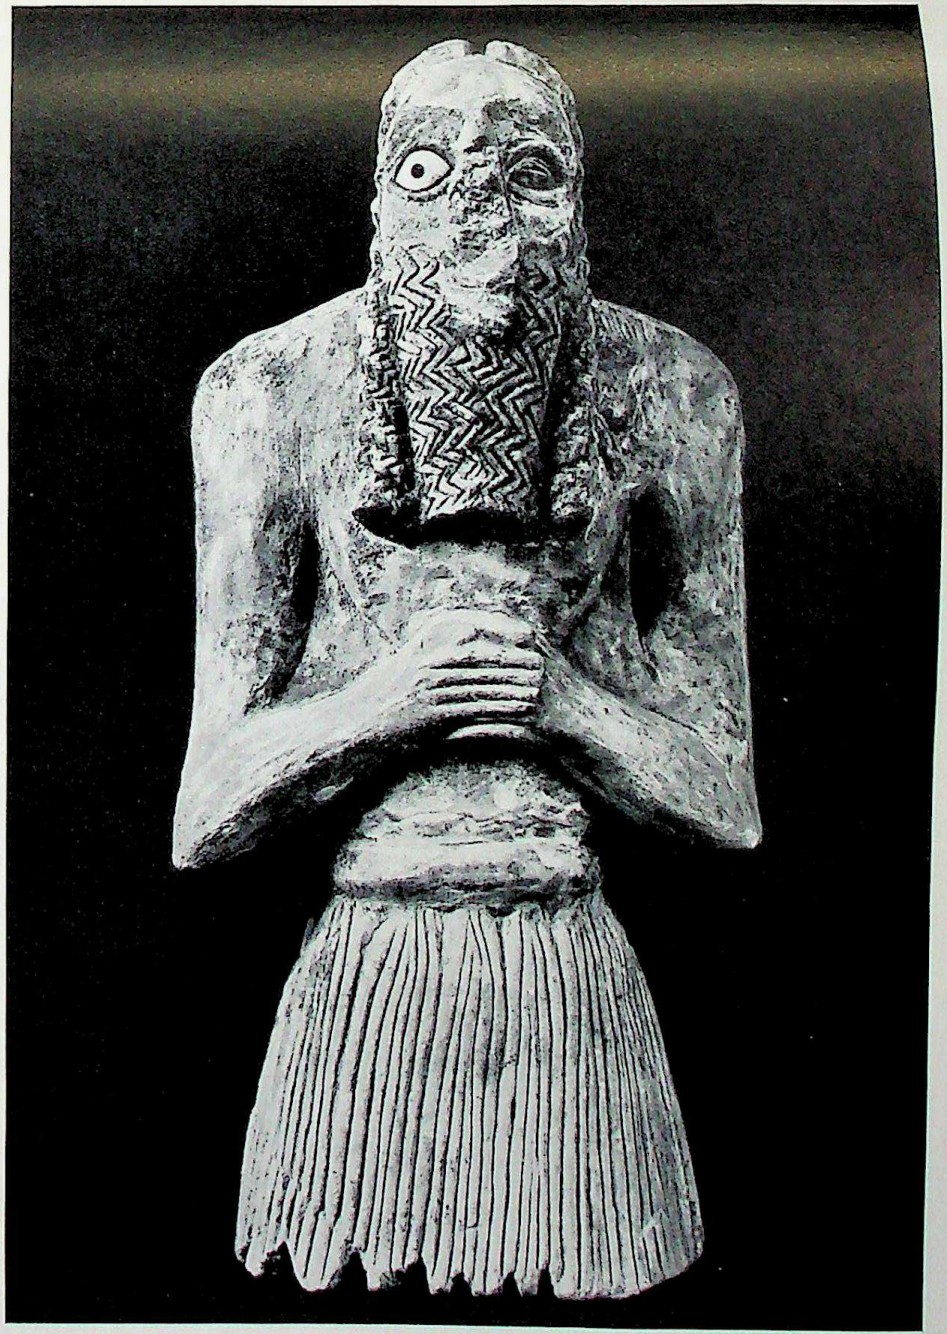
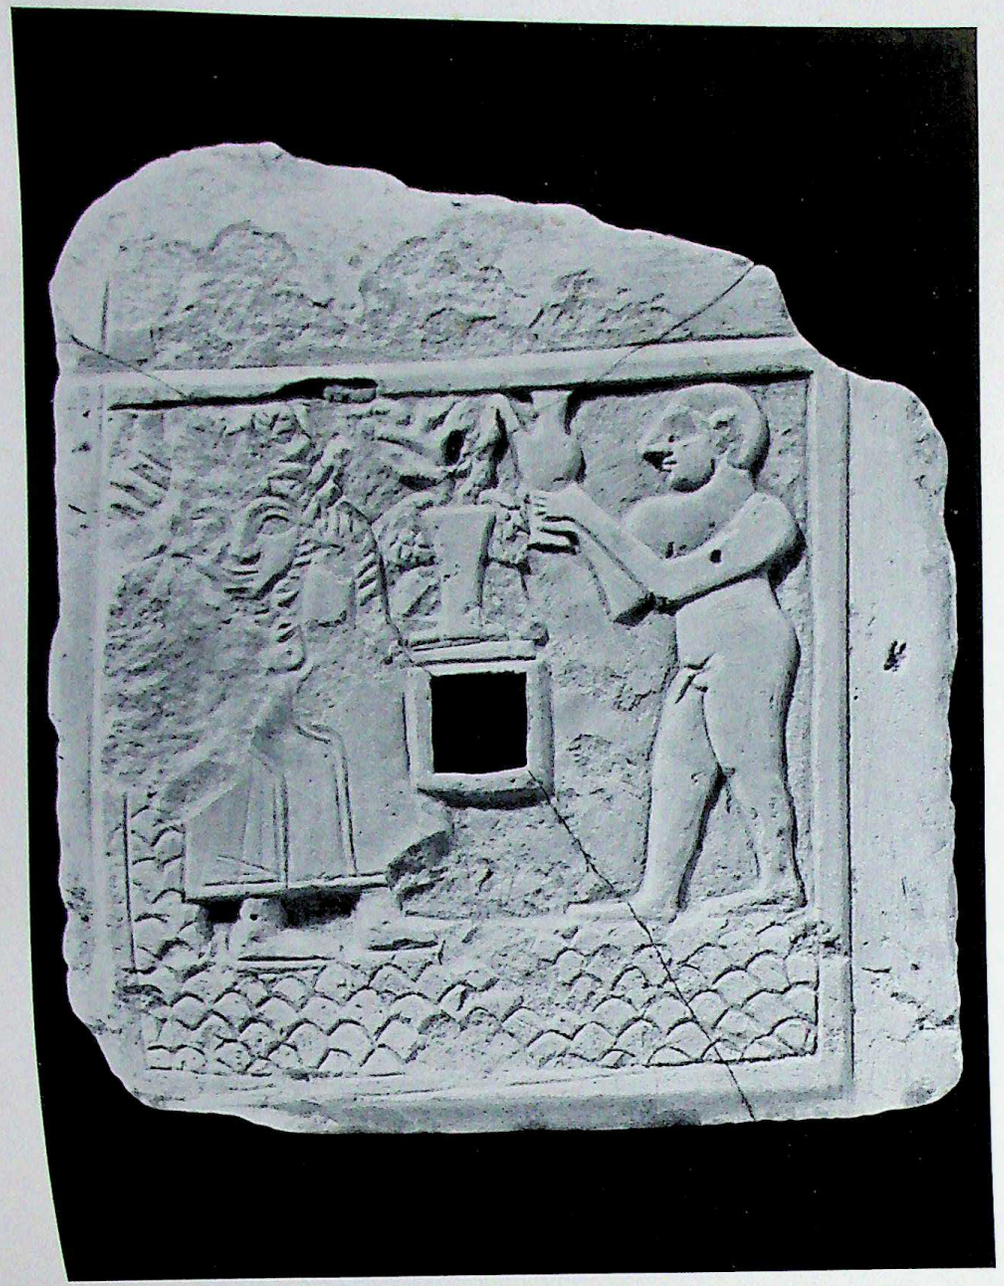
Pl. 464. Female head, from Erech (Uruk), Jamdat Nasr period. Alabaster, ht., ca. 8 1/2 in. Baghdad, Iraq Museum.

Pl. 465. *Above, left*: Fragment of mace head, from Sippar, Jamdat Nasr period. Brown limestone, ht., 6 1/4 in. *Right*: Sumerian libation vase, from Erech (Uruk), Jamdat Nasr period. Gray limestone, ht., 4 7/8 in. *Below*: Trough, from Erech, Jamdat Nasr period. Limestone, ht., 6 1/4 in. All, London, British Museum.

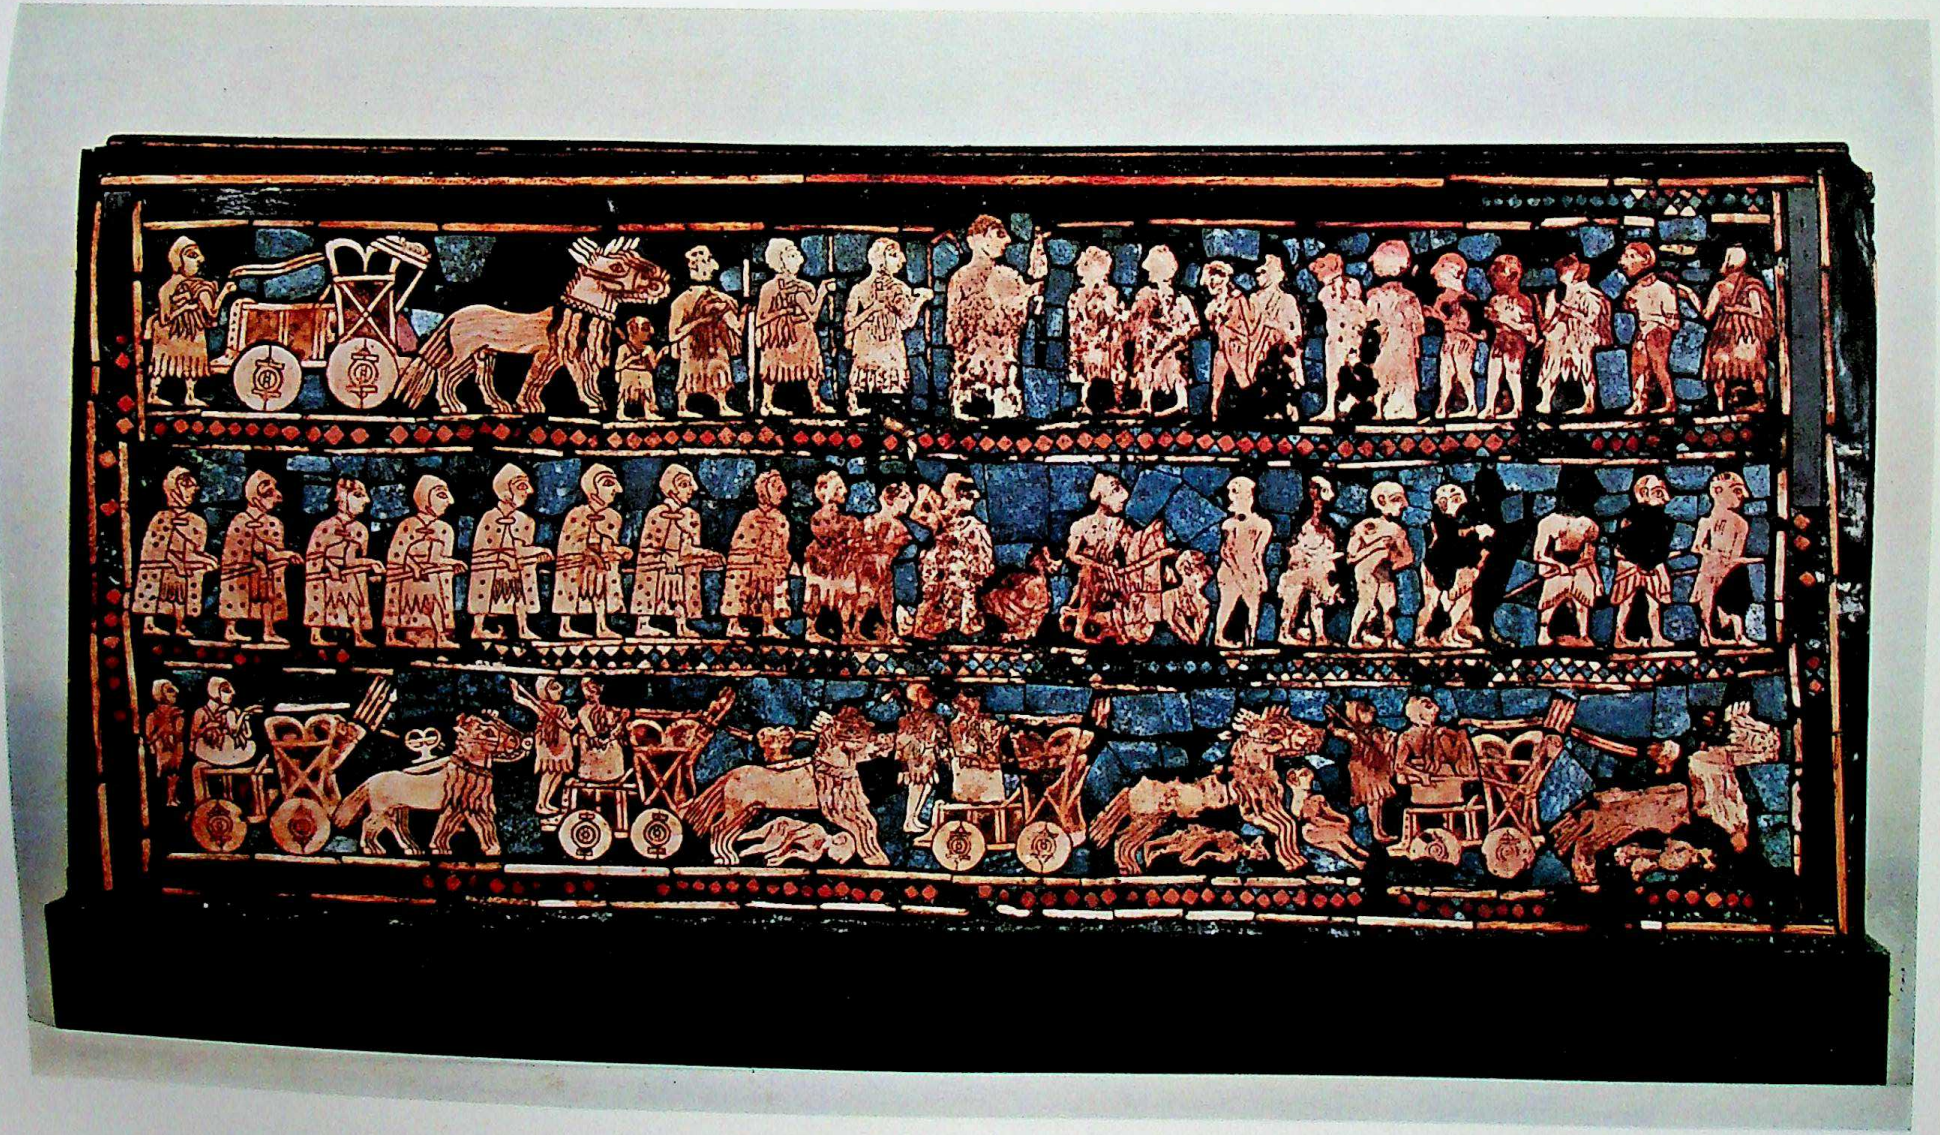
Pl. 466. Vase with scenes of offerings to the goddess Inanna (Ishtar), from Erech (Uruk), Jamdat Nasr period. Alabaster, ht., 43¼ in. Baghdad, Iraq Museum.



Pl. 467. Figure with plumed headdress, from Lagash (mod. Telloh), first half of 3d millennium B.C. Limestone, ht., 7 1/8 in. Paris, Louvre.



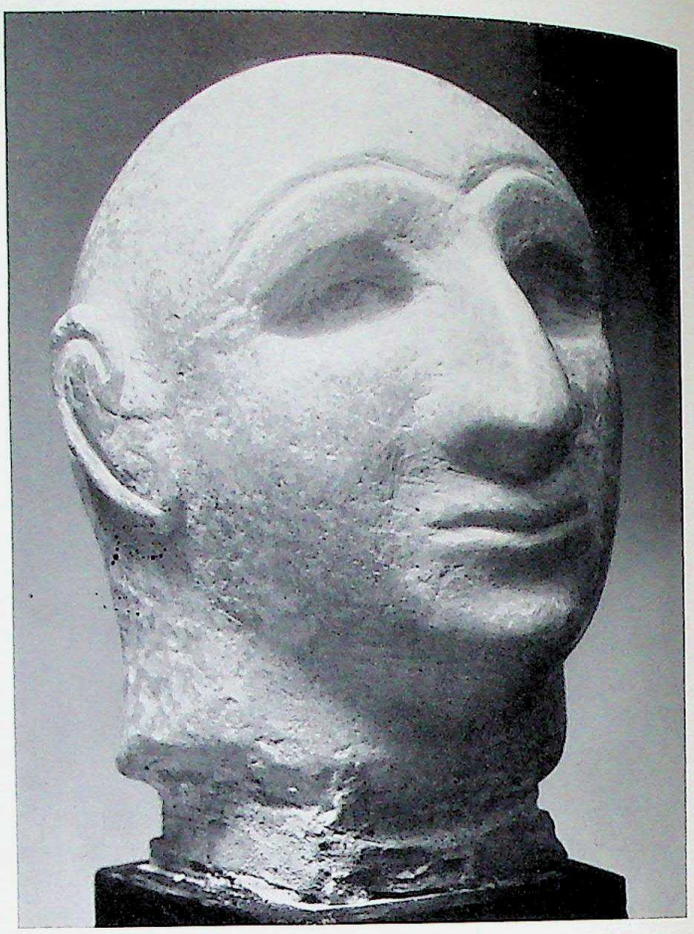
Pl. 468. Left: Female figure, from Khafaje, Mesilim period. Limestone, ht., 5¾ in. *Right*: Male statuette, from Khafaje, Mesilim period. Yellow stone, ht., 8 in. Both, Baghdad, Iraq Museum.



Pl. 469. *Left*: Male "adorant" figure, from Khafaje, Mesilim period. Gray limestone, ht., 9¼ in. *Right*: Male figure from Khafaje, Mesilim period. Gypsum, ht., 10¼ in. Both, Philadelphia, University Museum.

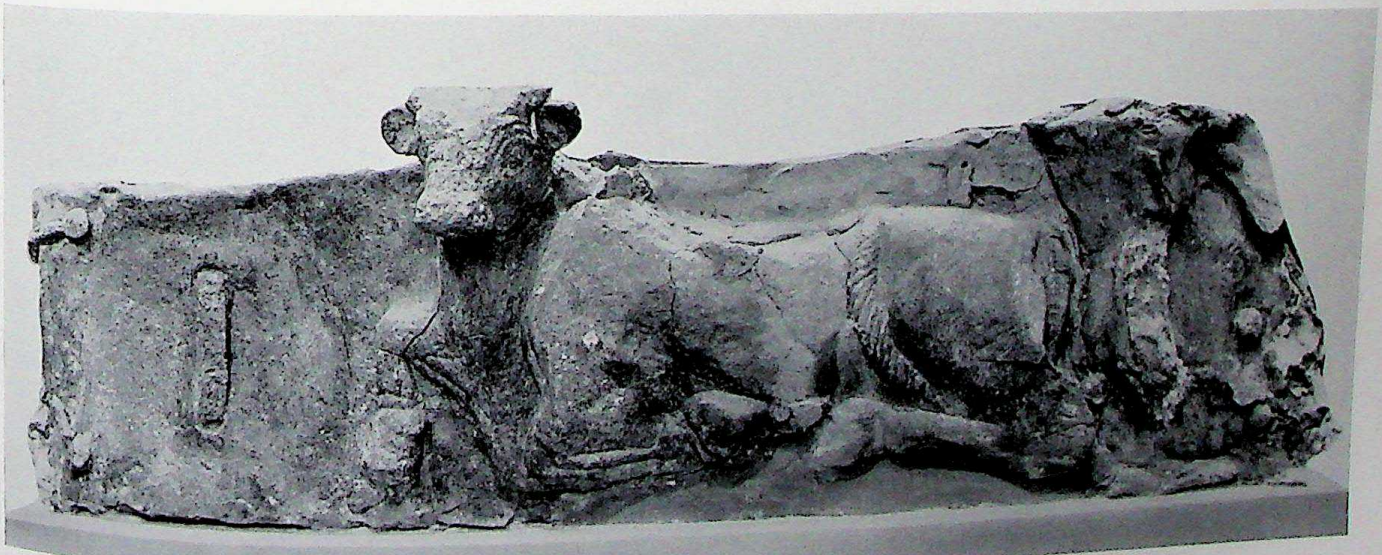
Pl. 470. *Left*: Nude priest pouring libation before a goddess, from Lagash (mod. Telloh), Mesilim period. Limestone, $6^{3}/_{4} \times 5^{7}/_{8}$ in. *Right*: Head of King Mesilim's mace, from Lagash, Mesilim period. Limestone, ht., $7^{1}/_{2}$ in. Both, Paris, Louvre.

Pl. 471. So-called "Standard" of Ur, with scenes of war, mid-3d millennium B.C. Panel inlaid with shell, lapis lazuli, and red limestone, 8×19 in. London, British Museum. (Cf. VIII, PL. 77.)



Pl. 472. Head of a statue of Gudea (known as the "head with a turban"), from Lagash (mod. Telloh), Neo-Sumerian period. Diorite, ht., 9 1/8 in. Paris, Louvre.

Pl. 473. Priest, from Khafaje, Mesilim-Ur I transition period. Limestone, ht., 23⅝ in. Baghdad, Iraq Museum.

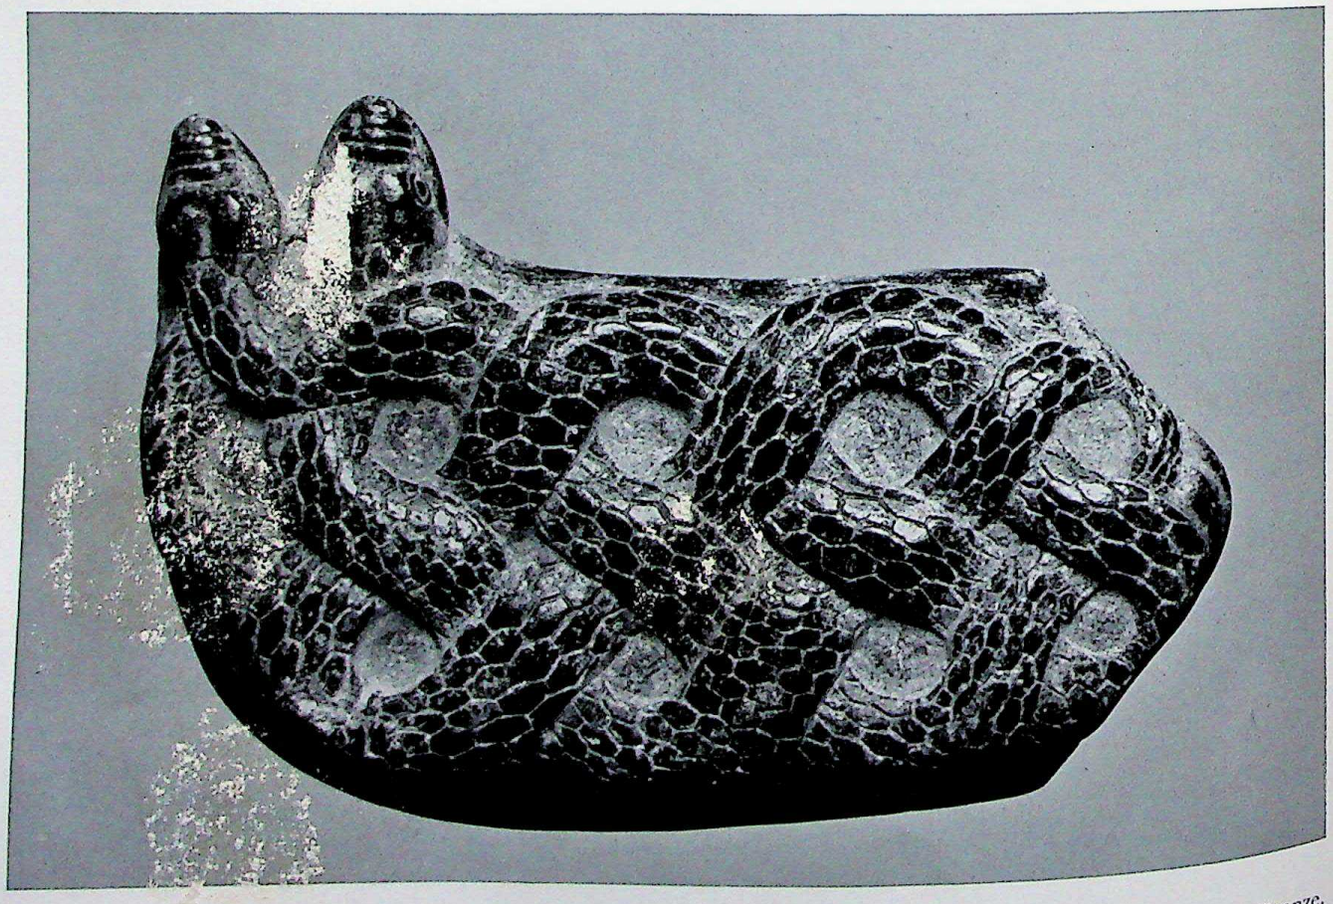


Pl. 474. *Above, left*: Female head, from Lagash (mod. Telloh), Mesilim-Ur I transition period. Alabaster, ht., 3 1/8 in. *Right*: Male head, from Umm el-Agareb, Ur I period. Limestone, ht., 2 3/4 in. *Below, left*: Torso of a statuette, from Lagash, Ur I period (?). Limestone; ht., 6 5/8 in. All three, Paris, Louvre. *Right*: Statuette of an official, from al-'Ubaid, Ur I period. Tufa, ht., 14 3/4 in. London, British Museum.

Pl. 475. *Above, left*: Support in shape of male figure, Khafaje, Mesilim period. Copper, ht., 21⅞ in. Baghdad, Iraq Museum. *Right*: Plaque with libation scene, from Nippur, Ur I period. Slate, ht., 7½ in. Istanbul, Archaeological Museums. *Center*: Plaque with Dudu, priest of the god Ningirsu, from Lagash (mod. Telloh), Ur I period. Bituminous stone, ht., 9⅞ in. Paris, Louvre. *Below*: Fragment of frieze with reclining bull, from al-'Ubaid, Ur I period. Copper, ht., ca. 10½ in. London, British Museum.

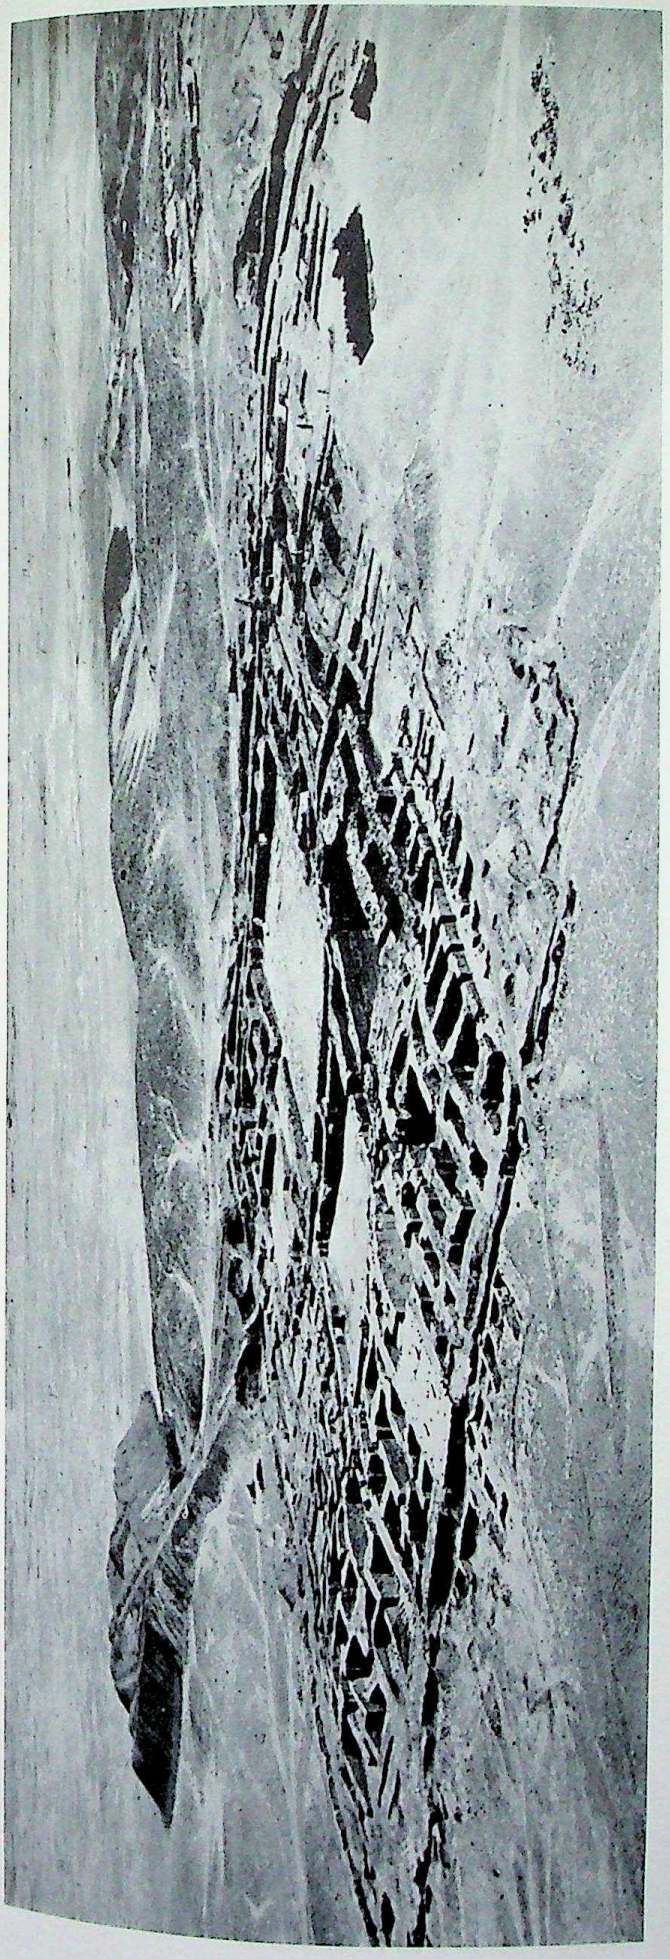
Pl. 476. Head of a divinity, from Lagash (mod. Telloh), Akkadian period. Terra cotta, ht., 4 in. Paris, Louvre.

Pl. 477. Male head, from Lagash (mod. Telloh), Neo-Sumerian period. Steatite, ht., 2 3/8 in. Paris, Louvre.

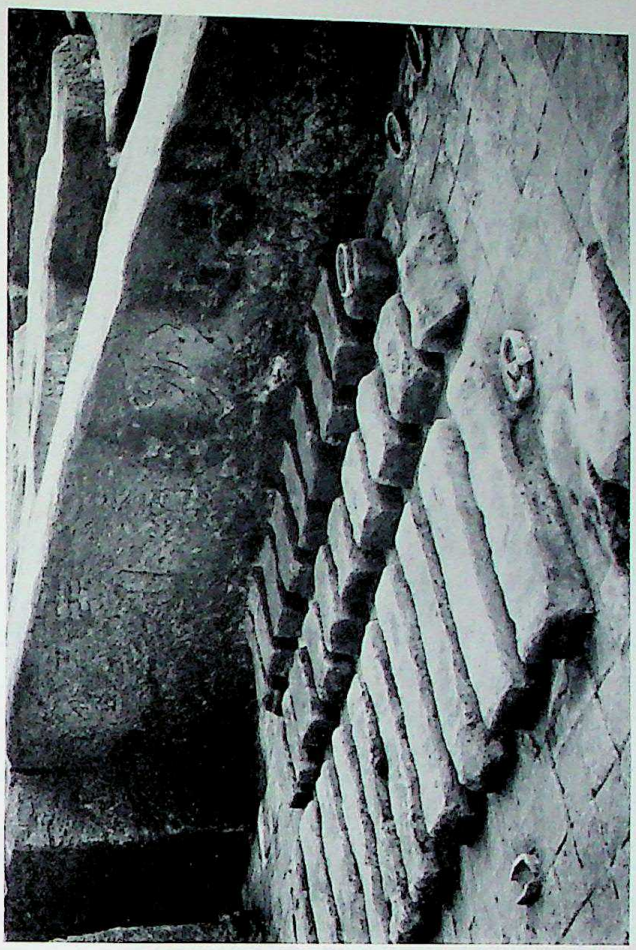


Pl. 478. The so-called "Woman with the Scarf," from Lagash (mod. Telloh), Neo-Sumerian period. Steatite, ht., 6 3/4 in. Paris, Louvre.

Pl. 479. Ur-Ningirsu, from Lagash (mod. Telloh), Ur III period. Alabaster, ht., 18⅛ in. Paris, Louvre.



Pl. 480. *Above, left*: Nail-shaped foundation figurine of a calf, from Lagash (mod. Telloh), Neo-Sumerian period. Bronze, ht., 10 1/4 in. *Right*: Fragment of a relief with the goddess Ninsun, Neo-Sumerian period. Black steatite, ht., 5 1/2 in. *Below*: Lamp cover, from Lagash, Neo-Sumerian period. Steatite, w., 2 3/4 in. All, Paris, Louvre.



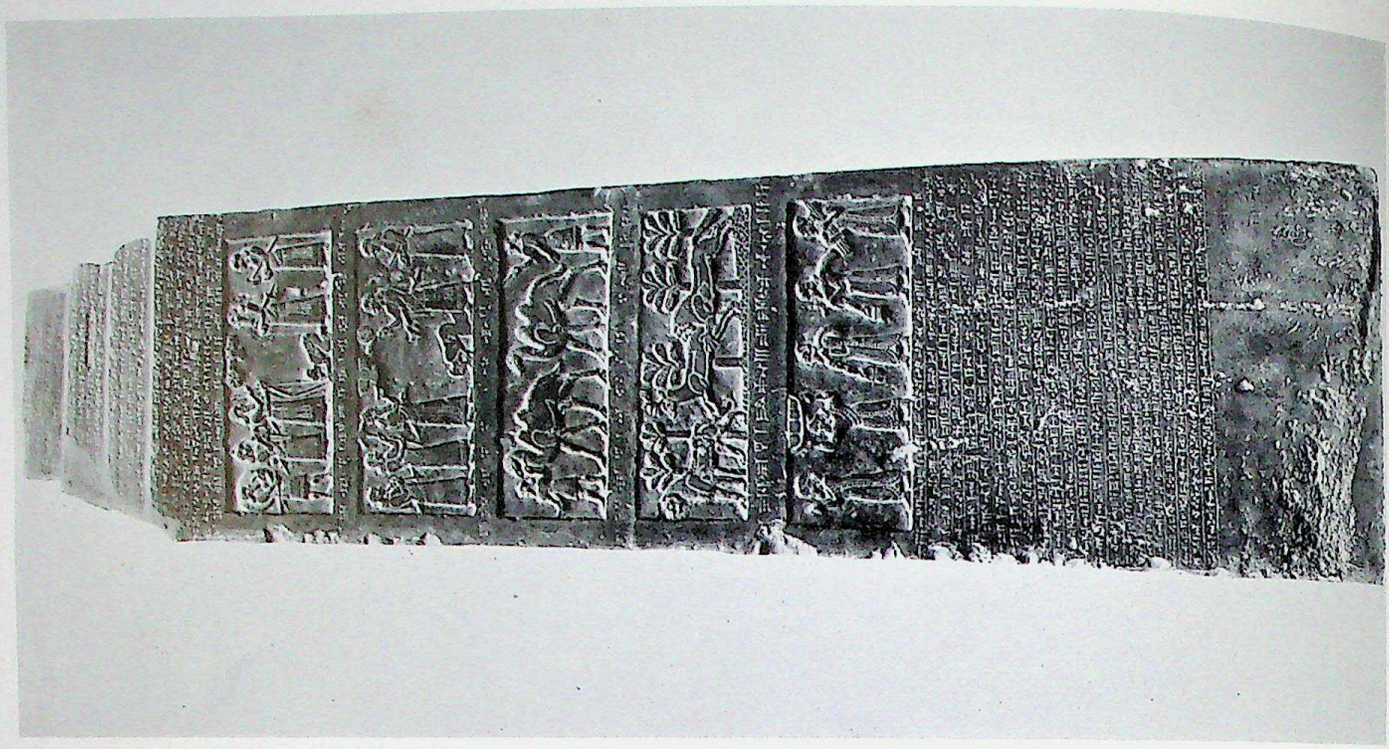
Pl. 481. Libation vase, from Lagash (mod. Telloh), Neo-Sumerian period. Dark-green steatite. Ht., 8 5/8 in. Paris, Louvre.

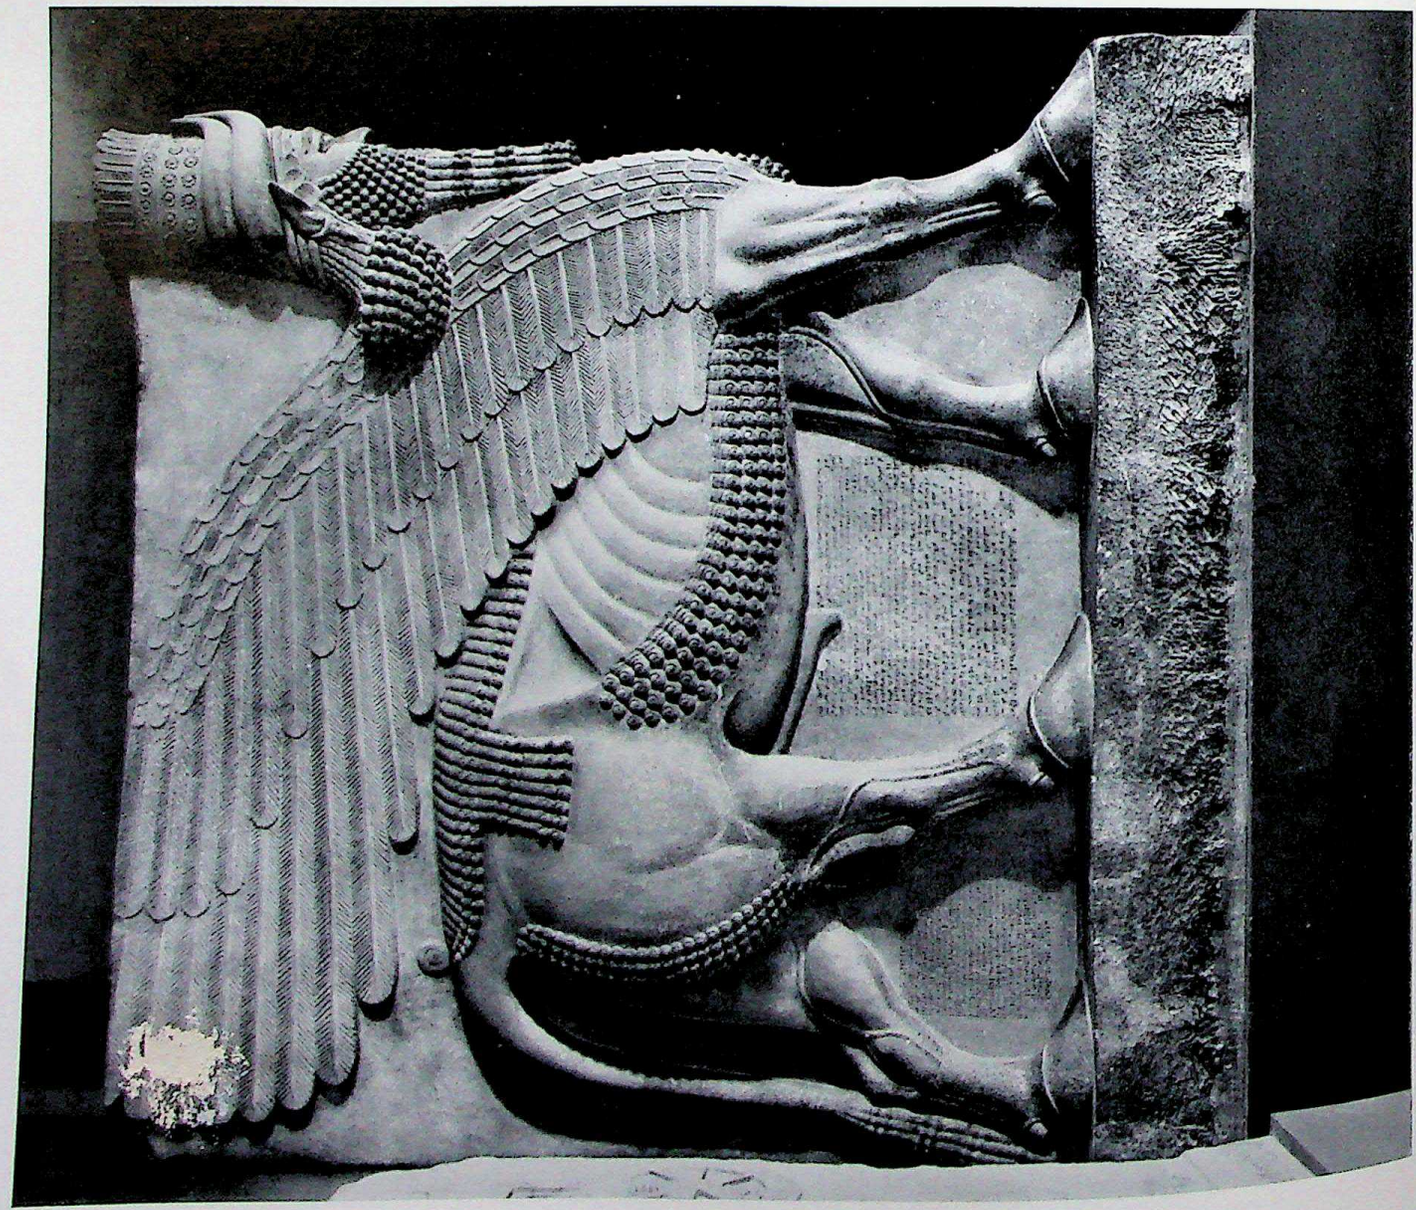
Pl. 482. Fragmentary sacrificial scene, from Zimrilim's palace in Mari, 1st half of 18th cent. B.C. Wall painting, 2 ft., 8 in. × 4 ft., 5 in. *Paris, Louvre.*

Pl. 483. Mari, Zimrilim's palace, 1st half of 18th cent. B.C. *Above*: General view. *Below, left*: Throne room. *Right*: Scribes' room.

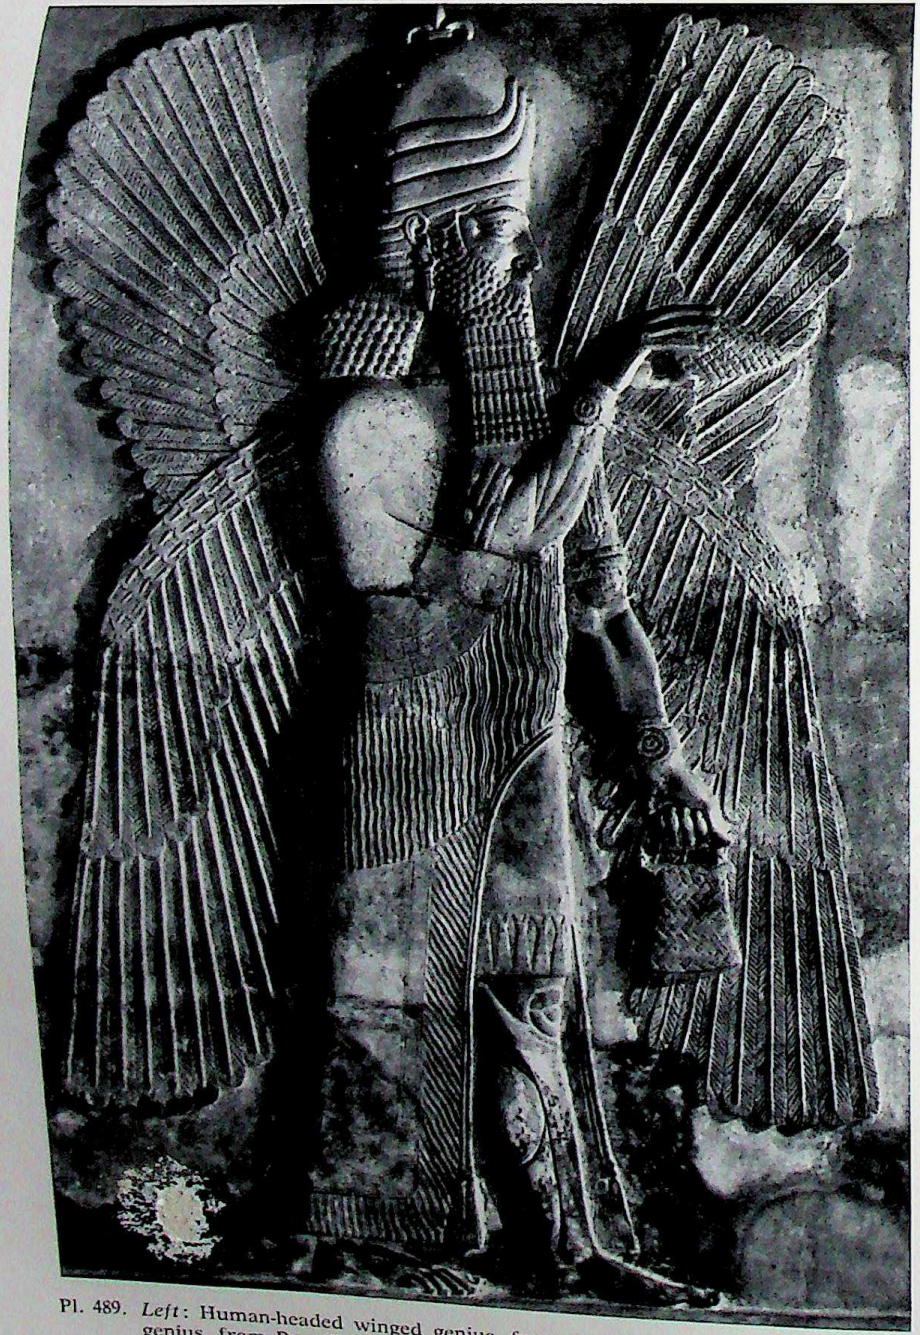
Pl. 484. The ruler Idi-ilum, from Mari, early 2d millennium B.C. Steatite, ht., 16 1/8 in. Paris, Louvre.

Pl. 485. *Above, left*: Goddess with flowing vase, from Mari, early 2d millennium B.C. White limestone, ht., 4 ft., $10^{5}/_{8}$ in. Aleppo, Syria, Musée National. *Right*: Puzur-Ishtar, governor of Mari, from Babylonia, early 2d millennium B.C. Diorite, ht., 5 ft., $8^{1}/_{8}$ in. Berlin, Staatliche Museen (reconstruction with original head and a cast of the body, which is preserved in Istanbul, Archaeological Museums). *Below, left*: A god killing a fiery "Cyclops," from Khafaje, early 2d millennium B.C. Terra cotta, $4^{1}/_{2} \times 3^{1}/_{2}$ in. Baghdad, Iraq Museum. *Right*: Wrestlers, from Eshnunna (mod. Tell Asmar), early 2d millennium B.C. Terra cotta, ht., $4^{1}/_{4}$ in. Paris, Louvre.

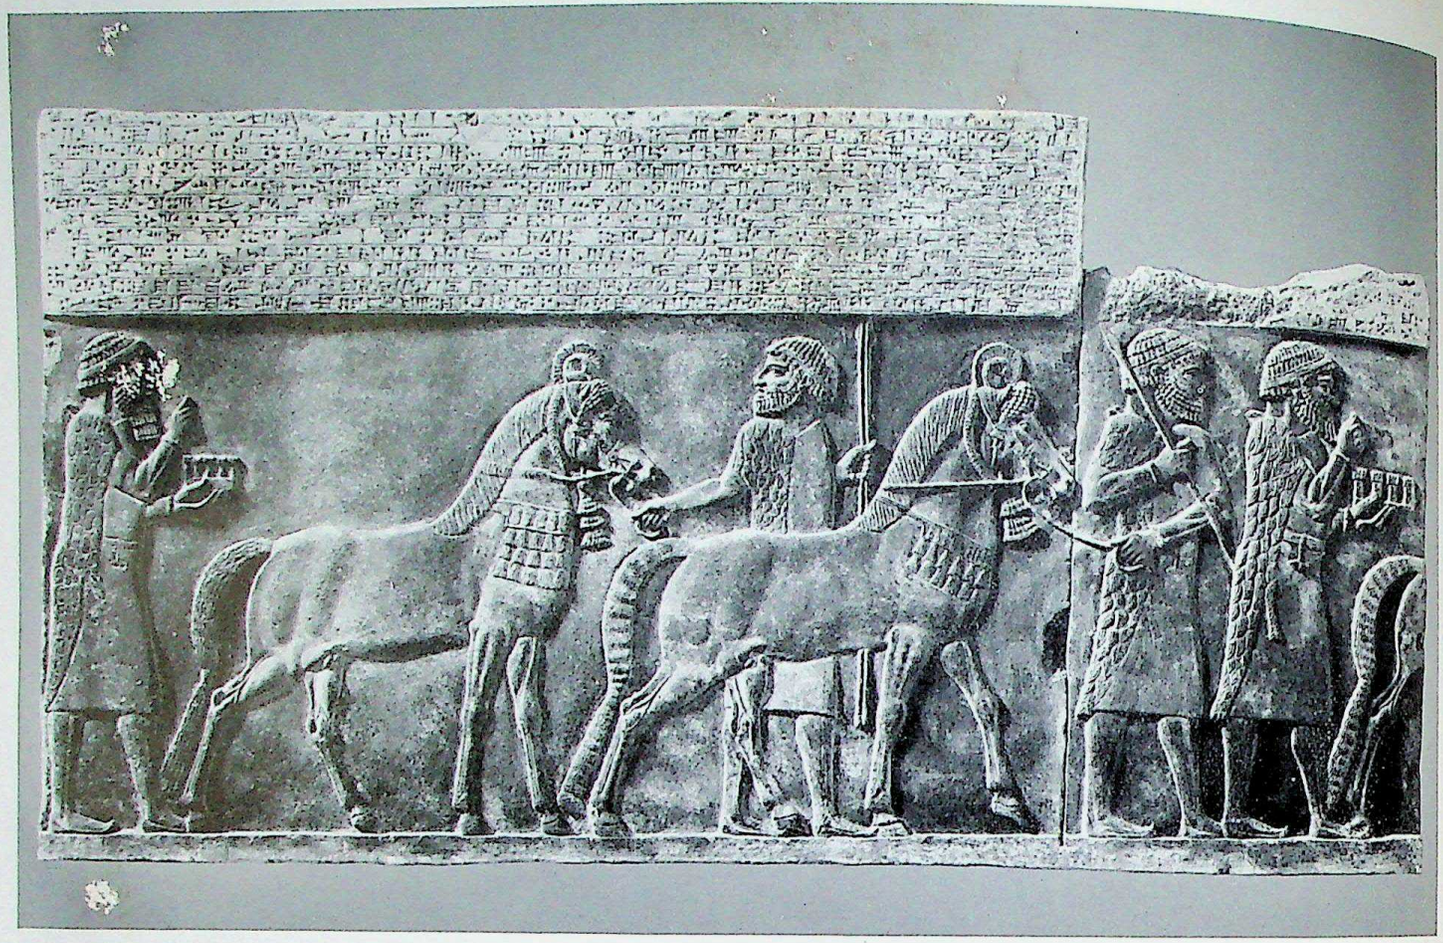


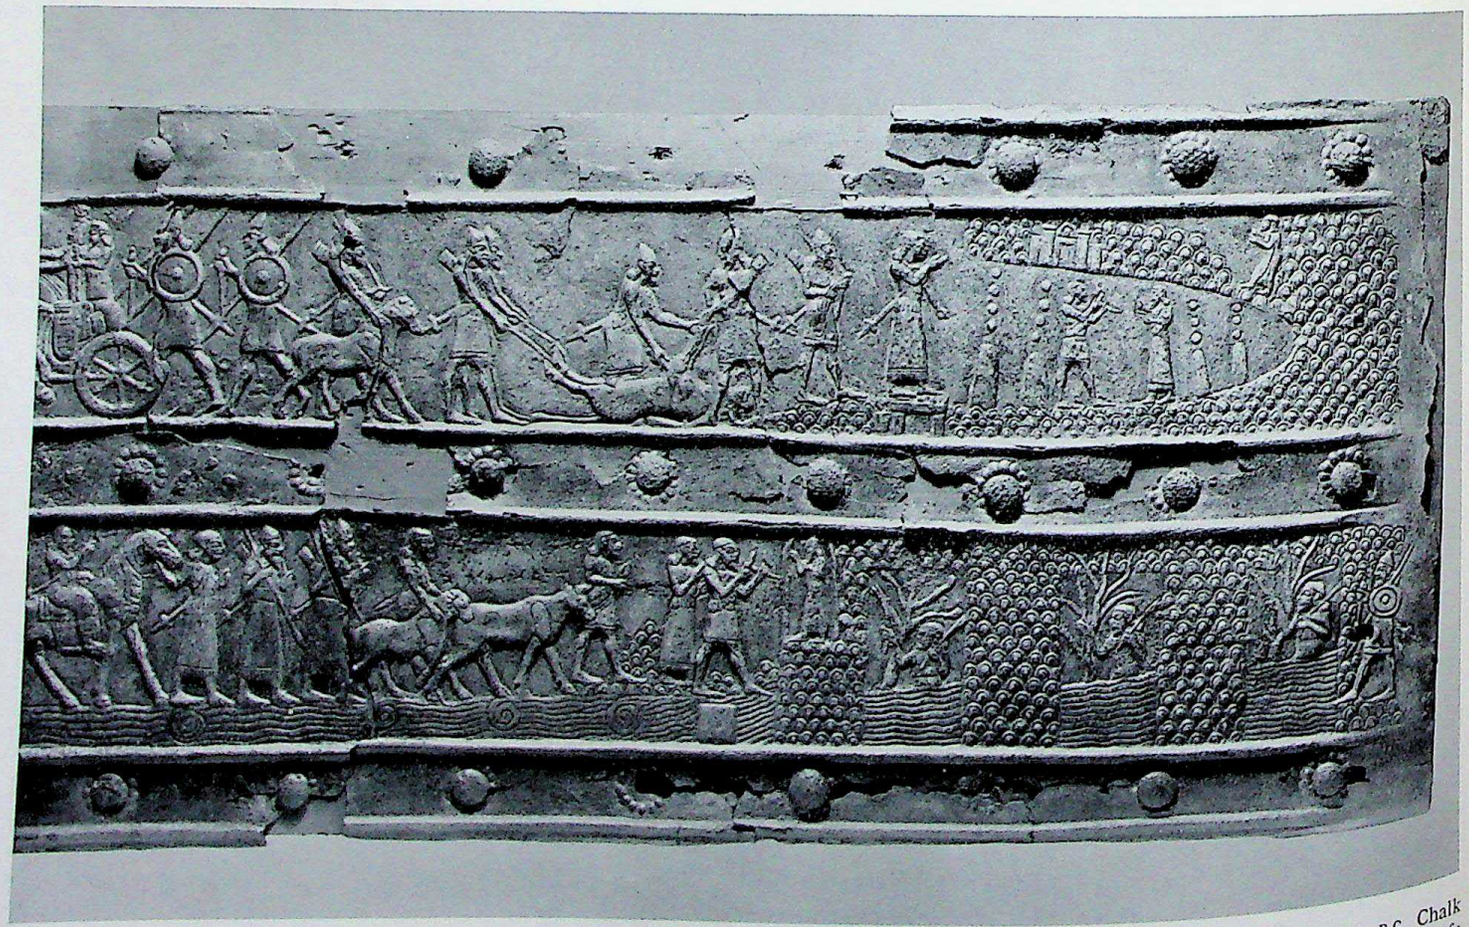


Pl. 486. Left: Top of a stele, with a worshiper before a seated god, from Susa, Old Babylonian period. Basalt, ht., 26 3/8 in. Paris, Louvre. *Right: So-called "Michaux Stone,"* a boundary stone (*kudurru*), Kassite period. Diorite, ht., 17 3/4 in. Paris, Cabinet des Médailles.



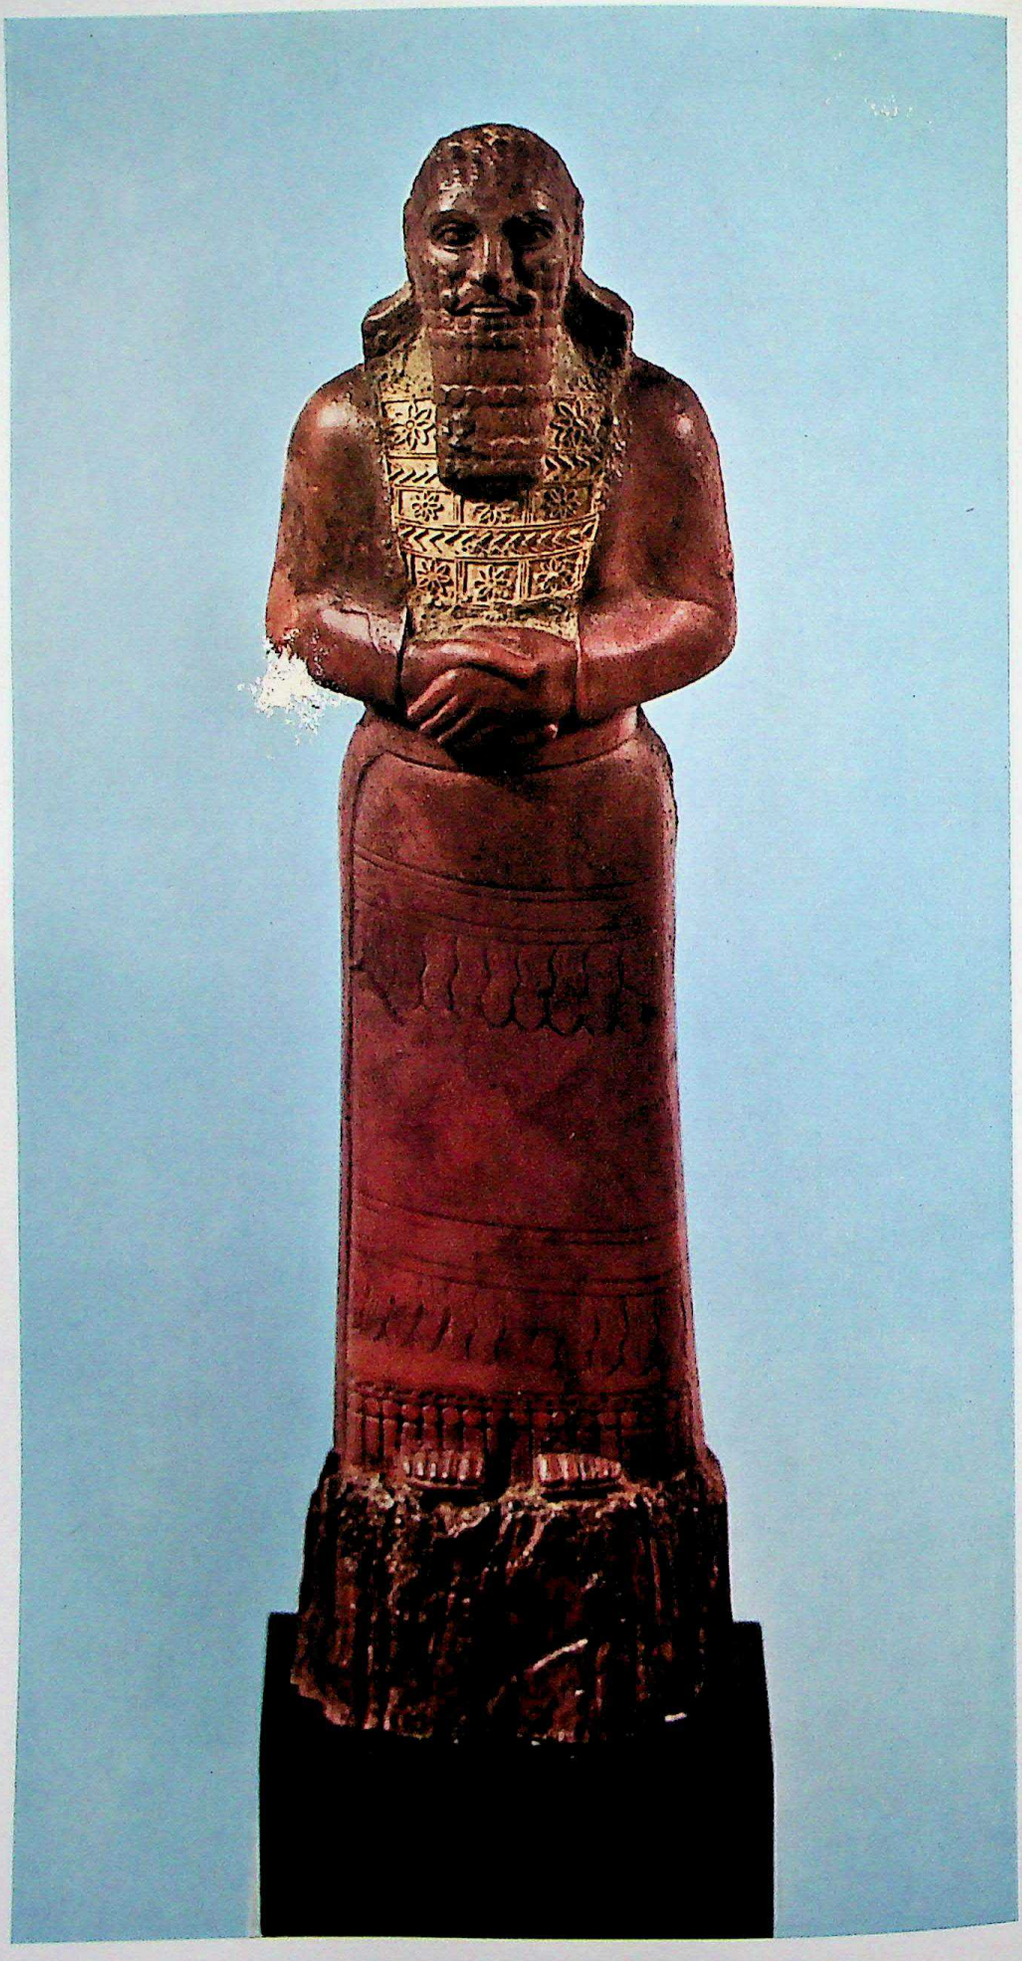
Pl. 487. *Left*: God of vegetation, from Ashur, Old Assyrian period. Chalk alabaster, ht., 4 ft., 5½ in. Berlin, Staatliche Museen. *Right*: The goddess Ishtar with dedication of King Ashurbelkala, from Nineveh, 11th cent. B.C. White limestone, ht., 37 in. London, British Museum.



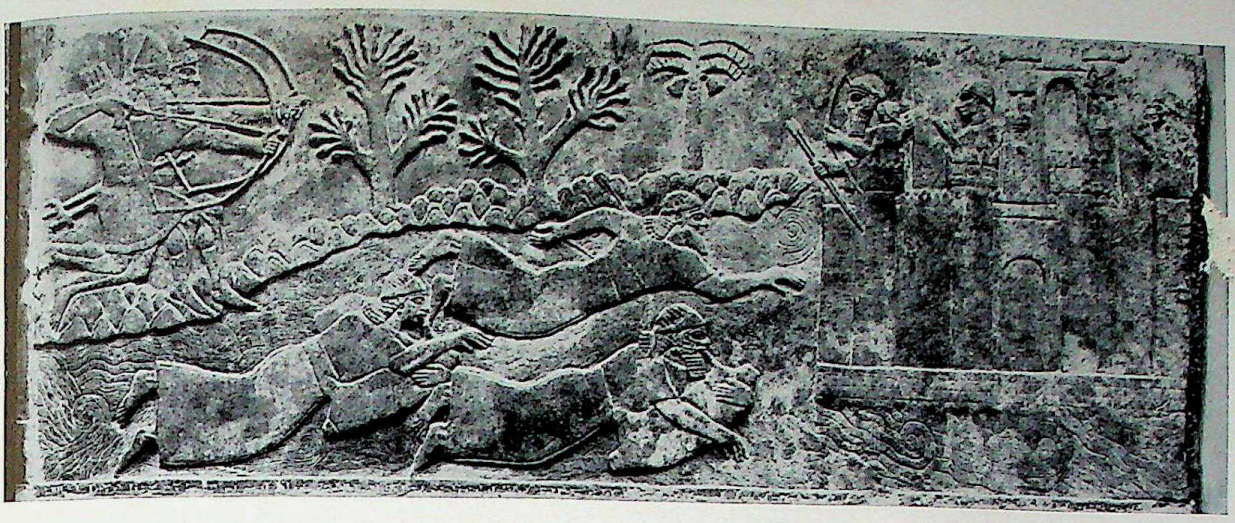


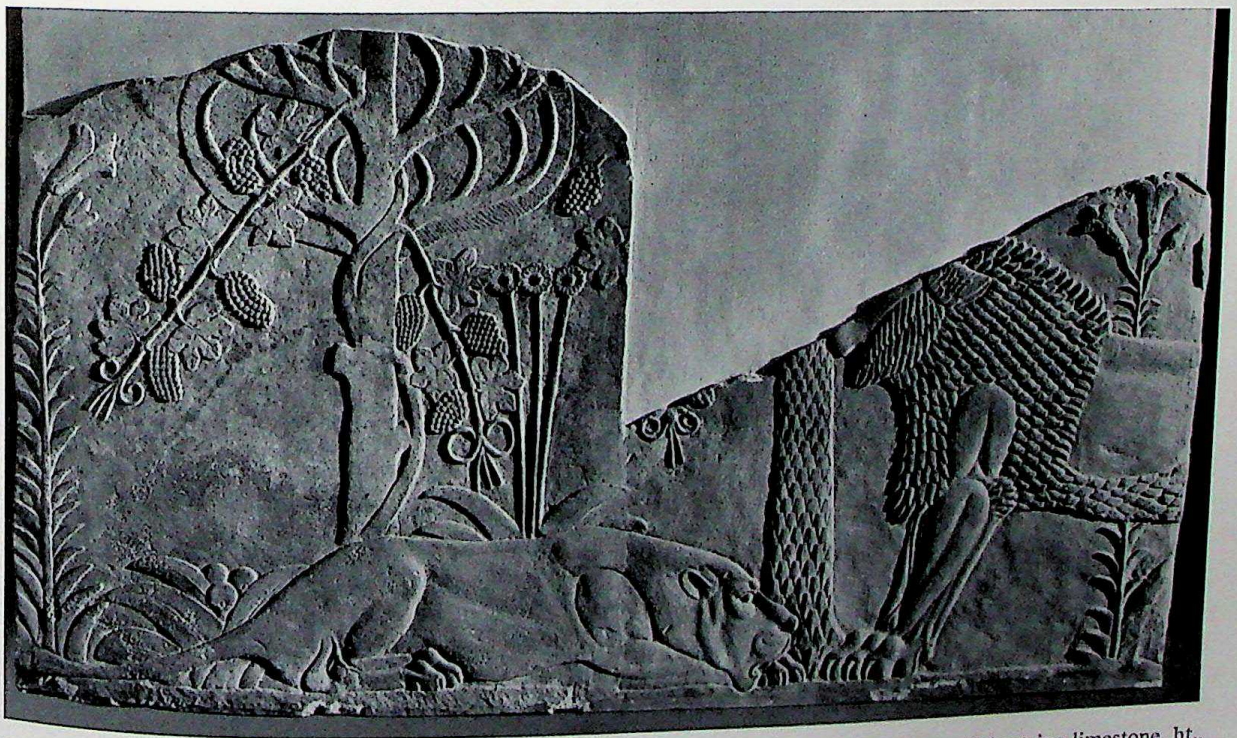
Pl. 488. *Left:* Human-headed winged bull, from the palace of Sargon II in Dur Sharrukin (mod. Khorsabad), 8th cent. B.C. Chalk alabaster, ht., 13 ft., 9⅛ in. Paris, Louvre. *Right:* The Black Obelisk of Shalmaneser III, from Nimrud, 9th cent. B.C. Marble, ht., 6 ft., 8¾ in. London, British Museum.

Pl. 489. *Left*: Human-headed winged genius, from the palace of Sargon II in Dur Sharrukin (mod. Khorsabad), 8th cent. B.C. Chalk alabaster, ht., 10 ft. *Right*: Eagle-headed winged genius, from Dur Sharrukin, 8th cent. B.C. Chalk alabaster, ht., 45 1/4 in. Both, Paris, Louvre.

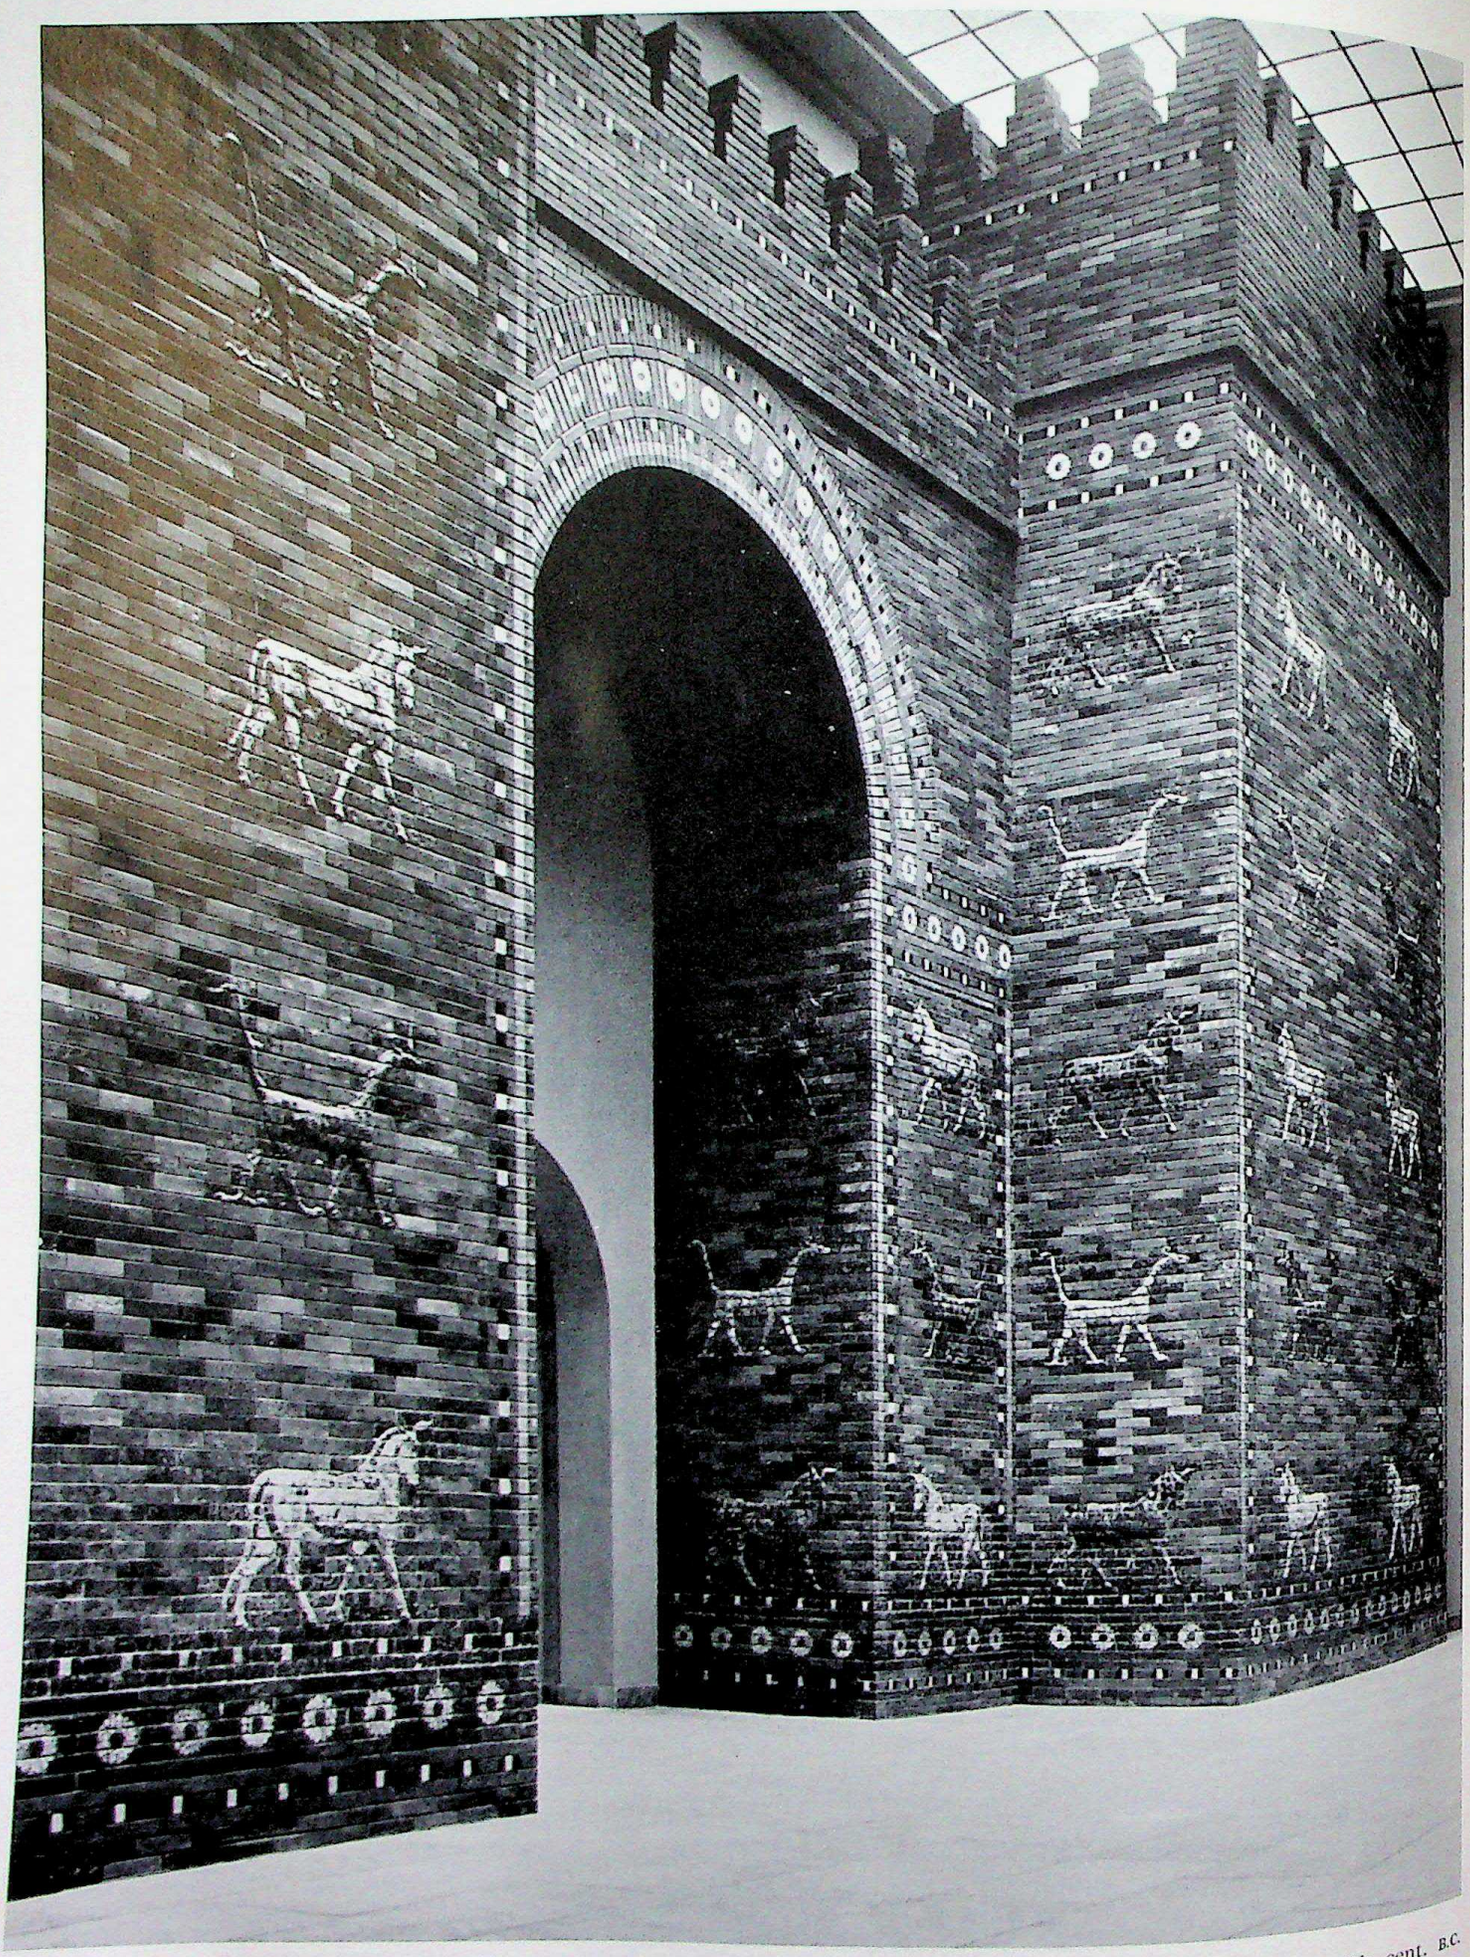


Pl. 490. *Above*: Relief with tribute bearers, from the palace of Sargon II in Dur Sharrukin (mod. Khorsabad), 8th cent. B.C. Chalk alabaster, ht., 5 ft., 3 3/4 in. Paris, Louvre. *Below*: Shalmaneser III's expedition to the source of the Tigris, detail of the reliefs from the palace gates of Balawat, 9th cent. B.C. Bronze, ht., ca. 11 in. London, British Museum.





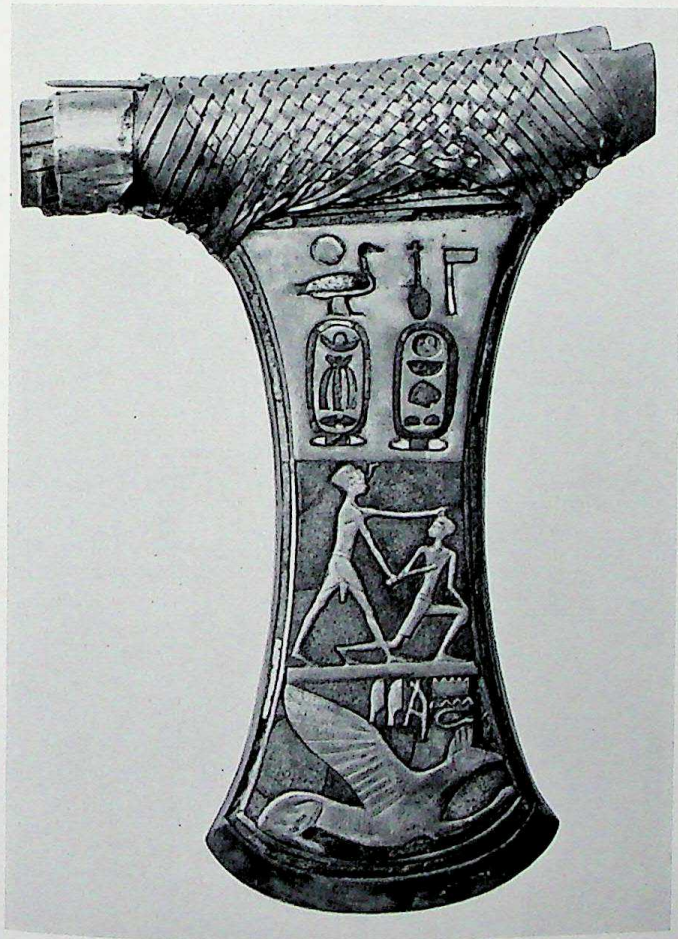
Pl. 491. *Above*: Lion doorkeeper from the temple of Dagan, Mari, early 2d millennium B.C. Bronze and stone, l., 27 1/2 in. *Below, left*: Kneeling worshiper, from Larsa, period of Hammurabi. Bronze and gold leaf, ht., 7 3/4 in. *Right*: Addorsed ibexes, from Larsa, period of Hammurabi. Bronze and gold, ht., 8 7/8 in. All, Paris, Louvre.



Pl. 492. Assyrian king, 9th cent. B.C. Amber, ht., 9 1/2 in. Boston, Museum of Fine Arts.

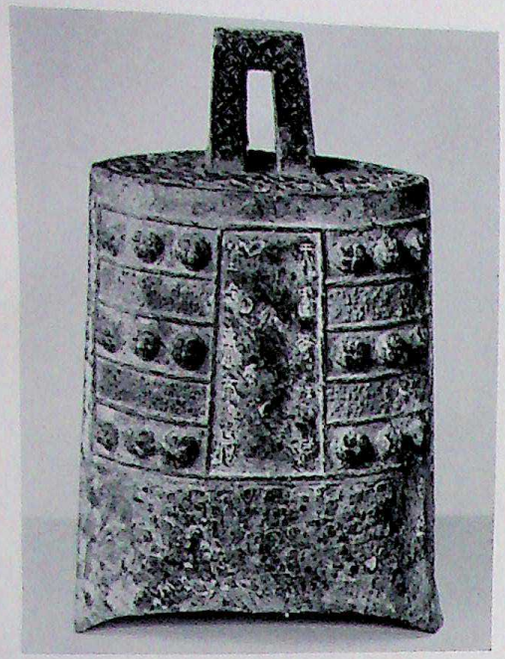
Pl. 493. *Above*: Fugitives swimming with the aid of wineskins, from Nimrud, 9th cent. B.C. Alabastrine limestone, ht., 39 in. *Center*: Hunting scene with Ashurnasirpal II, from Nimrud, 9th cent. B.C. Alabastrine limestone, ht., 39 in. *Below*: Relief fragment, with scenes of animal life, from the palace of Ashurbanipal in Nineveh, 7th cent. B.C. Alabastrine limestone, 39×49 in. All, London, British Museum.

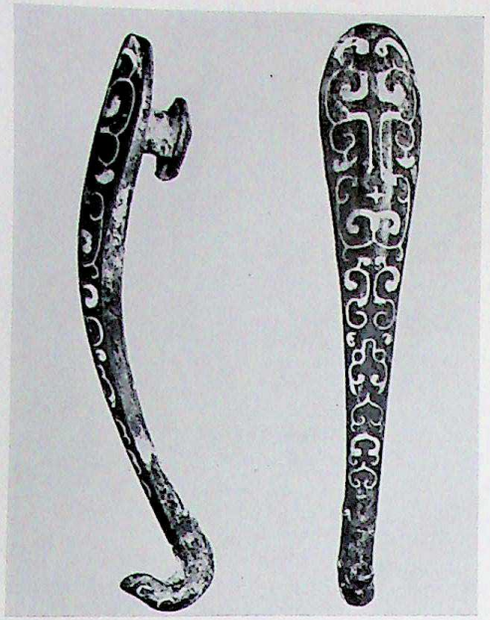
Pl. 494. The Ishtar Gate of Nebuchadnezzar II, from Babylon (Koldewey reconstruction), Neo-Babylonian period, 6th cent. B.C. Enameled bricks, ht., ca. 50 ft. Berlin, Staatliche Museen.

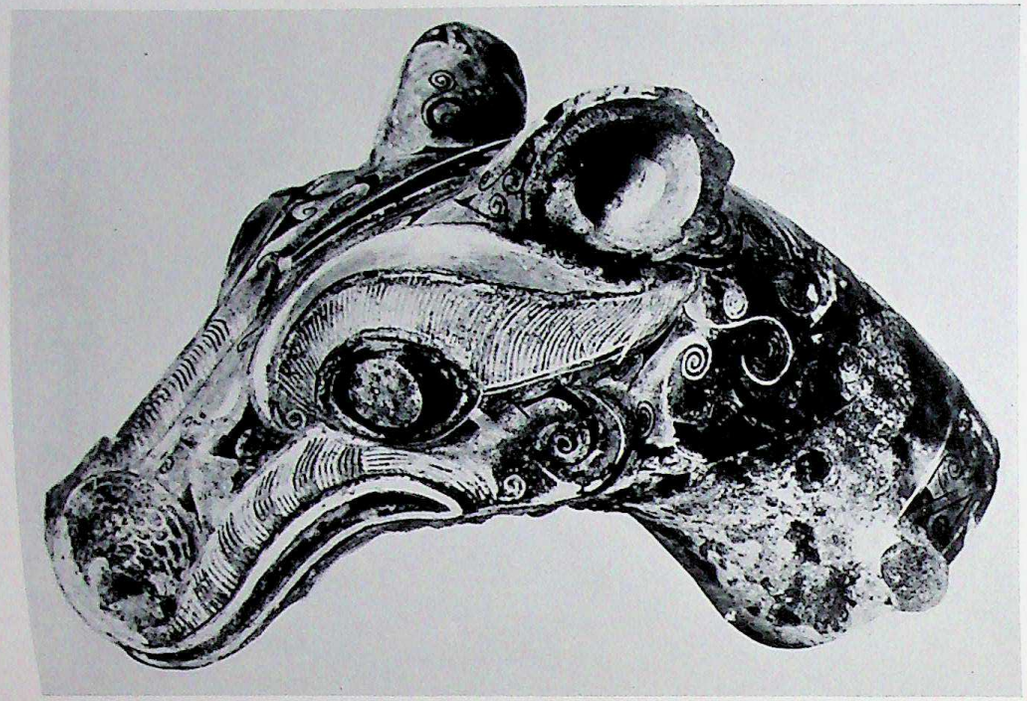


Pl. 495. Nabupaliddina before the god Shamash, from Sippar, Neo-Babylonian period, mid-9th cent. B.C. Stone, 11½ × 7⅛ in. London, British Museum.

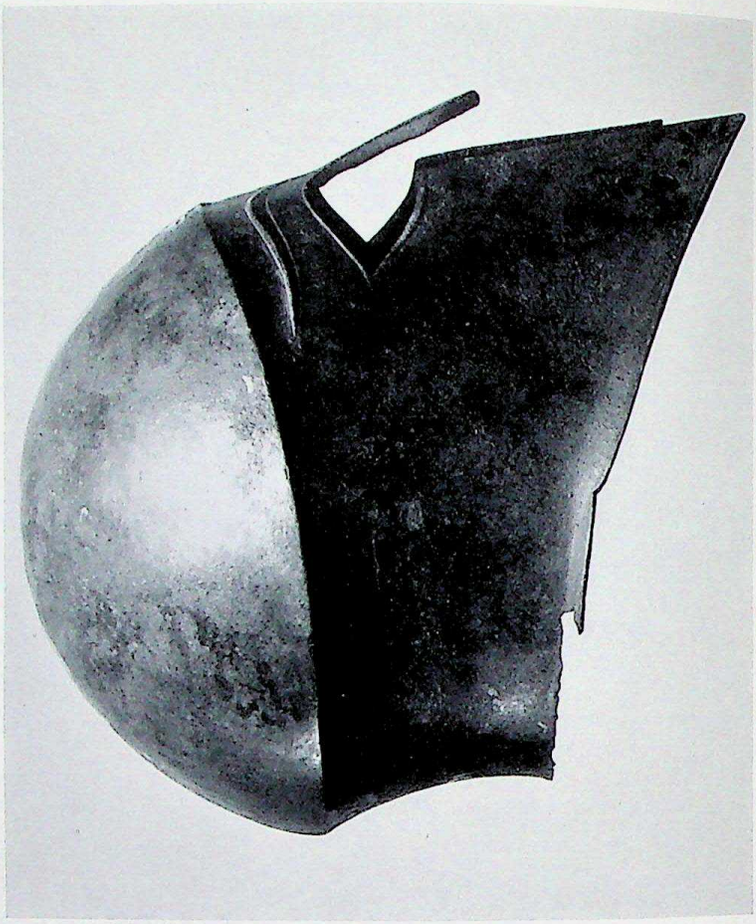
Pl. 496. Cylinder-seal impressions. *Top row, left*: "Brocade" pattern, from Ashur, Jamdat Naṣr period. Serpentine, ht., 1 3/4 in. *Right*: Worship of a divinity, Old Babylonian period. Iron mineral, ht., 1 in. *Second row, left*: Animals and fantastic beings, from Shuruppak (mod. Fara), ca. 2600 B.C. Gray limestone, ht., 1 1/2 in. All three, Berlin, Staatliche Museen. *Right*: Prayer to the god Marduk, Kassite period. Ht., 1 1/4 in. London, British Museum. *Third row, left*: Human figures and human-headed bulls, 2500–2350 B.C. Rock crystal, ht., 1 in. Berlin, Staatliche Museen. *Right*: Running deer and tree, from Ashur, Middle Assyrian period. Chalcedony, ht., 1 1/8 in. New York, Pierpont Morgan Library. *Bottom row, left*: Battle between mythical beings, Akkadian period. Serpentine, ht., 1 3/4 in. Paris, Bibliothèque Nationale. *Right*: Worship of the goddess Ishtar, Neo-Assyrian period. Greenish chalcedony, ht., 1 5/8 in. London, British Museum.



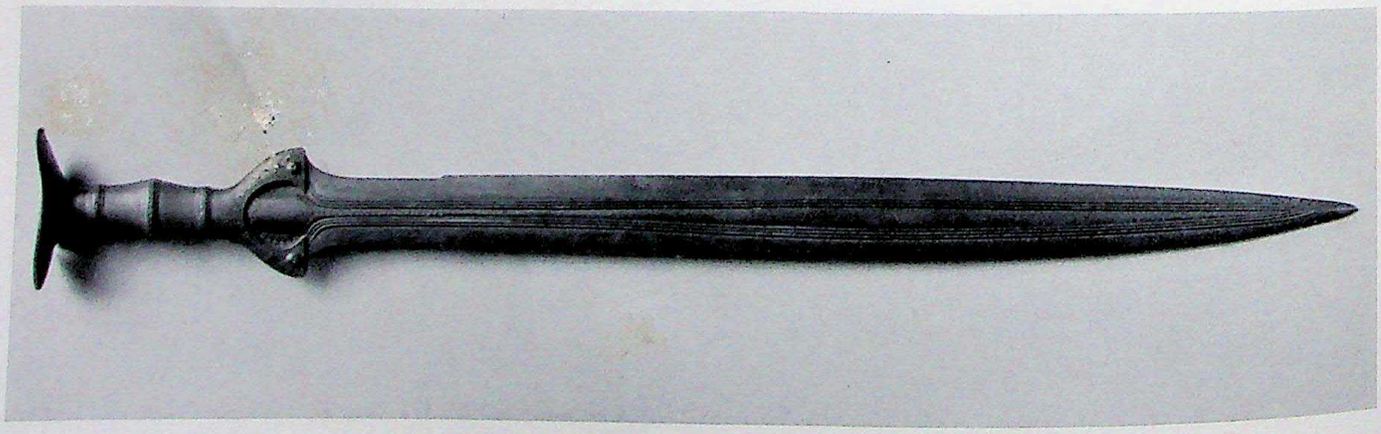




Pl. 497. *Above, left*: Bull's head, Erech (Uruk), first half of 3d millennium B.C. Bronze, 9×7½ in. Berlin, Staatliche Museen. *Right*: Finial, Luristan, late 2d–early 1st millennium B.C. Bronze. Teheran, Foroughi Coll. *Below, left*: Ax with name of King Ahmose, Thebes, early 18th dynasty. Bronze, gold, and lapis lazuli; l. of blade, 5⅜ in. Cairo, Egyptian Museum. *Right*: Winged centauress, part of an Urartian throne, Toprak Kale, 8th–7th cent. B.C. Bronze, ht., ca. 8 in. London, British Museum.

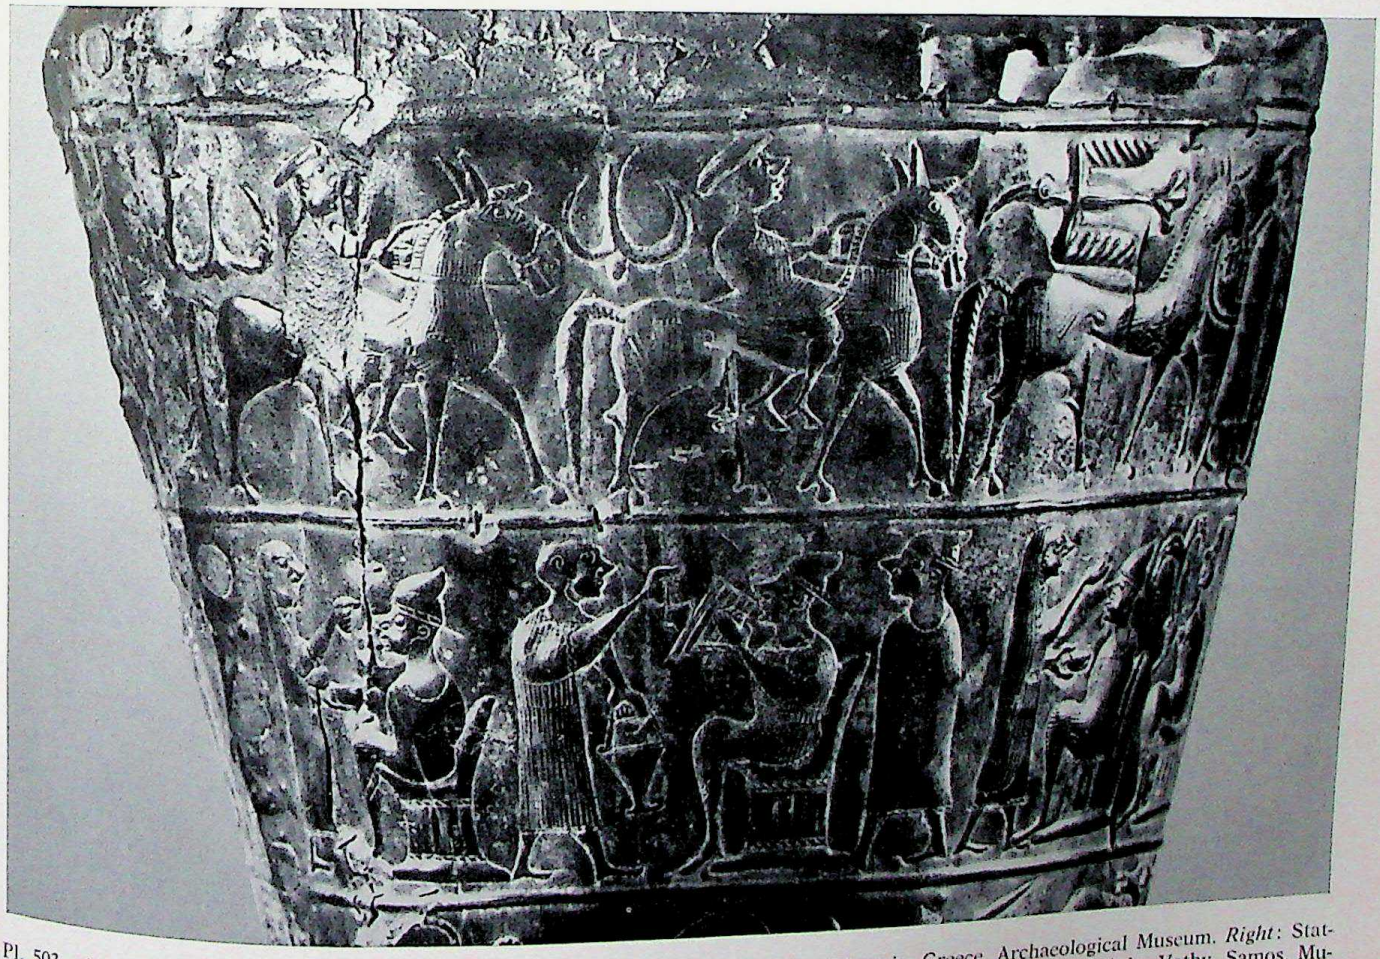


Pl. 498. *Left, above*: Bell (*chung*), from Shou-chou, Anhwei, China, Spring and Autumn period (722–481 B.C.). Bronze, ht., 11 in. *Center*: Girdle (?) hooks, from Chao-ku-ts'un, near Hui-hsien, Honan, China, Warring States period (5th cent.–221 B.C.). Bronze inlaid with gold; l., $3^{5}/_{8}$ in. *Below*: Chariot ornament, from Liu-li-ko, near Hui-hsien, Warring States period. Bronze, l., $5^{1}/_{4}$ in. All three, property of the Chinese Government. *Right*: Hunnish caldron with Chinese influences, from Törtel, Hungary, 4th–5th cent. Budapest, National Museum.



Pl. 499. *Left*: Tarascan mask representing the god Xipe, western Mexico. Copper. Mexico City, Museo Nacional de Antropología. *Right*: Diaguita axhead, northwestern Argentina. Bronze, l., 8½ in. Vienna, Museum für Völkerkunde.

Pl. 500. *Left*: Sword, Hungarian type, late Bronze Age. Bronze, with incised and punctured ornament; l., 21½ *in.* New York, Metropolitan Museum. *Right, above*: Cretan double ax, ca. 1500 B.C. Bronze. Heraklion, Crete, Archaeological Museum. *Below*: Helmet of Corinthian type, 6th–5th cent. B.C. Bronze. Athens, National Museum. (*Cf. I*, PL. 438.)



Pl. 501. Vessel with figurines, from Bisenzio (anc. Visentium), 7th cent. B.C. Bronze, sheet decorated in repoussé; ht., 9 7/8 in. Rome, Museo di Villa Giulia.

Pl. 502. Embossed disk (shield umbo?) showing Scythian influences, 1st cent. B.C. – 3d cent., probably from eastern Celtic lands, found in Helden, Netherlands. Gilded silver, diam., $8^{5}/_{8}$ in. Leiden, Netherlands, Rijksmuseum.
